[Customizing WebHelp Classic Mobile Systems](#) on page 898

### **DocBook to PDF Output Customization**

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
 <mediaobject/>
 <title
 t:named-template="book.verso.title"
 font-size="&nsize2;"
 font-weight="bold"
 font-family="${title.font.family}"/>
 <corpauthor/>
 ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a [DocBook customization layer](#).

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor and set the customization layer in [the XSL URL property of the scenario](#).

#### Related information

The book **DocBook XSL: The Complete Guide** by Bob Stayton contains more details about customizing the PDF output.

[Video demonstration for creating a DocBook customization layer in Oxygen XML Editor](#).

#### DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at [sourceforge.net](#).

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:

- To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
- To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.

3. Click the **Apply associated** button to run the transformation.

**Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

## DocBook to EPUB Transformation

The EPUB specification recommends the use of *OpenType* fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
 font-family: "MyFont";
 font-weight: bold;
 font-style: normal;
 src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

```
h1 {
 font-size: 20pt;
 margin-bottom: 20px;
 font-weight: bold;
 font-family: "MyFont";
 text-align: center;
}
```

3. Open the **Configure Transformation Scenario(s)** dialog box, select the **DocBook EPUB** transformation scenario, and click **Edit**.
4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

**Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

## DocBook 5 Transformation Scenarios

Default transformation scenarios allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB.

### DocBook 5 to WebHelp Output

DocBook 5 documents can be transformed into several types of WebHelp systems.

#### WebHelp Classic Output

To publish a DocBook 5 document as a *WebHelp Classic* system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

#### WebHelp Classic with Feedback Output

To publish a DocBook 5 document as a *WebHelp Classic with Feedback* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see [Deploying a Feedback-Enabled WebHelp System](#).

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback\\_Enabled\\_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

## WebHelp Classic Mobile Output

To publish a DocBook 5 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

## Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

### **clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

### **I10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

### **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
<div id="fb-root"/>
<script>
<!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
if (d.getElementById(id)) return;
js = d.createElement(s); js.id = id;
js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
fjs.parentNode.insertBefore(js, fjs);
(document, 'script', 'facebook-jssdk')) -->
</script>
<div data-share="true" data-show-faces="true" data-action="like"
data-layout="standard" class="fb-like"/>
```

```
</div>
```

### **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

### **webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

### **webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

### **webhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

### **webhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

### **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

### **webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

### **webhelp.skin.css**

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins` directory, or it can be a custom skin CSS generated with the [Oxygen Skin Builder](#) web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

### **DocBook to PDF Output Customization**

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
 <mediaobject>
 <title
 t:named-template="book.verso.title"
 font-size="&nsize2;"
 font-weight="bold"
 font-family="${title.font.family}" />
 <corpauthor/>
 ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a [DocBook customization layer](#).

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor and set the customization layer in [the XSL URL property of the scenario](#).

#### Related information

The book **DocBook XSL: The Complete Guide** by Bob Stayton contains more details about customizing the PDF output.

#### DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at [sourceforge.net](#).

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:

- To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
- To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.

3. Click the **Apply associated** button to run the transformation.

**Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

## DocBook to EPUB Transformation

The EPUB specification recommends the use of *OpenType* fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
 font-family: "MyFont";
 font-weight: bold;
 font-style: normal;
 src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

```
h1 {
 font-size: 20pt;
 margin-bottom: 20px;
 font-weight: bold;
 font-family: "MyFont";
 text-align: center;
}
```

3. Open the **Configure Transformation Scenario(s)** dialog box, select the **DocBook EPUB** transformation scenario, and click **Edit**.
4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

**Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

## DITA Topic Transformation Scenarios

The following default transformation scenarios are available for individual DITA topics:

- **DITA XHTML** - Transforms a DITA topic to XHTML using DITA Open Toolkit.
- **DITA PDF** - Transforms a DITA topic to PDF using the DITA Open Toolkit and the Apache FOP engine.

### Related information

[Editing a Transformation Scenario](#) on page 805

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

## DITA Map Transformation Scenarios

The following types of transformations scenarios are available for DITA maps:

- Predefined transformation scenarios allow you to transform a DITA map to a variety of outputs, such as PDF, ODF, XHTML, WebHelp, EPUB, and CHM files.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to [integrate a DITA-OT plugin](#). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. They contain information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Words count.
  - Information types such as number of containing maps, bookmaps, or topics.

## DITA Map to WebHelp Output

DITA maps can be transformed into a variety of WebHelp systems designed to suit your specific needs. This section contains the procedures for obtaining the output for the variants of the WebHelp system.

### Related information

[WebHelp System Output](#) on page 819

#### WebHelp Responsive Output

To publish a DITA map as a *WebHelp Responsive* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
  - **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
  - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
  - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
  - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

### Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

#### **clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

#### **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

#### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

#### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

#### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

## Parameters Specific to WebHelp Responsive Output

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo\_and\_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top\_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo\_and\_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top\_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.head**

In the generated output it displays a given XHTML fragment as a page header. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is yes.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

**webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

## **webhelp.show.side.toc**

Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

## **webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

## **webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

[WebHelp Responsive System](#) on page 820

*WebHelp Responsive with Feedback Output*

To publish a DITA map as a *WebHelp Responsive with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

  - [\*\*Templates Tab\*\*](#) - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
  - [\*\*Parameters Tab\*\*](#) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
  - [\*\*Filters Tab\*\*](#) - This tab allows you to filter certain content elements from the generated output.
  - [\*\*Advanced Tab\*\*](#) - This tab allows you to specify some advanced options for the transformation scenario.
  - [\*\*Output Tab\*\*](#) - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the [instructions to complete the system deployment](#).

### **Parameters for Customizing WebHelp Responsive with Feedback Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

#### **clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

#### **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

**webhelp.search.ranking**

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

**webhelp.show.changes.and.comments**

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

**webhelp.sitemap.base.url**

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

**webhelp.sitemap.change.frequency**

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

**Parameters Specific to WebHelp Responsive with Feedback Output****webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo\_and\_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top\_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo\_and\_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top\_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.head**

In the generated output it displays a given XHTML fragment as a page header. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is yes.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

**webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

**webhelp.show.side.toc**

Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

**WebHelp Classic Output**

To publish a DITA map as a **WebHelp Classic** system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

**Parameters for Customizing WebHelp Classic Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

## **clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

## **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

## **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

## **webhelp.body.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

## **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

## **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

## **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

## **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

## **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

## **webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (*iframe*) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is \_blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

## **webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

**webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

**WebHelp Classic With Feedback Output**

To publish a DITA map as a *WebHelp Classic with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- *Skins Tab* - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- *Parameters Tab* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the *Parameters section* below for details about the most commonly used parameters for WebHelp Responsive transformations.
- *Filters Tab* - This tab allows you to filter certain content elements from the generated output.
- *Advanced Tab* - This tab allows you to specify some advanced options for the transformation scenario.
- *Output Tab* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the webhelp.product.id parameter) and the documentation version (value for the webhelp.product.version parameter).

When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the *instructions to complete the system deployment*.

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback\\_Enabled\\_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

### Parameters for Customizing WebHelp Classic with Feedback Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

#### **clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

#### **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

#### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

#### **webhelp.body.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

#### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

#### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

#### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

## **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

## **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

## **webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is \_blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

## **webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

## **webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

## **webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

## **webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

## **webhelp.reload.stylesheet**

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

## **webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

## **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

### **webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

### **webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

### **webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

### **webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

### **webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between `0.0` (least important priority) and `1.0` (most important priority). For example, `0.3`, `0.5`, or `0.8`. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

## *WebHelp Classic Mobile Output*

To publish a DITA map as a *WebHelp Classic Mobile* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic Mobile** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- *Parameters Tab* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- *Filters Tab* - This tab allows you to filter certain content elements from the generated output.
- *Advanced Tab* - This tab allows you to specify some advanced options for the transformation scenario.
- *Output Tab* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

## **Parameters for Customizing WebHelp Classic Mobile Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

## **clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

## **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

## **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

## **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

## **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

## **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

## **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

## **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

## **webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (*iframe*) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is \_blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

## **webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

## **webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

#### **webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

#### **webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '`*`' (matches zero or more characters) or '`?`' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

#### **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

#### **webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

#### **webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

#### **webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

### **DITA Map to PDF Output Customization**

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps to PDF output. There are numerous ways that you can customize the PDF output and the topics in this section discuss some of those possibilities.

#### **Creating a DITA Map to PDF Transformation Scenario**

To create a *DITA Map to PDF* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your framework is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
  - `show.changes.and.comments` - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
  - `customization.dir` - Specifies the path to a customization directory.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

#### *Creating a Customization Directory for PDF Output*

DITA Open Toolkit PDF output can be customized in several ways:

- Creating a DITA Open Toolkit plugin that adds extensions to the PDF plugin. More details can be found in the [DITA Open Toolkit Documentation](#).
- Creating a customization directory and using it from the PDF transformation scenario. A small example of this procedure can be found below.

## How to Create a Customization Directory for PDF Output

The following procedure explains how to do a basic customization of the PDF output by setting up a customization directory. An example of a common use case is embedding a company logo image in the front matter of the book.

1. Copy the entire directory: *DITA\_OT\_DIR\plugins\org.dita.pdf2\Customization* to another location (for instance, C:\Customization).
2. Copy your logo image to: C:\Customization\common\artwork\logo.png.
3. Rename C:\Customization\catalog.xml.orig to: C:\Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: C:\Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl
6. Open the custom.xsl file in Oxygen XML Editor and create the template called createFrontCoverContents for DITA-OT 2.3.3 (or createFrontMatter\_1.0 for DITA-OT 1.8.5).

**Tip:** You can copy the same template from *DITA\_OT\_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl* and modify it in whatever way necessary to achieve your specific goal. This new template in the custom.xsl file will override the same template from *DITA\_OT\_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl*.

### DITA OT 2.3.3 Example:

For example, if you are using DITA OT 2.3.3, the custom.xsl could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format"
 version="2.0">

 <xsl:template name="createFrontCoverContents">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class, ' topic/title ')][1]">
 <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')][1]"/>
 </xsl:when>
 <xsl:when test="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]"/>
 </xsl:when>
 <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
 <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]">
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>

 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/booktitlealt ')]" />
 <fo:block xsl:use-attribute-sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')]" />
 </fo:block>

 <!-- Load the image logo -->
 <fo:block text-align="center" width="100%">
 <fo:external-graphic
 src="url({concat($artworkPrefix,
 '/Customization/OpenTopic/common/artwork/logo.png')})"
 />
 </fo:block>
 </xsl:template>

```

```
</xsl:template>
</xsl:stylesheet>
```

### DITA OT 1.8.5 Example:

For example, if you are using DITA OT 1.8.5, the `custom.xsl` could look like this:

```
<?xml version='1.0'?
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format"
 version="1.1">

<xsl:template name="createFrontMatter_1.0">
 <fo:page-sequence master-reference="front-matter"
 xsl:use-attribute-sets="__force__page__count">
 <xsl:call-template name="insertFrontMatterStaticContents"/>
 <fo:flow flow-name="xsl-region-body">
 <fo:block xsl:use-attribute-sets="__frontmatter">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class, ' topic/title ')][1]">
 <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')][1]"/>
 </xsl:when>
 <xsl:when test="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]"/>
 </xsl:when>
 <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
 <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')][1]">
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>

 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/booktitlealt ')]"/>
 <fo:block xsl:use-attribute-sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')]"/>
 </fo:block>

 <fo:block text-align="center" width="100%">
 <fo:external-graphic src="url(concat($artworkPrefix,
 '/Customization/OpenTopic/common/artwork/logo.png'))"/>
 </fo:block>
 </fo:block>
 <!--<xsl:call-template name="createPreface"/>-->
 </fo:flow>
 </fo:page-sequence>
 <xsl:call-template name="createNotices"/>
</xsl:template>
</xsl:stylesheet>
```

7. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab, set the `customization.dir` parameter to `C:\Customization`.

#### Related information

[Automatic PDF plugin customization generator by Jarno Elovirta.](#)

[DITA OT Documentation - PDF Customization Plugin](#)

*Customizing the Header and Footer in PDF Output*

The XSLT stylesheet `DITA_OT_DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA_OT_DIR\plugins\org.dita.pdf2\cfg\common\vars\en.xml`. These resource files contain variables (such as `Body odd footer`) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory as explained in [Creating a Customization Directory for PDF Output](#) on page 1625.

#### *Adding a Watermark to PDF Output*

To add a watermark to the PDF output of a DITA map transformation, create a DITA-OT customization directory and use it from a DITA Map to PDF transformation scenario, as in the following procedure:

1. Copy the entire directory: `DITA_OT_DIR\plugins\org.dita.pdf2\Customization` to another location (for instance, C :\Customization).
2. Copy your watermark image (for example, `watermark.png`) to: C :\Customization\common\artwork \watermark.png.
3. Rename the C :\Customization\catalog.xml.orig file to: C :\Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

The uncommented line should look like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: C :\Customization\fo\xsl\custom.xsl.orig to: C :\Customization\fo\xsl \custom.xsl
6. Open the C :\Customization\fo\xsl\custom.xsl file in Oxygen XML Editor to overwrite two XSLT templates:
  - The first template is located in the XSLT stylesheet `DITA_OT_DIR\plugins\org.dita.pdf2\xsl \fo\static-content.xsl` and we override it specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:

```
<fo:static-content flow-name="odd-body-header">
 <fo:block-container absolute-position="absolute"
 top="-2cm" left="-3cm" width="21cm" height="29.7cm"
 background-image="{concat($artworkPrefix,
 '/Customization/OpenTopic/common/artwork/watermark.png')}">
 <fo:block/>
 </fo:block-container>
 <fo:block xsl:use-attribute-sets="__body__odd__header">
 <xsl:call-template name="insertVariable">
 <xsl:with-param name="theVariableID" select="'Body odd header'"/>
 <xsl:with-param name="theParameters">
 <prodname>
 <xsl:value-of select="$productName"/>
 </prodname>
 <heading>
 <fo:inline xsl:use-attribute-sets="__body__odd__header__heading">
 <fo:retrieve-marker retrieve-class-name="current-header"/>
 </fo:inline>
 </heading>
 <pagenum>
 <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">
 <fo:page-number/>
 </fo:inline>
 </pagenum>
 </xsl:with-param>
 </xsl:call-template>
 </fo:block>
 </fo:static-content>
</xsl:template>
```

- The second template that we override is located in the XSLT stylesheet `DITA_OT_DIR\plugins \org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. We also override it by copying the original template content in our custom.xsl and adding the `block-container` element that references the watermark image file:

```
<xsl:template name="createFrontMatter_1.0">
 <fo:page-sequence master-reference="front-matter"
 xsl:use-attribute-sets="__force__page__count">
 <xsl:call-template name="insertFrontMatterStaticContents"/>
 <fo:flow flow-name="xsl-region-body">
```

```

 <fo:block-container absolute-position="absolute"
 top="-2cm" left="-3cm" width="21cm" height="29.7cm"
 background-image="{concat($artworkPrefix,
'Customization/OpenTopic/common/artwork/watermark.png')}">
 <fo:block/>
 </fo:block-container>
 <fo:block xsl:use-attribute-sets="__frontmatter">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class, 'topic/title')][1]">
 <xsl:apply-templates select="$map/*[contains(@class, 'topic/title')][1]" />
 </xsl:when>
 <xsl:when test="$map//*[contains(@class, 'bookmap/mainbooktitle')][1]">
 <xsl:apply-templates select="$map//*[contains
(@class, 'bookmap/mainbooktitle')][1]" />
 </xsl:when>
 <xsl:when test="//*[contains(@class, 'map/map')]/@title">
 <xsl:value-of select="//*[contains(@class, 'map/map')]/@title"/>
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/descendant::*[contains
(@class, 'topic/topic')][1]/*[contains(@class, 'topic/title')]" />
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>
 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains
(@class, 'bookmap/booktitlealt')]" />
 <fo:block xsl:use-attribute-sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains
(@class, 'bookmap/bookmeta')]" />
 </fo:block>
 </fo:block>
<!--<xsl:call-template name="createPreface"/>-->
</fo:flow>
</fo:page-sequence>
<xsl:if test="not($retain-bookmap-order)">
 <xsl:call-template name="createNotices"/>
</xsl:if>
</xsl:template>

```

7. Edit your **DITA Map PDF** transformation scenario. In the **Parameters** tab, set the customization.dir parameter to C:\Customization.

## Related tasks

[Adding a Watermark in DITA Map to XHTML Output](#) on page 1632

*Force Page Breaks Between Two Block Elements in PDF Output*

Suppose that in your DITA content you have two block level elements, such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```
<p>First para</p>
<?pagebreak?>
<p>Second para</p>
```

2. Locate the **DITA Open Toolkit** distribution and in the `plugins` directory create a new plugin folder (for example, `DITA_OT_DIR/plugins/pdf-page-break`).

3. In this new folder, create a new `plugin.xml` file with the following content:

```
<plugin id="com.yourpackage.pagebreak">
 <feature extension="package.support.name" value="Force Page Break Plugin"/>
 <feature extension="package.support.email" value="support@youremail.com"/>
 <feature extension="package.version" value="1.0.0"/>
 <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
 <xsl:template match="processing-instruction('pagebreak')">
 <fo:block break-after="page"/>
 </xsl:template>
</xsl:stylesheet>
```

5. [Install your plugin in the DITA Open Toolkit.](#)

#### Customizing note Images in PDF

To customize the images that appear next to each type of note in the PDF output, use a [PDF customization folder](#) with the following procedure:

1. Copy the `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml` file to the `[CUSTOMIZATION_DIR]\common\vars` folder.
2. Edit the copied `en.xml` file and modify, for example, the path to the image for `<note>` element with the `type` attribute set to `notice` from:

```
<variable id="notice Note Image Path">Configuration/OpenTopic/cfg/common/artwork/
important.png</variable>
```

to:

```
<variable id="notice Note Image Path">Customization/OpenTopic/common/artwork/
notice.gif</variable>
```

3. Add your custom `notice` image to `[CUSTOMIZATION_DIR]\common\artwork\notice.gif`.
4. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab set the path for the `customization.dir` property to point to the customization folder.

#### Show Comments and Tracked Changes in PDF Output

To make comments and tracked changes (stored within your DITA topics) appear in the PDF output, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your framework is read-only).
3. In the **Parameters** tab, set the value of the `show.changes.and.comments` parameter to `yes`.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

#### Set a Font for PDF Output Generated with FO Processor

When a DITA map is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor](#).

#### DITA OT PDF Font Mapping

The DITA OT contains a file `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the *font-mappings.xml*.

If it finds a mapping like this:

```
<aliases>
 <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *Monospaced* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
 <physical-font char-set="default">
 <font-face>Courier New, Courier</font-face>
 </physical-font>

</logical-font>
```

### Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

### Related information

#### DITA Map to PDF WYSIWYG Transformation

Oxygen XML Editor comes bundled with a DITA OT plugin that converts DITA maps to PDF using a CSS layout processor. Oxygen XML Editor supports the following processors (not included in the Oxygen XML Editor installation kit):

- **Prince Print with CSS** - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

The DITA-OT plugin is located in the following directory: *DITA\_OT\_DIR/plugins/com.oxygenxml.pdf.css*.

Although it includes a set of CSS files in its css subfolder, when this plugin is used in Oxygen XML Editor, the CSS files located in the *Frameworks* directory take precedence.

### Creating the Transformation Scenario

To create an experimental *DITA map to PDF WYSIWYG* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG - Experimental**.
3. In the **Parameters** tab, configure the following parameters:

- **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
- **dita.css.list** - Allows you to specify a list of CSS URLs to be used by the PDF processor. The files must have URL syntax and be separated using semicolons. If the value is empty, the current selection from the **Styles** drop-down menu is used.
- **args.css** - Allows you to specify a list of CSS URLs to be used in addition to those specified in the **dita.css.list** parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the **dita.css.list** parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

- Click **OK** and run the transformation scenario.

### Customizing the Styles (for Output and Editing)

If you need to change the styles in the associated CSS, make sure you install Oxygen XML Editor in a folder where you have full read and write privileges (for instance, your user home directory). This is due to the fact that the installed files are usually placed in a read-only folder (for instance, in Windows, Oxygen XML Editor is installed in the Program Files folder where the users do not have change rights).

To change the styles of an element you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Create an alternate CSS for the DITA document type:
  - Follow the procedure for adding an alternate CSS file in [Customizing the Main CSS of a Document Type](#) on page 1204.
  - Once you have configured your CSS as an additional layer, you can [select it from the \*\*Styles\*\* drop-down menu \(on the toolbar\)](#).
  - Run the **DITA Map PDF - WYSIWYG - Experimental** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and rendering **Author** mode while editing.

- Use the `args.css` parameter that allows you to specify a list of CSS URLs to be used in addition to the `dita.css.list` parameter:
  - Configure a *DITA map to PDF WYSIWYG* transformation scenario, as described in the procedure [above](#).
  - In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.
  - Click **OK** and run the transformation scenario.

This method is appropriate if you just want to apply the styling customization to the output.

### Using the CSS Inspector to See Style Associated with an Element

To find the styles associated with an element, follow this procedure:

- Open a document in the editor and select **Inspect Styles** from the contextual menu. This opens the [CSS Inspector view](#) that shows all the CSS rules that apply to the selected element.
- Click the particular link for the CSS selector that you need to change and Oxygen XML Editor will open the CSS file and position the cursor at that selector.
- After you identify the source of the styles you want to modify, copy the CSS rule in your customization CSS file and modify it according to your needs.

To see the changes in **Author** mode, press **F5** to reload the document.

### How to Make Remote Resources Appear in the Output When Using the Prince Processor

If your documentation references external resources (such as images that are stored on a Web-based repository) and your system is behind an HTTP(S) proxy, you may find that they do not appear in the output when using the **Prince Print with CSS** processor. To solve this, follow this procedure:

- Edit the `build.xml` file that is located in `DITA_OT_DIR/plugins/com.oxygenxml.pdf.css`.
- There are two instances in the file where a pair of arguments are commented out:

```

<!--
<arg value="-\http-proxy=${http.proxyHost}:${http.proxyPort}"/>
<arg value="-\https-proxy=${https.proxyHost}:${https.proxyPort}"/>
-->
```

3. Remove the comment in both instances.
4. Make sure you also remove the slash that appears before the property name `http-proxy` in each instance.

**Step Result:** The arguments should now look like this:

```
<arg value="--http-proxy=${http.proxyHost}:${http.proxyPort}"/>
<arg value="--http-proxy=${https.proxyHost}:${https.proxyPort}"/>
```

5. Save the `build.xml` file.
6. Run the [DITA map to PDF WYSIWYG transformation scenario](#).

**Result:** Your external resources should now appear in your output.

#### Related information

[Editing a Transformation Scenario](#) on page 805

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

[Selecting and Combining Multiple CSS Styles](#) on page 1222

[CSS Inspector View](#) on page 227

#### Compiled HTML Help (CHM) Output Format

To perform a **Compiled HTML Help (CHM)** transformation Oxygen XML Editor needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor automatically detects HTML Help Workshop and uses it.

**Note:** HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the `.hhp` and `.hhc` files. If the transformation fails to produce the CHM output but the `.hhp` (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

#### Changing the Output Encoding

Oxygen XML Editor uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. The **Compiled HTML Help (CHM)** default scenario that comes bundled with Oxygen XML Editor has the `htmlhelp.locale` parameter set to `en-US`.

The default value of the `htmlhelp.locale` is `en-US`. To customize this parameter, go to  [Configure Transformation Scenarios](#) and click the  **Edit** button. In the parameter tab search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`US`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

#### Kindle Output Format

Oxygen XML Editor requires KindleGen to generate Kindle output from DITA maps. To install KindleGen for use by Oxygen XML Editor, follow these steps:

1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor and open a DITA map in the **DITA Maps Manager** view.
4. In the **DITA Maps Manager** view, open the  [Configure Transformation Scenario\(s\)](#) dialog box.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the `kindlegen.executable` parameter as the path to the `KindleGen` directory.
7. Accept the changes.

#### XHTML Transformation Scenarios

The following default transformation scenarios are available for XHTML:

- **XHTML to DITA concept** - Converts an XHTML document to a DITA concept document.
- **XHTML to DITA reference** - Converts an XHTML document to a DITA reference document.
- **XHTML to DITA task** - Converts an XHTML document to a DITA task document.
- **XHTML to DITA topic** - Converts an XHTML document to a DITA topic document.

### TEI ODD Transformation Scenarios

The following default transformations are available for TEI ODD document types:

- **TEI ODD XHTML** - Transforms a TEI ODD document into an XHTML document
- **TEI ODD PDF** - Transforms a TEI ODD document into a PDF document using the Apache FOP engine
- **TEI ODD EPUB** - Transforms a TEI ODD document into an EPUB document
- **TEI ODD DOCX** - Transforms a TEI ODD document into a DOCX document
- **TEI ODD ODT** - Transforms a TEI ODD document into an ODT document
- **TEI ODD RelaxNG XML** - Transforms a TEI ODD document into a RelaxNG XML document
- **TEI ODD to DTD** - Transforms a TEI ODD document into a DTD document
- **TEI ODD to XML Schema** - Transforms a TEI ODD document into an XML Schema document
- **TEI ODD to RelaxNG Compact** - Transforms a TEI ODD document into an RelaxNG Compact document

#### Related information

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

### TEI P4 Transformation Scenarios

The following default transformations are available for TEI P4 documents:

- **TEI HTML** - Transforms a TEI document into an HTML document.
- **TEI P4 - TEI P5 Conversion** - Convert a TEI P4 document into a TEI P5 document.
- **TEI PDF** - Transforms a TEI document into a PDF document using the Apache FOP engine.

#### Related information

[Editing a Transformation Scenario](#) on page 805

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

### TEI P5 Transformation Scenarios

The following default transformations are available for TEI P5 documents:

- **TEI P5 XHTML** - Transforms a TEI P5 document into an XHTML document.
- **TEI P5 PDF** - Transforms a TEI P5 document into a PDF document using the Apache FOP engine.
- **TEI EPUB** - Transforms a TEI P5 document into an EPUB output. The EPUB output will contain any images referenced in the TEI XML document.
- **TEI DOCX** - Transforms a TEI P5 document into a DOCX (OOXML) document. The DOCX document will contain any images referenced in the TEI XML document.
- **TEI ODT** - Transforms a TEI P5 document into an ODT (ODF) document. The ODT document will contain any images referenced in the TEI XML document.

## Creating New Transformation Scenarios

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of scenarios that are available in Oxygen XML Editor and how to create each type of transformation.

### XML Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.
  - Use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.
- Note:** If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XML transformation with XSLT**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

### XSLT Tab

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

#### XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template](#) is specified in the scenario, the **XML**

URL field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors](#). Otherwise, a value is mandatory in this field.

### XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

### Use "xmlstylesheet" declaration

If enabled, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is disabled and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

### Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

### Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

### Parameters

Opens a [Configure parameters dialog box](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets](#). If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

### Extensions

Opens a [dialog box for configuring the XSLT extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

### Additional XSLT stylesheets

Opens a [dialog box for adding XSLT stylesheets](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

### XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

### Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc( '\${cfdu}/test.xml')//\*
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

#### New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

#### Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

#### Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

#### Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

#### Related information

[Editor Variables](#) on page 164

#### XSLT Extensions

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the  **Move up** or  **Move down** buttons.

#### Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

#### Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an *editor variable* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

#### Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

#### Open

Opens the selected stylesheet in a separate view.

#### Up

Moves the selected stylesheet up in the list.

#### Down

Moves the selected stylesheet down in the list.

## *Advanced Saxon HE/PE/EE XSLT Transformation Options*

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

### **Mode (" -im")**

A Saxon-specific option that sets the initial mode for the transformation.

### **Template (" -it")**

A Saxon-specific option that sets the name of the initial XSLT template to be executed.

### **Use a configuration file (" -config")**

Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.

### **Debugger trace into XPath expressions (applies to debugging sessions)**

Instructs the [XSLT Debugger](#) to step into XPath expressions.

### **Version warnings (" -versmsg")**

Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

### **Line numbering (" -l")**

Line numbers where errors occur are included in the output messages.

### **Expand attributes defaults (" -expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

### **DTD validation of the source (" -dtd")**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

### **Recoverable errors (" -warnings")**

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

### **Strip whitespaces (" -strip")**

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

## **Optimization level (" -opt")**

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

## **Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

## **Register Saxon-CE extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

## **Allow calls on extension functions (" -ext")**

If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

## **XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version option**.

## **Validation of the source file (" -val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

## **Validation errors in the result tree treated as warnings (" -outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

## **Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

## **Generate bytecode (" --generateByteCode:(on|off)")**

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javavadoc>.

## FO Processor Tab (XSLT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

### Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

### Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

### Method

The output format of the FO processing. The available options depend on the selected processor type.

### Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor](#).

## Output Tab (XSLT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

### Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

### Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

### Open in Browser/System Application

If enabled, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

### Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

### Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#).
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an [integrated SVG viewer in the results panel](#) at the bottom of the application window and renders the result as an SVG image.

- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:** When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

### XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XQuery**.
- Use the **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XQuery**.

**Note:** If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **XML transformation with XQuery**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

#### XQuery Tab

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

##### XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog

resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver.

### XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

### Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

### Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

### Parameters

Opens the [Configure parameters dialog box](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

### Extensions

Opens a [dialog box for configuring the XQuery extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

### XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

#### Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc('\${cfdu}/test.xml')//\*
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

## New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

## Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

## Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

## Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

## Related information

[Editor Variables](#) on page 164

### XQuery Extensions

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the  **Move up** or  **Move down** buttons.

### Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

#### Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

#### Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

- **None ("none")** - Strips *no* whitespace before further processing.

#### **Optimization level ("‐opt")**

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

#### **Use linked tree model ("‐tree:linked")**

This option activates the linked tree model.

#### **Enable XQuery 3.0 support ("‐qversion:(1.0|3.0)")**

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

#### **Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

#### **Use a configuration file ("‐config")**

Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

#### **Allow calls on extension functions ("‐ext")**

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

#### **Validation of the source file ("‐val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

#### **Validation errors in the result tree treated as warnings ("‐outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

#### **Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

#### **Generate bytecode ("‐generateByteCode:(on|off)")**

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#!javadoc>.

#### **Enable XQuery update ("‐update:(on|off)")**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

### **Backup files updated by XQuery ("`-backup:(on|off)`")**

If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

### **FO Processor Tab (XQuery Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

#### **Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

#### **Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

#### **Method**

The output format of the FO processing. The available options depend on the selected processor type.

#### **Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor](#).

### **Output Tab (XQuery Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

#### **Present as a sequence**

Enabling this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

#### **Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

#### **Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

#### **Open in Browser/System Application**

If enabled, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

## Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

## Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*.
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an *integrated SVG viewer in the results panel* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:** When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

## DITA OT Transformation

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

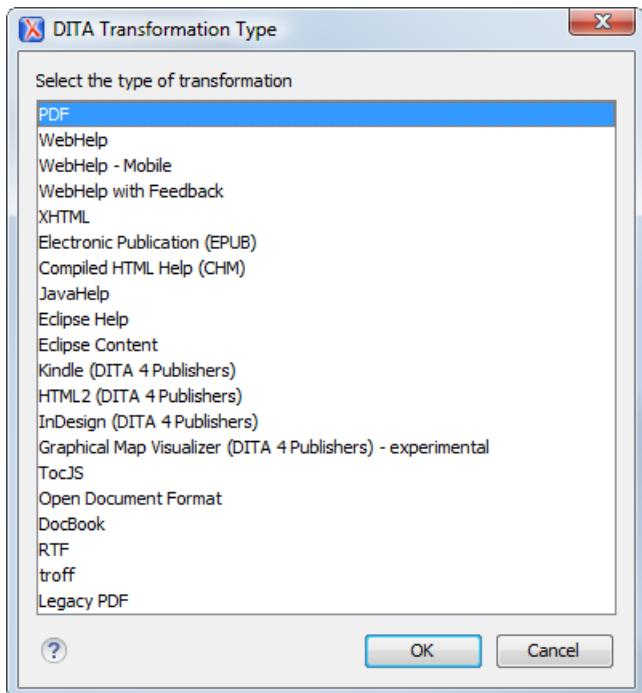

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.
- Use the **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.

**Note:** If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **DITA OT Transformation**.

All three methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

**Figure 439: DITA Transformation Type Dialog Box**

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

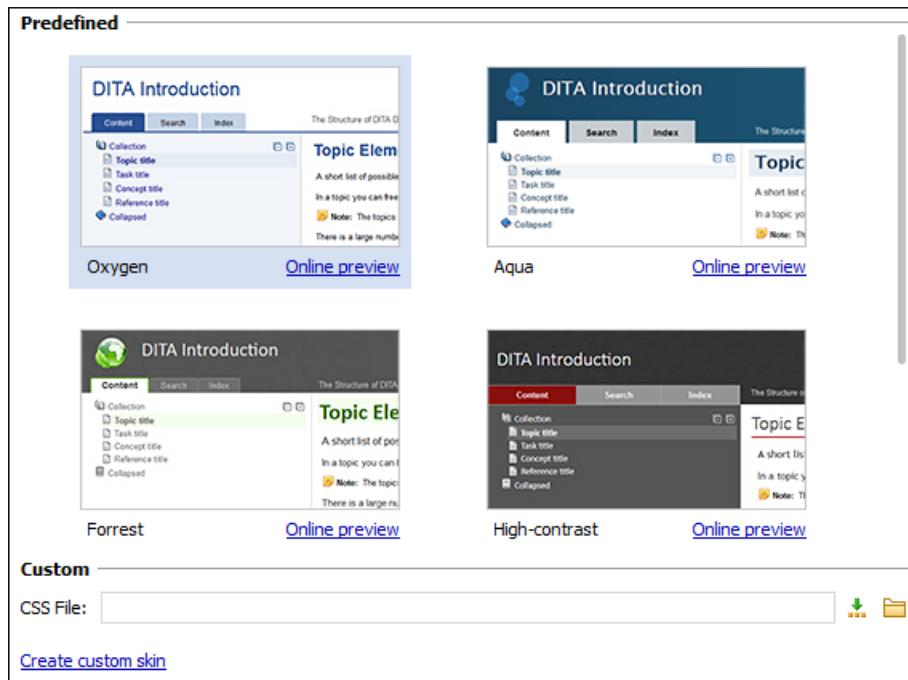

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

#### **Skins Tab (DITA OT Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of predefined skins that you can use as a base for your WebHelp system output.

A **skin** is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

**Figure 440: Skins Tab**

The **Skins** tab includes the following sections:

#### Predefined Skins

This section presents the predefined skins that are included in Oxygen XML Editor. The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Editor website, press the **Online preview** link.

#### Custom Skins

You can use this section to customize the look of the output.

#### CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

**Note:** The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

#### Create custom skin

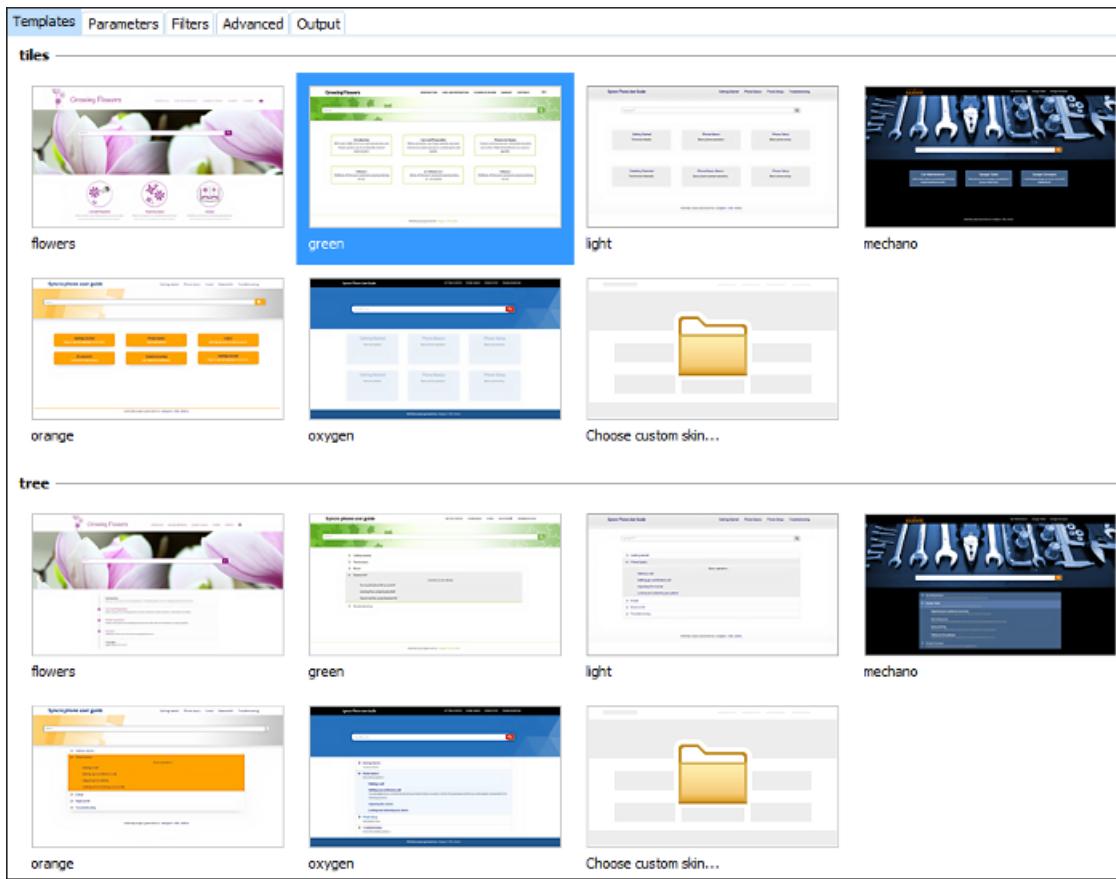

Use this link to open the [WebHelp Skin Builder](#) tool.

### Templates Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive** or **WebHelp Responsive with Feedback** output types and it provides a set of predefined skins that you can use as a base for the layout of your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output. You can choose predefined skins in a *tile* style of layout or a *tree* style of layout, and you can also [add your own customized skins](#).

**Figure 441: Templates Tab**

The **Templates** tab comes by default with the following predefined collections of skins:

#### **Tiles**

This section presents the predefined skins that are arranged in a *tiles* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

#### **Tree**

This section presents the predefined skins that are arranged in a *tree* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

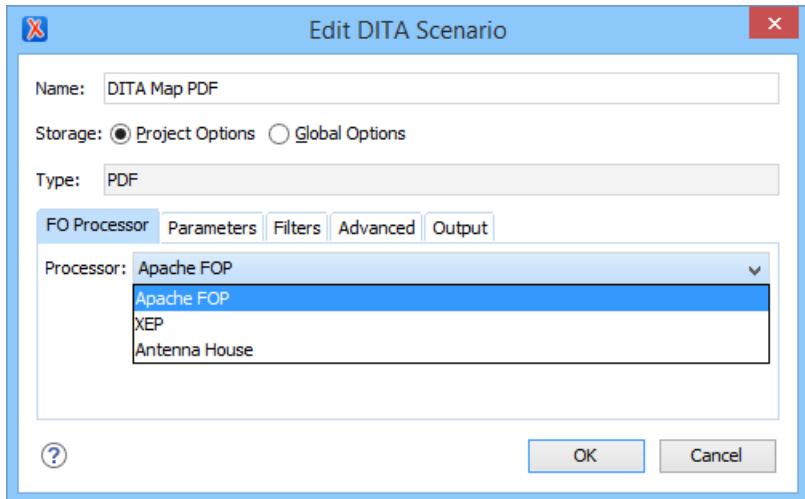

When you add a new collection of skins, this tab will list them.

#### **FO Processor Tab (DITA OT Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

**Figure 442: FO Processor Configuration Tab**

You can choose one of the following processors:

#### Apache FOP

The default processor that comes bundled with Oxygen XML Editor.

#### XEP

The [RenderX](#) XEP processor. If XEP is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the [FO Processors option page](#).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA_OT_DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor installation directory.

#### Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the [Parameters tab](#).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

#### Related information

[FO Processors Preferences](#) on page 125

[XSL-FO Processors](#) on page 816

#### Parameters Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA OT Documentation](#). You can also add, edit, and

remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an *editor variable* selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the *ask editor variable* in the **Value** column.

Below the table, the following actions are available for managing parameters:

#### New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  *Insert Editor Variables* button or the  *Browse* button.

#### Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

#### Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

#### Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

#### Related information

[DITA Open Toolkit Documentation](#)

#### Filters Tab (DITA Transformations)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

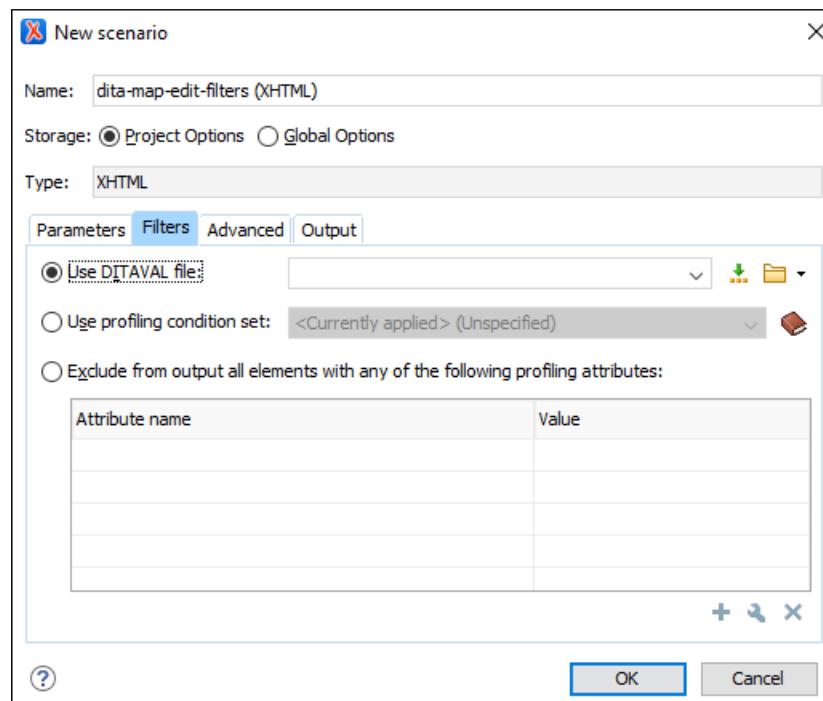

Figure 443: Edit Filters Tab

You can choose one of the following options to define filters:

#### Use DITAVAL file

If you already have a *DITAVAL* file associated with the DITA map, you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the [DITA Documentation](#).

**Attention:** If a filter file is specified in the `args.filter` parameter (in the [Parameters tab](#)), that file takes precedence over a *DITAVAL* file specified here.

#### Use profiling condition set

Sets the [profiling condition set](#) that will be applied to your transformation.

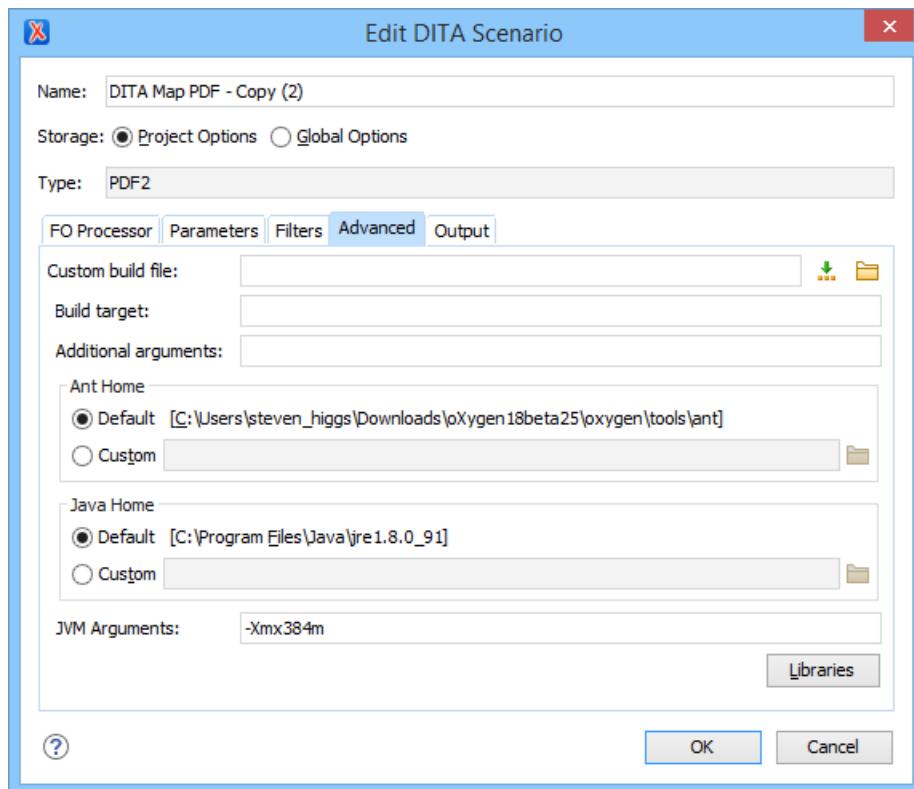

#### Exclude from output all elements with any of the following attributes

By using the  **New**,  **Edit**, or  **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

#### Advanced Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

**Figure 444: Advanced Settings Tab**

You can specify the following parameters:

#### Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the [Parameters tab](#) is used. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

## Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

## Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

## Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#).

## Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA OT 1.8 and older requires Java 1.6 or later, while DITA OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

## JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

## Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

## Output Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

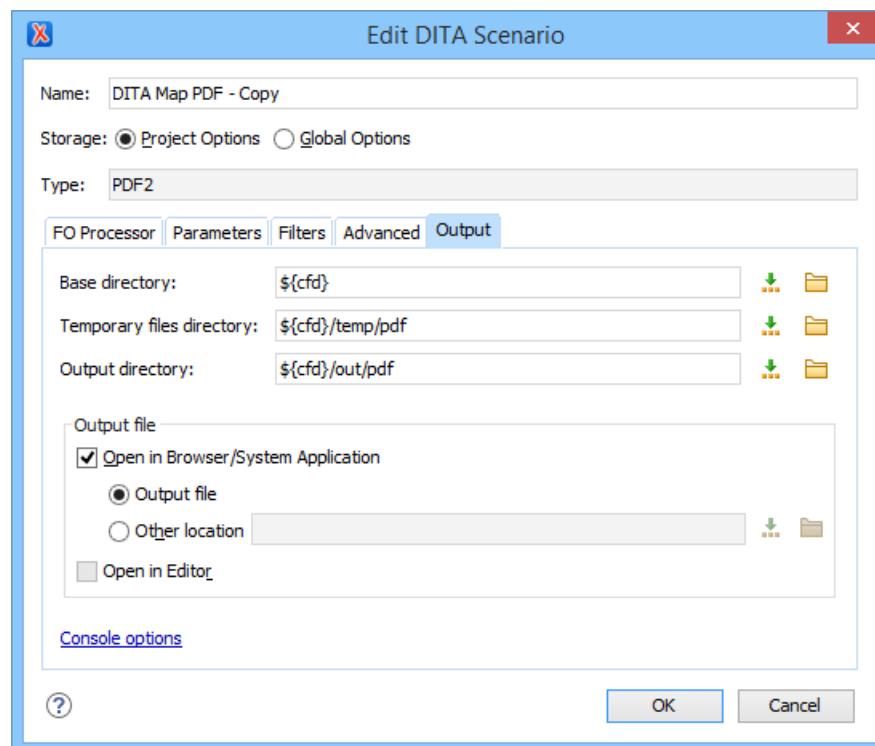

Figure 445: Output Settings Tab

You can specify the following parameters:

#### Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

#### Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

#### Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

**Note:** If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

#### Open in Browser/System Application

If enabled, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

#### Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the [Console options](#) preferences page that contains options to control the display of the console output received from the publishing engine.

#### Troubleshooting DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. [Validate the DITA map](#) by using the  [Validate and Check for Completeness](#) action that is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. [Run the DITA transformation scenario](#).
4. If the transformation results in errors or warnings, they are displayed in the **Transformation problems** message panel at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
  - **Severity** - The first column displays the following icons that indicate the severity of the problem:
    - **Informational** - The transformation encountered a condition of which you should be aware.
    - **Warning** - The transformation encountered a problem that should be corrected.

- **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
  - **Info** - You can click the  See More icon to open a web page that contains details about DITA-OT error messages.
  - **Description** - A description of the problem.
  - **Resource** - The name of the transformation resource.
  - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the oXygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
- a. Go to **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
  - b. Execute the transformation scenario again. The console output messages are displayed in the **DITA OT** view.
  - c. Copy the entire log, save it in a text file, then send it to the oXygen technical support team.
  - d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **When build fails**.

### Ant Transformation

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant version 1.8.2) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

To create an Ant transformation scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **ANT transformation**.
- Use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T (Command + Shift + T on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **ANT transformation**.

**Note:** If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **ANT transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

### Options Tab (Ant Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

#### Working directory

The path of the current directory of the Ant external process. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

#### Build file

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

#### Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

#### Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

#### Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#).

#### Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

#### JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (`OutOfMemoryError`).

#### Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

### Parameters Tab (Ant Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the [ask editor variable](#) in the **Value** column.

Below the table, the following actions are available for managing parameters:

#### New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  [Insert Editor Variables](#) button or the  [Browse](#) button.

#### Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

## Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

These parameters are also available for the built-in validation processor and the **Content Completion Assistant**.

## Related information

[Content Completion in Ant Build Files](#) on page 533

## Output Tab (Ant Transformations)

When you *create a new transformation scenario* or *edit an existing one*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

### Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

- **In System Application** - The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).
- **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

### Show console output

Allows you to specify when to display the console output log. The following options are available:

- **When build fails** - displays the console output log if the build fails.
- **Always** - displays the console output log, regardless of whether or not the build fails.

## XSLT Transformation

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation**.
- Use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation**.

**Note:** If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XSLT transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

### XSLT Tab

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

#### XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template](#) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors](#). Otherwise, a value is mandatory in this field.

#### XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

#### Use "xmlstylesheet" declaration

If enabled, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is disabled and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

#### Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

#### Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

#### Parameters

Opens a [Configure parameters dialog box](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets](#). If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

#### Extensions

Opens a [dialog box for configuring the XSLT extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

## Additional XSLT stylesheets

Opens a [dialog box for adding XSLT stylesheets](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

## XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@attr='val']
```

### Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc( '\${cfdu}/test.xml' )//\*
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

### New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

### Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

### Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

### Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

## Related information

[Editor Variables](#) on page 164

## XSLT Extensions

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **↑ Move up** or **↓ Move down** buttons.

#### Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

##### Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

##### Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

##### Open

Opens the selected stylesheet in a separate view.

##### Up

Moves the selected stylesheet up in the list.

##### Down

Moves the selected stylesheet down in the list.

#### Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

##### Mode (" -im")

A Saxon-specific option that sets the initial mode for the transformation.

##### Template (" -it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed.

##### Use a configuration file (" -config")

Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.

##### Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the [XSLT Debugger](#) to step into XPath expressions.

##### Version warnings (" -versmsg")

Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

##### Line numbering (" -l")

Line numbers where errors occur are included in the output messages.

##### Expand attributes defaults (" -expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

##### DTD validation of the source (" -dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.

- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

#### Recoverable errors ("warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

#### Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

#### Optimization level ("-opt")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

#### Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

#### Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

#### Allow calls on extension functions ("-ext")

If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http:// [URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

#### XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version** option.

### **Validation of the source file (" -val")**

Requests schema-based validation of the source file and of any files read using document( ) or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

### **Validation errors in the result tree treated as warnings (" -outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

### **Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

### **Generate bytecode (" --generateByteCode:(on|off)")**

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#javavadoc>.

## **FO Processor Tab (XSLT Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

### **Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

### **Input**

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

### **Method**

The output format of the FO processing. The available options depend on the selected processor type.

### **Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor](#).

## **Output Tab (XSLT Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

### **Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

### **Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

## Open in Browser/System Application

If enabled, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

## Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

## Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#).
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an [integrated SVG viewer in the results panel](#) at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:** When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

## XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XProc transformation**.
- Use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XProc transformation**.

**Note:** If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **XProc transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

### XProc Tab

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XProc** tab contains the following options:

#### XProc URL

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

#### Processor

Allows you to select the XProc engine to be used for the transformation. You can select the built-in *Calabash* engine or a custom engine that is [configured in the Preferences dialog box](#).

### Inputs Tab (XProc Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the **URL** column.

The following actions are available for managing the input ports:

#### New

Opens an **Edit** dialog box that allows you to add a new port and its URL. The [built-in editor variables](#) and [custom editor variables](#) can be used to specify the URL.

#### Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The [built-in editor variables](#) and [custom editor variables](#) can be used to specify the URL.

#### Delete

Removes the selected port from the list. It is enabled only for new ports that have been added to the list.

### Parameters Tab (XProc Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

#### List of Ports

In this section, you can use the **New** and **Delete** buttons to add or remove ports.

#### List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire parameters

collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

#### Editor Variable Information

The [built-in editor variables](#) and [custom editor variables](#) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

#### Outputs Tab (XProc Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

##### New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An [editor variable](#) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output results view.

##### Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An [editor variable](#) can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output results view.

##### Delete

Removes the selected output port from the list. It is enabled only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

##### Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

##### Open in Browser/System Application

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

#### Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

The screenshot shows a software interface for XProc transformation. On the left, there is a tree view labeled 'result' containing a single item: '<html>'. On the right, a code editor displays the following XProc XML code:

```
1 <html>
2 <table border="2">
3 <tr color="#FFFFFF" bgcolor="#336666" align="center">
4 <td>
5
6 Name
7
8 </td>
9 <td>
10
11 Email
```

Figure 446: XProc Transformation Results View

## Options Tab (XProc Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

### List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

### Editor Variable Information

The [built-in editor variables](#) and [custom editor variables](#) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

## XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:** When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation**.
- Use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation**.

**Note:** If a scenario is already associated with the edited document, selecting  **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the  **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the **New** button and select **XQuery transformation**.

All three methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

## XQuery Tab

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

## XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#), the XML input of the transformation is passed to that URI resolver.

## XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list. You can also use the  [Open in editor](#) button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

## Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

## Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

## Parameters

Opens the [Configure parameters dialog box](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

## Extensions

Opens a [dialog box for configuring the XQuery extension jars or classes](#) that define extension Java functions or extension XSLT elements used in the transformation.

## XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is checked, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

## Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (such as \${cfdu} [current file directory]) to specify other locations: doc(' \${cfdu}/test.xml')//\*
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

#### New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

#### Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is enabled, the parameter will be evaluated as an XPath expression.

#### Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

#### Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

#### Related information

[Editor Variables](#) on page 164

#### XQuery Extensions

The **Extensions** button is used to specify the jars and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the  **Move up** or  **Move down** buttons.

#### Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

#### Recoverable errors (" -warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

#### Strip whitespaces (" -strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

#### **Optimization level ("opt")**

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

#### **Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

#### **Enable XQuery 3.0 support ("-qversion:(1.0|3.0)")**

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

#### **Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

#### **Use a configuration file ("-config")**

Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

#### **Allow calls on extension functions ("-ext")**

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

#### **Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

#### **Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

#### **Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

### **Generate bytecode ("--generateByteCode:(on|off)")**

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#javadoc>.

### **Enable XQuery update ("-update:(on|off)")**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

### **Backup files updated by XQuery ("-backup:(on|off)")**

If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

## **FO Processor Tab (XQuery Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

### **Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

### **Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

### **Method**

The output format of the FO processing. The available options depend on the selected processor type.

### **Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor](#).

## **Output Tab (XQuery Transformations)**

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

### **Present as a sequence**

Enabling this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

### **Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

### **Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

### **Open in Browser/System Application**

If enabled, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in *Acrobat Reader*).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

#### Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

#### Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with *syntax highlighting*.
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an *integrated SVG viewer in the results panel* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option can only be selected if **Open in Browser/System Application** is disabled. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:** When transforming very large documents, you should be aware that enabling this feature may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

#### SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.
- Use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.

**Note:** If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **SQL transformation**.

All three methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

##### Name

The unique name of the SQL transformation scenario.

##### Storage

Allows you to select one of the following storage options:

- **Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

#### SQL URL

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list. You can also use the  **Open in editor** button to open the specified file in the editor panel.

#### Connection

Allows you to select a connection from a drop-down list. To configure a connection, use the  **Advanced options** button to open the [Data Source preferences page](#).

#### Parameters

Allows you to add or configure parameters for the transformation.

## Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

**Note:** You can edit transformation scenarios that are defined at project level only. To edit a transformation scenario that is associated with a predefined document type, [duplicate it and edit the duplicated scenario](#).

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.  
**Step Result:** The [Configure Transformation Scenario\(s\) dialog box](#) is opened.
2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

**Tip:** You could also select the scenario and the  **Edit** button in the **Transformation Scenarios** view to achieve the same result.

**Result:** This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

#### Transformation Types

The [Configure Transformation Scenario\(s\) dialog box](#) contains a **Type** column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains includes some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA OT** - This type of transformation includes configurable options in the following tabs:
  - [Skins Tab](#) (Available for **WebHelp Classic** and **WebHelp Classic with Feedback**)
  - [Templates Tab](#) (Available for **WebHelp Responsive** and **WebHelp Responsive with Feedback**)
  - [FO Processor Tab](#) (Available for PDF output)
  - [Parameters Tab](#)
  - [Filters Tab](#)
  - [Advanced Tab](#)
  - [Output Tab](#)
- **ANT** - This type of transformation includes configurable options in the following tabs:
  - [Options Tab](#)
  - [Parameters Tab](#)
  - [Output Tab](#)
- **XSLT** - This type of transformation includes configurable options in the following tabs:
  - [XSLT Tab](#)

- *FO Processor Tab*
- *Output Tab*
- **XProc** - This type of transformation includes configurable options in the following tabs:
  - *XProc Tab*
  - *Inputs Tab*
  - *Parameters Tab*
  - *Outputs Tab*
  - *Options Tab*
- **XQuery** - This type of transformation includes configurable options in the following tabs:
  - *XQuery Tab*
  - *FO Processor Tab*
  - *Output Tab*

#### **Related information**

[Creating New Transformation Scenarios](#) on page 768

[Duplicating a Transformation Scenario](#) on page 806

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

## Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a predefined transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.  
**Step Result:** The [Configure Transformation Scenario\(s\) dialog box](#) is opened.
2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.

**Tip:** You could also select the scenario and the  **Duplicate** button in the **Transformation Scenarios** view to achieve the same result.

**Result:** This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types section](#).

#### **Related information**

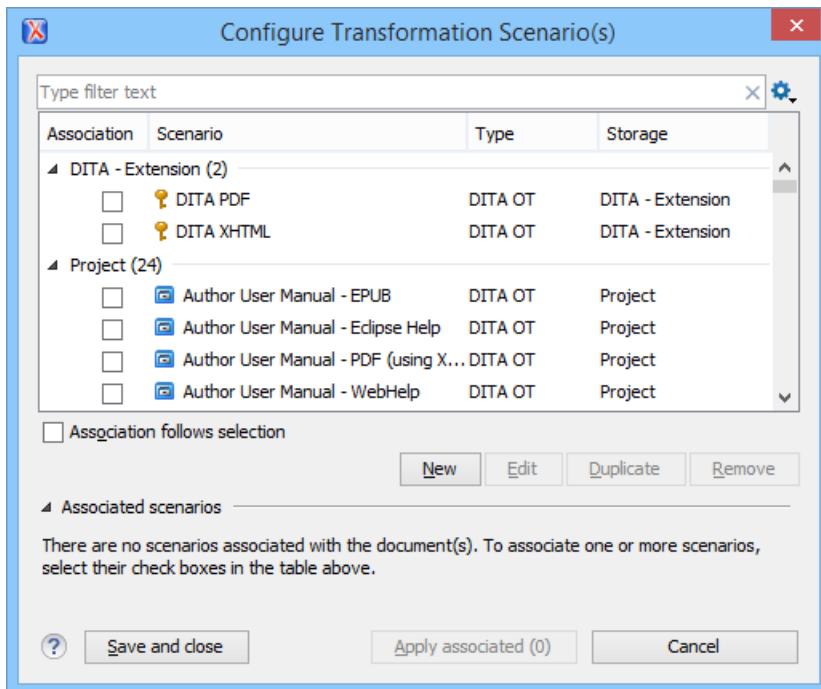

[Creating New Transformation Scenarios](#) on page 768

[Editing a Transformation Scenario](#) on page 805

## Configure Transformation Scenario(s) Dialog Box

You can use the **Configure Transformation Scenarios(s)** dialog box for *editing exiting transformation scenarios* or *creating new ones*.

To open this dialog box, use the  **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu.

**Figure 447: Configure Transformation Scenario(s) Dialog Box**

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

#### Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

#### Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

#### Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

#### Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor adds **imported** to the name of the imported scenario.

#### Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

The middle section of the dialog box displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at project level. The following columns are used to display the transformation scenarios:

- **Association** - The check-boxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.

- **Type** - Displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor, see the [Transformation Types section](#).
- **Storage** - Displays where a transformation scenario is stored (the [Show Storage option](#) must be enabled.)

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

#### Show Type

Use this option to display the transformation type of each scenario.

#### Show Storage

Use this option to display the storage location of the scenarios.

#### Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

#### Group by Type

Select this option to group the scenarios by their type.

#### Group by Storage

Select this option to group the scenarios by their storage location.

#### Ungroup all

Select this option to ungroup all the scenarios.

#### Reset Layout

Select this option to restore the default settings of the layout.

The bottom section of the dialog box contains the following actions:

#### Association follows selection

Enable this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

**Note:** When this option is enabled, the **Association** column is hidden.

#### New

This button allows you to [create a new transformation scenario](#).

#### Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the [Transformation Types section](#).

**Note:** If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor displays a warning message to inform you that this is not possible and gives you the option to create a [duplicate transformation scenario](#) to edit instead.

#### Duplicate

Use this button to create a [duplicate transformation scenario](#).

#### Remove

Use this button to remove transformation scenarios.

**Note:** Removing scenarios associated with a defined document type is not allowed.

The **Edit**, **Duplicate**, and **Remove** actions are also available in the contextual menu of the transformation scenarios listed in the middle section of the dialog box (along with  **Import scenarios** and  **Export selected scenarios**).

This contextual menu also contains a **Change storage** action that allows you to change the storage location of a transformation scenario to **Project Options** or **Global Options**. You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

#### Related information

[Editing a Transformation Scenario](#) on page 805

## Apply Batch Transformations

A transformation action can be applied on a batch of selected files [from the contextual menu of the Project view](#) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. (Optional, but recommended) Organize the files you want to transform in logical folders.
  - a) Create a logical folder in the **Project** view by using the **New > Logical Folder** action from the contextual menu of the root file.
  - b) Add files you want to transform to the logical folder by using the **Add Files** or **Add Edited File** actions from the contextual menu of the logical folder.

**Note:** You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the **Project** view each time you want to transform them, but this can be tedious.
2. Select the files you want to transform (or the newly created logical folder) and from the contextual menu, select **Transform > Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.
3. Use Oxygen XML Editor [editor variables](#) to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
  - a) Edit the transformation scenario to make sure the appropriate editor variable is assigned for the input file. For example, for a *DocBook PDF transformation* make sure the **XML URL** input box is set to the  `${currentFileURL}` editor variable. For a DITA PDF transformation make sure the `args.input` parameter is set to the  `${cf}` editor variable.
  - b) Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an *XML transformation with XSLT*, switch to the **Output** tab and set the path of the output file using a construct of editor variables, such as  `${cf}/ ${cfn}.html`.
4. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select **Transform > Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.
5. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform > Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

### Related information

[Editor Variables](#) on page 164

## Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by saving them at project level or by [exporting them to a specialized scenarios file](#) that can then be imported. When you create a new transformation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** or **Global Options**.

Storage:  **Project Options**  **Global Options**

Selecting **Project Options** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing transformation scenarios by using the [Change storage action](#) from the contextual menu of the list of scenarios.

## Related information

[Sharing Application Settings](#) on page 159

## Transformation Scenarios View

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, select **Window > Show View > Transformation Scenarios**.

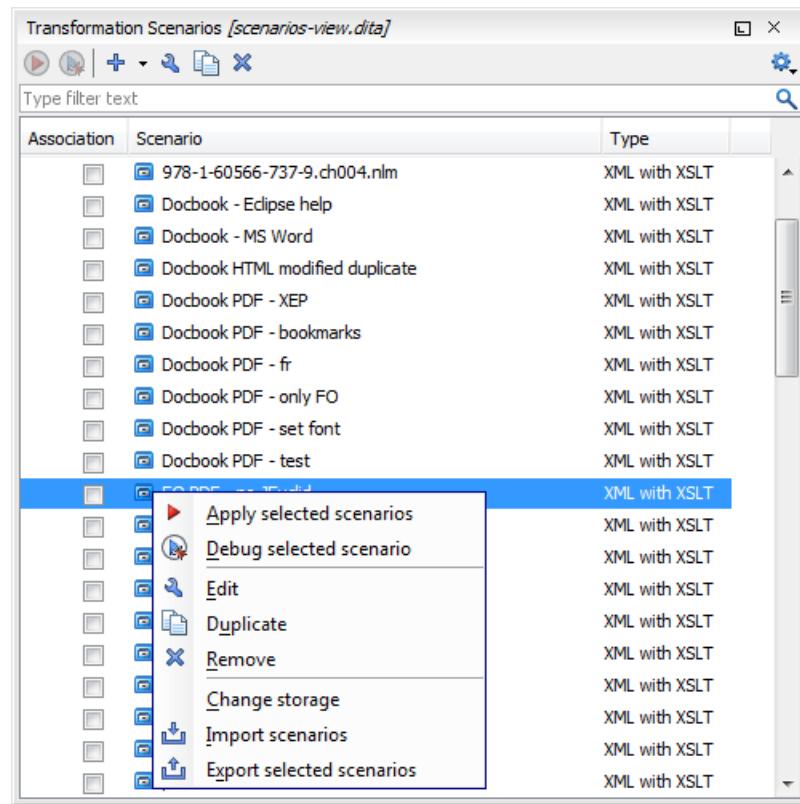

Figure 448: Transformation Scenarios view

Oxygen XML Editor supports multiple scenarios association. To associate multiple scenarios with a document, enable the check-boxes in front of each scenario. You can also associate multiple scenarios with a document from the [Configure Transformation Scenario\(s\) dialog box](#).

The **Transformation Scenarios** view presents both global and project-level scenarios. By default, Oxygen XML Editor presents the items in the following order:

1. Scenarios that match the current framework.
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

### Toolbar/Contextual Menu Actions and Options

The following actions and options are available on the toolbar or in the contextual menu:

#### **Apply selected scenarios**

Select this option to run the current transformation scenario.

#### **Debug selected scenario**

Select this option to switch to the **Debugger** perspective and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

## New

This drop-down menu contains a list of the [scenarios that you can create](#). Oxygen XML Editor determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

## Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

## Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types section](#).

## Remove

Removes the current scenario from the list. This action is also available by using the **Delete** key.

## Change storage

Use this option to change the storage location of the selected scenario. You are also able to keep the original storage location and make a copy of the selected scenario in the target storage location.

## Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

## Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Editor creates a scenarios file that contains the scenarios that you export.

## Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

### Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

### Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

### Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

## Change storage

Use this option to change the storage location of the selected scenario to **Project Options** or **Global Options**. You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

## Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

### Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

### Show Type

Use this option to display the transformation type of each scenario.

### Show Storage

Use this option to display the storage location of the scenarios.

### Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

### Group by Type

Select this option to group the scenarios by their type.

### Group by Storage

Select this option to group the scenarios by their storage location.

### Ungroup all

Select this option to ungroup all the scenarios.

### Reset Layout

Select this option to restore the default settings of the layout.

### Related information

## Debugging PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

1. Open the **Preferences** dialog box ([Options > Preferences](#)), go to **XML > XML Catalog**, click **Add**, and select the file located at `DITA_OT_DIR\plugins\org.dita.pdf2\cfg\catalog.xml`.
2. Open the map in the **DITA Maps Manager** and create a **DITA Map PDF** transformation scenario.
3. Edit the scenario, go to the **Parameters** tab and change the value of the `clean.temp` parameter to `no`.
4. Run the transformation scenario.
5. Open the `stage1.xml` file located in the temporary directory and [format and indent](#) it.
6. Create a transformation scenario for this XML file by associating the `topic2fo_shell_fop.xsl` stylesheet located at `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\f0\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the same folder.
7. In the transformation scenario edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).
8. In the transformation scenario edit the **Parameters** list and set the parameter `locale` with the value `en_GB` and the parameter `customizationDir.url` to point either to your customization directory or to the default DITA OT customization directory. Its value should have a URL syntax like this: `file:///c:/path/to/DITA_OT_DIR/plugins/org.dita.pdf2/cfg`.
9. Debug the transformation scenario.

### Related information

[Working with the XSLT / XQuery Debugger](#) on page 1033

## Configuring Calabash with XEP

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the `[OXYGEN_INSTALL_DIR]/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../../../tools/xep/xep.xml"/>` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor.

## Integration of an External XProc Engine

The Javadoc documentation of the XProc API is available for download from the application website as a zip file [xprocAPI.zip](#).

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a Java archive (jar) from the classes you created.
4. Create a `engine.xml` file according with the `engine.dtd` file. The attributes of the `engine` element are as follows:
  1. `name` - The name of the XProc engine.
  2. `description` - A short description of the XProc engine.
  3. `class` - The complete name of the class that implements `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface`.
  4. `version` - The version of the integration.
  5. `engineVersion` - The version of the integrated engine.
  6. `vendor` - The name of the vendor / implementer.
  7. `supportsValidation` - `true` if the engine supports validation (otherwise, `false`).
5. The `engine` element has only one child, `runtime`. The `runtime` element contains several `library` elements with the `name` attribute containing the relative or absolute location of the libraries necessary to run this integration.
6. Create a folder with the name of the integration in the `[OXYGEN_INSTALL_DIR]/lib/xproc`.
7. Place the `engine.xml` and all the libraries necessary to run the new integration in that folder.

## XSLT Processors

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor.

### Supported XSLT Processors

Oxygen XML Editor includes the following XSLT processors:

- **Xalan 2.7.1** - [Xalan-Java](#) is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - [Saxon 6.5.5](#) is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE)** - [Saxon-HE/PE](#) implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in

the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 9.6.0.7 Enterprise Edition (EE)** - *Saxon EE* is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the W3C XML Schema 1.0 or 1.1. This can be [configured in Preferences](#).

**Note:** Oxygen XML Editor implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:** Saxon can use the *ICU-J localization library* (*saxon9-icu.jar*) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability follow these steps:

1. Download Saxon 9.6.0.7 Professional Edition (PE) or Enterprise Edition (EE) from <http://www.saxonica.com>.
2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the *saxon9-icu.jar* file.

Note that the *saxon9-icu.jar* should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

**Note:** A specific template, named **Saxon-CE stylesheet**, is available in the [New document wizard](#).

- **Xsltproc (libxslt)** - *Libxslt* is the XSLT C library developed for the Gnome project. *Libxslt* is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions. The *libxml2* version included in Oxygen XML Editor is 2.7.6 and the *Libxslt* version is 1.1.26.

Oxygen XML Editor uses *Libxslt* through its command line tool (*Xsltproc*). The XSLT processor is included in the distribution kit of the stand-alone version for Windows and Mac OS X. Since there are differences between various Linux distributions, on Linux you must install *Libxslt* on your machine as a separate application and set the PATH variable to contain the *Xsltproc* executable.

**Note:** The *Xsltproc* processor can be configured from the [XSLTPROC options page](#).

**CAUTION:** There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor is installed in the default location on Windows (C:\Program Files). This is because the built-in XML catalog files are stored in the *[OXYGEN\_INSTALL\_DIR]/frameworks* subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 - MSXML 4.0** is available only on Windows platforms. It can be used for [transformation](#) and [validation of XSLT stylesheets](#).

Oxygen XML Editor uses the Microsoft XML parser through its command line tool *msxs1.exe*.

Since *msxs1.exe* is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from [Microsoft web-site](#).

- **MSXML .NET** - [MSXML .NET](#) is available only on Windows platforms. It can be used for *transformation* and *validation of XSLT stylesheets*.

Oxygen XML Editor performs XSLT transformations and validations using .NET Framework's XSLT implementation (`System.Xml.Xsl.XslTransform` class) through the `nxsit` command line utility. The `nxsit` version included in Oxygen XML Editor is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML .NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the [Microsoft website](#).

- **.NET 1.0** - A transformer based on the `System.Xml` 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (<http://msdn.microsoft.com/xml/>). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML .NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the [Microsoft website](#).

- **.NET 2.0** - A transformer based on the `System.Xml` 2.0 library available in the .NET 2.0 framework from [Microsoft](#). It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML .NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the [Microsoft website](#).

For information about configuring the XSLT preferences, see the [XSLT options](#) section.

### Configuring Custom XSLT Processors

Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the [parameters for the custom engine](#).
4. Click **OK**.

**Note:** You can not use these custom engines in [the Debugger perspective](#).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows [the format of an Oxygen XML Editor linked message](#), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

### Related information

[Custom Engines Preferences](#) on page 128

### Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

The DocBook extensions for Xalan and Saxon are included in the `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\extensions` folder.

For more information about how to use extensions, see the following links:

- **Xalan** - <http://xml.apache.org/xalan-j/extensions.html>
- **Saxon 6.5.5** - <http://saxon.sourceforge.net/saxon6.5.5/extensions.html>
- **Saxon 9.6.0.7** - <http://www.saxonica.com/documentation9.5/index.html#!extensibility>

To set an XSLT processor extension (a directory or a jar file), use [the Extensions button](#) in the **Edit scenario** dialog box.

**Note:** The old way of setting an extension (using the parameter -Dcom.oxygenxml.additional.classpath) was deprecated, and instead you should use the extension mechanism of the XSLT transformation scenario.

## XSL-FO Processors

This section explains how to apply XSL-FO processors when transforming XML documents to various output formats in Oxygen XML Editor.

### Built-in XSL-FO Processor

The Oxygen XML Editor installation package is distributed with the [Apache FOP](#) that is a Formatting Objects processor for rendering your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

Other FO processors can be configured in [the Preferences dialog box](#).

#### Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of [the procedure for setting a custom font in Apache FOP](#).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
  - a) Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">
 <renderers>
 <renderer mime="application/pdf">
 <fonts>
 <auto-detect/>
 </fonts>
 </renderer>
 </renderers>
</fop>
```

- b) [Open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XSLT/FO/XQuery > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

#### 2. Set the font on the document content.

This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

- For DocBook documents you can start with the predefined scenario called **DocBook PDF**, [edit the XSLT parameters](#) and set the font name (in our example the font family name is **Arial Unicode MS**) to the parameters `body.font.family` and `title.font.family`.
- For TEI documents you can start with the predefined scenario called **TEI PDF**, [edit the XSLT parameters](#) and set the font name (in our example **Arial Unicode MS**) to the parameters `bodyFont` and `sansFont`.
- For DITA transformations to PDF using DITA-OT you should modify the following two files:
  - `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `font-face` element included in each element `physical-font` having the attribute `char-set="default"` must contain the name of the font (**Arial Unicode MS** in our example)
  - `DITA_OT_DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element `auto-detect` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`:

```
<renderer mime="application/pdf">
 .

 <auto-detect/>

 .
</renderer>
```

## Add a Font to the Built-in FO Processor

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

**Important:** If this special font is installed in the operating system, there is a simple way of telling FOP to look for it. See [the simplified procedure for adding a font to FOP](#).

### 1. Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

On Windows the fonts are located into the C :\Windows\Fonts directory. On Mac, they are placed in / Library/Fonts. To install a new font on your system, is enough to copy it in the Fonts directory.

### 2. Generate a font metrics file from the font file.

- Open a terminal.
- Change the working directory to the Oxygen XML Editor install directory.
- Create the following script file in the Oxygen XML Editor installation directory.

For OS X and Linux create a file ttfConvert.sh:

```
#!/bin/sh

export LIB=lib
export CP=$LIB/fop.jar
export CP=$CP:$LIB/avalon-framework-4.2.0.jar
export CP=$CP:$LIB/xercesImpl.jar
export CP=$CP:$LIB/commons-logging-1.1.3.jar
export CP=$CP:$LIB/commons-io-1.3.1.jar
export CP=$CP:$LIB/xmlgraphics-commons-1.5.jar
export CP=$CP:$LIB/xml-apis.jar
export CMD="java -cp $CP org.apache.fop.fonts.apps.TTFFReader"
export FONT_DIR='.'

$CMD $FONT_DIR/Arialuni.ttf Arialuni.xml
```

For Windows create a file ttfConvert.bat:

```
@echo off
set LIB=lib
set CP=%LIB%\fop.jar
set CP=%CP%;%LIB%\avalon-framework-4.2.0.jar
set CP=%CP%;%LIB%\xercesImpl.jar
set CP=%CP%;%LIB%\commons-logging-1.1.3.jar
set CP=%CP%;%LIB%\commons-io-1.3.1.jar
set CP=%CP%;%LIB%\xmlgraphics-commons-1.5.jar
set CP=%CP%;%LIB%\xml-apis.jar
set CMD=java -cp "%CP%" org.apache.fop.fonts.apps.TTFFReader
set FONT_DIR=C:\Windows\Fonts
%CMD% %FONT_DIR%\Arialuni.ttf Arialuni.xml
```

The paths specified in the file are relative to the Oxygen XML Editor installation directory. If you decide to create it in other directory, change the file paths accordingly.

The *FONT\_DIR* can be something different on your system. Check that it points to the correct font directory. If the Java executable is not in the *PATH*, specify the full path of the executable.

If the font has bold and italic variants, convert them too by adding two more lines to the script file:

- for OS X and Linux:

```
$CMD $FONT_DIR/Arialuni-Bold.ttf Arialuni-Bold.xml
$CMD $FONT_DIR/Arialuni-Italic.ttf Arialuni-Italic.xml
```

- for Windows:

```
%CMD% %FONT_DIR%\Arialuni-Bold.ttf Arialuni-Bold.xml
%CMD% %FONT_DIR%\Arialuni-Italic.ttf Arialuni-Italic.xml
```

### d) Run the script.

On Linux and OS X, run the command sh ttfConvert .sh from the command line. On Windows, run the command ttfConvert .bat from the command line or double-click the file ttfConvert .bat.

3. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)

- Create a FOP configuration file that specifies the font metrics file for your font.

```
<fop version="1.0">
 <base>./</base>
 <font-base>file:/C:/path/to/FOP/font/metrics/files/</font-base>
 <source-resolution>72</source-resolution>
 <target-resolution>72</target-resolution>
 <default-page-settings height="11in" width="8.26in"/>
 <renderers>
 <renderer mime="application/pdf">
 <filterList>
 <value>flate</value>
 </filterList>
 <fonts>
 <font metrics-url="Arialuni.xml" kerning="yes"
 embed-url="file:/Library/Fonts/Arialuni.ttf">
 <font-triplet name="Arialuni" style="normal"
 weight="normal"/>

 </fonts>
 </renderer>
 </renderers>
</fop>
```

The `embed-url` attribute points to the font file to be embedded. Specify it using the URL convention. The `metrics-url` attribute points to the font metrics file with a path relative to the base element. The triplet refers to the unique combination of name, weight, and style (italic) for each variation of the font. In our case is just one triplet, but if the font had variants, you would have to specify one for each variant. Here is an example for Arial Unicode if it had italic and bold variants:

```
<fop version="1.0">
 ...
 <fonts>
 <font metrics-url="Arialuni.xml" kerning="yes"
 embed-url="file:/Library/Fonts/Arialuni.ttf">
 <font-triplet name="Arialuni" style="normal"
 weight="normal"/>

 <font metrics-url="Arialuni-Bold.xml" kerning="yes"
 embed-url="file:/Library/Fonts/Arialuni-Bold.ttf">
 <font-triplet name="Arialuni" style="normal"
 weight="bold"/>

 <font metrics-url="Arialuni-Italic.xml" kerning="yes"
 embed-url="file:/Library/Fonts/Arialuni-Italic.ttf">
 <font-triplet name="Arialuni" style="italic"
 weight="normal"/>

 </fonts>
 ...
</fop>
```

More details about the FOP configuration file are available on the FOP website.

- Open the [Preferences dialog box \(Options > Preferences\)](#), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

4. Set the font on the document content.

This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

For DocBook documents, you can start with the predefined scenario called [DocBook PDF, edit the XSLT parameters](#), and set the font name (in our example **Arialuni**) to the parameters `body.font.family` and `title.font.family`.

For TEI documents, you can start with the predefined scenario called [TEI PDF, edit the XSLT parameters](#), and set the font name (in our example **Arialuni**) to the parameters `bodyFont` and `sansFont`.

For DITA to PDF transformations using DITA-OT modify the following two files:

- [`DITA\_OT\_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml`](#) - The `font-face` element included in each element `physical-font` having the attribute `char-set="default"` must contain the name of the font (*Arialuni* in our example)

- *DITA\_OT\_DIR*/plugins/org.dita.pdf2/fop/conf/fop.xconf - An element font must be inserted in the element fonts, which is inside the element renderer that has the attribute mime="application/pdf":

```
<renderer mime="application/pdf">

 <font-metrics-url>Arialuni.xml</font-metrics-url>
 <kerning>yes</kerning>
 <embed-url>file:/Library/Fonts/Arialuni.ttf</embed-url>
 <font-triplet name="Arialuni" style="normal" weight="normal"/>

</fonts>
</renderer>
```

## Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

### Adding Hyphenation Support for XML with XSLT Transformation Scenarios

You can extend the functionality of the built-in FO processor by dropping additional libraries in the *[OXYGEN\_INSTALL\_DIR]/lib/fop* directory.

To add support for hyphenation, follow these steps:

1. Create a folder called fop in the *[OXYGEN\_INSTALL\_DIR]/lib* folder.
2. Download the compiled JAR from [OFFO](#).
3. Copy the *fop-hyph.jar* file into the *[OXYGEN\_INSTALL\_DIR]/lib/fop* folder.
4. Restart Oxygen XML Editor.

### Adding Support for PDF Images

To add support for PDF images, follow these steps:

1. Create a folder called fop in the *[OXYGEN\_INSTALL\_DIR]/lib* folder.
2. Download the *fop-pdf-images* JAR libraries.
3. Copy the libraries into the *[OXYGEN\_INSTALL\_DIR]/lib/fop* folder.
4. Restart Oxygen XML Editor.

### Adding Libraries to the Built-in FO Processor (DITA-OT)

To use additional libraries with the DITA-OT publishing engine, you need to edit the transformation scenario and add the path to the new libraries in the **Libraries** section of the **Advanced** tab.

### Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled JAR from [OFFO](#).
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the *fop-hyph.jar* library.

### Adding Support for PDF Images

1. Download the *fop-pdf-images* JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the libraries.

## WebHelp System Output

---

Oxygen XML Editor allows you to obtain WebHelp Classic and WebHelp Responsive outputs. This section contains information about the WebHelp system, its variants, and ways to customize it to better fit your specific needs.

**Table 37: WebHelp System Feature Matrix**

Features	WebHelp System Variants				
	Responsive w/ Feedback	Responsive	Classic w/ Feedback	Classic	Classic Mobile
Desktop Systems	✓	✓	✓	✓	
Mobile Devices	✓	✓			✓
Predefined Skins	✓	✓	✓	✓	
Predefined Templates	✓	✓			
Search Capabilities	✓	✓	✓	✓	✓
Modern Layout	✓	✓			
Adaptable to Any Screen Size	✓	✓			
Comments Section	✓		✓		
DITA Documents	✓	✓	✓	✓	✓
DocBook Documents			✓	✓	✓
Tri-Pane Frames or Frameless Version			✓	✓	

## WebHelp Responsive System

*WebHelp* is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Editor WebHelp system includes several variants to suit your specific needs. The *WebHelp Responsive* variant features a very flexible layout, is designed to adapt to any screen size, and is available for DITA document types.

This type of WebHelp system can be generated by using the [DITA Map WebHelp Responsive transformation scenario](#).

### Layout

The layout of the *WebHelp Responsive* system is platform independent and is able to adapt to any screen size. It is highly customizable and relies on a [template mechanism](#) that allows you to control the position of various functional [template components](#) to suit your particular requirements.

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each of these layouts include a collection of skins that you can choose from, or you can customize your own.

The screenshot shows a responsive web page for a flower-growing guide. At the top left is a decorative icon of two stylized flowers. The main title "Growing Flowers" is centered above a navigation bar with links: INTRODUCTION, CARE AND PREPARATION, FLOWERS BY SEASON, GLOSSARY, and COPYRIGHT. A small user icon is also present. Below the navigation is a large, close-up photograph of pink and white magnolia petals. Overlaid on this image is a search bar with the placeholder "Search" and a magnifying glass icon. The page content is organized into three columns. The left column, titled "Care and Preparation", features a purple flower icon with a water drop and contains text about proper plant care. The middle column, titled "Flowers by Season", features a cluster of purple flowers and text about the seasonal nature of flowers. The right column, titled "Glossary", features an open book icon with letters "A" and "Z" and contains text about definitions of gardening terms. At the bottom of the page is a footer note: "WebHelp output generated by <oxygene/> XML Author".

Figure 449: WebHelp Responsive Output on a Normal Screen

**Figure 450: WebHelp Responsive Output on a Narrow Screen**

### Search Feature

When you enter search terms in the **Search** field, the results are displayed in the results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search phrase is included in a meta keyword
  - The search phrase is in the title of the page
  - The search phrase is in bold text in a paragraph
  - The search phrase is in normal text in a paragraph

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "*grow flowers*", returns no results since it searches for two separate words).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside `keywords` elements weighs twice as much as content inside an `H1` HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("\_"), or dot (".") characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

**Note:** For DITA content, if you have topics that are referenced multiple times in your DITA map structure, they will be found by the search engine that same number of times in the search results. The first occurrence will have a **Similar results** link displayed below the search result and clicking this link will display the other occurrences. Note that the content may be different in some of the occurrences if they have different profiling applied than the others.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 851.

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

## WebHelp Responsive with Feedback System

*WebHelp* is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Editor WebHelp system includes several variants to suit your specific needs. The *WebHelp Responsive with Feedback* variant features a very flexible layout, is designed to adapt to any screen size, and includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This variant is available for DITA document types.

This type of WebHelp system can be generated by using the [DITA Map WebHelp Responsive with Feedback transformation scenario](#) and following the [instructions for deploying the system](#).

### Layout

The layout of the *WebHelp Responsive with Feedback* system is platform independent and is able to adapt to any screen size. It is highly customizable and relies on a [template mechanism](#) that allows you to control the position of various functional [template components](#) to suit your particular requirements.

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each of these layouts include a collection of skins that you can choose from, or you can customize your own.

The *WebHelp Responsive with Feedback* system also contains a **Comments** section at the bottom of the pane. This section is where you can interact with users through a comment system.

The screenshot shows a website for "Growing Flowers". At the top left is a logo of stylized flowers. The main title "Growing Flowers" is in a large, purple, serif font. Below the title is a horizontal menu with links: INTRODUCTION, CARE AND PREPARATION, FLOWERS BY SEASON, GLOSSARY, and COPYRIGHT. To the right of the menu is a small icon. A large, blurred image of pink flowers serves as the background for the header. Below the header is a search bar with the word "Search" and a magnifying glass icon. Underneath the search bar, the breadcrumb navigation shows "Care and Preparation > Pruning". On the right side of the page, there is a sidebar with a vertical line and three categories: Care and Preparation, Pruning (which is bolded), and Garden Preparation.

**Pruning**

Pruning is the process of removing certain above-ground elements from a plant; in landscaping this process usually involves removal of diseased, non-productive, or otherwise unwanted portions from a plant. In nature, certain meteorological conditions such as wind, snow or seawater mist can conduct a when for natural pruning process. The purpose of anthropomorphic pruning is to shape the plant by controlling or directing plant growth, to maintain the health of the plant, or to increase the yield or quality of flowers and fruits.

In general the smaller the wound (smaller the branch that is cut) the less harm to the tree. It is therefore typically better to formative prune the tree when juvenile than try to cut off large branches on a mature tree.

Here are the details

WebHelp output generated by <oxygen> XML Author

**Figure 451: WebHelp Output**

### Managing Comments

To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

**Note:** The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see [Managing Users and Comments in a Feedback-Enabled WebHelp System](#) on page 828.

## Search Feature

When you enter search terms in the **Search** field, the results are displayed in the results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search phrase is included in a meta keyword
  - The search phrase is in the title of the page
  - The search phrase is in bold text in a paragraph
  - The search phrase is in normal text in a paragraph

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "grow flowers", returns no results since it searches for two separate words).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside `keywords` elements weighs twice as much as content inside an `H1` HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("\_"), or dot (".") characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 851.

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

## Deploying a Feedback-Enabled WebHelp System

### System Requirements

The feedback-enabled WebHelp system of Oxygen XML Editor requires a standard server deployment. You can request this from your server admin and it needs the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

Oxygen XML WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

### Create WebHelp with Feedback Database

The *WebHelp with Feedback* system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

For example, the following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

### Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the *WebHelp with Feedback* output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT\_ROOT*) of your server.
3. Copy the transformation output folder into the *DOCUMENT\_ROOT* folder.
4. Rename it to something relevant (for example, *myProductWebHelp*).
5. Open the output folder (for example, *http://[YOUR\_SERVER]/myProductWebHelp/*). You are redirected to the installation wizard. Proceed with the installation as follows:
  - a. Verify that the prerequisites are met.
  - b. Press **Start Installation**.
  - c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

**Tip:** You can change some of the options later. The installation creates a *config.php* file in *[OXYGEN\_WEBHELP\_INSTALL\_DIR]/feedback/resources/php/config/config.php* where all your configuration options are stored.

- d. Configure the **MySQL Database Connection Settings** section. Use the information (database name, username, password) from the [Create WebHelp with Feedback Database section](#) to fill-in the appropriate text boxes.

 **Warning:** Checking the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the *WebHelp with Feedback* system, but you do not want to select this option on subsequent deployments.

- e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, check the **Enable LDAP Authentication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.

- f. If the **Create new database structure** option is checked, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple *WebHelp with Feedback* deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, enable the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

**Note:** You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

- g. Press **Next Step**.

- h. Remove the installation folder from your web server.

**Important:** When you publish subsequent iterations of your *WebHelp with Feedback* system, you will not upload the /install folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

- i. In your Web browser, go to your *WebHelp with Feedback* system main page.

## Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

**Note:** To read debug messages generated by the system:

1. Enable JavaScript logging by doing one of the following:

- Open the log.js file, locate the var log= new Log(Level.NONE); line, and change the logging level to: Level.INFO, Level.DEBUG, Level.WARN, or Level.ERROR.
- Append ?log=true to the WebHelp URL.

2. Inspect the PHP and Apache server log files.

## Documentation Product ID and Version

When you run a *WebHelp with Feedback* transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

**Note:** The *WebHelp with Feedback* installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

### Related information

## Refreshing the Content of a Feedback-Enabled WebHelp System

It is common to update the content of an existing installation of a *WebHelp with Feedback* system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the \feedback\resources\php\config\config.php file, and delete it.
3. Locate the \feedback\install directory and delete it.

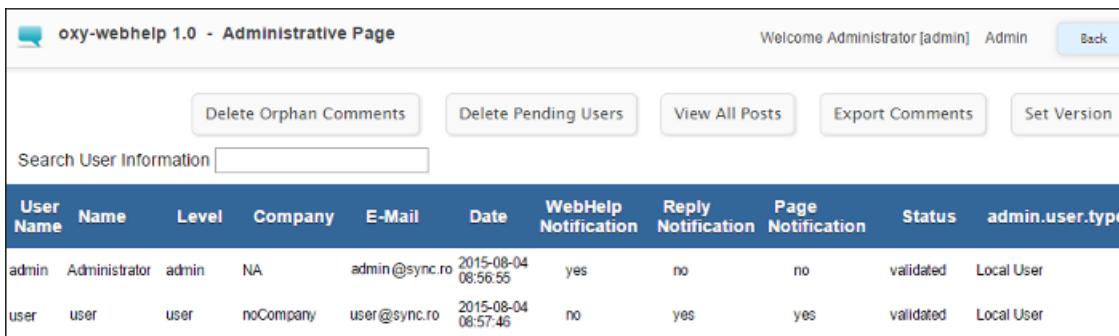

4. Copy the remaining structure of the output folder and paste it into your *WebHelp with Feedback* system installation directory, overwriting the existing content.

## Managing Users and Comments in a Feedback-Enabled WebHelp System

When you installed the *WebHelp with Feedback* system the first time (assuming the [Create new database structure option](#) was enabled), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

The screenshot shows the administrative interface for the oxy-webhelp 1.0 system. At the top, there's a header with the title 'oxy-webhelp 1.0 - Administrative Page', a welcome message 'Welcome Administrator [admin] Admin', and a 'Back' button. Below the header is a toolbar with five buttons: 'Delete Orphan Comments', 'Delete Pending Users', 'View All Posts', 'Export Comments', and 'Set Version'. There's also a search bar labeled 'Search User Information' with a placeholder 'Search User Information'. The main area is a table listing users. The columns are: User Name, Name, Level, Company, E-Mail, Date, WebHelp Notification, Reply Notification, Page Notification, Status, and admin.user.type. Two rows of data are visible:

User Name	Name	Level	Company	E-Mail	Date	WebHelp Notification	Reply Notification	Page Notification	Status	admin.user.type
admin	Administrator	admin	NA	admin@sync.ro	2015-08-04 08:56:55	yes	no	no	validated	Local User
user	user	user	noCompany	user@sync.ro	2015-08-04 08:57:46	no	yes	yes	validated	Local User

**Figure 452: Administrative Page**

3. Use this page to manage the following options:

### Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

### Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

### View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

### Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

### Set Version

Use this action to display comments starting with a particular version.

### Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

#### Name

The full name of the user.

#### Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

### **Company**

The name of the organization associated with the user.

### **E-Mail**

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

### **WebHelp Notification**

When enabled, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

### **Reply Notification**

When enabled, the user receives notifications when comments are posted as a reply to one of their comments.

### **Page Notification**

When enabled, the user receives notifications when comments are posted on a topic where they previously posted a comment.

### **Date**

The date the user registered is displayed.

### **Status**

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

**Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

## **WebHelp Responsive Template Mechanism**

The WebHelp Responsive template mechanism is the base of the system and it is responsible for defining its output. It consists of a set of HTML template files and other additional resources (such as images, CSS, and JavaScript files). Each of the HTML template files contain one or more template components (such as title, table of contents, search input, etc.) whose placement inside the template will define the final layout of the output.

This mechanism allows you to create multiple layouts simply by creating templates that define the location of where the various components will be displayed.

### **Creating WebHelp Responsive Templates**

To create a new WebHelp Responsive template, follow these steps:

1. Locate the following folder in your DITA-OT directory ([DITA\\_OT\\_DIR](#)):

`DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/`

2. Duplicate the bootstrap folder and rename it to whatever you want your new template to be identified as (for example, myTemplate).
3. Customize the structure of the new template according to your needs. For example, if you only want to keep one of the template variants, open the myTemplate/variants folder and delete all of its subdirectories, except for that one (for instance, the tiles directory). Keep in mind that the structure of the template directory is important. The names of folders at certain levels correspond to the names of templates and skins, while components and resources are defined and referenced in certain files or folders at specific locations within the directory structure. For more information, see [WebHelp Responsive Template Directory Structure](#) on page 830.

4. You can also customize the structure of the skins within the template variants. For example, if you only want to keep one of the skins in the tiles variant, open the myTemplate/variants/tiles folder and delete all of its subdirectory skins, except for that one (for instance, the light directory). You can also edit the skin.css file that is located in the skin directory to customize the styling. If your customization of the CSS file requires additional resources (such as images, fonts, or other CSS files), they need to be placed in the resources folder at the same level with the skin.css file.
5. To customize the components that appear in the WebHelp Responsive output, you can modify the HTML template files that define the output. For more information, see [WebHelp Responsive Template Files](#) on page 831.

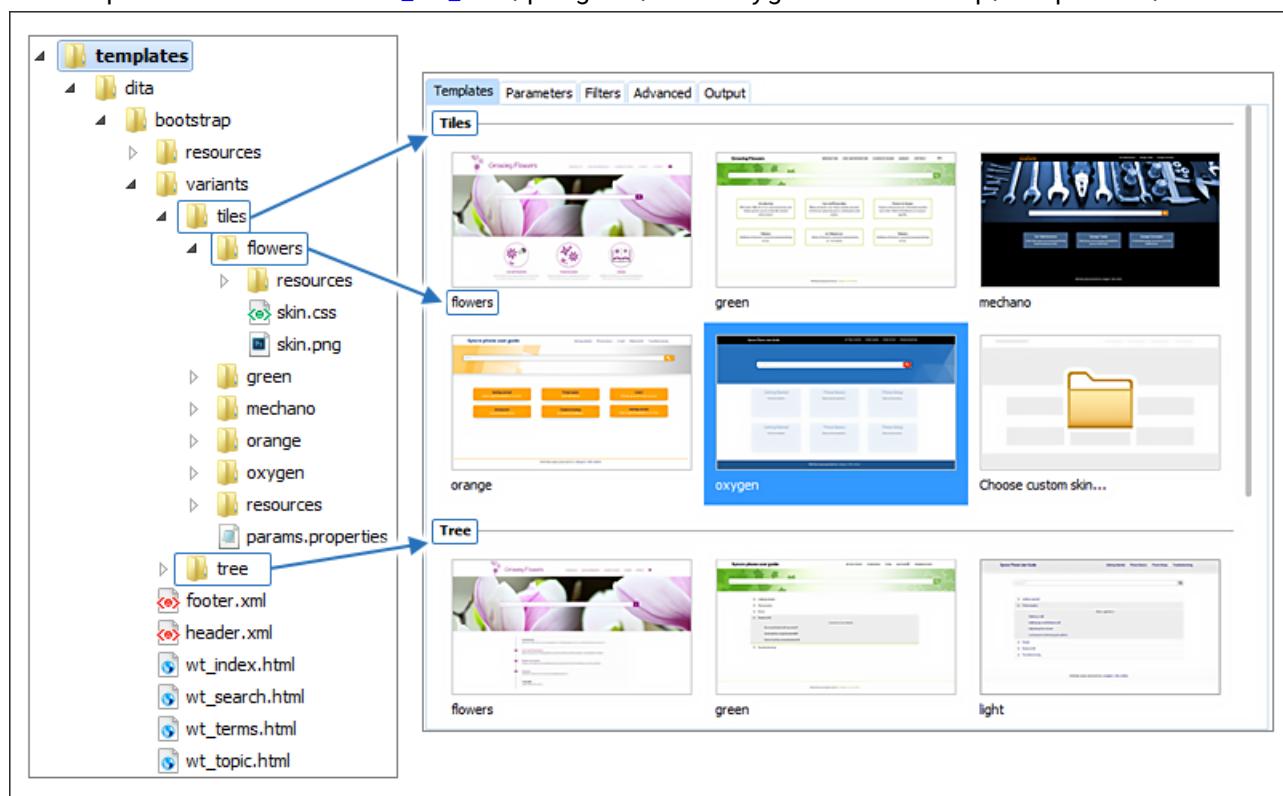

#### Related information

[Customizing the WebHelp Responsive Output](#) on page 842

#### WebHelp Responsive Template Directory Structure

A certain directory structure is required for the WebHelp Responsive templates. The names of folders at certain levels correspond to the names of template variants and skins, components are defined in specific files, and various resources need to be located in specific locations within the directory structure.

The templates are stored in `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita`.

**Figure 453: Templates Directory Structure**

At the first level of the template directory we can find the following predefined files and folders:

- **resources Folder** - Contains all additional resources used by the template, such as images, CSS, and JavaScript files.
- **variants Folder** - Contains the template variants, including folders for each skin. See [Template Variants and Skins](#) on page 831.
- **Template Files** - The HTML template files that are used to generate the output:
  - `wt_index.html` - Used to produce the main home page of the WebHelp Responsive output. See [WebHelp Responsive Main Page Template](#) on page 832.
  - `wt_topic.html` - Used to generate the HTML pages associated with individual topics. See [WebHelp Responsive Topic Template](#) on page 833.

- `wt_search.html` - Used to generate the HTML page that presents the search results. See [WebHelp Responsive Search Results Template](#) on page 834.
- `wt_terms.html` - Used to generate the HTML page that presents the documentation index. See [WebHelp Responsive Index Terms Template](#) on page 835.

After the transformation scenario is executed, the resources and variants folders are copied in the `/oxygen-webhelp/template/` folder within the output directory (defined in the **Output** tab of the transformation scenario).

## Template Variants and Skins

You could think of a *template* as being a set of WebHelp components that are placed in a predefined HTML layout. You can have multiple variants of the template. A WebHelp *template variant* is an instance of the template with a specific set of parameters. For example, you could have two variants of the WebHelp main page, one that displays the topics in a *tiles* style of layout, and another one that displays the topics in a *tree* style.

Each variant has its own directory that corresponds to the name of the variant. The name of the variant is displayed in the user interface when the variants are displayed (for example, in the **templates** tab of the transformation scenario).

Each variant directory may contain the following resources:

- **Skin Directories** - These folders represent skin templates for the current variant.
- **params.properties File** - This file specifies the values for the parameters imposed by the variant.
- **resources Folder** - This is an optional directory that contains resources that are specific to the current variant (such as images, CSS files, etc.) They will be copied to the output directory.

### Skins

A variant *skin* represents a CSS file that allows you to alter the styling of the template. The CSS associated with a skin must be named `skin.css` and it must be stored as a first child of the skin directory.

Each skin might need additional resources (images, fonts) that must be stored in the *resources* directory in the root folder for that particular skin. The name of the skin directory is displayed in the user interface when you choose a skin (in the **templates** tab of the transformation scenario).

Each skin directory can also contain a `skin.png` preview image that will be displayed in the user interface and a properties file that contains a URL for the online preview of the skin. This image file must be stored as a first child of the skin directory.

For information about creating or customizing skins, see [Create or Customize a WebHelp Responsive Skin](#) on page 844.

## WebHelp Responsive Template Files

The HTML pages that comprise the output of a WebHelp Responsive system are obtained after processing HTML template files. These files correspond to the type of page they generate in the output.

There are four types of template pages and corresponding HTML template files:

1. **Main Page Template** (`wt_index.html` file) - Used to produce the main home page of the WebHelp Responsive output.
2. **Topic Template** (`wt_topic.html` file) - Used to generate the HTML pages associated with individual topics.
3. **Search Results Template** (`wt_search.html` file) - Used to generate the HTML page that presents the search results.
4. **Index Terms Template** (`wt_terms.html` file) - Used to generate the HTML page that presents the documentation index.

The HTML template files are located in the following directory:

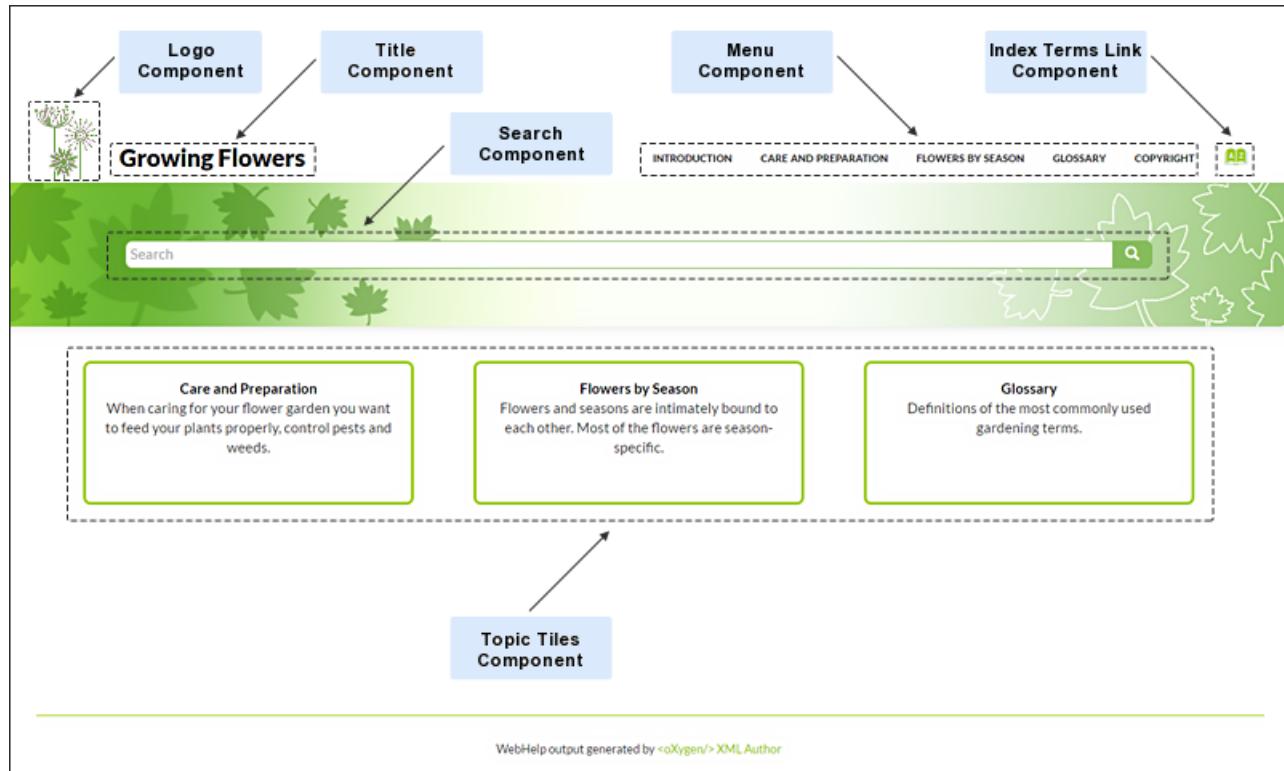

`DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/`

## WebHelp Responsive Main Page Template

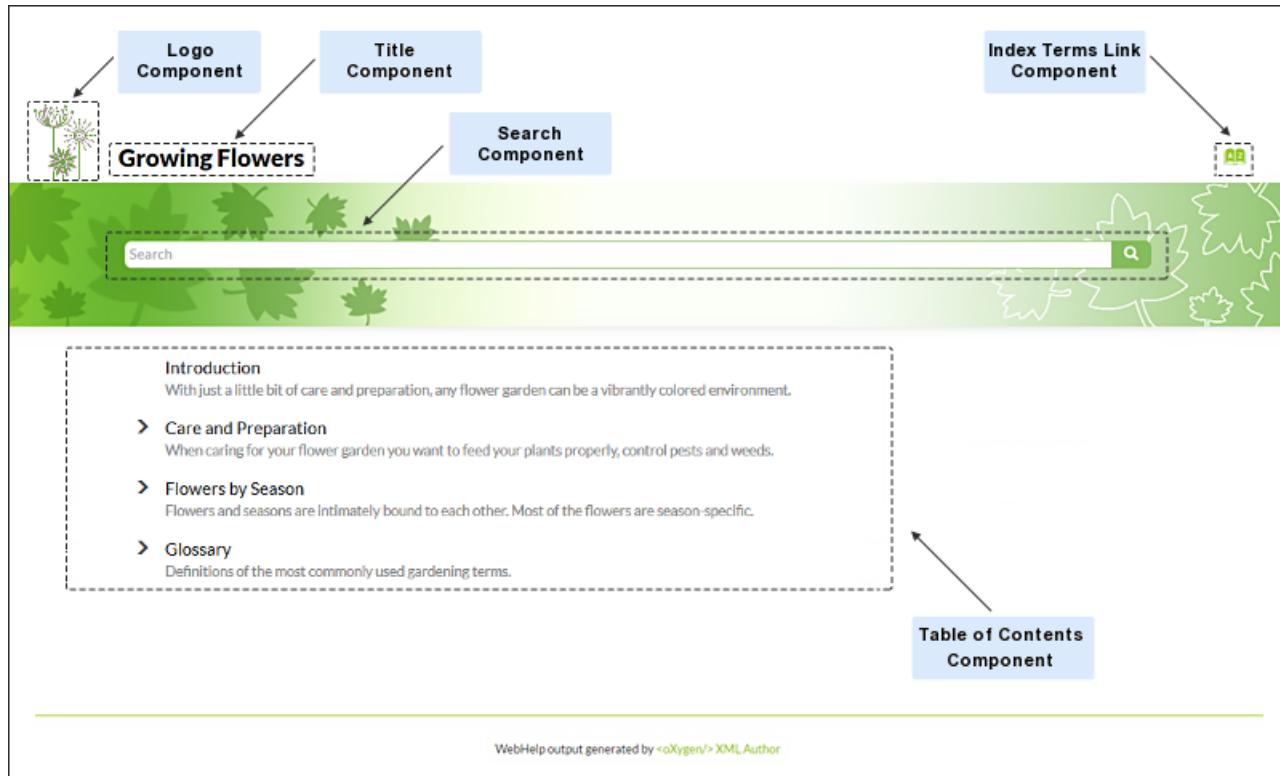

The *Main Page Template* is used to generate the home page of the WebHelp Responsive output. The name of the template file is `wt_index.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The main function of the home page is to display top level information and provide links that help you easily navigate to any of the top level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

**Figure 454: Example: Main Page Components of a Tiles Style of Layout**

**Figure 455: Example: Main Page Components of a Tree Style of Layout**

The components that can be referenced in the `wt_index.html` template file are as follows:

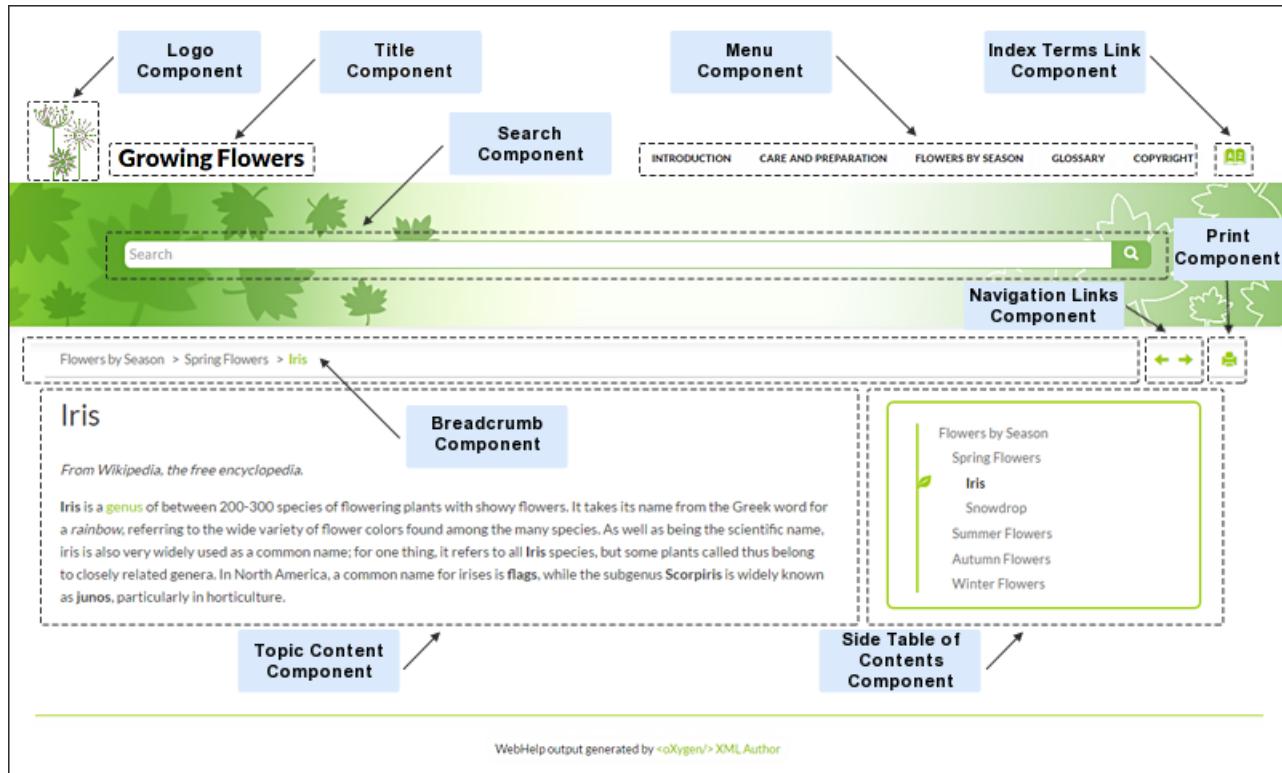

- *Publication Title*
- *Publication Logo*
- *Search Input*
- *Print Link*
- *Main Page Menu*
- *Main Page Topic Tiles*
- *Main Page Table of Contents*
- *Index Terms Link*
- *Link to Skin Resources*

#### *WebHelp Responsive Topic Template*

The *Topic Template* is used to generate HTML pages for each topic in the WebHelp Responsive output. The name of the template file is `wt_topic.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

**Figure 456: Example: Topic Page Components**

The components that can be referenced in the `wt_topic.html` template file are as follows:

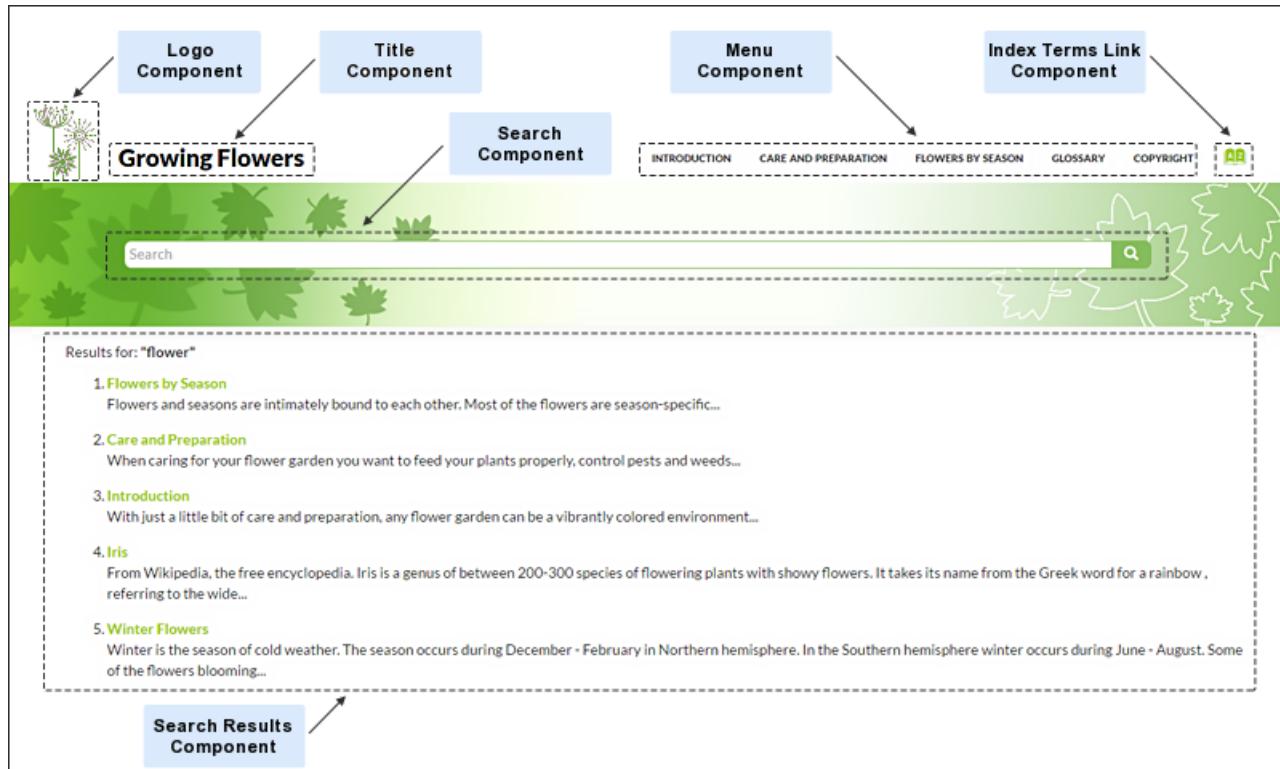

- *Publication Title*
- *Publication Logo*
- *Search Input*
- *Topic Breadcrumb*
- *Navigational Links*
- *Print Link*
- *Topic Content*
- *Topic Side TOC*
- *Topic Feedback*
- *Main Page Menu*
- *Index Terms Link*
- *Child Links*
- *Related Links*
- *Link to Skin Resources*

#### WebHelp Responsive Search Results Template

The *Search Results Template* is used to generate HTML pages that present search results in the WebHelp Responsive output. The name of the template file is `wt_search.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

**Figure 457: Example: Search Results Page Components**

The components that can be referenced in the `wt_search.html` template file are as follows:

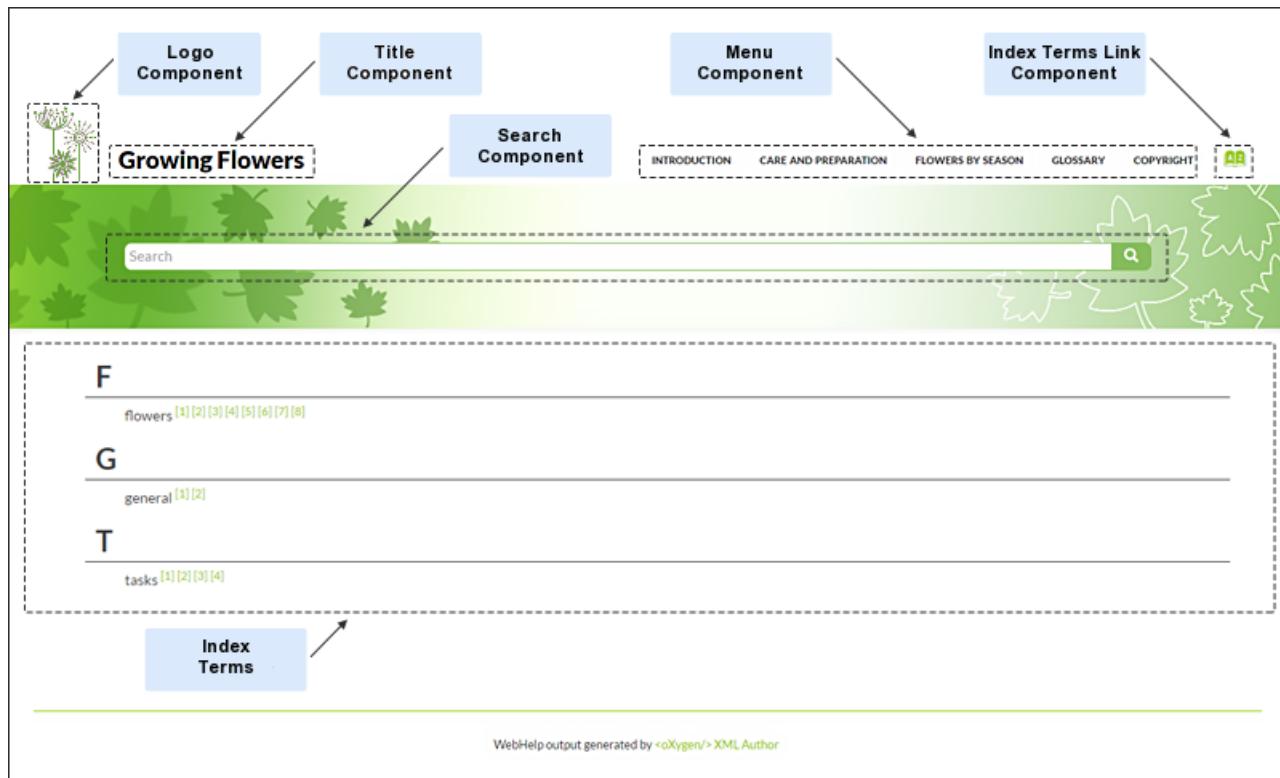

- *Publication Title*
- *Publication Logo*
- *Search Input*
- *Search Results*
- *Print Link*
- *Main Page Menu*
- *Index Terms Link*
- *Link to Skin Resources*

#### *WebHelp Responsive Index Terms Template*

The *Index Terms Template* is used to generate HTML pages that present index terms in the WebHelp Responsive output. The name of the template file is `wt_terms.html` and it is located in the following directory:

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/
```

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

**Figure 458: Example: Index Terms Page Components**

The components that can be referenced in the `wt_terms.html` template file are as follows:

- *Publication Title*
- *Publication Logo*
- *Search Input*
- *Print Link*
- *Main Page Menu*
- *Index Terms Link*
- *Link to Skin Resources*

#### WebHelp Responsive Template Components

A WebHelp Responsive *template component* adds dynamics to a WebHelp *template page*. The rendering of a component depends on the context of where it is placed and its content depends on the transformed DITA Map.

Some of the template components can be used in all the *types of template pages*, while some are only available for certain template pages. For instance, the *Publication Title* component can be used in all pages, but the *Navigation Breadcrumb* component can only be used in *Topic Template* pages.

To include a *template component* in the output of a particular type of *template page*, you have to reference a specific element in the particular *template file*. All the elements associated with a template component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component could contain custom content or reference another component. To specify where the component content will be located in the output you can use the `component_content` element as a descendant of the `component` element.

#### Example:

```
<whc:webhelp_search_input class="navbar-form webhelp_main_page_search"
 role="form" >
 <whc:include_html href="${webhelp.include.before.search}" />
 <div class="search_input">
 <whc:component_content/>
 </div>
</whc:webhelp_search_input>
```

The various components and where they can be used are as follows:

### **Publication Title [webhelp\_publication\_title]**

This component generates the publication title in the output. To generate this component, the webhelp\_publication\_title element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the webhelp\_publication\_title element can be specified as in the following example:

```
<whc:webhelp_publication_title
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_publication\_title.

### **Publication Logo [webhelp\_logo]**

This component generates a logo image in the output. To generate this component, the webhelp\_logo element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the webhelp\_logo element can be specified as in the following example:

```
<whc:webhelp_logo
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In addition, you must also specify the path of the logo image in the webhelp.logo.image transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the webhelp.logo.image.target.url parameter to generate a link to a URL when you click the logo image. If this parameter is not set, a link to the home page will automatically be generated.

In the output, you will find an element with the class: wh\_logo.

### **Search Input [webhelp\_search\_input]**

This component is used to generate the input widget associated with search function in the output. To generate this component, the webhelp\_search\_input element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the webhelp\_search\_input element can be specified as in the following example:

```
<whc:webhelp_search_input
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: webhelp\_search\_input.

## Search Results [webhelp\_search\_results]

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the webhelp\_search\_results element must be specified in the template file. It can be used in the following type of template page:

- [Search Results Template \(wt\\_search.html file\)](#)

In the template file, the webhelp\_search\_results element can be specified as in the following example:

```
<whc:webhelp_search_results
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_search\_results.

## Topic Breadcrumb [webhelpBreadcrumb]

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the webhelpBreadcrumb element must be specified in the template file. It can be used in the following type of template page:

- [Topic Template \(wt\\_topic.html file\)](#)

In the template file, the webhelpBreadcrumb element can be specified as in the following example:

```
<whc:webhelpBreadcrumb
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: whBreadcrumb. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the home class. The last item in the list corresponds to the current topic and has the active class set.

## Navigational Links [webhelp\_navigation\_links]

This component generates navigation links to the next and previous topics. To generate this component, the webhelp\_navigation\_links element must be specified in the template file. It can be used in the following type of template page:

- [Topic Template \(wt\\_topic.html file\)](#)

In the template file, the webhelp\_navigation\_links element can be specified as in the following example:

```
<whc:webhelp_navigation_links
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_navigation\_links. This element will contain the links to the next and previous topics.

## Topic Content [webhelp\_topic\_content]

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the webhelp\_topic\_content element must be specified in the template file. It can be used in the following type of template page:

- [Topic Template \(wt\\_topic.html file\)](#)

In the template file, the webhelp\_topic\_content element can be specified as in the following example:

```
<whc:webhelp_topic_content
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_topic\_content.

## **Topic Side TOC [webhelp\_side\_toc]**

This component generates a mini table of contents for the current topic. It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the webhelp\_side\_toc element must be specified in the template file. It can be used in the following type of template page:

- ***Topic Template (wt\_topic.html file)***

In the template file, the webhelp\_side\_toc element can be specified as in the following example:

```
<whc:webhelp_side_toc
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_side\_toc. This element will contain links to the topics that are close to the current topic.

## **Topic Feedback [webhelp\_feedback]**

This component generates a placeholder for where the comments section will be presented. To generate this component, the webhelp\_feedback element must be specified in the template file. It can be used in the following type of template page:

- ***Topic Template (wt\_topic.html file)***

In the template file, the webhelp\_feedback element can be specified as in the following example:

```
<whc:webhelp_feedback
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

## **Child Links [webhelp\_child\_links]**

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the webhelp\_child\_links element must be specified in the template file. It can be used in the following type of template page:

- ***Topic Template (wt\_topic.html file)***

In the template file, the webhelp\_child\_links element can be specified as in the following example:

```
<whc:webhelp_child_links
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

## **Related Links [webhelp\_related\_links]**

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the webhelp\_related\_links element must be specified in the template file. It can be used in the following type of template page:

- ***Topic Template (wt\_topic.html file)***

In the template file, the webhelp\_related\_links element can be specified as in the following example:

```
<whc:webhelp_related_links
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

## **Main Page Topic Tiles [webhelp\_tiles]**

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that corresponds to the topic title, short description, and image. To generate this component, the webhelp\_tiles element must be specified in the template file. It can be used in the following type of template page:

- ***Main Page Template (wt\_index.html file)***

In the template file, the webhelp\_tiles element can be specified as in the following example:

```
<whc:webhelp_tiles
```

```
xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_tiles.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the whc:webhelp\_tile component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
 <!-- Place holder for tile's image -->
 <whc:webhelp_tile_image/>

 <div class="webhelp_tile_text">
 <!-- Place holder for tile's title -->
 <whc:webhelp_tile_title/>

 <!-- Place holder for tile's shordesc -->
 <whc:webhelp_tile_shortdesc/>
 </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see [Configuring the Tiles on the Main Page](#) on page 848.

### Main Page Table of Contents [webhelp\_main\_page\_toc]

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the webhelp\_main\_page\_toc element must be specified in the template file. It can be used in the following type of template page:

- [Main Page Template \(wt\\_index.html file\)](#)

In the template file, the webhelp\_main\_page\_toc element can be specified as in the following example:

```
<whc:webhelp_main_page_toc
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_main\_page\_toc.

### Main Page Menu [webhelp\_topics\_menu]

This component generates a menu with all the documentation topics. To generate this component, the webhelp\_topics\_menu element must be specified in the template file. It can be used in the following type of template page:

- [Main Page Template \(wt\\_index.html file\)](#)

In the template file, the webhelp\_topics\_menu element can be specified as in the following example:

```
<whc:webhelp_topics_menu
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: wh\_topics\_menu.

You can control the maximum level of topics that will be included in the menu using the webhelp.top.menu.depth transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [Customizing the Menu](#) on page 850.

### Print Link [webhelp\_print\_link]

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the webhelp\_print\_link element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the `webhelp_print_link` element can be specified as in the following example:

```
<whc:webhelp_print_link
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_print_link`.

### Include HTML files [webhelp\_include\_html]

This component can be used to include custom HTML files. To generate this component, the `include_html` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the `include_html` element can be specified as in the following example:

```
<whc:include_html href="${wh.param}" />
```

Where the `href` can have the following values:

- **any URL** - In this case, the file to be included is specified as an URL.
- **\${Oxygen-webhelp-template-dir}/file\_to\_include.html** - To include resources that are part of the template.
- **\${webhelp.param}** - To include a resource whose path is specified through a WebHelp transformation scenario parameter. The value of this parameter can be a simple HTML fragment, in which case it will be copied to the output.

### Index Terms Link [webhelp\_indexterms\_link]

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the `webhelp_indexterms_link` element can be specified as in the following example:

```
<whc:webhelp_indexterms_link
 xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

### Link to Skin Resources [webhelp\_skin\_resources]

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the template file. It can be used in all four types of template pages:

- [Main Page Template \(wt\\_index.html file\)](#)
- [Topic Template \(wt\\_topic.html file\)](#)
- [Search Results Template \(wt\\_search.html file\)](#)
- [Index Terms Template \(wt\\_terms.html file\)](#)

In the template file, the `webhelp_skin_resources` element can be specified as in the following example:

```
<whc:webhelp_skin_resources />
```

In the output, you will find a link to the skin resources.

## Customizing the WebHelp Responsive Output

To change the overall appearance of your WebHelp Responsive output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

## WebHelp Responsive Customization Methods

There are several methods that you can use to customize your WebHelp Responsive output. This topic provides information on each of the methods and highlights its advantages so that you can choose the best possible method based upon your needs.

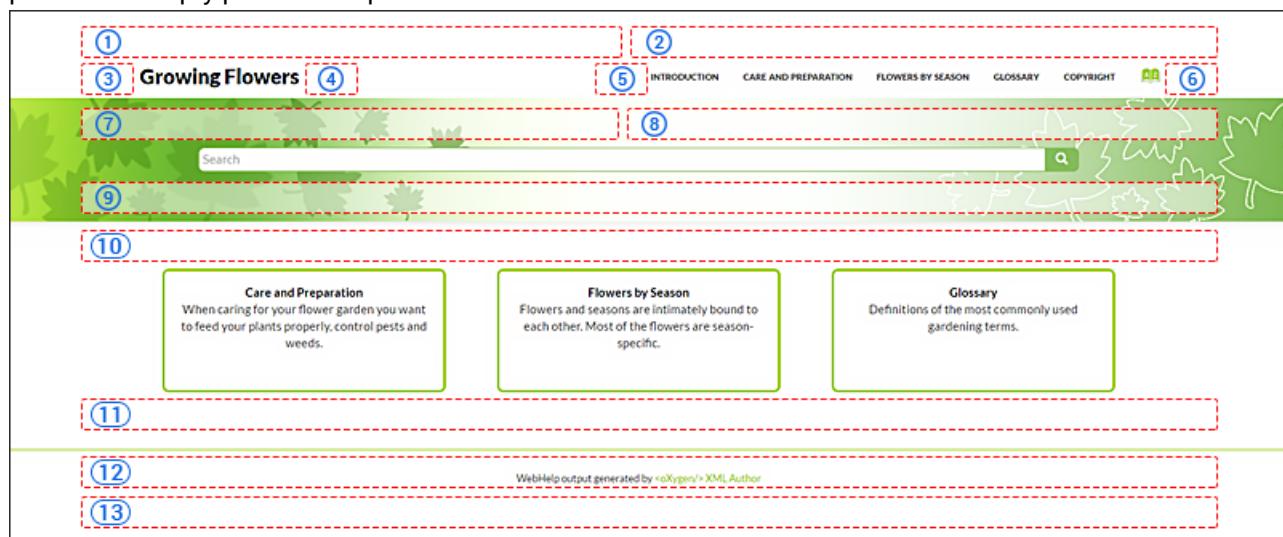

### Insert Custom XHTML Fragments in Predefined Placeholders

The WebHelp Responsive template contains a series of component placeholders. Some of these placeholders are left empty in the default output configurations, but you can use them to display custom content. This method is recommended if you want to use an existing skin and simply make some minor changes or additions in certain locations within the final output.

#### Advantages:

- This method is very easy, since the fragments for the placeholders can be specified in the transformation scenario.
- Advanced knowledge of CSS styling is not required for this method.

Each such placeholder has an associated parameter in the transformation scenario **Parameters** tab. These predefined empty placeholder parameters are illustrated and described below:

**Figure 459: Predefined Placeholders Diagram**

Each of these parameters can hold either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

#### 1- webhelp.fragment.head

In the generated output it displays a given XHTML fragment as a page header. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

#### 2- webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **3- webhelp.fragment.before.logo\_and\_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **4- webhelp.fragment.after.logo\_and\_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **5- webhelp.fragment.before.top\_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **6- webhelp.fragment.after.top\_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **7- webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **8- webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **9- webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **10- webhelp.fragment.before.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **11- webhelp.fragment.after.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **12- webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **13- webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **EXAMPLE:**

To insert a message above the search field component in the main page of the output, follow this procedure:

1. Edit the *WebHelp Responsive* transformation scenario.
2. Go to **Parameters** tab and find the parameter associated with the place holder that you want to use. In this case, it is called `webhelp.fragment.welcome`.
3. Edit the parameter. Depending on the size of the content you want to add, you can insert one of the following:
  - A small well-formed XHTML fragment, such as: `<i>Welcome to our user guide</i>`.
  - A path to a file that contains well-formed XHTML content.

### **Customize WebHelp Output with a Custom CSS**

This method is recommended if you just want to adapt an existing skin (that is very close to what you need) and only need to change the styling of the final output. For example, this might be the case if you simply want to change a color, or adjust some of the margins or paddings of certain components.

### **Advantages:**

- This method could be used as a quick and easy way to make small styling changes.
- The custom CSS can be distributed with your project and shared with other members of your team.
- This method can be used for advanced and precise styling.

#### **Additional Notes:**

- The fonts, images, and other resources must be stored in a remote server location.
- This type of customization will not appear in the **Templates** tab of the transformation scenario. Instead, the custom CSS needs to be set as a parameter of an existing transformation scenario.

To set a custom CSS to a transformation scenario:

1. Edit the *WebHelp Responsive* transformation scenario.
2. Open the **Parameters** tab.
3. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed. Also, if your customization CSS requires additional resources, you can copy them to the generated output by specifying the [`webhelp.custom.resources` parameter](#).

If you are using DITA, you could also override the default XSLT templates that are used for WebHelp transformations by using some extension points. For information about this method, see [Overriding the XSLT Processing Step of a DITA WebHelp Transformation](#) on page 857.

#### **Create or Customize a WebHelp Responsive Skin**

This method is recommended if you want a design that is not similar to any of the predefined skins, or if you want to make a lot of changes to one of the existing skins. This method is also useful if you want to distribute additional resources (such as fonts and images) together with a custom CSS.

#### **Advantages:**

- The customized skin will be available in the **Templates** tab of the transformation scenario.
- The resources are encapsulated into the `skin` directory and can be shared with other team members, along with a custom CSS file.

#### **Additional Notes:**

- This method requires access to the installation folder, or the use of an external *DITA-OT* engine (with the [\*WebHelp plugin\*](#) installed).

To create a new WebHelp Responsive skin, follow this procedure:

1. Locate the following folder in your *DITA-OT* directory ([`DITA\_OT\_DIR`](#)):

`DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/bootstrap/variants/`

2. Here you can see some subdirectories corresponding to different variants for the same template. For instance, the default directories are `tiles` and `tree`.
3. In each of these variants, you will find a directory for each of the skins (for example, the default skins and their corresponding directories are: `flowers`, `green`, `light`, `mechano`, `orange`, etc.)
4. Duplicate one of the skin folders and rename it to whatever you want your new skin to be identified as.
5. Edit the `skin.css` file and customize it the way you want. If your customization of the CSS file requires additional resources (such as images, fonts, or other CSS files), they need to be placed in the `resources` folder at the same level with the `skin.css` file.

**Result:** Your new skin should now be included in the list of skins in the **Templates** tab of the transformation scenario.

**Tip:** During development, you may want to regularly test your customization. To shorten the publishing time of your tests, use a small set of test files (you could use one of the Oxygen XML Editor sample projects). Also, you can use your web browser CSS inspector tool to lookup the CSS classes you want to modify.

## Create a New WebHelp Responsive Template

This method can be used when you need to make significant structural changes to the WebHelp output. For example, if you want to move some components to other positions, or if you want to use a different responsive front-end framework than the default [Bootstrap framework](#) (for instance, if you want to switch to [ZURB Foundation](#)).

### Advantages:

- This method allows you to fully customize the output.
- This method allows you to [change the structure of the generated HTML files](#).
- You can [create your own skins](#) for the new template.

### Additional Notes:

- This method requires access to the installation folder, or the use of an external DITA-OT engine (with the [WebHelp plugin](#) installed).

To create a new WebHelp Responsive template, follow these steps:

1. Locate the following folder in your DITA-OT directory ([DITA\\_OT\\_DIR](#)):

```
DITA_OT_DIR/plugins/com.oxygenxml.webhelp/templates/dita/
```

2. Duplicate the bootstrap folder and rename it to whatever you want your new template to be identified as (for example, myTemplate).
3. Customize the structure of the new template according to your needs. For example, if you only want to keep one of the template variants, open the myTemplate/variants folder and delete all of its subdirectories, except for that one (for instance, the tiles directory). Keep in mind that the structure of the template directory is important. The names of folders at certain levels correspond to the names of templates and skins, while components and resources are defined and referenced in certain files or folders at specific locations within the directory structure. For more information, see [WebHelp Responsive Template Directory Structure](#) on page 830.
4. You can also customize the structure of the skins within the template variants. For example, if you only want to keep one of the skins in the tiles variant, open the myTemplate/variants/tiles folder and delete all of its subdirectory skins, except for that one (for instance, the light directory).
5. Edit the skin.css file that is located in the skin directory (for example, myTemplate/variants/tiles/light) and customize it the way you want. If your customization of the CSS file requires additional resources (such as images, fonts, or other CSS files), they need to be placed in the resources folder at the same level with the skin.css file.

**Result:** Your new templates and skins should now be included in the **Templates** tab of the transformation scenario.

**Tip:** During development you regularly need to test your customization. To shorten the publishing time of your test, use a small project (you could use one of the Oxygen XML Editor sample projects). Also, you can use your web browser CSS inspector tool to lookup the CSS classes you want to modify.

For more information about WebHelp Responsive templates, see the [WebHelp Responsive Template Mechanism](#) on page 829 section.

## Copying Additional Resources to WebHelp Output Directory

To copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system, follow these steps:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value for the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
5. Click **OK** to save the changes to the transformation scenario.

All files from the new directory will be copied to the root of the WebHelp output directory.

## Adding Custom HTML Content in WebHelp Responsive Output

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file that will be referenced in the transformation scenario. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

To include custom HTML content in the WebHelp Responsive output files, follow these steps:

1. Insert the HTML content in a well-formed XML file. There are several things to consider in regards to this XML file:

- a. **Well-Formedness** - If the file is not a [Well-formed XML document](#) (or fragments are not well-formed), the transformation will fail.

A common use case is if you want to include several script or link elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.

- b. **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the predefined \${oxygen-webhelp-output-dir} macro to specify their paths relative to the output directory:

```
<html>
 <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
 <link rel="stylesheet" type="text/css"
 href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

If you want that the path of your resource to be relative to the [templates directory](#), you can use the \${oxygen-webhelp-template-dir} macro.

To copy the referenced resources to the output directory, follow the procedure in: [Copying Additional Resources to WebHelp Output Directory](#) on page 845.

- c. **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

JavaScript:

```
<script type="text/javascript">
 <!--
 /* Include JavaScript code here. */
 function myFunction() {
 return true;
 }
 -->
</script>
```

CSS:

```
<style>
 <!--
 /* Include CSS style rules here. */
 *{
 color:red
 }
 -->
</style>
```

2. Edit the WebHelp Responsive transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value of the [webhelp.fragment.head parameter](#) and set it to the absolute path of the XML file created in step 1. Your additional content will be included at the end of the head element of your output document.

**Note:** If you want to insert the content in another location within the output document, you can reference the XML file in any of the other parameters listed in [Insert Custom XHTML Fragments in Predefined Placeholders](#) on page 842.

5. Click **OK** to save the changes to the transformation scenario.

## Related tasks

[Copying Additional Resources to WebHelp Output Directory](#) on page 845

## Related information

[WebHelp Responsive Template Directory Structure](#) on page 830

[WebHelp Responsive Customization Methods](#) on page 842

### Adding a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp system by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DITA and DocBook WebHelp systems using **WebHelp Responsive**, **WebHelp Responsive with Feedback**, **WebHelp Classic**, **WebHelp Classic with Feedback**, or **WebHelp Classic Mobile** transformation scenarios.

To add a favicon, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Locate the webhelp.favicon parameter and enter the file path that points to the image that will be used as the favicon.
3. Run the transformation scenario.

### Adding a Logo Image in the Title Area

To add a logo in the title area of your WebHelp output, follow this procedure:

1. Edit a WebHelp transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the webhelp.logo.image parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the webhelp.logo.image.target.url parameter.
4. Run the transformation scenario.

### Adding a Welcome Message in the Home Page

The main page of the WebHelp Responsive output contains a set of empty placeholders that can be used to display customized text fragments. These placeholders are available to you through [WebHelp Responsive transformation scenario parameters](#). One of these placeholders (identified through the webhelp.fragment.welcome parameter) was designed to display text content above the search box in the main page.

To add a customized welcome message in the main page of the WebHelp Responsive output, follow this procedure:

1. Edit a WebHelp Responsive transformation scenario.
2. Open the **Templates tab** and choose a skin.
3. Open the **Parameters tab** and edit the webhelp.fragment.welcome parameter. The value of this parameter can be one of the following:
  - A small well-formed XHTML fragment (such as: <i>Welcome to the User Guide</i>).
  - Path to a file that contains well-formed XHTML content.
4. Click **OK**, then click the **Apply associated** button to execute the transformation scenario.

### Adding Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

## Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video by using the  **Insert Media Object toolbar action** or by manually adding an object element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
```

or, instead of the data attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
 <param name="src" value="videos/MyVideo.mp4" />
</object>
```

2. Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the object element to an HTML5 video element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

## Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip by using the  **Insert Media Object toolbar action** or by manually adding an object element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the data attribute, you can specify the audio clip using a parameter like this:

```
<object outputclass="audio">
 <param name="src" value="audio/MyClip.mp3" />
</object>
```

2. Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the object element to an HTML5 audio element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

## Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the  **Insert Media Object toolbar action** or by manually adding an object element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the data attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
 <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4" />
</object>
```

2. Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the object element to an HTML5 iframe element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics](#) on page 1575

## Configuring the Tiles on the Main Page

The *tiles* version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the DITA map source. However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize these tiles either by setting metadata information in the DITA map or by customizing the CSS that is associated with the DITA map.

## How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the id of the topic.

### Editing the DITA Map

To edit the metadata in the DITA map to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Open the DITA map in the **Text** editing mode of Oxygen XML Editor.
2. Add the following metadata information in the **topicref** element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```
<topicmeta>
 <data name="wh_TILE">
 <data name="hide" value="yes"/>
 </data>
</topicmeta>
```

### Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an id on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic id `growing-flowers`). The CSS file should have content that is similar to this:

```
.wh_TILE [data-id='growing-flowers'] {
 display:none;
}
```

3. Use the [Customizing WebHelp Output with a Custom CSS](#) method to pass the CSS file you just created to the transformation scenario.

## How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

### Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the **Text** editing mode of Oxygen XML Editor.
2. Add the following metadata information in the **topicref** element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```
<topicmeta>
 <data name="wh_TILE">
 <data name="image" href="img/tile-image.png" format="png">
 <data name="attr-width" value="64"/>
 <data name="attr-height" value="64"/>
 </data>
 </data>
</topicmeta>
```

**Note:** The `attr-width` and `attr-height` attributes can be used to control the size of the image, but they are optional.

### Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an id on the topic that you want the tile include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```
.wh_tile[data-id='growing-flowers']> div {
 background-image:url('resources/flower.png');
}
```

3. Use the [Customizing WebHelp Output with a Custom CSS](#) or the [Create a WebHelp Responsive Skin](#) method to pass the CSS file you just created to the transformation scenario.

### Change Numbering Styles for Ordered Lists

Ordered lists (ol) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom outputclass value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
 A
 B
 C

```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
 list-style-type:lower-alpha;
}
```

3. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.

- a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
4. Run the transformation scenario.

### CSS Styling to Customize WebHelp Output

One way to customize WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario.

As a practical example, to hide the horizontal separator line between the content and footer, follow these steps:

1. Create a custom CSS file that contains the following snippet:

```
.footer_separator {
 display:none;
}
```

2. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.

- a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
3. Run the transformation scenario.

### Customizing the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

### How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

## Editing the DITA Map

To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:

1. Open the DITA map in the **Text** editing mode of Oxygen XML Editor.
2. Add the following metadata information in the **topicref** element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```
<topicmeta>
 <data name="wh-menu">
 <data name="hide" value="yes" />
 </data>
</topicmeta>
```

## Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an id on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic id `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```
.wh_top_menu *[data-id='growing-flowers'] {
 display:none;
}
```

3. Use the [Customizing WebHelp Output with a Custom CSS](#) method to pass the CSS file you just created to the transformation scenario.

## How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely. To do so, follow this procedure:

1. Edit a WebHelp Responsive transformation scenario.
2. Open the **Templates tab** and choose a skin.
3. Open the **Parameters tab** and set the value of the `webhelp.show.top.menu` parameter to no.
4. Click **OK**, then click the **Apply associated** button to execute the transformation scenario.

## Editing Scoring Values of Tag Elements in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Editor includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
  - a) For DITA WebHelp systems, edit the following file: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties`.
  - b) For DocBook WebHelp system, edit the following file: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties`.

The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
```

```
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp system transformation scenario.

### Exclude Certain DITA Topics from WebHelp Search Results

The WebHelp **Search** engine does not index DITA topics that have the @search attribute set to no. This is useful if you have topics in your DITA map structure that you do not want to be included in search results for your WebHelp system.

To exclude DITA topics from WebHelp search results, follow these steps:

1. Edit the DITA map and for any `topicref` that you want to exclude from search results, set the `search` attribute to no.

For example:

```
<topicref href=".../topics/internal-topic1.dita" search="no" />
```

2. Save your changes to the DITA map.
3. Re-run your WebHelp system transformation scenario.

### Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
 <prop att="audience" val="programmer" action="flag"
 img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
4. Run the transformation scenario.

### Integrating Social Media and Google Tools in WebHelp Output

Oxygen XML Editor includes support for integrating some of the most popular social media sites in WebHelp output.

#### How to Add a Facebook Like Button in WebHelp Responsive Output

To add a Facebook™ Like widget to your WebHelp output, follow these steps:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.  
A dialog box that contains code snippets is displayed.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each script element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!--
 (function(d, s, id) {
 var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "/connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 })(document, 'script', 'facebook-jssdk');
 -->
 </script>
 <div class="fb-like" data-layout="standard" data-action="like"
 data-show-faces="true" data-share="true" />
</div>
```

4. In Oxygen XML Editor, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab. Depending on where you want to display the button, edit *one of the parameters that begin with webhelp.fragment*. Set that parameter to reference the facebook-widget.xml file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

#### *How to Add a Google+ Button in WebHelp Responsive Output*

To add a Google+ widget to your WebHelp Responsive output, follow these steps:

1. Go to the [Google Developers](#) website.
  2. Fill-in the displayed form.  
The preview area on the right side displays the code and a preview of the widget.
  3. Copy the code snippet displayed in the preview area and paste it into a div element inside an XML file called google-plus-button.xml.
- Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```
<div id="google-plus">
 <!-- Place this tag in your head or just before your close body tag. -->
 <script src="https://apis.google.com/js/platform.js" async defer></script>

 <!-- Place this tag where you want the +1 button to render. -->
 <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. In Oxygen XML Editor, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab. Depending on where you want to display the button, edit *one of the parameters that begin with webhelp.fragment*. Set that parameter to reference the google-plus-button.xml file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

## How to Add Tweet Button in WebHelp Responsive Output

To add a Twitter™ Tweet widget to your WebHelp Responsive output, follow these steps:

1. Go to the [Tweet button generator](#) page.
2. Fill-in the displayed form.  
The **Preview and code** area displays the code.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a div element inside an XML file called `tweet-button.xml`.  
Make sure you follow these rules:
  - The file must be well-formed.
  - The code for each `script` element must be included in an XML comment.
  - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
 Tweet
 <script>
 <!--
 !function (d, s, id) {
 var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
 if (! d.getElementById(id)) {
 js = d.createElement(s);
 js.id = id;
 js.src = p + '//platform.twitter.com/widgets.js';
 fjs.parentNode.insertBefore(js, fjs);
 }
 (document,
 'script', 'twitter-wjs');
 -->
 </script>
 </div>
```

4. In Oxygen XML Editor, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab. Depending on where you want to display the button, edit [one of the parameters that begin with webhelp.fragment](#). Set that parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

## How to Integrate Google Analytics in WebHelp Responsive Output

To enable your WebHelp Responsive system to benefit from Google Analytics reports, follow these steps:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that fits the needs of your website.
3. Follow the on-screen instructions to obtain a *Tracking Code* that contains your *Tracking ID*.

A Tracking Code looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new HTML file called `googleAnalytics.html`.

5. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab. Depending on where you want to display the button, edit *one of the parameters that begin with webhelp.fragment*. Set that parameter to reference the googleAnalytics.html file that you created earlier.
8. Click **Ok**.
9. Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 1085

#### How to Integrate Google Search in WebHelp Responsive Output

You can integrate Google Search into your WebHelp Responsive output.

To enable your WebHelp system to use Google Search, follow these steps:

1. Go to the Google Custom Search Engine page using your Google account.
2. Press the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet.

A Google Search script looks like this:

```
<script>
(function() {
 var cx =
 '00088821088977588983:8mn4x_mf-yg';
 var gcse = document.createElement('script');
 gcse.type = 'text/javascript';
 gcse.async = true;
 gcse.src = (document.location.protocol == 'https:' ?
 'https:' : 'http:') + '//www.google.com/cse/cse.js?cx=' + cx;
 var s = document.getElementsByTagName('script')[0];
 s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called googlecse.html.
5. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the webhelp.google.search.script parameter to reference the googlecse.html file that you created earlier.
8. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
  - a) Create an HTML file with the following content: <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div> (you must use the [HTML5 version for the GCSE](#)). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
  - b) Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>.
9. Click **Ok**.
10. Run the transformation scenario.

[Integrating Social Media and Google Tools in WebHelp Output](#) on page 852

## Localizing the Email Notifications of WebHelp with Feedback Systems

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Suppose that you want to localize the emails into Dutch (*nl*). Follow these steps:

### DocBook WebHelp Classic with Feedback

1. Create the following directory:

```
[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp
\resources\php\templates\nl
```

2. Copy all English template files from `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en` and paste them into the directory you just created.
  3. Edit the HTML files from the `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl` directory and translate the content into Dutch.
  4. Start Oxygen XML Editor and edit the **DocBook WebHelp Classic with Feedback** transformation scenario.
  5. In the **Parameters** tab, look for the `110n.gentext.default.language` parameter and set its value to the appropriate language code. In our example, use the value *nl* for Dutch.
- Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code
6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

### DITA WebHelp Classic with Feedback or WebHelp Responsive with Feedback

1. Create the following directory:

```
DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates
\nl
```

2. Copy all English template files from `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en` and paste them into the directory you just created.
  3. Edit the HTML files from the `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl` directory and translate the content into Dutch.
  4. Start Oxygen XML Editor and edit the **DITA Map WebHelp Classic with Feedback** or **DITA Map WebHelp Responsive with Feedback** transformation scenario.
  5. In the **Parameters** tab, look for the `args.default.language` parameter and set its value to the appropriate language code. In our example, use the value *nl* for Dutch.
- Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code
6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

### Localizing the Interface of WebHelp Output (for DITA Map Transformations)

Static labels that are used in the WebHelp output are kept in translation files in the `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.

3. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the *integrator* is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. Make sure that the new XML file that you created in the previous two steps is listed in the file `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the `args.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

#### Related information

[Searching Japanese Content in WebHelp Pages](#) on page 857

#### Searching Japanese Content in WebHelp Pages

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor installation kit.

#### Activating Japanese Indexing in DITA WebHelp Systems

To activate the Japanese indexing in your WebHelp system generated from DITA content, follow these steps:

1. Set the language for your content to Japanese with one of the following two methods:
  - Edit a **DITA to WebHelp** transformation scenario and in the [Parameters tab](#), set the value of the `args.default.language` parameter to `ja-jp`.
  - Set the `xml:lang` attribute on the root of the DITA map and the referenced topics to `ja-jp`.
2. For the analyzer to work properly, search terms that are entered into the WebHelp search text field must be separated by spaces.
3. Run the **DITA to WebHelp** transformation scenario to generate the output.

Optionally a Japanese user dictionary can be set with the [webhelp.search.japanese.dictionary parameter](#).

#### Activating Japanese Indexing in DocBook WebHelp Systems

To activate the Japanese indexing in your WebHelp system generated from DocBook content, follow these steps:

1. Edit a **DocBook to WebHelp** transformation scenario and in the [Parameters tab](#), set the value of the `110n.gentext.default.language` parameter to `ja`.
2. Run the transformation scenario to generate the output.

[Localizing the Interface of WebHelp Output \(for DocBook Transformations\)](#) on page 888

#### Overriding the XSLT Processing Step of a DITA WebHelp Transformation

There are several methods that you can use to customize your WebHelp output. Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the **DITA Map WebHelp** transformation scenarios), one possibility would be to override the default XSLT templates that are used for WebHelp transformations by using some extension points.

#### XSLT-Import Extension Points

You can customize your WebHelp output by overriding the default XSLT templates that are used for each type of WebHelp transformation. This can be done by creating a DITA extension plugin that specifies one of the following extension points:

### **com.oxygenxml.webhelp.xsl.dita2webhelp**

You can use this extension point to override a template of the XSLT stylesheet (`dita2webhelpImpl.xsl`) that produces an HTML file for each DITA topic. Depending on the type of WebHelp transformation you are currently using, the path to this stylesheet is as follows:

- **WebHelp Classic Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\dita2webhelpImpl.xsl`
- **WebHelp Classic Mobile Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\mobile\dita2webhelpImpl.xsl`
- **WebHelp Responsive Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\dita2webhelpImpl.xsl`

### **com.oxygenxml.webhelp.xsl.createMainFiles**

You can use this extension point to override a template of the XSLT stylesheet (`createMainFilesImpl.xsl`) that produces the WebHelp main HTML page. Depending on the type of WebHelp transformation you are currently using, the path to this stylesheet is as follows:

- **WebHelp Classic Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\createMainFilesImpl.xsl`
- **WebHelp Classic Mobile Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\mobile\createMainFilesImpl.xsl`
- **WebHelp Responsive Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\createMainFilesImpl.xsl`

**Attention:** The customizations you made by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain plugin, please use the [Overriding the XSLT Stylesheet from a Customized ANT Build File](#) method.

## XSLT-Parameter Extension Points

In case your customization stylesheet declares one or more XSLT parameters and you want to control their value from the transformation scenario, you can use one of the following XSLT parameter extension points:

### **com.oxygenxml.webhelp.xsl.dita2webhelp.param**

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.dita2webhelp extension point](#).

### **com.oxygenxml.webhelp.xsl.createMainFiles.param**

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.createMainFiles extension point](#).

## Overriding the XSLT Stylesheet from a Customized Ant Build File

This method is useful if you want to create a customization that is only available for a certain DITA-OT extension plugin. This method implies that you create a DITA-OT plugin that defines a custom `transtype`. From the Ant target associated with the plugin `transtype`, you will specify a custom XSLT stylesheet. This customized XSLT stylesheet will import the original WebHelp stylesheet and will also add some customization templates.

If you want to use this method, you need to create a DITA-OT extension plugin, as in the following sample procedure for customizing WebHelp Responsive output:

1. In the `DITA_OT_DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies a new DITA-OT `transtype` and the build file associated with the plugin. For example:

```
<plugin id="com.oxygenxml.webhelp.responsive.customization">
 <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
 <transtype name="webhelp-responsive-custom" extends="webhelp-responsive"
 desc="WebHelp Responsive Customization"/>
</plugin>
```

3. Create the **integrator.xml** file that will import the actual plugin Ant build file.

```
<project basedir=". " name="Webhelp Responsive Customization">
 <import file="build.xml"/>
</project>
```

4. Create the **build.xml** file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files. The following two Ant properties can be overridden to specify your customization stylesheets:

#### **args.wh.xsl**

Override this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic.

#### **args.create.main.files.xsl**

Override this property if you want to customize the XSLT stylesheet used to produce the main HTML file.

For customizing the WebHelp Responsive, the build file should look like:

```
<project basedir=". " name="Webhelp Responsive Customization">
 <target name="dita2webhelp-custom">
 <!--
 Override this property if you want to customize the XSLT stylesheet
 used to produce an HTML file for each topic
 -->
 <property
 name="args.wh.xsl"
 value="${dita.plugin.com.oxygenxml.webhelp.responsive.custom.dir}
 /xsl/dita2webhelpCustom.xsl"/>
 <!--
 Override this property if you want to customize the XSLT stylesheet
 used to produce the main HTML file.
 -->
 <property
 name="args.create.main.files.xsl"
 value="${dita.plugin.com.oxygenxml.webhelp.responsive.custom.dir}
 /xsl/createMainFilesCustom.xsl"/>
 <!--
 Depending on which version of WebHelp you want to customize,
 you need to delegate to different build targets:
 * dita2webhelp-responsive - when you are customizing the Webhelp Responsive
 * dita2webhelp-mobile - when you are customizing the Webhelp Mobile
 * dita2webhelp - when you are customizing the Webhelp Classic
 -->
 <antcall target="dita2webhelp-responsive"/>
 </target>
</project>
```

**Note:** Depending on which version of WebHelp you want to customize, you need to specify one of the following build targets:

- **dita2webhelp-responsive** - To customize WebHelp Responsive (with or without feedback) output.
- **dita2webhelp-mobile** - To customize WebHelp Classic Mobile output.
- **dita2webhelp** - To customize WebHelp Classic (with or without feedback) output.

5. Create an **xsl** directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.

#### **Customizing the XSLT Stylesheet to Produce an HTML File for Each Topic**

If you want to produce an HTML file for each topic (defined with the **args.wh.xsl** property), create a **dita2webhelpCustom.xsl** stylesheet and save it in the newly created **xsl** directory. This stylesheet will import the original stylesheet and will contain the customization templates. It should look like:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
 exclude-result-prefixes="xs math"
 version="2.0">
 <!--
 Import the original stylesheet used to produce an HTML file for each topic.
 -->
 <xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/
 dita/responsive/dita2webhelp.xsl"/>
 <!--
 Please add your customization templates here.
 -->
</xsl:stylesheet>
```

Depending on which version of WebHelp you want to customize, you need to import one of the following XSLT stylesheets:

- **dita2webhelp-responsive** (WebHelp Responsive) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
responsive/dita2webhelp.xsl"/>
```

- **dita2webhelp-mobile** (WebHelp Classic Mobile) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/mobile/
dita2webhelp.xsl"/>
```

- **dita2webhelp** (WebHelp Classic) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/desktop/
dita2webhelp.xsl"/>
```

### Customizing the XSLT Stylesheet to Produce the Main HTML File

If you just want to produce a main HTML file (defined with the **args.create.main.files.xsl** property), you need to create a **createMainFilesCustom.xsl** stylesheet and save it in the newly created **xsl** directory. This stylesheet will import the original stylesheet and will contain the customization templates. It should look like:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
 exclude-result-prefixes="xs math"
 version="2.0">
 <!--
 Import the original stylesheet used to produce the main HTML file.
 -->
 <xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
 responsive/createMainFiles.xsl"/>
 <!--
 Please add your customization templates here.
 -->
</xsl:stylesheet>
```

Depending on which version of WebHelp you want to customize, you need to import one of the following XSLT stylesheets:

- **dita2webhelp-responsive** (WebHelp Responsive) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
responsive/createMainFiles.xsl"/>
```

- **dita2webhelp-mobile** (WebHelp Classic Mobile) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/mobile/
createMainFiles.xsl"/>
```

- **dita2webhelp** (WebHelp Classic) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/desktop/
createMainFiles.xsl"/>
```

### Related information

[\[DITA-OT 2.3\] XSLT-Import Extension Points](#)

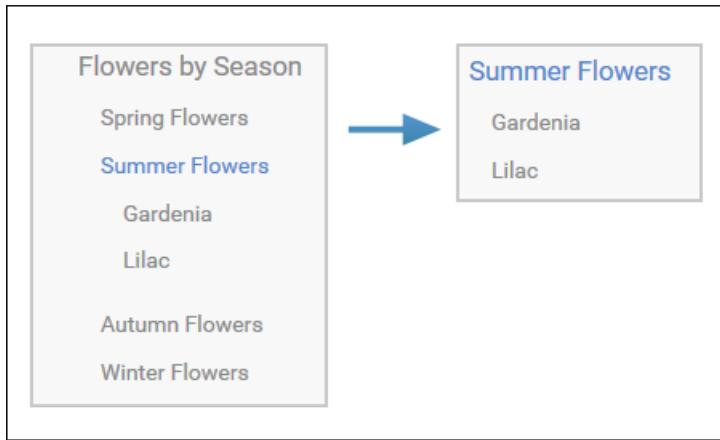

[\[DITA-OT 2.3\] XSLT-Parameter Extension Points](#)

*Changing the Topics Displayed in the WebHelp Responsive Side TOC*

A specific use-case for customizing your WebHelp Responsive output by overriding the default XSLT templates is if you want to change how the topics are displayed in the side table of contents. The default transformation generates a mini table of contents for the current topic and it contains links to the children of current topic, its siblings, and all of its ancestors.

### Use-Case 1: Customizing the Side TOC Using a WebHelp XSLT-Import Extension Point

Suppose you want to customize this mini table of contents to only include the current topic and its child topics (while excluding its siblings and ancestors).

**Figure 460: Example: Filtered Side Table of Contents**

The default XSLT template responsible for this functionality is defined in: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\navigationLinks.xsl`.

```

<xsl:template
 match="
 toc:topic
 [not(@toc = 'no')]
 [not(@processing-role = 'resource-only'))]"
 mode="toc-pull" priority="10">

```

This template computes the link for the current topic along with the links for the sibling topics, and then propagates them recursively to the parent topic. For the specific use-case described above, you need to override this template so that it will produce the link for the current topic along with just the child links that the template already receives.

To add this functionality without modifying the sources of the WebHelp plugin, you can implement an external DITA-OT plugin that uses the `com.oxygenxml.webhelp.xsl.dita2webhelp extension point`. This extension point allows you to specify a customization stylesheet that will override the template described above.

### How to Use a DITA-OT Plugin to Customize the Side TOC

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA_OT_DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.custom.sidetoc`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```

<plugin id="com.oxygenxml.webhelp.custom.sidetoc">
 <feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp"
 file="custom_side_TOC.xsl"/>
</plugin>

```

3. Create your customization stylesheet (for example, `custom_side_TOC.xsl`), and edit it to override the template that produces the side TOC:

```

<xsl:template
 match="
 toc:topic
 [not(@toc = 'no')]
 [not(@processing-role = 'resource-only'))]"
 mode="toc-pull"
 priority="10">

 <xsl:param name="pathFromMaplist" as="xs:string"/>
 <xsl:param name="children" select="()" as="element()*"/>
 <xsl:param name="parent" select="parent::*" as="element()?" />

 <xsl:apply-templates select=". " mode="sideTocEntry">
 <xsl:with-param name="pathFromMaplist" select="$pathFromMaplist"/>
 <xsl:with-param name="children" select="$children"/>
 </xsl:apply-templates>
</xsl:template>

```

4. Run the **Run DITA OT Integrator** transformation scenario.

- Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.

### **Use-Case 2: Customizing the Side TOC Dynamically with a WebHelp XSLT-Parameter Extension Point**

Another use-case might be if you want to control what is displayed in the side table of contents more dynamically, meaning that you can declare XSLT parameters in your customization stylesheet and control the parameter values from the transformation scenario. For this use-case, you can use the [com.oxygenxml.webhelp.xsl.dita2webhelp.param extension point](#).

Suppose that you want to add a parameter to control whether the side TOC will only contain the current topic along with its children or if it will contain all the topics in the default form (with the current, sibling, child, and parent topics all displayed).

#### **How to Customize the Side TOC Dynamically by Using Parameters**

To add this functionality, follow these steps:

- Create a DITA-OT plugin structure by following the first 3 steps in the [procedure above](#).
- In the customization stylesheet that you created in step 3, declare the `side_toc_only_children` parameter and modify the template to match the topic only when the `side_toc_only_children` parameter is set to yes:

```
<xsl:param name="side_toc_only_children" select="'yes'"/>
...
<xsl:template
 match=
 toc:topic
 [not(@toc = 'no')]
 [not(@processing-role = 'resource-only')]
 [$side_toc_only_children = 'yes']"
```

- Edit the **plugin.xml** file to specify the [com.oxygenxml.webhelp.xsl.dita2webhelp.param](#) extension point and a custom parameter file by adding the following line:

```
<feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp.param"
 file="custom_params.xsl"/>
```

- Create a custom parameter file (for example, **custom\_params.xml**). It should look like this:

```
<dummy>
 <param name="side_toc_only_children" expression="${side_toc_only_children}"
 if="side_toc_only_children"/>
</dummy>
```

- Run the **Run DITA OT Integrator** transformation scenario.
- Edit a **DITA Map WebHelp Responsive** transformation scenario and in the **Parameters** tab, specify the desired value (yes or no) for your custom parameter (`side_toc_only_children`).
- Run the transformation scenario.

#### **Search Engine Optimization for DITA WebHelp**

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A `sitemap` lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
 <url>
 <loc>http://www.example.com/topics/introduction.html</loc>
 <lastmod>2014-10-24</lastmod>
 <changefreq>weekly</changefreq>
 <priority>0.5</priority>
 </url>
 <url>
 <loc>http://www.example.com/topics/care.html#care</loc>
 <lastmod>2014-10-24</lastmod>
 <changefreq>weekly</changefreq>
 <priority>0.5</priority>
 </url>
 ...
</urlset>
```

Each page has a <url> element structure containing additional information, such as:

- loc - the URL of the page. This URL must begin with the protocol (such as http), if required by your web server. It is constructed from the value of the webhelp.sitemap.base.url parameter from the transformation scenario and the relative path to the page (collected from the href attribute of a topicref element in the DITA map).

**Note:** The value must have fewer than 2,048 characters.

- lastmod - the date when the page was last modified. The date format is YYYY-MM-DD.
- changefreq - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.change.frequency parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

**Note:** The value always should be used to describe documents that change each time they are accessed. The value never should be used to describe archived URLs.

- priority - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.priority parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

**Note:** lastmod, changefreq, and priority are optional elements.

### **Creating and Editing the sitemap.xml File**

Follow these steps to produce a sitemap.xml file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
  - webhelp.sitemap.base.url - the URL of the location where your WebHelp system is deployed
  - **Note:** This parameter is required for Oxygen XML Editor to generate the sitemap.xml file.
  - webhelp.sitemap.change.frequency - how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never)
  - webhelp.sitemap.priority - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the sitemap.xml file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

### **Support for Right-to-Left (RTL) Oriented Languages for DITA WebHelp**

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map and set the xml:lang attribute on its root element (map). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

### **WebHelp Responsive Runtime Additional Parameters**

A deployed WebHelp Responsive system can accept the following GET parameters:

- contextId - The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.

- Note:** You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.
- `appname` - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding *appname attribute value* in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
• searchQuery - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for growing flowers, the URL should look like this: http://localhost/webhelp/index.html?searchQuery=growing%20flowers.
```

## Related information

[Context-Sensitive WebHelp Responsive System](#) on page 864

### Context-Sensitive WebHelp Responsive System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

### Generating Context-Sensitive Help

When WebHelp Responsive output is generated by Oxygen XML Editor, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
 <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
 <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
</map>
```

The possible attributes are as follows:

#### helpID

A Unique ID provided by a topic from two possible sources (`resourceid` element or `id` attribute):

#### resourceid

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a DITA map or in a prolog within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an **appid** attribute is used.

**Note:** Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

#### Example: `resourceid` Specified in a DITA Map

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```
<map title="App Help">
 <topicref href="app-help1.dita" type="task">
 <topicmeta>
 <resourceid appname="myapp" appid="functionid1"/>
 <resourceid appname="myapp" appid="functionid2"/>
 </topicmeta>
 </topicref>
```

```
</map>
```

### **Example: resourceId Specified in a DITA Topic**

The resourceId element can be specified in a prolog element within a DITA topic.

```
<task id="app-help1">
 <title>My App Help</title>
 <prolog>
 <resourceid appname="myapp" appid="functionid1"/>
 <resourceid appname="myapp" appid="functionid2"/>
 </prolog>
 ...
</task>
```

For more information about the resourceId element, see [DITA Specifications: <resourceid>](#).

#### **id**

If a resourceId element is not declared in the DITA map or DITA topic (as described above), the id attribute that is set on the topic root element is mapped into the appContext element.

**Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

#### **path**

The path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.

#### **productID (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)**

The ID of the product for your documentation project.

#### **productVersion (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)**

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.
- Invoke the index.html WebHelp system file and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.

```
index.html?contextId=myDITATopic
```

### **Context-Sensitive Queries**

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- contextId - The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.

**Note:** You can use an anchor in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

- appname - You can use this parameter in conjunction with contextId to search for this value in the corresponding [appname attribute value](#) in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
```

#### **Related information**

[WebHelp Responsive Runtime Additional Parameters](#) on page 863

## Publishing WebHelp Responsive Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

To publish WebHelp Responsive output on a SharePoint site, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: <https://support.microsoft.com/en-us/kb/2616712>.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx. Fortunately, this can be done in the transformation scenario.
  - a. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
  - b. Set the args.outext parameter to .aspx.
  - c. Run the transformation scenario.

## WebHelp Classic System

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Editor WebHelp system includes several variants to suit your specific needs. The *WebHelp Classic* variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook and DITA document types.

### Layout of the WebHelp Classic System Interface

The layout of the *WebHelp Classic* system is comprised of the following components:

#### Left Pane or Frame

This section on the left side of the help system includes the following tabs:

##### Content

A typical table of contents style presentation of your content. You can use the Expand all/ Collapse all buttons to expand or collapse all the topics presented in the Table of Contents.

**Note:** You can enhance the appearance of items in the *Table of Contents*. See the [Customizing WebHelp Classic Systems chapter](#) for more details.

##### Index

Presents the index terms for your content. If your content does not contain any `indexterm` elements, this tab is not generated.

##### Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the [Search Feature section](#).

#### Upper Pane or Frame

The upper section of the help system includes the following features:

##### Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the [Search Feature section](#).

##### Frames Option

Click on this option to display the output rendered in HTML frames.

##### Print Option

Opens a dialog box with various printing options and a print preview.

## Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the [Parent topic](#), [Previous topic](#), or [Next topic](#). Links to the parent topics of the currently opened topic are also presented at the top of the page.

**Note:** You can edit the `args.hide.parent.link` parameter to hide the Parent, Next, and Previous links.

## Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

The screenshot shows a web-based help system interface. At the top, there's a search bar and some navigation icons. Below the header, a breadcrumb trail shows 'Flowers by Season / Spring Flowers'. To the right of the breadcrumb are links for 'Parent topic', 'Previous topic', and 'Next topic'. On the far left is a sidebar with a tree map of the site's contents. The 'Snowdrop' node is highlighted in blue. The main content area has a large heading 'Snowdrop'. Below it is a snippet from Wikipedia. A photograph of two white snowdrop flowers is shown. A detailed paragraph describes the plant. At the bottom of the main content, there's a 'Related information' section with a link to 'Iris'. The footer of the page includes the text 'WebHelp output generated by <Oxygen/> XML Author'.

Figure 461: WebHelp Classic Output

## Search Feature

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section, along with a rating scheme for each result. When you click on a result in the **Search Results** tab, the search terms are highlighted in the main pane. If you click **Enter** with the **Search** field empty, the highlights are removed.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search phrase is included in a meta keyword
  - The search phrase is in the title of the page

- The search phrase is in bold text in a paragraph
- The search phrase is in normal text in a paragraph

**Growing Flowers**

**Snowdrop**  
*From Wikipedia, the free encyclopedia.*  
Snowdrop is the common name for members of the **genus Galanthus**, a small genus of about 20 **species** in the family **Amaryllidaceae**; snowdrops are among the first **bulbs** to bloom in spring, although certain **species** flower in late autumn and winter.  

**Galanthus nivalis** is the best-known and most widespread representative of the genus **Galanthus**. It is native to a large area of Europe, stretching from the Pyrenees in the west, through France and Germany to Poland in the north, Italy, Northern Greece and European Turkey. It has been introduced and is widely naturalised elsewhere. Although it is often thought of as a British native wild flower, or to have been brought to the British Isles by the Romans, it was probably introduced around the early sixteenth century.

All **species** of **Galanthus** are **perennial**, herbaceous plants which grow from bulbs. The flower has no petals: it consists of six tepals, the outer three being larger and more convex than the inner series. An important feature which helps to distinguish between **species** (and to help to determine the parentage of hybrids) is their "vernation" (the arrangement of the emerging leaves relative to each other). This can be "applanate", "supervolute" or "explicative". In **applanate** **vernation** the two leaf blades are pressed flat to each other within the bud and as they emerge; **explicative** leaves are also pressed flat against each other, but the edges of the leaves are folded back or sometimes rolled; in **supervolute** plants one leaf is tightly clasped around the other within the bud and generally remains at the point where the leaves emerge from the soil.

WebHelp output generated by  XML Author

**Figure 462: WebHelp Classic Search Mechanism**

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "*grow flowers*", returns no results since it searches for two separate words).
- **indexterm** and **keywords** DITA elements are an effective way to increase the ranking of a page (for example, content inside **keywords** elements weighs twice as much as content inside an **H1** HTML element).
- Words composed by merging two or more words with colon (:), minus (-), underline (\_), or dot (.) characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 851.

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

**Important:** Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

 **Warning:** Due to some restrictions in web browsers in regards to JavaScript code, the `frameless` version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the `frameset` version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file:///...`).

## WebHelp Classic with Feedback System

*WebHelp* is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and a feedback mechanism that allows your authors and audience to interact with one another through comments. The Oxygen XML Editor WebHelp system includes several variants to suit your specific needs. The *WebHelp Classic with Feedback* variant is designed for desktop systems, includes a feedback system that allows your users to make comments and allows you to manage and reply to them, and it is available for DocBook and DITA document types.

### Layout

The layout of the *WebHelp Classic with Feedback* system is comprised of the following components:

#### Left Pane or Frame

This section on the left side of the help system includes the following tabs:

##### Content

A typical table of contents style presentation of your content. You can use the  **Expand all**/ **Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.

**Note:** You can enhance the appearance of items in the *Table of Contents*. See the [Customizing WebHelp Classic Systems chapter](#) for more details.

##### Index

Presents the index terms for your content. If your content does not contain any `indexterm` elements, this tab is not generated.

##### Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the [Search Feature section](#).

#### Upper Pane or Frame

The upper section of the help system includes the following features:

## Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the [Search Feature section](#).

## Frames Option

Click on this option to display the output rendered in HTML frames.

## Print Option

Opens a dialog box with various printing options and a print preview.

## Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the **Parent topic**, **Previous topic**, or **Next topic**. Links to the parent topics of the currently opened topic are also presented at the top of the page.

**Note:** You can edit the args.hide.parent.link parameter to hide the **Parent**, **Next**, and **Previous** links.

## Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

## Feedback Section

The *WebHelp Classic with Feedback* system contains a **Comments** bar at the bottom of the main pane. This section is where you can interact with users through a comment system.

The screenshot shows a web-based help system interface. At the top, there's a header with a search bar, a 'Frames' icon, and a 'Print' icon. Below the header, a breadcrumb trail reads 'Flowers by Season > Spring Flowers'. On the left, a sidebar menu lists categories like 'Introduction', 'Care and Preparation', 'Flowers by Season' (which is expanded to show 'Spring Flowers', 'Iris', 'Snowdrop', 'Summer Flowers', 'Gardenia', 'Lilac', 'Autumn Flowers', 'Winter Flowers', 'Glossary', and 'Copyright'). The main content area is titled 'Spring Flowers'. It contains a paragraph about spring time and flowering plants, followed by a numbered list: '1. Iris' and '2. Snowdrop'. At the bottom of the main content area, it says 'WebHelp output generated by coOxygen XML Author'. Below this, there's a 'Comments' section with a heading '2 Comments'. It shows two comments: one from 'heath' dated 2015-10-30 11:39:50 stating 'I'm not sure where to look for what I need.' with a 'Reply' link, and one from 'Mihaela' dated 2015-11-02 01:58:04 with a link 'Here are the details'.

Figure 463: WebHelp Classic with Feedback System

## Managing Comments

To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user

name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

**Note:** The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see [Managing Users and Comments in a Feedback-Enabled WebHelp System](#) on page 828.

## Search Feature

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section, along with a rating scheme for each result. When you click on a result in the **Search Results** tab, the search terms are highlighted in the main pane. If you click **Enter** with the **Search** field empty, the highlights are removed.

The **Search** feature is also enhanced with a rating mechanism that computes scores for every page that matches the search criteria. These scores are then translated into a 5-star rating scheme. The search results are sorted depending on the following:

- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search phrase is included in a meta keyword
  - The search phrase is in the title of the page
  - The search phrase is in bold text in a paragraph
  - The search phrase is in normal text in a paragraph

## Lilac

From Wikipedia, the free encyclopedia. *Lilac* (*Syringa*) is a genus of about 20–25 species of flowering plants in the olive family (Oleaceae), native to Europe and Asia. They are deciduous shrubs or...

## Snowdrop

From Wikipedia, the free encyclopedia.

Snowdrop is the common name for members of the **genus Galanthus**, a small genus of about 20 **species** in the family **Amaryllidaceae**; snowdrops are among the first **bulbs** to bloom in spring, although certain **species** flower in late autumn and winter.

**Galanthus nivalis** is the best-known and most widespread representative of the genus **Galanthus**. It is native to a large area of Europe, stretching from the Pyrenees in the west, through France and Germany to Poland in the north, Italy, Northern Greece and European Turkey. It has been introduced and is widely naturalised elsewhere. Although it is often thought of as a British native wild flower, or to have been brought to the British Isles by the Romans, it was probably introduced around the early sixteenth century.

All **species** of **Galanthus** are **perennial**, herbaceous plants which grow from bulbs. The flower has no petals: it consists of six tepals, the outer three being larger and more convex than the inner series. An important feature which helps to distinguish between **species** (and to help to determine the parentage of hybrids) is their "vernation" (the arrangement of the emerging leaves relative to each other). This can be "applanate", "supervolute" or "explicative". In **applanate** **vernation** the two leaf blades are pressed flat to each other within the bud and as they emerge; **explicative** leaves are also pressed flat against each other, but the edges of the leaves are folded back or sometimes rolled; in **supervolute** plants one leaf is tightly clasped around the other within the bud and generally remains at the point where the leaves emerge from the soil.

**Figure 464: WebHelp Classic Search Mechanism**

Rules that are applied during a search include:

- Boolean searches are supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- Do not use quotes to perform an exact search for multiple word expressions (an expression such as "*grow flowers*", returns no results since it searches for two separate words).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside `keywords` elements weighs twice as much as content inside an `H1` HTML element).
- Words composed by merging two or more words with colon (:), minus (-), underline (\_), or dot (.) characters count as a single word.
- Always search for words containing three or more characters (shorter words, such as *to* or *of* are ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [Editing Scoring Values of Tag Elements in Search Results](#) on page 851.

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 8 or newer)
- Chrome
- Firefox
- Safari
- Opera

**Important:** Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web\_pages/index.html).

## Deploying a Feedback-Enabled WebHelp System

### System Requirements

The feedback-enabled WebHelp system of Oxygen XML Editor requires a standard server deployment. You can request this from your server admin and it needs the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

Oxygen XML WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

### Create WebHelp with Feedback Database

The *WebHelp with Feedback* system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

For example, the following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

### Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the *WebHelp with Feedback* output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT\_ROOT*) of your server.
3. Copy the transformation output folder into the *DOCUMENT\_ROOT* folder.

4. Rename it to something relevant (for example, myProductWebHelp).
5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/`). You are redirected to the installation wizard. Proceed with the installation as follows:
  - a. Verify that the prerequisites are met.
  - b. Press **Start Installation**.
  - c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

**Tip:** You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.

- d. Configure the **MySQL Database Connection Settings** section. Use the information (database name, username, password) from the [Create WebHelp with Feedback Database section](#) to fill-in the appropriate text boxes.

 **Warning:** Checking the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the *WebHelp with Feedback* system, but you do not want to select this option on subsequent deployments.

- e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, check the **Enable LDAP Authentication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
- f. If the **Create new database structure** option is checked, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple *WebHelp with Feedback* deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, enable the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

**Note:** You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

- g. Press **Next Step**.
- h. Remove the installation folder from your web server.

**Important:** When you publish subsequent iterations of your *WebHelp with Feedback* system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

- i. In your Web browser, go to your *WebHelp with Feedback* system main page.

## Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

**Note:** To read debug messages generated by the system:

1. Enable JavaScript logging by doing one of the following:
  - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
  - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

## Documentation Product ID and Version

When you run a *WebHelp with Feedback* transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on

the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

**Note:** The *WebHelp with Feedback* installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

### Related information

[Managing Users and Comments in a Feedback-Enabled WebHelp System](#) on page 828

### Refreshing the Content of a Feedback-Enabled WebHelp System

It is common to update the content of an existing installation of a *WebHelp with Feedback* system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the \feedback \resources\php\config\config.php file, and delete it.
3. Locate the \feedback\install directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp with Feedback* system installation directory, overwriting the existing content.

### Managing Users and Comments in a Feedback-Enabled WebHelp System

When you installed the *WebHelp with Feedback* system the first time (assuming the **Create new database structure option** was enabled), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

The screenshot shows the 'oxy-webhelp 1.0 - Administrative Page'. At the top, there are buttons for 'Delete Orphan Comments', 'Delete Pending Users', 'View All Posts', 'Export Comments', and 'Set Version'. Below these is a search bar labeled 'Search User Information'. A table lists users with columns: User Name, Name, Level, Company, E-Mail, Date, WebHelp Notification, Reply Notification, Page Notification, Status, and admin.user.type. Two users are listed: 'admin' and 'user'.

User Name	Name	Level	Company	E-Mail	Date	WebHelp Notification	Reply Notification	Page Notification	Status	admin.user.type
admin	Administrator	admin	NA	admin@sync.ro	2015-08-04 08:56:55	yes	no	no	validated	Local User
user	user	user	noCompany	user@sync.ro	2015-08-04 08:57:46	no	yes	yes	validated	Local User

**Figure 465: Administrative Page**

3. Use this page to manage the following options:

#### Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

#### Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

#### View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

## **Export Comments**

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

## **Set Version**

Use this action to display comments starting with a particular version.

## **Manage User Information**

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

### **Name**

The full name of the user.

### **Level**

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

### **Company**

The name of the organization associated with the user.

### **E-Mail**

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

### **WebHelp Notification**

When enabled, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

### **Reply Notification**

When enabled, the user receives notifications when comments are posted as a reply to one of their comments.

### **Page Notification**

When enabled, the user receives notifications when comments are posted on a topic where they previously posted a comment.

### **Date**

The date the user registered is displayed.

### **Status**

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

**Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

## **Customizing WebHelp Classic Systems**

To change the overall appearance of the WebHelp output, you can use the visual [WebHelp Skin Builder tool](#), which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp

output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

### Copying Additional Resources to WebHelp Output Directory

To copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system, follow these steps:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value for the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
5. Click **OK** to save the changes to the transformation scenario.

All files from the new directory will be copied to the root of the WebHelp output directory.

### Adding Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation scenario. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

To include custom HTML content in the WebHelp Classic output files, follow these steps:

1. Insert the HTML content in a well-formed XML file. There are several things to consider in regards to this XML file:
  - a. **Well-Formedness** - If the file is not a [Well-formed XML document](#) (or fragments are not well-formed), the transformation will fail.  
A common use case is if you want to include several script or link elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.
  - b. **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the predefined \${oxygen-webhelp-output-dir} macro to specify their paths relative to the output directory:

```
<html>
 <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
 <link rel="stylesheet" type="text/css"
 href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: [Copying Additional Resources to WebHelp Output Directory](#) on page 845.

- c. **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

JavaScript:

```
<script type="text/javascript">
 <!--
 /* Include JavaScript code here. */
 function myFunction() {
 return true;
 }
 -->
</script>
```

CSS:

```
<style>
```

```

<!--
/* Include CSS style rules here. */

{
 color:red
}
-->
</style>

```

2. Edit the WebHelp Classic transformation scenario.
  3. Go to the **Parameters** tab.
  4. Edit the value of the webhelp.head.script parameter and set it to the URL of the XML file created in step 1. Your additional content will be included at the end of the head element of your output document.
- Note:** If you want to include the content in the body element, use the webhelp.body.script parameter instead.
5. Click **OK** to save the changes to the transformation scenario.

#### Related tasks

[Copying Additional Resources to WebHelp Output Directory](#) on page 845

### Adding a Button in Code Snippet Areas in DITA WebHelp Classic Output

This task will get you started with how to add an action (such as a button or link) in the code snippet areas that are displayed in WebHelp Classic output created from a DITA Map transformation. You can then attach your code that does the actual processing for the action.

Follow these steps:

1. Open the *DITA\_OT\_DIR\plugins\org.dita.xhtml\xsl\xslhtml\dita2htmlImpl.xsl* file.
2. Locate the `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to check the default behavior of this template.
3. Open the *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\fixup.xsl* file.
4. Create a `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to override the default processing.
5. This new template will include your code for creating the button. It will have the action code that does the actual processing attached to it (this can be written in JavaScript, for example).

Example of a *Select all* button:

```

<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">
 <button onclick="SelectText(element)">Select all</button>
 <script>
 function SelectText(element) {
 var text = document.getElementById(element);
 var range = document.body.createTextRange();
 range.moveToElementText(text);
 range.select();
 }
 </script>
</xsl:template>

```

### Adding a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp system by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp systems using **WebHelp Responsive**, **WebHelp Responsive with Feedback**, **WebHelp Classic**, **WebHelp Classic with Feedback**, or **WebHelp Classic Mobile** transformation scenarios.

To add a *favicon*, follow these steps:

1. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the *favicon*.
3. Run the transformation scenario.

### Adding a Logo Image in the Title Area

To add a logo in the title area of your WebHelp output, follow this procedure:

1. Edit a WebHelp transformation scenario, then open the **Parameters** tab.

- Specify the path to your logo in the `webhelp.logo.image` parameter.
- If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
- Run the transformation scenario.

### Adding Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

#### Adding Videos to DITA WebHelp Output

- Edit the DITA topic and insert a reference to the video by using the  **Insert Media Object toolbar action** or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
```

or, instead of the `data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
 <param name="src" value="videos/MyVideo.mp4" />
</object>
```

- Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the `object` element to an HTML5 video element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

#### Adding Audio Clips to DITA WebHelp Output

- Edit the DITA topic and insert a reference to the audio clip by using the  **Insert Media Object toolbar action** or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the `data` attribute, you can specify the audio clip using a parameter like this:

```
<object outputclass="audio">
 <param name="src" value="audio/MyClip.mp3" />
</object>
```

- Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the `object` element to an HTML5 audio element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

#### Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

- Edit the DITA topic and insert a reference to the embedded object by using the  **Insert Media Object toolbar action** or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the `data` attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
 <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4" />
</object>
```

- Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the object element to an HTML5 iframe element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

## Related information

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics](#) on page 1575

## Adding Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the WebHelp Classic output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an mediaobject element, as in the following example:

```
<mediaobject>
 <videoobject>
 <videodata fileref="http://www.youtube.com/watch/v/VideoName" />
 </videoobject>
</mediaobject>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

## Change Numbering Styles for Ordered Lists

Ordered lists (ol) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom outputclass value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
 A
 B
 C

```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
 list-style-type:lower-alpha;
}
```

3. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.

- a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
4. Run the transformation scenario.

## Changing the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, the icons for the WebHelp Classic table of contents are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
 background: url('../img/book_closed16.png') no-repeat;
 padding-left: 16px;
 cursor: pointer;
}

.hasSubMenuOpened{
 background: url('../img/book_opened16.png') no-repeat;
 padding-left: 16px;
 cursor: pointer;
}
```

To assign other icons, use the following procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
 background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
 background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons.
  - a) For DITA transformations: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\`.
  - b) For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\`.
3. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
  - a) For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b) For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

### CSS Styling to Customize WebHelp Output

One way to customize WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario.

As a practical example, to hide the horizontal separator line between the content and footer, follow these steps:

1. Create a custom CSS file that contains the following snippet:

```
.footer_separator {
 display:none;
}
```

2. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
  - a) For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b) For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the transformation scenario.

### Customize the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory:
  - a) For DITA transformations: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\css`.
  - b) For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\css`.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.

**Note:** You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario (see step 3 in the [Changing the Icons in a WebHelp Classic Table of Contents](#) topic).

### Customizing WebHelp Output with a Custom CSS

By creating your own custom CSS stylesheet, you can customize the look and style of WebHelp output to fit your specific needs.

To use a custom CSS in WebHelp output, follow these steps:

1. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.
  - a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
2. Run the transformation scenario.

### Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
  - For DITA WebHelp systems, edit the following file: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\createMainFiles.xsl`.
  - For DocBook WebHelp system, edit the following file: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\xsl\createMainFiles.xsl`.
2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

**Note:** The code should look like this:

```
<html>
 <head>
 <xsl:if test="$withFrames">
 <base target="contentwin"/>
 </xsl:if>
 <meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
 <!-- Disable caching of WebHelp pages in web browser. -->
 <meta http-equiv="Pragma" content="no-cache" />
 <meta http-equiv="Expires" content="-1" />

```

3. Save your changes to the file.
4. Re-run your WebHelp system transformation scenario.

### Editing Scoring Values of Tag Elements in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Editor includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
  - a) For DITA WebHelp systems, edit the following file: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties`.
  - b) For DocBook WebHelp system, edit the following file: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties`.

The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
```

```
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp system transformation scenario.

### Exclude Certain DITA Topics from WebHelp Search Results

The WebHelp **Search** engine does not index DITA topics that have the @search attribute set to no. This is useful if you have topics in your DITA map structure that you do not want to be included in search results for your WebHelp system.

To exclude DITA topics from WebHelp search results, follow these steps:

1. Edit the DITA map and for any topicref that you want to exclude from search results, set the search attribute to no.

For example:

```
<topicref href="../topics/internal-topic1.dita" search="no"/>
```

2. Save your changes to the DITA map.
3. Re-run your WebHelp system transformation scenario.

### Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as audience-flag-build.ditaval.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the audience attribute set to programmer, the content of the DITAVAL file should look like the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
 <prop att="audience" val="programmer" action="flag"
 img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
4. Run the transformation scenario.

### Integrating Social Media and Google Tools in WebHelp Output

Oxygen XML Editor includes support for integrating some of the most popular social media sites in WebHelp output.

#### *How to Add a Facebook Like Button in WebHelp Classic Output*

To add a Facebook™ Like widget to your WebHelp output, follow these steps:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.  
A dialog box that contains code snippets is displayed.

3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!--
 (function(d, s, id) {
 var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 }(document, 'script', 'facebook-jssdk'));
 -->
 </script>
 <div class="fb-like" data-layout="standard" data-action="like"
 data-show-faces="true" data-share="true"/>
</div>
```

4. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

#### How to Add a Google+ Button in WebHelp Classic Output

To add a Google+ widget to your WebHelp output, follow these steps:

1. Go to the [Google Developers](#) website.
2. Fill-in the displayed form.  
The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`.

Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```
<div id="google-plus">
 <!-- Place this tag in your head or just before your close body tag. -->
 <script src="https://apis.google.com/js/platform.js" async defer></script>

 <!-- Place this tag where you want the +1 button to render. -->
 <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok**.

8. Run the transformation scenario.

*How to Add Tweet Button in WebHelp Classic Output*

To add a Twitter™ Tweet widget to your WebHelp output, follow these steps:

1. Go to the [Tweet button generator](#) page.
2. Fill-in the displayed form.  
The **Preview and code** area displays the code.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`.  
Make sure you follow these rules:
  - The file must be well-formed.
  - The code for each `script` element must be included in an XML comment.
  - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
 Tweet
 <script>
 <!--
 !function (d, s, id) {
 var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
 if (! d.getElementById(id)) {
 js = d.createElement(s);
 js.id = id;
 js.src = p + '//platform.twitter.com/widgets.js';
 fjs.parentNode.insertBefore(js, fjs);
 }
 (document,
 'script', 'twitter-wjs');
 -->
 </script>
 </div>
```

4. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 1085

*How to Integrate Google Analytics in WebHelp Classic Output*

To enable your WebHelp system to benefit from Google Analytics reports, follow these steps:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that fits the needs of your website.
3. Follow the on-screen instructions to obtain a *Tracking Code* that contains your *Tracking ID*.

A *Tracking Code* looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');
```

```

ga('create', 'UA-XXXXXXXX-X', 'auto');
ga('send', 'pageview');

```

4. Save the Tracking Code (obtained in the previous step) in a new HTML file called `googleAnalytics.html`.
5. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click **Ok**.
9. Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 1085

*How to Integrate Google Search in WebHelp Classic Output*

You can integrate Google Search into your WebHelp output.

To enable your WebHelp system to use Google Search, follow these steps:

1. Go to the Google Custom Search Engine page using your Google account.
2. Press the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet.

A Google Search script looks like this:

```

<script>
(function() {
 var cx =
 '000888210889775888983:8mn4x_mf-yg';
 var gcse = document.createElement('script');
 gcse.type = 'text/javascript';
 gcse.async = true;
 gcse.src = (document.location.protocol == 'https:' ?
 'https:' : 'http:') + '//www.google.com/cse/cse.js?cx=' + cx;
 var s = document.getElementsByTagName('script')[0];
 s.parentNode.insertBefore(gcse, s);
})();
</script>

```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
  - a) Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-queryParameterName="searchQuery" >` (you must use the [HTML5 version for the GCSE](#)). It is recommended that you set the `data-linkTarget` attribute value to `frm` for *frameless* versions of the WebHelp system or to `data-contentWin` for *frameset* versions of WebHelp. The default value is `_blank` and if you do not specify a value the search results will be loaded in a new window. For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
  - b) Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.
9. Click **Ok**.

10.Run the transformation scenario.

*Integrating Social Media and Google Tools in WebHelp Output* on page 852

### Localizing the Email Notifications of WebHelp with Feedback Systems

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Suppose that you want to localize the emails into Dutch (*nl*). Follow these steps:

#### DocBook WebHelp Classic with Feedback

1. Create the following directory:

*[OXYGEN\_INSTALL\_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl*

2. Copy all English template files from *[OXYGEN\_INSTALL\_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en* and paste them into the directory you just created.
3. Edit the HTML files from the *[OXYGEN\_INSTALL\_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl* directory and translate the content into Dutch.
4. Start Oxygen XML Editor and edit the **DocBook WebHelp Classic with Feedback** transformation scenario.
5. In the **Parameters** tab, look for the `l10n.gentext.default.language` parameter and set its value to the appropriate language code. In our example, use the value *nl* for Dutch.

**Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

#### DITA WebHelp Classic with Feedback or WebHelp Responsive with Feedback

1. Create the following directory:

*DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl*

2. Copy all English template files from *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\en* and paste them into the directory you just created.
3. Edit the HTML files from the *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\php\templates\nl* directory and translate the content into Dutch.
4. Start Oxygen XML Editor and edit the **DITA Map WebHelp Classic with Feedback or DITA Map WebHelp Responsive with Feedback** transformation scenario.
5. In the **Parameters** tab, look for the `args.default.language` parameter and set its value to the appropriate language code. In our example, use the value *nl* for Dutch.

**Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code

6. Run the transformation scenario to obtain the *WebHelp with Feedback* output.

### Localizing the Interface of WebHelp Output

You can localize the interface of WebHelp output for DITA or DocBook transformations.

#### *Localizing the Interface of WebHelp Output (for DITA Map Transformations)*

Static labels that are used in the WebHelp output are kept in translation files in the *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\localization* folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the *integrator* is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. Make sure that the new XML file that you created in the previous two steps is listed in the file `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the `args.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

#### Related information

[Searching Japanese Content in WebHelp Pages](#) on page 857

*Localizing the Interface of WebHelp Output (for DocBook Transformations)*

Static labels that are used in the WebHelp output are kept in translation files in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback, or the mobile version) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

**Searching Japanese Content in WebHelp Pages**

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor installation kit.

#### Activating Japanese Indexing in DITA WebHelp Systems

To activate the Japanese indexing in your WebHelp system generated from DITA content, follow these steps:

1. Set the language for your content to Japanese with one of the following two methods:

- Edit a **DITA to WebHelp** transformation scenario and in the **Parameters tab**, set the value of the args.default.language parameter to ja-jp.
  - Set the xml:lang attribute on the root of the DITA map and the referenced topics to ja-jp.
2. For the analyzer to work properly, search terms that are entered into the WebHelp search text field must be separated by spaces.
  3. Run the **DITA to WebHelp** transformation scenario to generate the output.

Optionally a Japanese user dictionary can be set with the [\*webhelp.search.japanese.dictionary parameter\*](#).

## Activating Japanese Indexing in DocBook WebHelp Systems

To activate the Japanese indexing in your WebHelp system generated from DocBook content, follow these steps:

1. Edit a **DocBook to WebHelp** transformation scenario and in the **Parameters tab**, set the value of the 110n.gentext.default.language parameter to ja.
2. Run the transformation scenario to generate the output.

### Related tasks

[\*Localizing the Interface of WebHelp Output \(for DITA Map Transformations\)\*](#) on page 856

[\*Localizing the Interface of WebHelp Output \(for DocBook Transformations\)\*](#) on page 888

## Overriding the XSLT Processing Step of a DITA WebHelp Transformation

There are several methods that you can use to customize your WebHelp output. Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the **DITA Map WebHelp** transformation scenarios), one possibility would be to override the default XSLT templates that are used for WebHelp transformations by using some extension points.

### XSLT-Import Extension Points

You can customize your WebHelp output by overriding the default XSLT templates that are used for each type of WebHelp transformation. This can be done by creating a DITA extension plugin that specifies one of the following extension points:

#### com.oxygenxml.webhelp.xsl.dita2webhelp

You can use this extension point to override a template of the XSLT stylesheet (dita2webhelpImpl.xsl) that produces an HTML file for each DITA topic. Depending on the type of WebHelp transformation you are currently using, the path to this stylesheet is as follows:

- **WebHelp Classic Transformations** - *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\dita2webhelpImpl.xsl*
- **WebHelp Classic Mobile Transformations** - *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\mobile\dita2webhelpImpl.xsl*
- **WebHelp Responsive Transformations** - *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\dita2webhelpImpl.xsl*

#### com.oxygenxml.webhelp.xsl.createMainFiles

You can use this extension point to override a template of the XSLT stylesheet (createMainFilesImpl.xsl) that produces the WebHelp main HTML page. Depending on the type of WebHelp transformation you are currently using, the path to this stylesheet is as follows:

- **WebHelp Classic Transformations** - *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\createMainFilesImpl.xsl*
- **WebHelp Classic Mobile Transformations** - *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\mobile\createMainFilesImpl.xsl*
- **WebHelp Responsive Transformations** - *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\createMainFilesImpl.xsl*

**Attention:** The customizations you made by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain plugin, please use the [Overriding the XSLT Stylesheet from a Customized ANT Build File](#) method.

## XSLT-Parameter Extension Points

In case your customization stylesheet declares one or more XSLT parameters and you want to control their value from the transformation scenario, you can use one of the following XSLT parameter extension points:

### **com.oxygenxml.webhelp.xsl.dita2webhelp.param**

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.dita2webhelp extension point](#).

### **com.oxygenxml.webhelp.xsl.createMainFiles.param**

Use this extension point to pass parameters to the stylesheet specified using the [com.oxygenxml.webhelp.xsl.createMainFiles extension point](#).

## Overriding the XSLT Stylesheet from a Customized Ant Build File

This method is useful if you want to create a customization that is only available for a certain DITA-OT extension plugin. This method implies that you create a DITA-OT plugin that defines a custom transtype. From the Ant target associated with the plugin transtype, you will specify a custom XSLT stylesheet. This customized XSLT stylesheet will import the original WebHelp stylesheet and will also add some customization templates.

If you want to use this method, you need to create a DITA-OT extension plugin, as in the following sample procedure for customizing WebHelp Responsive output:

1. In the [DITA\\_OT\\_DIR\plugins\](#) folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies a new DITA-OT transtype and the build file associated with the plugin. For example:

```
<plugin id="com.oxygenxml.webhelp.responsive.customization">
 <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
 <transtype name="webhelp-responsive-custom" extends="webhelp-responsive"
 desc="WebHelp Responsive Customization"/>
</plugin>
```

3. Create the **integrator.xml** file that will import the actual plugin Ant build file.

```
<project basedir=". " name="Webhelp Responsive Customization">
 <import file="build.xml"/>
</project>
```

4. Create the **build.xml** file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files. The following two Ant properties can be overridden to specify your customization stylesheets:

### **args.wh.xsl**

Override this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic.

### **args.create.main.files.xsl**

Override this property if you want to customize the XSLT stylesheet used to produce the main HTML file.

For customizing the WebHelp Responsive, the build file should look like:

```
<project basedir=". " name="Webhelp Responsive Customization">
 <target name="dita2webhelp-custom">
 <!--
 Override this property if you want to customize the XSLT stylesheet
 used to produce an HTML file for each topic
 -->
 <property
 name="args.wh.xsl"
 value="${dita.plugin.com.oxygenxml.webhelp.responsive.custom.dir}
 /xsl/dita2webhelpCustom.xsl"/>
 <!--
 Override this property if you want to customize the XSLT stylesheet
 used to produce the main HTML file.
 -->
 <property
```

```

 name="args.create.main.files.xsl"
 value="${dita.plugin.com.oxygenxml.webhelp.responsive.custom.dir}
 /xsl/createMainFilesCustom.xsl"/>
<!--
 Depending on which version of WebHelp you want to customize,
 you need to delegate to different build targets:
 * dita2webhelp-responsive - when you are customizing the Webhelp Responsive
 * dita2webhelp-mobile - when you are customizing the Webhelp Mobile
 * dita2webhelp - when you are customizing the Webhelp Classic
-->
<antcall target="dita2webhelp-responsive"/>
</target>
</project>

```

**Note:** Depending on which version of WebHelp you want to customize, you need to specify one of the following build targets:

- **dita2webhelp-responsive** - To customize WebHelp Responsive (with or without feedback) output.
- **dita2webhelp-mobile** - To customize WebHelp Classic Mobile output.
- **dita2webhelp** - To customize WebHelp Classic (with or without feedback) output.

5. Create an **xsl** directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.

### Customizing the XSLT Stylesheet to Produce an HTML File for Each Topic

If you want to produce an HTML file for each topic (defined with the **args.wh.xsl** property), create a **dita2webhelpCustom.xsl** stylesheet and save it in the newly created **xsl** directory. This stylesheet will import the original stylesheet and will contain the customization templates. It should look like:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
 exclude-result-prefixes="xs math"
 version="2.0">
 <!--
 Import the original stylesheet used to produce an HTML file for each topic.
 -->
 <xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/
 dita/responsive/dita2webhelp.xsl"/>
 <!--
 Please add your customization templates here.
 -->
</xsl:stylesheet>

```

Depending on which version of WebHelp you want to customize, you need to import one of the following XSLT stylesheets:

- **dita2webhelp-responsive** (WebHelp Responsive) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
 responsive/dita2webhelp.xsl"/>
```

- **dita2webhelp-mobile** (WebHelp Classic Mobile) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/mobile/
 dita2webhelp.xsl"/>
```

- **dita2webhelp** (WebHelp Classic) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/desktop/
 dita2webhelp.xsl"/>
```

### Customizing the XSLT Stylesheet to Produce the Main HTML File

If you just want to produce a main HTML file (defined with the **args.create.main.files.xsl** property), you need to create a **createMainFilesCustom.xsl** stylesheet and save it in the newly created **xsl** directory. This stylesheet will import the original stylesheet and will contain the customization templates. It should look like:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
 exclude-result-prefixes="xs math"
 version="2.0">
 <!--
 Import the original stylesheet used to produce the main HTML file.
 -->
 <xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
 responsive/createMainFiles.xsl"/>

```

```

<!--
 Please add your customization templates here.
-->

</xsl:stylesheet>

```

Depending on which version of WebHelp you want to customize, you need to import one of the following XSLT stylesheets:

- **dita2webhelp-responsive** (WebHelp Responsive) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
responsive/createMainFiles.xsl"/>
```

- **dita2webhelp-mobile** (WebHelp Classic Mobile) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/mobile/
createMainFiles.xsl"/>
```

- **dita2webhelp** (WebHelp Classic) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/desktop/
createMainFiles.xsl"/>
```

[\[DITA-OT 2.3\] XSLT-Parameter Extension Points](#)

#### Removing the Previous/Next Links from WebHelp Classic Output

The **Previous** and **Next** links that are created at the top area of each WebHelp Classic page can be hidden with a CSS code.

To remove these links from WebHelp Classic output, follow these steps:

1. Add the following CSS code in a custom CSS stylesheet:

```
.navparent, .navprev, .navnext {
 visibility:hidden;
}
```

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

- a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the transformation scenario.

#### Search Engine Optimization for DITA WebHelp

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```

<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
 <url>
 <loc>http://www.example.com/topics/introduction.html</loc>
 <lastmod>2014-10-24</lastmod>
 <changefreq>weekly</changefreq>
 <priority>0.5</priority>
 </url>
 <url>
 <loc>http://www.example.com/topics/care.html#care</loc>
 <lastmod>2014-10-24</lastmod>
 <changefreq>weekly</changefreq>
 <priority>0.5</priority>
 </url>
 .
 .
 .
</urlset>

```

Each page has a `<url>` element structure containing additional information, such as:

- loc - the URL of the page. This URL must begin with the protocol (such as http), if required by your web server. It is constructed from the value of the webhelp.sitemap.base.url parameter from the transformation scenario and the relative path to the page (collected from the href attribute of a topicref element in the DITA map).

**Note:** The value must have fewer than 2,048 characters.

- lastmod - the date when the page was last modified. The date format is YYYY-MM-DD.
- changefreq - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.change.frequency parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

**Note:** The value always should be used to describe documents that change each time they are accessed. The value never should be used to describe archived URLs.

- priority - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.priority parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

**Note:** lastmod, changefreq, and priority are optional elements.

### Creating and Editing the sitemap.xml File

Follow these steps to produce a sitemap.xml file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
  - webhelp.sitemap.base.url - the URL of the location where your WebHelp system is deployed  
**Note:** This parameter is required for Oxygen XML Editor to generate the sitemap.xml file.
  - webhelp.sitemap.change.frequency - how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never)
  - webhelp.sitemap.priority - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the sitemap.xml file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

### Support for Right-to-Left (RTL) Oriented Languages for DITA WebHelp

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map and set the xml:lang attribute on its root element (map). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

### WebHelp Skin Builder

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML Editor website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to Oxygen XML Editor website.
- A late version web browser.

To start the **Skin Builder**, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to <https://www.oxygenxml.com/webhelp-skin-builder>.
- For DITA WebHelp systems, you can click the **Online preview** link in the **Skins tab** of a DITA OT transformation scenario. In the upper section of the preview, click the **Select Skin** button, then choose **Customize Skin**.

## Skin Builder Layout

The left side panel of the *Skin Builder* is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - Header
  - TOC Area
  - Vertical Splitter
  - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

## Create a Customization Skin

1. The starting point can be either one of the predefined skins or a CSS stylesheet applied over the sample using the **Import** button.
  2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the **+ Add** button and choosing from the available properties.
- Note:** If you want to revert a particular property to its initial value, press the **Reset** button.
3. When you are happy with the skin customizations you have made, press the **Export** button. All settings will be saved in a CSS file.

## Apply a Customization Skin to a DITA Map to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor.
2. Load the DITA map you want to produce as a WebHelp output.
3. Edit a *DITA Map to WebHelp*-type transformation scenario. Set the previously exported CSS file in the **Custom** section of the **Skins tab**.
4. Run the transformation to obtain the WebHelp output.

## Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the **Parameters** tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: `webhelp.logo.image` and `webhelp.logo.image.target.url`.
5. Run the transformation to obtain the WebHelp output.

To see our video demonstration about using the WebHelp Skin Builder, go to [https://www.oxygenxml.com/demo/Skin\\_Builder.html](https://www.oxygenxml.com/demo/Skin_Builder.html).

## Related information

[Skins Tab \(DITA OT Transformations\)](#) on page 1617

### WebHelp Classic Runtime Additional Parameters

A deployed WebHelp system can accept the following GET parameters:

- **log** - The value can be true or false (default value). When set to true, it enables JavaScript debugging.
- **contextId** - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.

**Note:** You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

- **appname** - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding [\*appname attribute value\*](#) in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
• toc.visible - The value can be true (default value) or false. When set to false, the table of contents will be collapsed when you load the WebHelp page.
• searchQuery - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for growing flowers, the URL should look like this: http://localhost/webhelp/index.html?searchQuery=growing%20flowers.
```

## Related information

[Context-Sensitive WebHelp Classic System](#) on page 895

### Context-Sensitive WebHelp Classic System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

### Generating Context-Sensitive Help

When WebHelp Classic output is generated by Oxygen XML Editor, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
 <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
 <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
 .
 .
</map>
```

The possible attributes are as follows:

#### helpID

A Unique ID provided by a topic from two possible sources (`resourceid` element or `id` attribute):

#### resourceid

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a DITA map or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used.

**Note:** Multiple appid values can be associated with a single appname value (and multiple appname values can be associated with a single appid value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the appid and appname attributes should be unique within the context of a single root map. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

### **Example: resourceId Specified in a DITA Map**

The resourceId element can be specified in a topicmeta element within a topicref.

```
<map title="App Help">
 <topicref href="app-help1.dita" type="task">
 <topicmeta>
 <resourceid appname="myapp" appid="functionid1"/>
 <resourceid appname="myapp" appid="functionid2"/>
 </topicmeta>
 </topicref>
</map>
```

### **Example: resourceId Specified in a DITA Topic**

The resourceId element can be specified in a prolog element within a DITA topic.

```
<task id="app-help1">
 <title>My App Help</title>
 <prolog>
 <resourceid appname="myapp" appid="functionid1"/>
 <resourceid appname="myapp" appid="functionid2"/>
 </prolog>
 ...
</task>
```

For more information about the resourceId element, see [DITA Specifications: <resourceid>](#).

#### **id**

If a resourceId element is not declared in the DITA map or DITA topic (as described above), the id attribute that is set on the topic root element is mapped into the applicationContext element.

**Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

#### **path**

The path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.

#### **productID (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)**

The ID of the product for your documentation project.

#### **productVersion (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)**

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.
- Invoke one of the WebHelp system files index.html or index\_frames.html and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.

The following example will open a frameless version of the WebHelp system showing the page associated with the id dialog1ID:

```
index.html?contextId=dialog1ID
```

The following example will open a frameset version of the WebHelp system showing the page associated with the id view1ID:

```
index_frames.html?contextId=view1ID
```

**Tip:** You can use an *anchor* in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

### Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- contextId - The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.

**Note:** You can use an *anchor* in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

- appname - You can use this parameter in conjunction with contextId to search for this value in the corresponding [appname attribute value](#) in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
```

### Related information

[WebHelp Classic Runtime Additional Parameters](#) on page 895

### Publishing WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

To publish WebHelp Classic output on a SharePoint site, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: <https://support.microsoft.com/en-us/kb/2616712>.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx. Fortunately, this can be done in the transformation scenario.
  - a. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
    - a. For a DITA transformation, set the args.outext parameter to .aspx.
    - b. For a DocBook transformation, set the html.ext parameter to .aspx.
  - b. Run the transformation scenario.

### WebHelp Classic Mobile System

WebHelp is a form of online help that consists of a series of web pages (XHTML format). Its advantages include platform independence, ability to update content continuously, and it can be viewed using a regular web browser. The Oxygen XML Editor WebHelp system includes several variants to suit your specific needs. The *WebHelp Classic Mobile* variant works on multiple platforms (Android, iOS, BlackBerry, Windows Mobile) and is specially designed for mobile devices when feedback from users is not necessary. It is available for DocBook and DITA document types. The functionality of the desktop WebHelp Classic layout is preserved, it is organized in an intuitive layout, and offers table of contents, search capabilities, and index navigation.

**Figure 466: WebHelp Classic Mobile**

**Important:** Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the file:///... format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as http://your.server.com/webhelp/index.html or http://localhost/web\_pages/index.html).

### Customizing WebHelp Classic Mobile Systems

If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario. This section includes topics that explain various ways to customize your WebHelp Classic Mobile system output.

#### Copying Additional Resources to WebHelp Output Directory

To copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system, follow these steps:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value for the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
5. Click **OK** to save the changes to the transformation scenario.  
All files from the new directory will be copied to the root of the WebHelp output directory.

#### Adding Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation scenario. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

To include custom HTML content in the WebHelp Classic output files, follow these steps:

1. Insert the HTML content in a well-formed XML file. There are several things to consider in regards to this XML file:
  - a. **Well-Formedness** - If the file is not a *Well-formed XML document* (or fragments are not well-formed), the transformation will fail.

A common use case is if you want to include several script or link elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an html element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in head, body, html/head, or html/body elements.

- b. **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the predefined \${oxygen-webhelp-output-dir} macro to specify their paths relative to the output directory:

```
<html>
 <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
 <link rel="stylesheet" type="text/css"
 href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: [Copying Additional Resources to WebHelp Output Directory](#) on page 845.

- c. **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

JavaScript:

```
<script type="text/javascript">
 <!--
 /* Include JavaScript code here. */

 function myFunction() {
 return true;
 }
 -->
</script>
```

CSS:

```
<style>
 <!--
 /* Include CSS style rules here. */

 *{
 color:red
 }
 -->
</style>
```

2. Edit the WebHelp Classic transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value of the webhelp.head.script parameter and set it to the URL of the XML file created in step 1. Your additional content will be included at the end of the head element of your output document.

**Note:** If you want to include the content in the body element, use the webhelp.body.script parameter instead.  
5. Click **OK** to save the changes to the transformation scenario.

#### Related tasks

[Copying Additional Resources to WebHelp Output Directory](#) on page 845

#### Adding a Button in Code Snippet Areas in DITA WebHelp Classic Output

This task will get you started with how to add an action (such as a button or link) in the code snippet areas that are displayed in WebHelp Classic output created from a DITA Map transformation. You can then attach your code that does the actual processing for the action.

Follow these steps:

1. Open the [DITA\\_OT\\_DIR\plugins\org.dita.xhtml\xsl\xslhtml\dita2htmlImpl.xsl](#) file.
2. Locate the `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to check the default behavior of this template.
3. Open the [DITA\\_OT\\_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\fixup.xsl](#) file.
4. Create a `<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">` template to override the default processing.

- This new template will include your code for creating the button. It will have the action code that does the actual processing attached to it (this can be written in JavaScript, for example).

Example of a *Select all* button:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" mode="pre-fmt">
 <button onclick="SelectText(element)">Select all</button>
 <script>
 function SelectText(element) {
 var text = document.getElementById(element);
 var range = document.body.createTextRange();
 range.moveToElementText(text);
 range.select();
 }
 </script>
</xsl:template>
```

## Adding a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp system by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp systems using **WebHelp Responsive**, **WebHelp Responsive with Feedback**, **WebHelp Classic**, **WebHelp Classic with Feedback**, or **WebHelp Classic Mobile** transformation scenarios.

To add a *favicon*, follow these steps:

- Edit the WebHelp transformation scenario* and open the **Parameters** tab.
- Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the *favicon*.
- Run the transformation scenario.

## Adding Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

### Adding Videos to DITA WebHelp Output

- Edit the DITA topic and insert a reference to the video by using the  **Insert Media Object toolbar action** or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
```

or, instead of the `data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
 <param name="src" value="videos/MyVideo.mp4" />
</object>
```

- Apply a *DITA to WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the `object` element to an HTML5 video element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

### Adding Audio Clips to DITA WebHelp Output

- Edit the DITA topic and insert a reference to the audio clip by using the  **Insert Media Object toolbar action** or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the `data` attribute, you can specify the audio clip using a parameter like this:

```
<object outputclass="audio">
 <param name="src" value="audio/MyClip.mp3" />
```

```
</object>
```

2. Apply a *DITA* to *WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the object element to an HTML5 audio element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

## Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the  [Insert Media Object toolbar action](#) or by manually adding an object element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the data attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
 <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4" />
</object>
```

2. Apply a *DITA* to *WebHelp* transformation scenario to obtain the output.

**Result:** The transformation converts the object element to an HTML5 iframe element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

## Related information

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics](#) on page 1575

## Adding Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the WebHelp Classic output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an mediaobject element, as in the following example:

```
<mediaobject>
 <videoobject>
 <videodata fileref="http://www.youtube.com/watch/v/VideoName" />
 </videoobject>
</mediaobject>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

## Changing the Style of WebHelp Mobile Pages

You can change the style for your WebHelp Mobile pages by setting a custom theme created with a third-party tool.

To create a custom theme for WebHelp Mobile pages, use the following procedure:

1. Create a custom theme (the result will be a CSS stylesheet). Use a designer tool, such as the [ThemeRoller for jQuery Mobile](#), to create your own custom theme and then download the resulting CSS stylesheet.

**Tip:** If you are using ThemeRoller for jQuery Mobile, make sure you use a type C swatch.

2. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.

- For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
3. Make sure that the output folder is empty.
  4. Run the transformation scenario.

## Change Numbering Styles for Ordered Lists

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
 A
 B
 C

```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
 list-style-type:lower-alpha;
}
```

3. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.

- a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

## Changing the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, the icons for the WebHelp Classic table of contents are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
 background: url('../img/book_closed16.png') no-repeat;
 padding-left: 16px;
 cursor: pointer;
}

.hasSubMenuOpened{
 background: url('../img/book_opened16.png') no-repeat;
 padding-left: 16px;
 cursor: pointer;
}
```

To assign other icons, use the following procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
 background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
 background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons.
  - a) For DITA transformations: `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\`.
  - b) For DocBook transformations: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\img\`.
3. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
  - a) For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b) For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

## CSS Styling to Customize WebHelp Output

One way to customize WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario.

As a practical example, to hide the horizontal separator line between the content and footer, follow these steps:

1. Create a custom CSS file that contains the following snippet:

```
.footer_separator {
 display:none;
}
```

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

- a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
3. Run the transformation scenario.

## Customize the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the toc.css file in the following directory:
  - a. For DITA transformations: *DITA\_OT\_DIR*\plugins\com.oxygenxml.webhelp\oxygen-webhelp\resources\css.
  - b. For DocBook transformations: *[OXYGEN\_INSTALL\_DIR]*\frameworks\docbook\xsl\com.oxygenxml.webhelp\oxygen-webhelp\resources\css.
2. Edit that CSS file, find the menuItemSelected class, and change the value of the background property.

**Note:** You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario (see step 3 in the *Changing the Icons in a WebHelp Classic Table of Contents* topic).

## Customizing WebHelp Output with a Custom CSS

By creating your own custom CSS stylesheet, you can customize the look and style of WebHelp output to fit your specific needs.

To use a custom CSS in WebHelp output, follow these steps:

1. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.
  - a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
  - b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.
2. Run the transformation scenario.

## Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
  - For DITA WebHelp systems, edit the following file: *DITA\_OT\_DIR*\plugins\com.oxygenxml.webhelp\xsl\createMainFiles.xsl.
  - For DocBook WebHelp system, edit the following file: *[OXYGEN\_INSTALL\_DIR]*\frameworks\docbook\xsl\com.oxygenxml.webhelp\xsl\createMainFiles.xsl.

- Locate the following template in the XSL file: <xsl:template name="create-toc-common-file"> and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

**Note:** The code should look like this:

```
<html>
 <head>
 <xsl:if test="$withFrames">
 <base target="contentwin"/>
 </xsl:if>
 <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
 <!-- Disable caching of WebHelp pages in web browser. -->
 <meta http-equiv="Pragma" content="no-cache" />
 <meta http-equiv="Expires" content="-1" />

```

- Save your changes to the file.
- Re-run your WebHelp system transformation scenario.

### Editing Scoring Values of Tag Elements in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. Oxygen XML Editor includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

- Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
  - For DITA WebHelp systems, edit the following file: *DITA\_OT\_DIR\plugins\com.oxygenxml.webhelp\indexer\scoring.properties*.
  - For DocBook WebHelp system, edit the following file: *[OXYGEN\_INSTALL\_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp\indexer\scoring.properties*.

The values that can be edited in the *scoring.properties* file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

- Save your changes to the file.
- Re-run your WebHelp system transformation scenario.

### Exclude Certain DITA Topics from WebHelp Search Results

The WebHelp **Search** engine does not index DITA topics that have the @search attribute set to no. This is useful if you have topics in your DITA map structure that you do not want to be included in search results for your WebHelp system.

To exclude DITA topics from WebHelp search results, follow these steps:

- Edit the DITA map and for any *topicref* that you want to exclude from search results, set the *search* attribute to no.

For example:

```
<topicref href="..topics/internal-topic1.dita" search="no"/>
```

2. Save your changes to the DITA map.
3. Re-run your WebHelp system transformation scenario.

### Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block-level elements (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the audience attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
 <prop att="audience" val="programmer" action="flag"
 img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
4. Run the transformation scenario.

### Integrating Social Media and Google Tools in WebHelp Output

Oxygen XML Editor includes support for integrating some of the most popular social media sites in WebHelp output.

#### *How to Add a Facebook Like Button in WebHelp Classic Output*

To add a Facebook™ *Like* widget to your WebHelp output, follow these steps:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.  
A dialog box that contains code snippets is displayed.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!--
 (function(d, s, id) {
 var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 })(document, 'script', 'facebook-jssdk');
 -->
 </script>
 <div class="fb-like" data-layout="standard" data-action="like"
 data-show-faces="true" data-share="true" />
</div>
```

4. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

*How to Add a Google+ Button in WebHelp Classic Output*

To add a Google+ widget to your WebHelp output, follow these steps:

1. Go to the [Google Developers](#) website.
2. Fill-in the displayed form.  
The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`.  
Make sure that the content of the file is well-formed.

The content of the XML file should look like this:

```
<div id="google-plus">
 <!-- Place this tag in your head or just before your close body tag. -->
 <script src="https://apis.google.com/js/platform.js" async defer></script>

 <!-- Place this tag where you want the +1 button to render. -->
 <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

*How to Add Tweet Button in WebHelp Classic Output*

To add a Twitter™ Tweet widget to your WebHelp output, follow these steps:

1. Go to the [Tweet button generator](#) page.
2. Fill-in the displayed form.  
The **Preview and code** area displays the code.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`.

Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
 Tweet
 <script>
 <!--
 !function (d, s, id) {
 var js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
 if (!d.getElementById(id)) {
 js = d.createElement(s);
 js.id = id;
 js.src = p + '//platform.twitter.com/widgets.js';
 fjs.parentNode.insertBefore(js, fjs);
 }
 (document,
 'script', 'twitter-wjs');
 -->
 </script>
 </div>
```

4. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document** > **Transformation** menu).
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok**.
8. Run the transformation scenario.

[DITA Map to WebHelp Output](#) on page 1085

#### How to Integrate Google Analytics in WebHelp Classic Output

To enable your WebHelp system to benefit from Google Analytics reports, follow these steps:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that fits the needs of your website.
3. Follow the on-screen instructions to obtain a *Tracking Code* that contains your *Tracking ID*.

A Tracking Code looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new HTML file called `googleAnalytics.html`.
5. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document** > **Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click **Ok**.
9. Run the transformation scenario.

#### Related information

[DITA Map to WebHelp Output](#) on page 1085

## *How to Integrate Google Search in WebHelp Classic Output*

You can integrate Google Search into your WebHelp output.

To enable your WebHelp system to use Google Search, follow these steps:

1. Go to the Google Custom Search Engine page using your Google account.
2. Press the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet.

A Google Search script looks like this:

```
<script>
(function() {
 var cx =
 '000888210889775888983:8mn4x_mf-yg';
 var gcse = document.createElement('script');
 gcse.type = 'text/javascript';
 gcse.async = true;
 gcse.src = (document.location.protocol == 'https:' ?
 'https:' : 'http:') + '//www.google.com/cse/cse.js?cx=' + cx;
 var s = document.getElementsByTagName('script')[0];
 s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In Oxygen XML Editor, click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback, or the mobile variant) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
  - a) Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-queryParameterName="searchQuery" >` (you must use the [HTML5 version for the GCSE](#)). It is recommended that you set the `data-linkTarget` attribute value to `frm` for *frameless* versions of the WebHelp system or to `data-contentWin` for *frameset* versions of WebHelp. The default value is `_blank` and if you do not specify a value the search results will be loaded in a new window. For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
  - b) Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

9. Click **Ok**.

10. Run the transformation scenario.

### **Related information**

[Integrating Social Media and Google Tools in WebHelp Output](#) on page 852

## **Localizing the Interface of WebHelp Output**

You can localize the interface of WebHelp output for DITA or DocBook transformations.

### *Localizing the Interface of WebHelp Output (for DITA Map Transformations)*

Static labels that are used in the WebHelp output are kept in translation files in the `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DITA map transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the *integrator* is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. Make sure that the new XML file that you created in the previous two steps is listed in the file `DITA_OT_DIR/plugins/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback, or the mobile version) and set the `args.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

[Searching Japanese Content in WebHelp Pages](#) on page 857

#### Localizing the Interface of WebHelp Output (for DocBook Transformations)

Static labels that are used in the WebHelp output are kept in translation files in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/com.oxygenxml.webhelp/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback, or the mobile version) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, `fr-ca` for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

#### Related information

[Searching Japanese Content in WebHelp Pages](#) on page 857

#### Searching Japanese Content in WebHelp Pages

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor installation kit.

#### Activating Japanese Indexing in DITA WebHelp Systems

To activate the Japanese indexing in your WebHelp system generated from DITA content, follow these steps:

1. Set the language for your content to Japanese with one of the following two methods:
  - Edit a **DITA to WebHelp** transformation scenario and in the **Parameters tab**, set the value of the `args.default.language` parameter to `ja-jp`.

- Set the `xml:lang` attribute on the root of the DITA map and the referenced topics to `ja-jp`.
2. For the analyzer to work properly, search terms that are entered into the WebHelp search text field must be separated by spaces.
  3. Run the **DITA to WebHelp** transformation scenario to generate the output.

Optionally a Japanese user dictionary can be set with the [`webhelp.search.japanese.dictionary parameter`](#).

## Activating Japanese Indexing in DocBook WebHelp Systems

To activate the Japanese indexing in your WebHelp system generated from DocBook content, follow these steps:

1. Edit a **DocBook to WebHelp** transformation scenario and in the **Parameters tab**, set the value of the `110n.gentext.default.language` parameter to `ja`.
2. Run the transformation scenario to generate the output.

### Related tasks

[Localizing the Interface of WebHelp Output \(for DocBook Transformations\)](#) on page 888

## Overriding the XSLT Processing Step of a DITA WebHelp Transformation

There are several methods that you can use to customize your WebHelp output. Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the **DITA Map WebHelp** transformation scenarios), one possibility would be to override the default XSLT templates that are used for WebHelp transformations by using some extension points.

### XSLT-Import Extension Points

You can customize your WebHelp output by overriding the default XSLT templates that are used for each type of WebHelp transformation. This can be done by creating a DITA extension plugin that specifies one of the following extension points:

#### **com.oxygenxml.webhelp.xsl.dita2webhelp**

You can use this extension point to override a template of the XSLT stylesheet (`dita2webhelpImpl.xsl`) that produces an HTML file for each DITA topic. Depending on the type of WebHelp transformation you are currently using, the path to this stylesheet is as follows:

- **WebHelp Classic Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\dita2webhelpImpl.xsl`
- **WebHelp Classic Mobile Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\mobile\dita2webhelpImpl.xsl`
- **WebHelp Responsive Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\dita2webhelpImpl.xsl`

#### **com.oxygenxml.webhelp.xsl.createMainFiles**

You can use this extension point to override a template of the XSLT stylesheet (`createMainFilesImpl.xsl`) that produces the WebHelp main HTML page. Depending on the type of WebHelp transformation you are currently using, the path to this stylesheet is as follows:

- **WebHelp Classic Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\desktop\createMainFilesImpl.xsl`
- **WebHelp Classic Mobile Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\mobile\createMainFilesImpl.xsl`
- **WebHelp Responsive Transformations** - `DITA_OT_DIR\plugins\com.oxygenxml.webhelp\xsl\dita\responsive\createMainFilesImpl.xsl`

 **Attention:** The customizations you made by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain plugin, please use the [\*Overriding the XSLT Stylesheet from a Customized ANT Build File\*](#) method.

## XSLT-Parameter Extension Points

In case your customization stylesheet declares one or more XSLT parameters and you want to control their value from the transformation scenario, you can use one of the following XSLT parameter extension points:

### **com.oxygenxml.webhelp.xsl.dita2webhelp.param**

Use this extension point to pass parameters to the stylesheet specified using the [\*\*com.oxygenxml.webhelp.xsl.dita2webhelp extension point\*\*](#).

### **com.oxygenxml.webhelp.xsl.createMainFiles.param**

Use this extension point to pass parameters to the stylesheet specified using the [\*\*com.oxygenxml.webhelp.xsl.createMainFiles extension point\*\*](#).

## Overriding the XSLT Stylesheet from a Customized Ant Build File

This method is useful if you want to create a customization that is only available for a certain DITA-OT extension plugin. This method implies that you create a DITA-OT plugin that defines a custom transtype. From the Ant target associated with the plugin transtype, you will specify a custom XSLT stylesheet. This customized XSLT stylesheet will import the original WebHelp stylesheet and will also add some customization templates.

If you want to use this method, you need to create a DITA-OT extension plugin, as in the following sample procedure for customizing WebHelp Responsive output:

1. In the **DITA\_OT\_DIR\plugins\** folder, create a folder for this plugin (for example, **com.oxygenxml.webhelp.responsive.custom**).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies a new DITA-OT transtype and the build file associated with the plugin. For example:

```
<plugin id="com.oxygenxml.webhelp.responsive.customization">
 <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
 <transtype name="webhelp-responsive-custom" extends="webhelp-responsive"
 desc="WebHelp Responsive Customization"/>
</plugin>
```

3. Create the **integrator.xml** file that will import the actual plugin Ant build file.

```
<project basedir"." name="Webhelp Responsive Customization">
 <import file="build.xml"/>
</project>
```

4. Create the **build.xml** file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files. The following two Ant properties can be overridden to specify your customization stylesheets:

### **args.wh.xsl**

Override this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic.

### **args.create.main.files.xsl**

Override this property if you want to customize the XSLT stylesheet used to produce the main HTML file.

For customizing the WebHelp Responsive, the build file should look like:

```
<project basedir"." name="Webhelp Responsive Customization">
<target name="dita2webhelp-custom">
 <!--
 Override this property if you want to customize the XSLT stylesheet
 used to produce an HTML file for each topic
 -->
 <property
 name="args.wh.xsl"
 value="${dita.plugin.com.oxygenxml.webhelp.responsive.custom.dir}
 /xsl/dita2webhelpCustom.xsl"/>
 <!--
 Override this property if you want to customize the XSLT stylesheet
 used to produce the main HTML file.
 -->
 <property
 name="args.create.main.files.xsl"
 value="${dita.plugin.com.oxygenxml.webhelp.responsive.custom.dir}
 /xsl/createMainFilesCustom.xsl"/>
 <!--
 Depending on which version of WebHelp you want to customize,
 you need to delegate to different build targets:
 * dita2webhelp-responsive - when you are customizing the Webhelp Responsive
 -->
```

```

 * dita2webhelp-mobile - when you are customizing the Webhelp Mobile
 * dita2webhelp - when you are customizing the Webhelp Classic
-->
<antcall target="dita2webhelp-responsive"/>
</target>
</project>

```

**Note:** Depending on which version of WebHelp you want to customize, you need to specify one of the following build targets:

- **dita2webhelp-responsive** - To customize WebHelp Responsive (with or without feedback) output.
- **dita2webhelp-mobile** - To customize WebHelp Classic Mobile output.
- **dita2webhelp** - To customize WebHelp Classic (with or without feedback) output.

5. Create an **xsl** directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.

### Customizing the XSLT Stylesheet to Produce an HTML File for Each Topic

If you want to produce an HTML file for each topic (defined with the **args.wh.xsl** property), create a **dita2webhelpCustom.xsl** stylesheet and save it in the newly created **xsl** directory. This stylesheet will import the original stylesheet and will contain the customization templates. It should look like:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
 exclude-result-prefixes="xs math"
 version="2.0">
 <!--
 Import the original stylesheet used to produce an HTML file for each topic.
 -->
 <xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/
 dita/responsive/dita2webhelp.xsl"/>
 <!--
 Please add your customization templates here.
 -->
</xsl:stylesheet>

```

Depending on which version of WebHelp you want to customize, you need to import one of the following XSLT stylesheets:

- **dita2webhelp-responsive** (WebHelp Responsive) -
 

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
 responsive/dita2webhelp.xsl"/>
```
- **dita2webhelp-mobile** (WebHelp Classic Mobile) -
 

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/mobile/
 dita2webhelp.xsl"/>
```
- **dita2webhelp** (WebHelp Classic) -
 

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/desktop/
 dita2webhelp.xsl"/>
```

### Customizing the XSLT Stylesheet to Produce the Main HTML File

If you just want to produce a main HTML file (defined with the **args.create.main.files.xsl** property), you need to create a **createMainFilesCustom.xsl** stylesheet and save it in the newly created **xsl** directory. This stylesheet will import the original stylesheet and will contain the customization templates. It should look like:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:math="http://www.w3.org/2005/xpath-functions/math"
 exclude-result-prefixes="xs math"
 version="2.0">
 <!--
 Import the original stylesheet used to produce the main HTML file.
 -->
 <xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
 responsive/createMainFiles.xsl"/>
 <!--
 Please add your customization templates here.
 -->
</xsl:stylesheet>

```

Depending on which version of WebHelp you want to customize, you need to import one of the following XSLT stylesheets:

- **dita2webhelp-responsive** (WebHelp Responsive) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/
responsive/createMainFiles.xsl"/>
```

- **dita2webhelp-mobile** (WebHelp Classic Mobile) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/mobile/
createMainFiles.xsl"/>
```

- **dita2webhelp** (WebHelp Classic) -

```
<xsl:import href="plugin:com.oxygenxml.dita-ot.plugin.webhelp:xsl/dita/desktop/
createMainFiles.xsl"/>
```

### Removing the Previous/Next Links from WebHelp Classic Output

The **Previous** and **Next** links that are created at the top area of each WebHelp Classic page can be hidden with a CSS code.

To remove these links from WebHelp Classic output, follow these steps:

1. Add the following CSS code in a custom CSS stylesheet:

```
.navparent, .navprev, .navnext {
 visibility:hidden;
}
```

2. *Edit the WebHelp transformation scenario* and open the **Parameters** tab.

- a. For a DITA transformation, set the args.css parameter to the path of your custom CSS file. Also, set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- b. For a DocBook transformation, set the html.stylesheet parameter to the path of your custom CSS file.

3. Run the transformation scenario.

### Search Engine Optimization for DITA WebHelp

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A `sitemap` lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
 <url>
 <loc>http://www.example.com/topics/introduction.html</loc>
 <lastmod>2014-10-24</lastmod>
 <changefreq>weekly</changefreq>
 <priority>0.5</priority>
 </url>
 <url>
 <loc>http://www.example.com/topics/care.html#care</loc>
 <lastmod>2014-10-24</lastmod>
 <changefreq>weekly</changefreq>
 <priority>0.5</priority>
 </url>
 .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- `loc` - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the DITA map).

- Note:** The value must have fewer than 2,048 characters.
- lastmod - the date when the page was last modified. The date format is YYYY-MM-DD.
- changefreq - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.change.frequency parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

**Note:** The value always should be used to describe documents that change each time they are accessed. The value never should be used to describe archived URLs.

- priority - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.priority parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

**Note:** lastmod, changefreq, and priority are optional elements.

### Creating and Editing the sitemap.xml File

Follow these steps to produce a sitemap.xml file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
  - webhelp.sitemap.base.url - the URL of the location where your WebHelp system is deployed
  - Note:** This parameter is required for Oxygen XML Editor to generate the sitemap.xml file.
  - webhelp.sitemap.change.frequency - how frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never)
  - webhelp.sitemap.priority - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the sitemap.xml file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

### Support for Right-to-Left (RTL) Oriented Languages for DITA WebHelp

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map and set the xml:lang attribute on its root element (map). The corresponding attribute value can be set for following RTL languages:

- ar-eg - Arabic
- he-il - Hebrew
- ur-pk - Urdu

### WebHelp Classic Runtime Additional Parameters

A deployed WebHelp system can accept the following GET parameters:

- log - The value can be true or false (default value). When set to true, it enables JavaScript debugging.
- contextId - The WebHelp JavaScript engine will look for this value in the context-help-map.xml mapping file and load the corresponding help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.

**Note:** You can use an anchor in the contextId parameter to jump to a specific section in a document. For example, contextId=topicID#anchor.

- appname - You can use this parameter in conjunction with contextId to search for this value in the corresponding [appname attribute value](#) in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
```

- `toc.visible` - The value can be `true` (default value) or `false`. When set to `false`, the table of contents will be collapsed when you load the WebHelp page.
- `searchQuery` - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

#### Related information

[Context-Sensitive WebHelp Classic System](#) on page 895

### Context-Sensitive WebHelp Classic System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

#### Generating Context-Sensitive Help

When WebHelp Classic output is generated by Oxygen XML Editor, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
 <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
 <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
</map>
```

The possible attributes are as follows:

#### helpID

A Unique ID provided by a topic from two possible sources (`resourceid` element or `id` attribute):

#### resourceid

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a DITA map or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `appid` attribute is used.

**Note:** Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single root map. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

#### Example: resourceid Specified in a DITA Map

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```
<map title="App_Help">
 <topicref href="app-help1.dita" type="task">
 <topicmeta>
 <resourceid appname="myapp" appid="functionid1"/>
 <resourceid appname="myapp" appid="functionid2"/>
 </topicmeta>
 </topicref>
</map>
```

#### Example: resourceid Specified in a DITA Topic

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```
<task id="app-help1">
```

```

<title>My App Help</title>
<prolog>
 <resourceid appname="myapp" appid="functionid1"/>
 <resourceid appname="myapp" appid="functionid2"/>
</prolog>
...
</task>

```

For more information about the `resourceid` element, see [DITA Specifications: <resourceid>](#).

### **id**

If a `resourceid` element is not declared in the DITA map or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

**Important:** You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

### **path**

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

### **productID (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)**

The ID of the product for your documentation project.

### **productVersion (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)**

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke one of the WebHelp system files `index.html` or `index_frames.html` and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

The following example will open a *frameless* version of the WebHelp system showing the page associated with the `id dialog1ID`:

```
index.html?contextId=dialog1ID
```

The following example will open a *frameset* version of the WebHelp system showing the page associated with the `id view1ID`:

```
index_frames.html?contextId=view1ID
```

**Tip:** You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

## **Context-Sensitive Queries**

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- `contextId` - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page. For more information, see the [Context-Sensitive WebHelp System](#) topic.

**Note:** You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

- `appname` - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding [\*appname attribute value\*](#) in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
```

## Related information

[WebHelp Classic Runtime Additional Parameters](#) on page 895

### Publishing WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to .aspx, as described in the steps below.

To publish WebHelp Classic output on a SharePoint site, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: <https://support.microsoft.com/en-us/kb/2616712>.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from .html to .aspx. Fortunately, this can be done in the transformation scenario.
  - a. [Edit the WebHelp transformation scenario](#) and open the **Parameters** tab.
    - a. For a DITA transformation, set the args.outext parameter to .aspx.
    - b. For a DocBook transformation, set the html.ext parameter to .aspx.
  - b. Run the transformation scenario.

## Using the Oxygen XML WebHelp Plugin to Automate Output

Oxygen XML WebHelp plugin allows you to use a command line interface script to obtain WebHelp output from DITA and DocBook documents. Note that the Oxygen XML WebHelp plugin is a standalone product with its own licensing terms and cannot be used with a Oxygen XML Editor license.

The WebHelp output files created with the Oxygen XML WebHelp plugin are the same as the output files produced when you run DITA or DocBook to WebHelp transformation scenarios from within Oxygen XML Editor.

When an automated process is required due to the amount of output needed, do the following:

1. Install the Oxygen XML WebHelp plugin.
2. Acquire a Oxygen XML WebHelp license from [https://www.oxygenxml.com/buy\\_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html).
3. Integrate the Oxygen XML WebHelp plugin with [DITA](#) or [DocBook](#).

### Oxygen XML WebHelp Plugin for DITA

To transform DITA documents using the Oxygen XML WebHelp plugin, first integrate the plugin with the DITA Open Toolkit. The purpose of the integration is to add the following transformation types to the DITA Open Toolkit:

- **webhelp-responsive** - The transformation that produces *WebHelp Responsive* and *WebHelp Responsive with Feedback* output for desktop and mobile devices.
- **webhelp** - The transformation that produces *WebHelp Classic* output for desktop.
- **webhelp-feedback** - The transformation that produces feedback-enabled *WebHelp Classic with Feedback* for desktop.
- **webhelp-mobile** - The transformations that produce *WebHelp Classic Mobile* output for mobile devices.

### Integrating the Oxygen XML WebHelp Plugin with the DITA Open Toolkit

The requirements of the Oxygen XML WebHelp plugin for the DITA Open Toolkit are as follows:

- Java Virtual Machine 1.6 or newer if you want to use DITA-OT 1.8.5 or Java Virtual Machine 1.8 or newer if you want to use DITA-OT 2.3.3.
- DITA Open Toolkit 1.8.5 or 2.3.3 (includes Saxon 9.x libraries).

**Note:** The Oxygen XML WebHelp Plugin has been tested with these two specific versions (**DITA-OT 1.8.5** or **DITA-OT 2.3.3**) and therefore they are the recommended versions.

To integrate the Oxygen XML WebHelp plugin with the DITA Open Toolkit, follow these steps:

1. Download and install a [Java Virtual Machine](#) version compatible with the DITA-OT version.
2. Download and unpack the [DITA Open Toolkit](#) version 1.8.5 or 2.3.3.

3. Go to [Oxygen XML WebHelp website](#), download the latest installation kit, and unzip it.
4. Copy all plugin directories from the unpacked archive to the plugins directory of the DITA OT distribution. This is necessary to enable certain functionality. For example, the com.oxygenxml.highlight directory adds syntax highlight capabilities to your WebHelp output for codeblock sections that contain source code snippets (XML, Java, JavaScript).
5. If you have not already done so, [copy your license key into a licensekey.txt file](#) and place it in the `DITA_OT_DIR/plugins/com.oxygenxml.webhelp` directory.
6. In the home directory of the DITA Open Toolkit, run `ant -f integrator.xml`.

#### Related tasks

[Licensing the Oxygen XML WebHelp Plugin for DITA OT](#) on page 918

[Upgrading the Oxygen XML WebHelp Plugin for DITA OT](#) on page 918

### Licensing the Oxygen XML WebHelp Plugin for DITA OT

To register the license for the Oxygen XML WebHelp plugin for the DITA Open Toolkit, follow these steps:

1. Open the `DITA_OT_DIR/plugins/com.oxygenxml.webhelp` directory and create a file called `licensekey.txt`.
2. In this file, copy your license key that you purchased for your Oxygen XML WebHelp plugin. The WebHelp transformation process reads the Oxygen XML WebHelp license key from this file. In case the file does not exist, or it contains an invalid license, an error message will be displayed.

#### Related tasks

[Integrating the Oxygen XML WebHelp Plugin with the DITA Open Toolkit](#) on page 917

[Upgrading the Oxygen XML WebHelp Plugin for DITA OT](#) on page 918

### Upgrading the Oxygen XML WebHelp Plugin for DITA OT

To upgrade your Oxygen XML WebHelp plugin for the DITA Open Toolkit, follow these steps:

1. Navigate to the plugins directory of your DITA OT distribution and delete the old Oxygen XML WebHelp plugin files (`oxygen_custom.xsl`, `oxygen_custom_html.xsl`) and directories (`com.oxygenxml.highlight`, `com.oxygenxml.media`, `com.oxygenxml.webhelp`).
2. Go to [Oxygen XML WebHelp website](#), download the latest installation kit, and unzip it.
3. Copy all plugin directories from the unpacked archive to the plugins directory of the DITA OT distribution. This is necessary to enable certain functionality. For example, the `com.oxygenxml.highlight` directory adds syntax highlight capabilities to your WebHelp output for codeblock sections that contain source code snippets (XML, Java, JavaScript).
4. In the home directory of the DITA Open Toolkit, run `ant -f integrator.xml`.

### Running an External DITA Transformation Using the Oxygen XML WebHelp Plugin

There are two main ways to run a DITA to WebHelp ([webhelp-responsive](#), [webhelp](#), [webhelp-feedback](#), [webhelp-mobile](#)) transformation using the Oxygen XML WebHelp plugin:

#### Startup Script from WebHelp Plugin Method

The first method involves running the `ditaWebhelp.bat` or `ditaWebhelp.sh` startup script that comes bundled in the WebHelp plugin folder:

- `WEBHELP_PLUGIN_DIR\ditaWebhelp.bat` script file (Windows based systems)
- `WEBHELP_PLUGIN_DIR\ditaWebhelp.sh` script file (Unix/Linux based systems)

Before using the script to generate output, you must customize it to specify the paths to the Java VM, DITA Open Toolkit, and also to set the transformation type. To do this, open the script file and edit the following variables and parameters:

- `JVM_INSTALL_DIR` - Specifies the path to the Java Virtual Machine installation directory on your disk.
  - `DITA_OT_INSTALL_DIR` - Specifies the path to DITA Open Toolkit installation directory on your disk.
- Note:** The scripts reference the `dost-patches-DITA-1.8.jar` JAR file containing DITA OT 1.8.5-specific patches. If you use DITA OT 1.7, please update that reference to `dost-patches-DITA-1.7.jar`. If you use DITA OT 2.3.3, no patches are needed, so just remove the reference.
- `TRANSTYPE` - Specifies the type of the transformation you want to apply. You can set it to `webhelp-responsive`, `webhelp`, `webhelp-feedback` or `webhelp-mobile`.
  - `DITA_MAP_BASE_DIR` - Specifies the path to the directory where the input DITA map file is located.
  - `DITAMAP_FILE` - Specifies the input DITA map file.
  - `DITAVAL_FILE` - Specifies the `.ditaval` input filter that the transformation process applies to the input DITA map file.
  - `DITAVAL_DIR` - Specifies the path to the directory where the `.ditaval` file is located.
  - `-Doutput.dir` - Specifies the output directory of the transformation.

### Startup Script from DITA OT Distribution Method

The second method involves using the startup script that comes bundled with each DITA OT distribution.

#### DITA OT 1.8.5

For DITA Open Toolkit 1.8.5, the general instructions for running the startup script can be found here: <http://www.dita-ot.org/1.8/readme/building-output-using-cl-tool.html>.

#### DITA OT 2.3.3

For DITA Open Toolkit 2.3.3, the general instructions for running the startup script can be found here: <http://www.dita-ot.org/2.3/parameters/dita-command-arguments.html>.

#### DITA OT Startup Script Examples:

- `DITA_OT_DIR\bin\dita.bat -i path_to_input.ditamap -f webhelp` (Windows based systems)
- `DITA_OT_DIR\bin\dita -i path_to_input.ditamap -f webhelp` (Unix/Linux based systems)

**Note:** For the `-format (-f)` argument, you use the following transformation types: `webhelp-responsive`, `webhelp`, `webhelp-feedback` or `webhelp-mobile`.

The downside of this approach is the fact that you will lose certain small fixes and patches that Oxygen XML Editor adds to the automated DITA OT processing. For example, you may lose the ability to process DITA topics that contain entity references inside them.

#### Related tasks

[Integrating the Oxygen XML WebHelp Plugin with the DITA Open Toolkit](#) on page 917

#### Additional Oxygen XML WebHelp Plugin Parameters for DITA

You can append the following parameters to the command line that runs the transformation:

##### `-Dwebhelp.copyright`

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

##### `-Dwebhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

##### `-Dwebhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

##### `-Dwebhelp.footer.file` (not available for WebHelp Responsive systems)

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
<div id="fb-root"/>
```

```

<script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
</script>
<div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
</div>

```

#### **-Dwebhelp.footer.include (not available for WebHelp Responsive systems)**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

#### **-Dwebhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is \_blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

#### **-Dwebhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

#### **-Dwebhelp.logo.image.target.url (not available for WebHelp Classic Mobile systems)**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

#### **-Dwebhelp.logo.image (not available for WebHelp Classic Mobile systems)**

Specifies a path to an image displayed as a logo in the left side of the output header.

#### **-Dwebhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

#### **-Dwebhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

#### **-Dwebhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

#### **-Dwebhelp.search.ranking**

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

#### **-Dwebhelp.show.changes.and.comments**

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

**-Dwebhelp.sitemap.base.url**

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

**-Dwebhelp.sitemap.change.frequency**

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**-Dwebhelp.sitemap.priority**

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

**-Dwebhelp.skin.css (available only for WebHelp Classic and WebHelp Classic with Feedback systems)**

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the OXYGEN\_INSTALL\_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the [Oxygen Skin Builder](#) web application.

**Parameters Specific to WebHelp Responsive Output (available only for WebHelp Responsive and WebHelp Responsive with Feedback systems)****-Dwebhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.after.logo\_and\_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.after.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.after.top\_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.before.logo\_and\_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.before.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.before.top\_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.head**

In the generated output it displays a given XHTML fragment as a page header. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**-Dwebhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

**-Dwebhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

**-Dwebhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

**-Dwebhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

**-Dwebhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

**-Dwebhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

**-Dwebhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is yes.

**-Dwebhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

**-Dwebhelp.show.side.toc**

Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

**-Dwebhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

**-Dwebhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

**Note:** Note that the fix.external.refs.com.oxygenxml parameter is not supported in Oxygen XML WebHelp plugin. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

## Further Customization

If you need to further customize the transformation process, you can append other DITA-OT parameters as well. Any parameter that you want to append must follow the -D model of the above parameters. For example, to append the args.csspath parameter, use:

```
-Dargs.csspath=[CSS_FILE_PATH]
```

where [CSS\_FILE\_PATH] is the location of the directory that contains the CSS file.

## Related information

[DITA OT Parameter Reference](#)

### Configuring the Comment Database for DITA WebHelp Systems with Feedback

If you run the [webhelp-responsive](#) or [webhelp-feedback](#) transformation using the WebHelp plugin, you need to configure the database that holds the user comments.

The instructions for configuring the database are presented in the `installation.html` file, located at: [DITA\_MAP\_BASE\_DIR]/out/[TRANSFORM\_TYPE]/oxygen-webhelp/resources. The `installation.html` file is created by the transformation process.

### Building Oxygen XML WebHelp Output on Jenkins

This procedure assumes that you have already [integrated, configured, and registered the WebHelp plugin with the DITA Open Toolkit](#).

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML WebHelp.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```
<properties>
 <oxygen-webhelp>${basedir}/tools/DITA-OT1.8.5/
 plugins/com.oxygenxml.webhelp</oxygen-webhelp>
</properties>

<plugin>
 <artifactId>exec-maven-plugin</artifactId>
 <groupId>org.codehaus.mojo</groupId>
 <executions>
 <execution><!-- Run our version calculation script -->
 <id>Version Calculation</id>
 <phase>generate-sources</phase>
 <goals>
 <goal>exec</goal>
 </goals>
 <configuration>
 <executable>${oxygen-webhelp}/ditaWebhelp.bat</executable>
 </configuration>
 </execution>
 </executions>
</plugin>
```

**Note:** In the fragment above it is assumed that you are using DITA-OT version 1.8.5. If you are using another version, please adjust the path accordingly.

3. Go to the Jenkins top page and [create a new Jenkins job](#). Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

### Building Oxygen XML WebHelp Output on Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you setup a Travis continuous integration job that automatically publishes your DITA project to [GitHub pages](#) after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

#### Enable the Travis CI Build

1. [Sign in to Travis CI](#) with your GitHub account, accepting the GitHub [access permissions confirmation](#).
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your [profile page](#) and enable Travis CI for the repository you want to build.

#### Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the `.travis` folder from [here](#) to the root directory of your project.

- In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```
language: dita
install:
 - echo "Installed"
script:
 - sh .travis/publish.sh
after_success:
 - sh .travis/deploy.sh
env:
 global:
 - DITAMAP=/path/to/your/ditamap/file
 - DITAVAL=/path/to/your/ditaval/file
 - ANT_OPTS=-Xmx1024M
```

**Note:** Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your DITA Map and ditaval files.

- Create a GitHub personal access token by following [this procedure](#).
- Define an environment variable in the repository settings that has the name GH\_TOKEN and the value equal with the GitHub personal access token created earlier.

## Register Your License Key

- Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

```
licenseKey.txt
```

- Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

**Important:** The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

- Encrypt the `license key file` and add it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

## Commit to GitHub

- Commit the following files and folders and push the commit to GitHub:

```
git add .gitignore licenseKey.txt.enc .travis.yml .travis/
git commit -m "Set up the Travis CI publishing system"
git push
```

- Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure [here](#).

## Oxygen XML WebHelp Plugin for DocBook

To transform DocBook documents using the Oxygen XML WebHelp plugin, first integrate the plugin with the DocBook XSL distribution. The purpose of the integration is to add the following transformation types to the DocBook XSL distribution:

- webhelp** - The transformation that produces *WebHelp Classic* output for desktop.
- webhelp-feedback** - The transformation that produces feedback-enabled *WebHelp Classic with Feedback* for desktop.
- webhelp-mobile** - The transformations that produce *WebHelp Classic Mobile* output for mobile devices.
- webhelp-responsive** - The transformation that produces *WebHelp Responsive* and *WebHelp Responsive with Feedback* output for desktop and mobile devices.

## Integrating the Oxygen XML WebHelp Plugin with the DocBook XSL Distribution

The WebHelp plugin transformations run as an Ant build script. The requirements are:

- Ant 1.8 or later
- Java Virtual Machine 1.6 or later
- DocBook XSL 1.78.1 or later
- Saxon 6.5.5
- Saxon 9.1.0.8

To integrate the Oxygen XML WebHelp plugin with the DocBook XSL distribution, follow these steps:

1. Download and install a [Java Virtual Machine](#) 1.6 or later.
2. Download and install [Ant 8.0](#) or later.
3. Download and unzip the DocBook XSL distribution on your computer.
4. Unzip the Oxygen XML WebHelp distribution package in the DocBook XSL installation directory.  
The DocBook XSL directory now contains a new subdirectory named com.oxygenxml.webhelp and two new files, oxygen\_custom.xsl and oxygen\_custom\_html.xsl.
5. Download and unzip [saxon6-5-5.zip](#) on your computer.
6. Download and unzip [saxonb9-1-0-8j.zip](#) on your computer.

### Licensing the Oxygen XML WebHelp Plugin for DocBook

To register the license for the Oxygen XML WebHelp plugin for the DocBook XSL distribution, follow these steps:

1. Create a licenseKey.txt file in the com.oxygenxml.webhelp subdirectory of the DocBook XSL directory.
2. In this file, copy the license key that you purchased for your Oxygen XML WebHelp plugin.

The WebHelp transformation process reads the Oxygen XML Editor license key from this file. If the file does not exist, or it contains an invalid license, an error message is displayed.

### Upgrading the Oxygen XML WebHelp Plugin for DocBook

To upgrade your Oxygen XML WebHelp plugin for DocBook, follow these steps:

1. Navigate to the [OXYGEN\_INSTALL\_DIR]/frameworks/docbook/xsl directory and delete the old Oxygen XML WebHelp plugin files (oxygen\_custom.xsl, oxygen\_custom\_html.xsl) and directory (com.oxygenxml.webhelp).
2. Go to [Oxygen XML WebHelp website](#), download the latest installation kit, and unzip it.
3. Copy the com.oxygenxml.webhelp directory in [OXYGEN\_INSTALL\_DIR]/frameworks/docbook/xsl.

### Running an External DocBook Transformation Using the WebHelp Plugin

To run a DocBook to WebHelp ([webhelp](#), [webhelp-feedback](#), [webhelp-mobile](#)) transformation using the Oxygen XML WebHelp plugin, use:

- The docbook.bat script file for Windows based systems.
- The docbook.sh script file for Unix/Linux based systems.

**Note:** You can call these files in an automated process or from the command line.

The docbook.bat and the docbook.sh files are located in the home directory of the Oxygen XML WebHelp Plugin. Before using them to generate an WebHelp system, customize them to match the paths to the JVM, DocBook XSL distribution and Saxon engine, and also to set the transformation type. To do this, open a script file and edit the following variables:

- JVM\_INSTALL\_DIR - Specifies the path to the Java Virtual Machine installation directory on your disk.
- ANT\_INSTALL\_DIR - Specifies the path to the installation directory of Ant.
- SAXON\_6\_DIR - Specifies the path to the installation directory of Saxon 6.5.5.
- SAXON\_9\_DIR - Specifies the path to the installation directory of Saxon 9.1.0.8.
- DOCBOOK\_XSL\_DIR - Specifies the path to the installation directory of the DocBook XSL distribution.
- TRANSTYPE - Specifies the type of the transformation you want to apply. You can set it to webhelp, webhelp-feedback and webhelp-mobile.
- INPUT\_DIR - Specifies the path to the input directory, containing the input XML file.
- XML\_INPUT\_FILE - Specifies the name of the input XML file.
- OUTPUT\_DIR - Specifies the path to the output directory where the transformation output is generated.
- DOCBOOK\_XSL\_DIR\_URL - Specifies the path to the directory of the DocBook XSL distribution in URL format.

### Additional Oxygen XML WebHelp Plugin Parameters for DocBook

You can append the following parameters to the command line that runs the transformation:

#### -Dwebhelp.copyright

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

#### **-Dwebhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

#### **-Dwebhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
<div id="fb-root" />
<script>
<!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
if (d.getElementById(id)) return;
js = d.createElement(s); js.id = id;
js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
fjs.parentNode.insertBefore(js, fjs);
(document, 'script', 'facebook-jssdk')) -->
</script>
<div data-share="true" data-show-faces="true" data-action="like"
data-layout="standard" class="fb-like"/>
</div></pre>
```

#### **-Dwebhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

#### **-Dwebhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

#### **-Dwebhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the -D model of the above parameters. For example, you can append the html.stylesheet parameter in the following form:

```
-Dhtml.stylesheet=/path/to/directory/of/stylesheet.css
```

### **Configuring the Comment Database for DocBook WebHelp Classic with Feedback**

If you run the **webhelp-feedback** transformation using the WebHelp plugin, you need to configure the database that holds the user comments. The instructions for configuring the database are presented in the `installation.html` file, located at: [OUTPUT\_DIR]/oxygen-webhelp/resources/installation.html. The `installation.html` file is created by the transformation process.

## Topics:

- [Working with XPath Expressions](#)
- [Working with XQuery](#)

This chapter includes information about running XPath expressions and working with the XQuery language. Each mechanism has some useful features and tools to help you use them, and Oxygen XML Editor has some unique methods of handling each mechanism.

## Working with XPath Expressions

XPath is a language for addressing specific parts of an XML document. XPath, such as the Document Object Model (DOM), models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the XML document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

- `child::*` - Selects all children of the root node.
- `./name` - Selects all elements having the name "name", descendants of the current node.
- `/catalog/cd[price>10.80]` - Selects all the cd elements that have a price element with a value larger than 10.80.

To find out more about XPath, go to <http://www.w3.org/TR/xpath>.

## XPath Toolbar

XPath is a query language for selecting nodes from an XML document. To use XPath expressions effectively, you need a good understanding of [the XPath Core Function Library](#).

### XPath Toolbar

Oxygen XML Editor provides an XPath toolbar to let you query XML documents fast and easy using XPath expressions.

**Figure 467: XPath Toolbar**

The XPath toolbar includes the following features:

## XPath version chooser drop-down menu

You can choose the XPath version from the drop-down menu available in the left side of the toolbar. Available options include **XPath 1.0**, **XPath 2.0**, **XPath 2.0 SA**, **XPath 3.0**, **XPath 3.0 SA**.

**Note:** The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

 **Warning:** Oxygen XML Editor uses Saxon to execute XPath 3.0 expressions, but implements a part of the 3.0 functions. When using a function that is not implemented, Oxygen XML Editor can return a compilation error.

## XPath scope menu

Oxygen XML Editor allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Current selected file only.
-  **Project** - All the files in the project.
-  **Selected project resources** - The files selected in the project.
-  **All opened files** - All files opened in the application.
-  **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view.
-  **Opened archive** - Files open in the [Archive Browser](#) view.
-  **Working sets** - The selected working sets.

At the bottom of the scope menu the following scope configuration actions are available:

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
-  **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

## History drop-down list

The XPath combo box keeps a history of the last 15 expressions that were used so that you can easily choose them again.

## Switch to XPath Builder View

Opens the [XPath Builder](#) view.

## Settings menu

The following actions are available in this drop-down menu:

-  **Update on cursor move** - When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
-  **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

**Note:** The  **Evaluate as you type** option and the automatic validation are disabled when you edit [huge documents](#) or when the scope is other than **Current file**.

-  **Options** - Opens the Preferences page of the currently selected processing engine.

**Note:** During the execution of an XPath expression, the XPath toolbar displays a  **Stop** button. Press this button to stop the XPath execution.

When you type expressions longer than 60 characters, a dialog box opens that offers you the possibility to switch to the **XPath Builder view**.

## Related information

[XPath Expression Results View](#) on page 931

## XPath/XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath and XQuery expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, or XQuery expressions, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened from the **Window > Show View** menu. You can also open it simply by pressing the  **Switch to XPath Builder View** button that is located on the [XPath toolbar](#).

The upper part of the view contains the following actions:

### XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, XQuery 1.0, XQuery 3.0, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:** The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:** Oxygen XML Editor uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor returns a compilation error.

### Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the [Results view](#).

### Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor automatically groups favorites in folders named after the method of execution.

### History drop-down menu

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the  **Clear history** action from the bottom of the list to remove them.

### Settings drop-down menu

Contains the following three options:

-  **Update on cursor move** - When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
-  **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

**Note:** The  **Evaluate as you type** option and the automatic validation are disabled when you edit [huge documents](#) or when the scope is other than **Current file**.

- **Options** - Opens the Preferences page of the currently selected processing engine.

### XPath scope menu

Oxygen XML Editor allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Project** - All the files in the project.
- **Selected project resources** - The files selected in the project.
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view.
- **Opened archive** - Files open in the *Archive Browser* view.
- **Working sets** - The selected working sets.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

The screenshot shows the Oxygen XML Editor's XPath/XQuery Builder View. The code editor contains an XQuery script named 'authors.xquery'. The script declares namespaces foroxy and saxon, defines a variable \$library to 'books.xml', and performs a query to list authors based on their titles. A tooltip for the 'adjust-date-to-timezone' function is displayed, providing its definition and usage example. The code editor interface includes tabs for XQuery 1.0 and XSLT 2.0, and a toolbar with various icons.

```

XPath/XQuery Builder - authors.xquery
XQuery 1.0 ▶
Scope: Current File
1 (: You can activate the content completion by pressing the Ctrl+Space keys. :)
2 xquery version "1.0";
3
4 (: Namespace for the <oxy/> custom functions and variables :)
5 declare namespace oxy="http://www.oxygenxml.com/xquery/functions";
6
7 (: The URI of the document that is to be queried :)
8 declare variable $oxy:document-to-query as xs:string := "books.xml";
9
10 (: Queries an XML document for authors
11 declare function oxy:list-authors($d
12
13 let $library := doc($document)
14 let $seq := $library//author
15 let $distinct := distinct-values($seq)
16
17 for $a in $distinct
18 return
19 <author>
20 <name> {$a} </name>
21 {
22 for $book in $library/library/publications
23 where (compare($book/author, $a)
24 return $book/title
25 }
26 </author>
27 };
28
29 <author_list>
30 {oxy:list-authors($oxy:document-to-query)}
31 </author_list>
32

```

**Figure 468: XPath/XQuery Builder View**

While you edit an XPath or XQuery expression, Oxygen XML Editor assists you with the following features:

- **Content Completion Assistant** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the **Content Completion Assistant** also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlight - Allows you to identify the components of an expression. To customize the colors of the components of the expression, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.
- Automatic validation of the expression as you type.

**Note:** When you type invalid syntax a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut, Copy, Paste, Select All, Undo, Redo**) are available in the contextual menu of the top editable part of the view.

#### Related information

[XPath Expression Results View](#) on page 931

## XPath Expression Results View

When you run an XPath expression, Oxygen XML Editor displays the results of its execution in the [Results view](#).

This view contains the following columns:

- **Description** - The result that Oxygen XML Editor displays when you run an XPath expression.
- **Resource** - The name of the document that you run the XPath expression on.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. To group the results by their resource, or by their system id, right-click the header of any column in the results view and select **Group by "Resource"** or **Group by "System ID"**. If no information regarding location is available, Oxygen XML Editor displays **Not available** in the **Location** column. Oxygen XML Editor displays the results in a valid XPath expression format.

Description	XPath location	Resource	Location
Boss	/personnel[1]/person[1]/name[1]/family[1]	personal.xml	6:13
Worker	/personnel[1]/person[2]/name[1]/family[1]	personal.xml	14:13
Worker	/personnel[1]/person[3]/name[1]/family[1]	personal.xml	22:13
Worker	/personnel[1]/person[4]/name[1]/family[1]	personal.xml	30:13
Worker	/personnel[1]/person[5]/name[1]/family[1]	personal.xml	38:13
Worker	/personnel[1]/person[6]/name[1]/family[1]	personal.xml	46:13

Figure 469: XPath Results Highlighted in Editor Panel with Character Precision

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `// chapter` in the XPath expression field and press **(Enter)**. This action returns all the chapter nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all example nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor adds a result in the **Results View** for each example node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the example node is located in the first chapter, third section level one, seventh section level 2.

## XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through the [XML catalogs](#). These catalogs are [configured in the Preferences](#) pages and [the current XInclude preferences](#).

As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an XML catalog, specify the class name of the XML catalog enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```
let $docs := collection(iri-to-uri(
 "file:///D:/temp/test/XQuery-catalog/mydocsdir?reurse=yes;select=*.xml;
 parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
```

## XPath Prefix Mapping

To define default mappings between prefixes (that you can use in the [XPath toolbar](#)) and namespace URIs go to the [XPath preferences page](#) and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

**Important:** If you define a default namespace, Oxygen XML Editor binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `level` elements when you define a default namespace in the root element, use this expression: `// default:level` in the XPath toolbar.

## Working with XQuery

XQuery is the query language for XML and is officially defined by a [W3C Recommendation document](#). The many benefits of XQuery include:

- XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.

- XQuery allows you to query both relational sources and XML sources, and create one XML result.

## XQuery Syntax Highlights and Content Completion

To [create an XQuery document](#), select **File > New (Ctrl (Meta on Mac OS)+N)** and when the **New** document wizard appears, select XQuery entry.

Oxygen XML Editor provides syntax highlight for keywords and all known XQuery functions and operators. A **Content Completion Assistant** is also available and can be activated with the **(Ctrl (Meta on Mac OS)+Space)** shortcut. The functions and operators are presented together with a description of the parameters and functionality. For some supported database engines such as eXist and Berkeley DB, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario that uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the [XQuery Preferences](#) page.

The extension functions included in the Saxon product are available on content completion if one of the following conditions are true:

- The edited file has a transformation scenario associated that uses as transformation engine Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE.
- The validation engine specified in [Preferences](#) is Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE.

If the Saxon namespace (<http://saxon.sf.net>) is mapped to a prefix, the functions are presented using this prefix. Otherwise, the default prefix for the Saxon namespace (saxon) is used.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix, the XQuery functions from this namespace offered by content completion are also prefixed. Otherwise, only the function name being used.

The content completion pop-up window presents all the variables and functions from both the edited XQuery file and its imports.

```

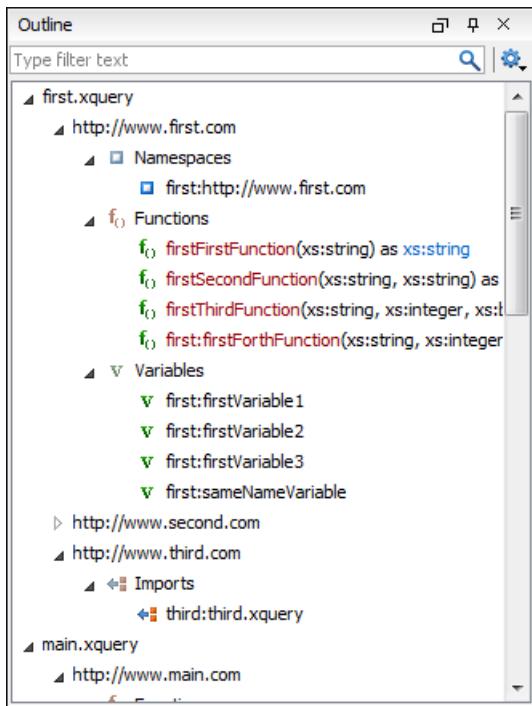

7 where (exists($link/@manager) and
8 (compare($link/@manager, "Big.Boss") eq 0))
9 return
10 <person id
11 <name>
12 </name>
13 }
14 </BigBoss_subo
15

```

**Figure 470: XQuery Content Completion**

## XQuery Outline View

The XQuery document structure is presented in the **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 471: XQuery Outline View**

The following actions are available in the **Settings** menu on the **Outline** view toolbar:

#### **Selection update on cursor move**

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

#### **Sort**

Allows you to alphabetically sort the XQuery components.

#### **Show all components**

Displays all collected components starting from the current file. This option is set by default.

#### **Show only local components**

Displays the components defined in the current file only.

#### **Group by location/namespace/type**

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, **(Enter)**, **(Tab)**, **(Shift-Tab)**. To switch from tree structure to the filter text field, you can use **(Tab)**, **(Shift-Tab)**.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

## XPath/XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath and XQuery expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, or XQuery expressions, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened from the **Window > Show View** menu. You can also open it simply by pressing the  **Switch to XPath Builder View** button that is located on the **XPath toolbar**.

The upper part of the view contains the following actions:

### XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, XQuery 1.0, XQuery 3.0, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:** The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:** Oxygen XML Editor uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor returns a compilation error.

### Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view**.

### Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor automatically groups favorites in folders named after the method of execution.

### History drop-down menu

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the  **Clear history** action from the bottom of the list to remove them.

### Settings drop-down menu

Contains the following three options:

-  **Update on cursor move** - When enabled and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
-  **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

**Note:** The  **Evaluate as you type** option and the automatic validation are disabled when you edit **huge documents** or when the scope is other than **Current file**.

-  **Options** - Opens the Preferences page of the currently selected processing engine.

### XPath scope menu

Oxygen XML Editor allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Current selected file only.

- **Project** - All the files in the project.
- **Selected project resources** - The files selected in the project.
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view.
- **Opened archive** - Files open in the *Archive Browser* view.
- **Working sets** - The selected working sets.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

The screenshot shows the 'XPath/XQuery Builder - authors.xquery' window in Oxygen XML Editor. The code being edited is:

```

1 (: You can activate the content completion by pressing the Ctrl+Space keys. :)
2 xquery version "1.0";
3
4 (: Namespace for the <oXygen/> custom functions and variables :)
5 declare namespace oxy="http://www.oxygenxml.com/xquery/functions";
6
7 (: The URI of the document that is to be queried :)
8 declare variable $oxy:document-to-query as xs:string := "books.xml";
9
10 (: Queries an XML document for authors
11 declare function oxy:list-authors($d
12
13 let $library := doc($document)
14 let $seq := $library//author
15 let $distinct := distinct-values($seq)
16
17 for $a in $distinct
18 return
19 <author>
20 <name> {$a} </name>
21 {
22 for $book in $library/library/public
23 where (compare($book/author, $a)
24 return $book/title
25 }
26 </author>
27 };
28
29 <author_list>
30 {oxy:list-authors($oxy:document-to-query)}
31 </author_list>
32

```

A tooltip is displayed over the function call 'adjust-date-to-timezone(\$arg)'. The tooltip contains the following information:

**adjust-date-to-timezone(\$arg as xs:date?) as xs:date?**

Adjusts an xs:date value to the value of the implicit timezone in the dynamic context.  
If \$arg is the empty sequence, then the result is the empty sequence.

<http://www.w3.org/TR/xquery-operators/>

Figure 472: XPath/XQuery Builder View

While you edit an XPath or XQuery expression, Oxygen XML Editor assists you with the following features:

- **Content Completion Assistant** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the **Content Completion Assistant** also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- Syntax Highlight - Allows you to identify the components of an expression. To customize the colors of the components of the expression, [open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Syntax Highlight](#).
- Automatic validation of the expression as you type.

**Note:** When you type invalid syntax a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut, Copy, Paste, Select All, Undo, Redo**) are available in the contextual menu of the top editable part of the view.

#### Related information

[XPath Expression Results View](#) on page 931

## XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the **XSLT/XQuery Input** view. If the view is not displayed, it can be opened from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

### XSLT

If you click a node in the **XSLT/XQuery Input** view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting `xsl:template`, `xsl:for-each`, or other XSLT elements that have the `match/select/test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

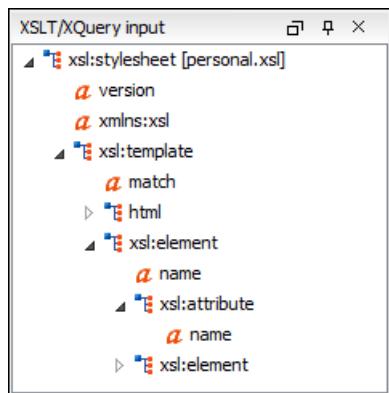

Figure 473: XSLT Input View

### XSLT Example:

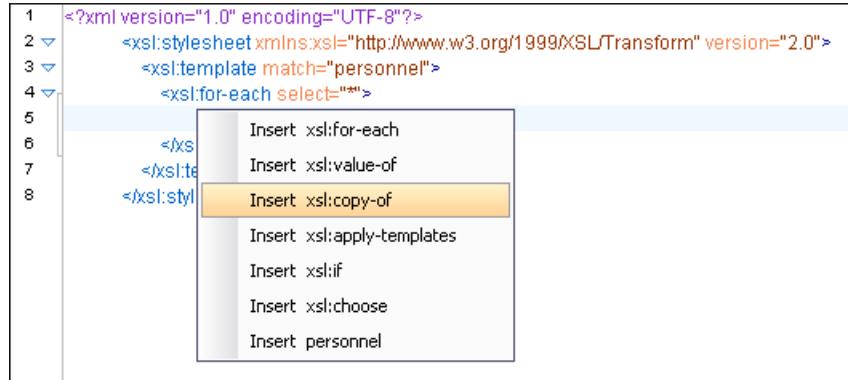

For the following XML document:

```
<personnel>
 <person id="Big.Boss">
 <name>
 <family>Boss</family>
 <given>Big</given>
 </name>
 <email>chief@oxygenvxml.com</email>
 <link subordinates="one.worker"/>
 </person>
 <person id="one.worker">
 <name>
 <family>Worker</family>
 <given>One</given>
 </name>
 <email>one@oxygenvxml.com</email>
 <link manager="Big.Boss"/>
 </person>
</personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 version="2.0">
 <xsl:template match="personnel">
 <xsl:for-each select="*">
 </xsl:for-each>
 </xsl:template>
 </xsl:stylesheet>
```

if you drag the given element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

**Figure 474: XSLT Input Drag and Drop Pop-up Menu**

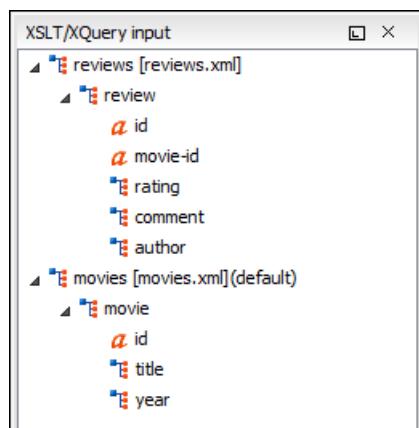

If you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
 <xsl:template match="personnel">
 <xsl:for-each select="*"/>
 <xsl:copy-of select="name/given"/>
 </xsl:for-each>
 </xsl:template>
</xsl:stylesheet>
```

**Figure 475: XSLT Input Drag and Drop Result**

## XQuery

You can also use the **XSLT/XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

**Figure 476: XQuery Input View**

## XQuery Example:

For the following XML documents:

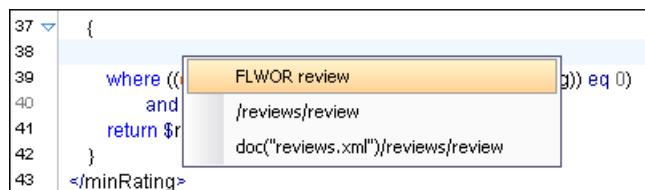

```
<movies>
<movie id="1">
<title>The Green Mile</title>
<year>1999</year>
</movie>
<movie id="2">
<title>Taxi Driver</title>
<year>1976</year>
</movie>
</movies>

<review id="104" movie-id="2">
<rating>4</rating>
<comment>Robert De Niro is my favorite actor.</comment>
<author>Maria</author>
</review>
</reviews>
```

and the following XQuery:

```
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{
}
</maxRating>
</movie>
```

If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

**Figure 477: XQuery Input Drag and Drop Pop-up Menu**

Select **FLWOR review**, the resulting document will look like this:

```
37 {
38 for $review in doc("reviews.xml")/reviews/review
39 return
40 where ((compare($rev/rating/text(), string($minRating)) eq 0)
41 and ($rev/@movie-id = $movie/@id))
42 return $rev/author
43 }
```

**Figure 478: XQuery Input Drag and Drop Result**

## XQuery Validation

With Oxygen XML Editor, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 9.6.0.7 PE processor or the 9.6.0.7 EE, IBM DB2, eXist, Berkeley DB XML,

Documentum xDB (X-Hive/DB) 10, or MarkLogic (version 5 or newer) if you installed them. Any other XQuery processor that offers an [XQJ API implementation](#) can also be used. This is in conformance with [the XQuery Working Draft](#). The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

The screenshot shows the Oxygen XML Editor interface with an XQuery file named 'personal.xquery' open. The code editor displays the following XQuery:

```

1 (: You can activate the content completion by pressing the Ctrl+Space keys.
2
3 <BigBoss_subordinates>
4 {
5 for $person in doc("personal.xml")/personnel/person
6 let $link := $person/link
7 where (exists($link/@manager) and (compareee($link/@manager, "Big.Boss"))
8 return
9 <person id="{$person/@id}">
10 <name>{$person/name/given/text(), " ", $person/name/family,
11 />
12
```

A red squiggly underline is under the expression `(exists($link/@manager) and (compareee($link/@manager, "Big.Boss")))`, indicating a static error. A tooltip message 'Unknown system function' appears over the error. Below the editor, the 'Messages' view shows one error entry:

Info	Description - 1 item	Resource	Loca
<span style="color: red;">●</span>	F [Saxon-PE XQuery 9.2.1.2] XQuery static error in #...ink/@manager, "Big.Boss") eq 0 #: Unknown system function	personal.xquery	7:0

**Figure 479: XQuery Validation**

**Note:** If you choose a processor that does not support XQuery validation, Oxygen XML Editor displays a warning when trying to validate.

The **Validation options** button, available in the **Document > Validate** menu, allows quick access to the [XQuery options](#) in the Oxygen XML Editor preferences.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation better resolves imports.

## Transforming XML Documents Using XQuery

XQuery is similar to XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you [define the transformation scenario](#). The result can be saved and opened in the associated application. You can even run a [FO processor](#) on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are [exported](#) together with the XSLT scenarios and can be managed in [the Configure Transformation Scenario dialog box](#), or in [the Scenarios view](#). The transformation can be performed on the XML document specified in the **XML URL** field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in [the Parameters dialog box](#). Parameters that are in a namespace must be specified using the qualified name (for example, a `param` parameter in the `http://www.oxygenxml.com/ns` namespace must be set with the name `{http://www.oxygenxml.com/ns}param`).

The transformation uses one of the Saxon 9.6.0.7 HE, Saxon 9.6.0.7 PE, Saxon 9.6.0.7 EE processors, a database connection (details can be found in the [Working with Databases](#) chapter - in the [XQuery transformation](#) section) or any XQuery processor that provides an XQJ API implementation.

The Saxon 9.6.0.7 EE processor also supports XQuery 3.0 transformations.

### XQuery XQJ Transformers

This section describes the necessary procedures before running an XQJ transformation.

## How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is [Zorba](#).

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to PATH - on Windows, to LD\_LIBRARY\_PATH - on Linux, or to DYLD\_LIBRARY\_PATH - on OS X. Restart Oxygen XML Editor after configuring the environment variables.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java(XQJ)** in the **Type** combo box.
6. Press the **Add** button to add XQJ API-specific files.  
You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.  
Oxygen XML Editor detects any implementation of javax.xml.xquery.XQDataSource and presents it in **Driver class** field.
7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.

## How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for this connection.
4. Select one of the previously configured **XQJ data sources** in the **Data Source** combo box.
5. Fill-in the connection details.

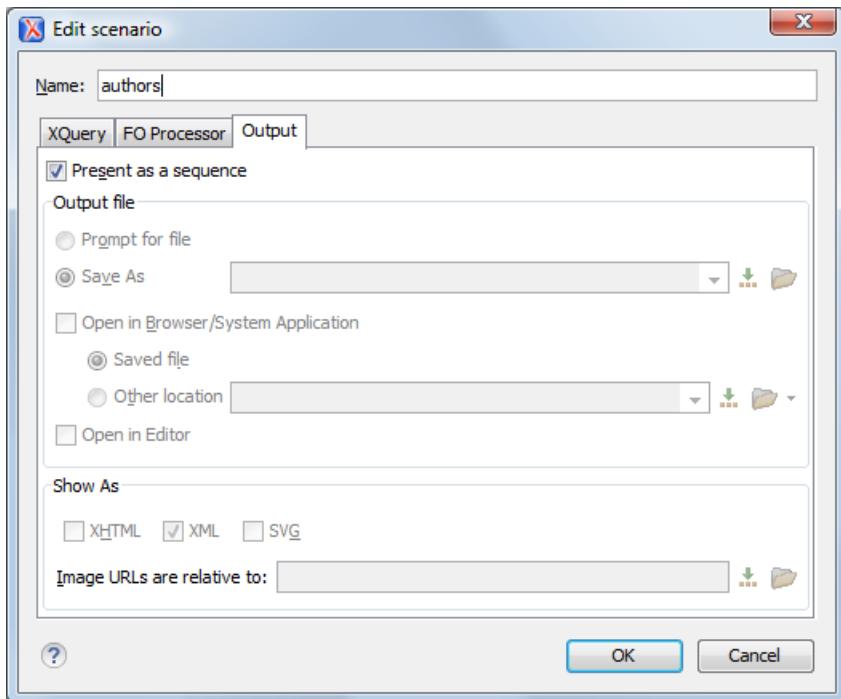

The properties presented in the connection details table are automatically detected depending on the selected data source.

6. Click the **OK** button.

## Display XQuery Result in Sequence View

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the [Present as a sequence option](#) in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

The size of a chunk can be set with the [Size limit of Sequence view option](#). The  [XQuery options](#) button from the **More results available** label provides a quick access to this option by opening the [XQuery preferences page](#) where the option can be modified.

**Figure 480: XQuery transformation result displayed in Sequence view**

A chunk of the XQuery transformation result is displayed in the **Sequence** view.

```

**Figure 481: XQuery transformation result displayed in Sequence view**

### Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

The advanced options for Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

#### Recoverable errors ("warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

### **Strip whitespaces ("strip")**

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

### **Optimization level ("opt")**

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

### **Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

### **Enable XQuery 3.0 support ("-qversion:(1.0|3.0)")**

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

### **Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

The following advanced options are specific for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

### **Use a configuration file ("-config")**

Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

### **Allow calls on extension functions ("-ext")**

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The advanced options that are specific for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

### **Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

### **Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

### **Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

### **Generate bytecode ("--generateByteCode:(on|off)")**

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#javadoc>.

### **Enable XQuery update ("-update:(on|off)")**

This option controls whether or not XQuery update syntax is accepted. The default value is off.

### **Backup files updated by XQuery ("-backup:(on|off)")**

If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

## **Updating XML Documents using XQuery**

Using the bundled Saxon 9.6.0.7 EE XQuery processor Oxygen XML Editor offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the [XQuery Update 1.0](#) standard.

Choose Saxon 9.6.0.7 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Editor will notify you if the update was successful.

### **Using XQuery Update to modify a tag name in an XML file**

```
rename node doc("books.xml")//publisher[1]//book[1] as "firstBook"
```

## Topics:

- [Browsing Archives](#)
- [Working with Archive Files](#)

Oxygen XML Editor includes a useful **Archive Browser** view that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the  **Browse for archived file** action to browse and select files from a particular archive.

## Browsing Archives

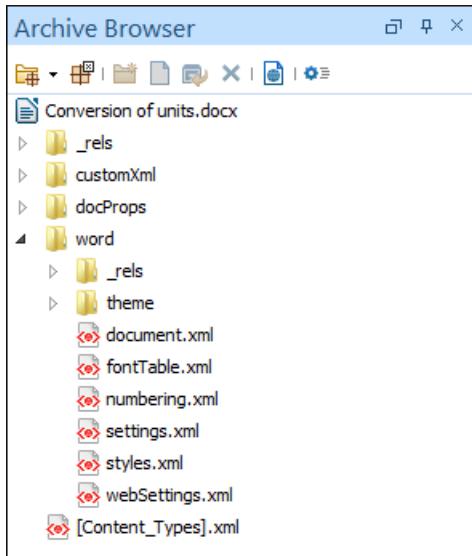

Oxygen XML Editor includes a helper view called the **Archive Browser** that allows you to view the contents and structure of an archive, and it offers a variety of toolbar and contextual menu actions. If the view is not displayed, it can be opened from the **Window > Show View** menu.

To open an archive in the **Archive Browser** view, use one of the following methods:

- Open an archive from the [Project view](#).
- Select an archive in one of the file chooser dialog boxes in Oxygen XML Editor (such as the [Open](#) dialog box).
- Drag an archive from a system file explorer and drop it in the **Archives Browser** view.

When displaying an archive, the **Archive Browser** view locks the archive file. It is then automatically unlocked when the **Archive Browser** view is closed.

**Tip:** If a file is not recognized by Oxygen XML Editor as a supported archive type, you can add it from the [Archive preferences page](#).

**Figure 482: Archive Browser**

### Archive Browser Toolbar Actions

The following actions are available on the **Archive Browser** toolbar:

#### **Open Archive menu**

Provides access to the **Open Archive** action that opens a new archive in the browser. If the extension is not known as an archive extension, you will be directed to the [Archive preferences page](#) to add a new extension. The sub-menu keeps a list of recently open archive files and a **Clear history** action that allows you to delete the list.

#### **Close**

Closes the browsed archive and unlocks the archive file.

#### **Validate (available for EPUB archives only)**

Checks the EPUB archive to see if its content and structure is valid.

#### **New folder**

Creates a folder as child of the selected folder in the browsed archive.

#### **New file**

Creates a file as child of the selected folder in the browsed archive.

#### **Add files**

Adds existing files as children of the selected folder in the browsed archive.

**Note:** You can also add files in the archive by dragging them from the file browser or the **Project** view and dropping them in the **Archive Browser** view.

#### **Delete**

Deletes the selected resource in the browsed archive.

#### **Open in System Application**

Opens the selected resource in the default system application that is associated with that type of file.

#### **Archive Options**

Opens the [Archive preferences page](#).

## Archive Browser Contextual Menu Actions

The following additional actions are available from the contextual menu for resources in the **Archive Browser** view:

**Open**  
Opens a resource from the archive in the editor.

### Extract

Extracts a resource from the archive in a specified folder.

**New folder**  
Creates a folder as child of the selected folder in the browsed archive.

**New file**  
Creates a file as child of the selected folder in the browsed archive.

**Add files**  
Adds existing files as children of the selected folder in the browsed archive.

**Note:** On OS X, the **Add file** action is also available and it allows you to add one file at a time.

### Rename

Renames a resource in the archive.

**Find/Replace in Files**  
Allows you to search for and replace specific pieces of text inside the archive.

**Cut**  
Cuts the selected archive resource.

**Copy**  
Copies the selected archive resource.

**Paste**  
Pastes a file or folder into the archive.

**Delete**  
Removes a file or folder from archive.

### Preview

Previews an image contained in the archive. See the [Image Preview](#) topic for more details.

### Copy location

Copies the URL location of the selected resource.

**Refresh**  
Refreshes the selected resource.

### Properties

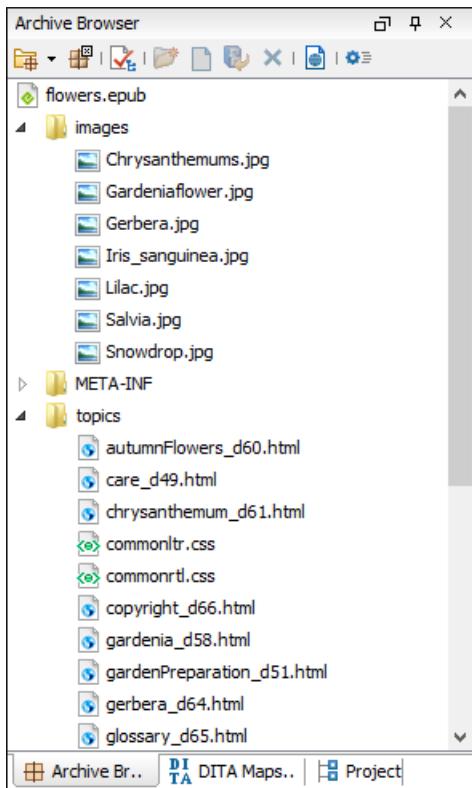

Shows the properties of the selected resource.

## Working with Archive Files

Oxygen XML Editor includes support for working with various types of archives. These include EPUB, OOXML, and ODF files.

When these types of files are opened in the **Archive Browser** view, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

**Figure 483: EPUB File Displayed in the Archive Browser View**

When an archive is expanded in the **Archive Browser** view, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to *edit them in the main editing pane and save changes* back to the archive. You can also use the  **Open in System Application** action to open the archive in the default system application that is associated with that type of file.

### EPUB-Specific Validation

When working with EPUB archives, the **Archive Browser** includes a  **Validate** action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor uses the open-source *EpubCheck* validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

To watch our video demonstration about EPUB support in Oxygen XML Editor, go to <https://www.oxygenxml.com/demo/Epub.html>.

### Related information

[The Archive Browser View](#) on page 945

## Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to **File > New** or click  **New** on the main toolbar.
2. Choose your particular type of archive template. For example, select one of the **ODF**, **OOXML**, or **EPUB** templates.
3. Click **Create** and choose the name and location of the file.
4. Click **Save**.

A skeleton archive is saved on disk and opened in the **Archive Browser** view.

**Tip:** Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the  **Validate** action to verify the integrity of the EPUB archive.

## Editing and Saving Files Inside an Archive

You can open files directly from an archive in the **Archive Browser** view and then edit them in the main editor pane. To open a file, simply double-click it or select  **Open** from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the [Messages preferences page](#).

## Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in the **Archive Browser**.
2. Open the **document.xml** file contained in the archive.
3. Run one of the following predefined transformation scenarios:
  - a) **DOCX DITA** to migrate to DITA.
  - b) **DOCX TEI P5** to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

**Tip:** Oxygen XML Editor also includes a predefined transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.

## Topics:

- [Working with Databases](#)
- [Content Management System \(CMS\) Integration](#)

Oxygen XML Editor provides support for connecting and integrating with various databases and content management systems. This section includes information about the database-related features in Oxygen XML Editor. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint and Documentum (CMS) integration.

## Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor offers the means for managing the interaction with some of the most commonly used databases (both *Relational* and *Native XML* databases). Through this interaction, Oxygen XML Editor helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

### Related information

[Integration with Microsoft SharePoint](#) on page 1005

## Data Source Explorer View

The **Data Source Explorer** view displays your database connections. You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Editor supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

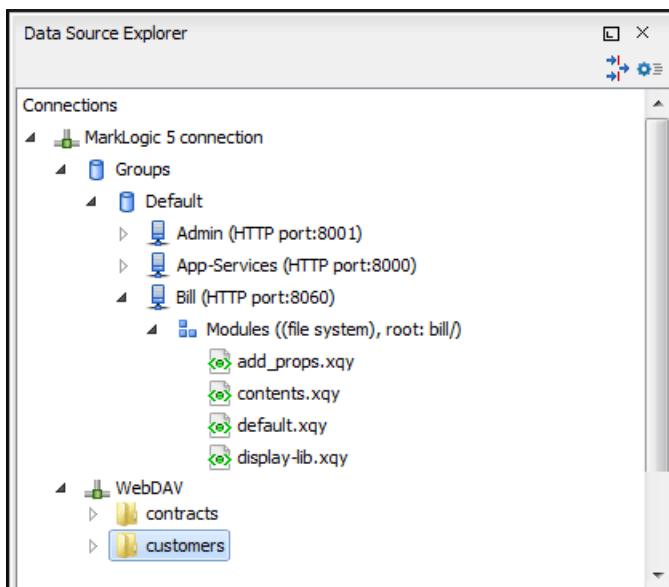

Figure 484: Data Source Explorer View

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project** view, a file browsing application, or another database.

### Toolbar Actions

The following actions are available in the toolbar of this view:

Opens the [Data Sources / Table Filters preferences page](#), allowing you to decide which table types are displayed in the **Data Source Explorer** view.

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

### Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node in which the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

### Related information

[Data Sources Preferences](#) on page 134

## Table Explorer View

Relational databases tables in the **Data Source Explorer** view can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a Table node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor attempts to update the database with the new cell content.

A screenshot of the Table Explorer view in Oxygen XML Editor. The window title is "Table Explorer". Inside, there is a data grid with 10 rows and 8 columns. The columns are labeled: ID [SMALLINT], NAME [VARCHAR], DEPT [SMALLINT], JOB [CHAR], YEARS [SMALLINT], SALARY [DECIMAL], and COMM [DECIMAL]. The data represents employees with their names, department IDs, job titles, years of service, salaries, and commissions. A vertical toolbar on the right side contains icons for copy, paste, cut, and delete operations. At the bottom, there are navigation buttons for rows and columns, and a status bar showing "1" and "111".

	ID [SMALLINT]	NAME [VARCHAR]	DEPT [SMALLINT]	JOB [CHAR]	YEARS [SMALLINT]	SALARY [DECIMAL]	COMM [DECIMAL]
0	10	Sanders	20	Mgr	7	98357.50	(null)
1	20	Pernal	20	Sales	8	78171.25	612.45
2	30	Marenghi	38	Mgr	5	77506.75	(null)
3	40	O'Brien	38	Sales	6	78006.00	846.55
4	50	Hanes	15	Mgr	10	80659.80	(null)
5	60	Quigley	38	Sales	(null)	66808.30	650.25
6	70	Rothman	15	Sales	7	76502.83	1152.00
7	80	James	20	Clerk	(null)	43504.60	128.20
8	90	Koonitz	42	Sales	6	38001.75	1386.70
9	100	Plotz	42	Mgr	7	78352.80	(null)

**Figure 485: Table Explorer View**

You can sort the content of a table by one of its columns by clicking its column header.

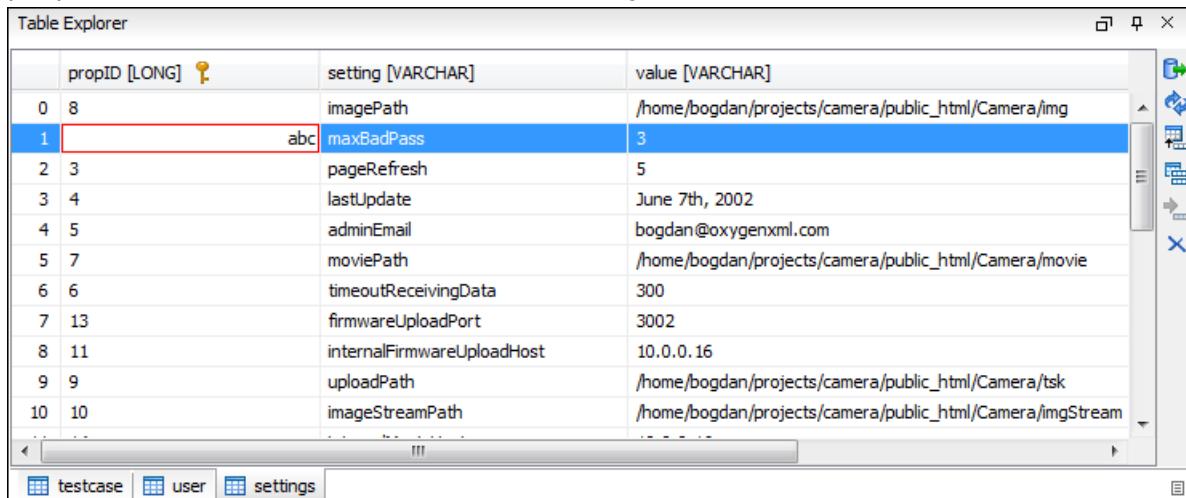

Note the following:

- The first column is an index (not part of the table structure)
- Every column header contains the field name and its data type
- The primary key columns are marked with this symbol:
- Multiple tables are presented in a tabbed manner

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the [Limit the number of cells option in the Data Sources Preferences page](#)). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, the cell is marked by a red square and remains in an editing state until a correct value is inserted. For example, in the following figure propID contains LONG values. If a character or string is inserted, the cell will look like this:

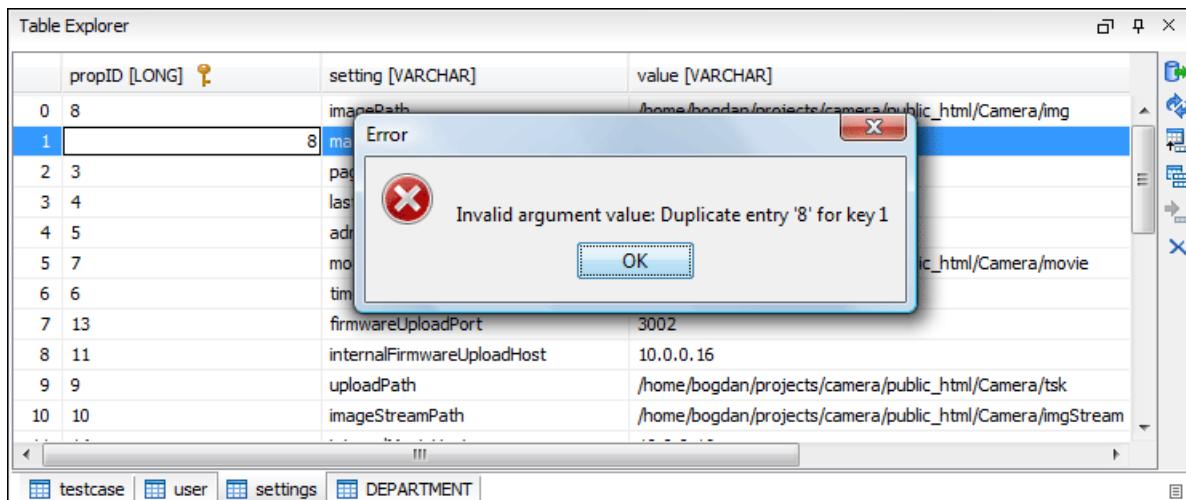

The screenshot shows the Table Explorer interface with a table named 'propID'. The columns are 'propID [LONG]', 'setting [VARCHAR]', and 'value [VARCHAR]'. The first two rows have valid values: row 0 has propID 8, setting imagePath, and value /home/bogdan/projects/camera/public\_html/Camera/img; row 1 has propID 1, setting maxBadPass, and value 3. The third row has propID 2, setting pageRefresh, and value 5. Rows 4 through 10 have various settings and values. The cell for propID 1 is highlighted with a red border, indicating it contains an invalid value.

	propID [LONG]	setting [VARCHAR]	value [VARCHAR]
0	8	imagePath	/home/bogdan/projects/camera/public_html/Camera/img
1	1	maxBadPass	3
2	3	pageRefresh	5
3	4	lastUpdate	June 7th, 2002
4	5	adminEmail	bogdan@oxygencxml.com
5	7	moviePath	/home/bogdan/projects/camera/public_html/Camera/movie
6	6	timeoutReceivingData	300
7	13	firmwareUploadPort	3002
8	11	internalFirmwareUploadHost	10.0.0.16
9	9	uploadPath	/home/bogdan/projects/camera/public_html/Camera/tsk
10	10	imageStreamPath	/home/bogdan/projects/camera/public_html/Camera/imgStream

**Figure 486: Cell Containing an Invalid Value**

- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

The screenshot shows the Table Explorer interface with the same 'propID' table. The cell for propID 1 is highlighted with a red border. A modal dialog box titled 'Error' is displayed, showing the message 'Invalid argument value: Duplicate entry '8' for key 1'. The 'OK' button is visible at the bottom of the dialog. The rest of the table data is visible in the background.

	propID [LONG]	setting [VARCHAR]	value [VARCHAR]
0	8	imagePath	/home/bogdan/projects/camera/public_html/Camera/img
1	8	maxBadPass	Error
2	3	pageRefresh	
3	4	lastUpdate	
4	5	adminEmail	
5	7	moviePath

**Figure 487: Duplicate Entry for Primary Key**

### Table Explorer Contextual Menu Actions

Common editing actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

#### Set NULL

Sets the content of the cell to *null*. This action is disabled for columns that cannot have a value of *null*.

### **Insert row**

Inserts an empty row in the table.

### **Duplicate row**

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

### **Commit row**

Commits the selected row.

### **Delete row**

Deletes the selected row.

### **Copy**

Copies the content of the cell.

### **Paste**

Pastes copied content into the selected cell.

## **Table Explorer Toolbar Actions**

The toolbar of the **Table Explorer** view also includes the following actions:

### **Export to XML**

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from database](#) chapter).

### **Refresh**

Performs a refresh for the sub-tree of the selected node.

### **Insert row**

Inserts an empty row in the table.

### **Duplicate row**

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

### **Commit row**

Commits the selected row.

### **Delete row**

Deletes the selected row.

## **Related information**

[Data Source Explorer View](#) on page 950

## **Database Connection Support**

Oxygen XML Editor offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the [Data Sources preferences page](#) and once configured, the database connections can be viewed and managed in the [Data Source Explorer view](#). Oxygen XML Editor also includes a [Database perspective](#) that helps you to manage databases.

The database support in Oxygen XML Editor offers a variety of capabilities, including:

- Browsing the structure of databases in the [Data Source Explorer view](#).
- Viewing relational tables in the [Table Explorer view](#).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

## **Relational Database Support**

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Editor also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

To watch our video demonstration about the integration between the relational databases and Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Author\\_Database\\_Integration.html](https://www.oxygenxml.com/demo/Author_Database_Integration.html).

## **Native XML Database Support**

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor offers support for the most commonly used native XML databases, including:

- Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDB (X-Hive/DB) 10
- Oracle XML DB
- Base X

To watch our video demonstration about the integration between the native XML databases and Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Author\\_Database\\_XML\\_Native.html](https://www.oxygenxml.com/demo/Author_Database_XML_Native.html).

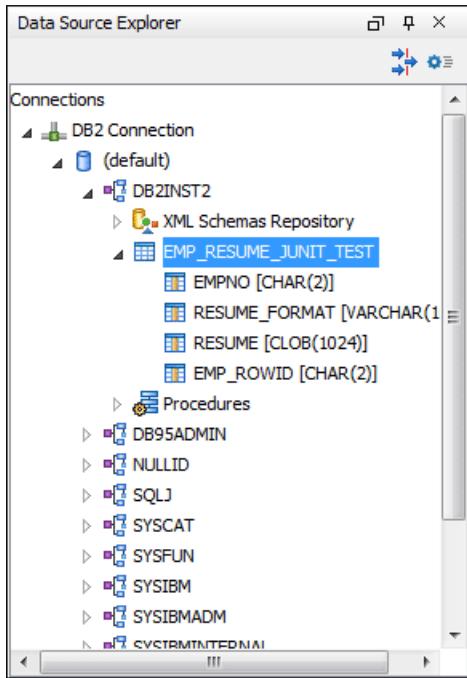

### **Related information**

[Integration with Microsoft SharePoint](#) on page 1005

### **IBM DB2 Database Connections**

Oxygen XML Editor includes support for IBM DB2 database connections. Oxygen XML Editor allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer** view, open tables in the **Table Explorer** view, and perform various operations on the resources in the repository.

**Figure 488: IBM DB2 Database Connection**

#### Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor for [configuring a DB2 data source](#).
2. [Configure IBM DB2 Data Source drivers](#).
3. [Configure an IBM DB2 Server Connection](#).
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### How to Configure IBM DB2 Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
4. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

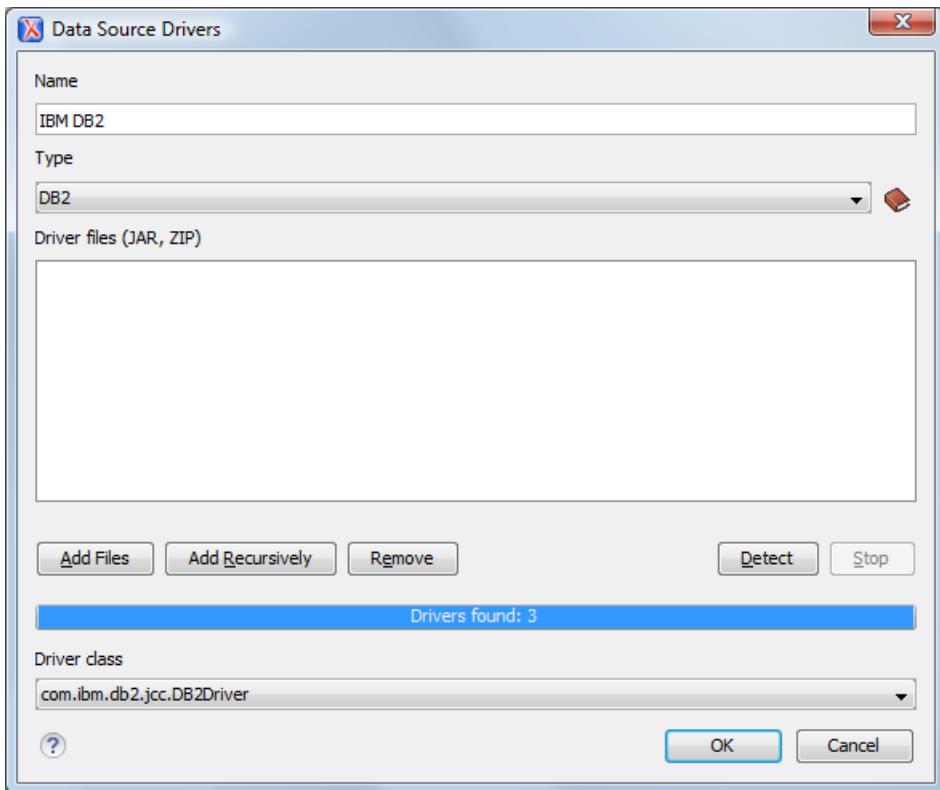

Figure 489: Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select **DB2** in the driver **Type** drop-down menu.
7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

The IBM DB2 driver files are:

- db2jcc.jar
- db2jcc\_license\_cisuz.jar
- db2jcc\_license\_cu.jar

8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to [configure your IBM DB2 connection](#).

To watch our video demonstration about running XQuery against an IBM DB2 Pure XML database, go to <https://www.oxygenxml.com/demo/DB2.html>.

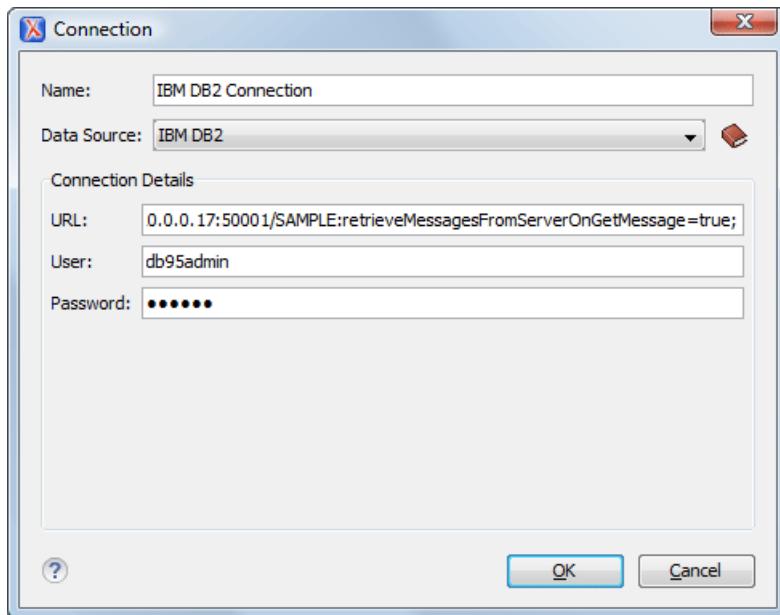

#### How to Configure an IBM DB2 Connection

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **+ New** button.

The dialog box for configuring a database connection is displayed.

**Figure 490: Connection Configuration Dialog Box**

3. Enter a unique name for the connection.
4. Select an **IBM DB2** data source in the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Enter the URL to the installed IBM DB2 engine.
  - b) Enter the user name to access the IBM DB2 engine.
  - c) Enter the password to access the IBM DB2 engine.
6. Click the **OK** button to finish the configuration of the database connection.

To watch our video demonstration about running XQuery against an IBM DB2 Pure XML database, go to <https://www.oxygenxml.com/demo/DB2.html>.

### IBM DB2 Contextual Menu Actions

#### General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

##### Refresh

Performs a refresh on the selected node.

##### Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

##### Configure Database Sources (available on Connection nodes)

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

##### Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

##### Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from Database](#) chapter).

## Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the various nodes in IBM DB2 connections include the following additional contextual menu actions:

### XML Schema Repository Level Nodes

#### Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

### Schema Level Nodes

#### Unregister

Removes the selected schema from the XML Schema Repository.

#### View

Opens the selected schema in Oxygen XML Editor.

## Microsoft SQL Server Database Connections

Oxygen XML Editor includes support for Microsoft SQL Server database connections. Oxygen XML Editor allows you to browse the structure of a SQL Server database in the **Data Source Explorer view**, open tables in the **Table Explorer view**, and perform various operations on the resources in the repository.

### Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014 go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
2. *Configure MS SQL Server Data Source drivers.*
3. *Configure a MS SQL Server Connection.*
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### How to Configure Microsoft SQL Server Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older, go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014, go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
2. *Open the Preferences dialog box (**Options > Preferences**) and go to **Data Sources**.*
3. Click the  **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

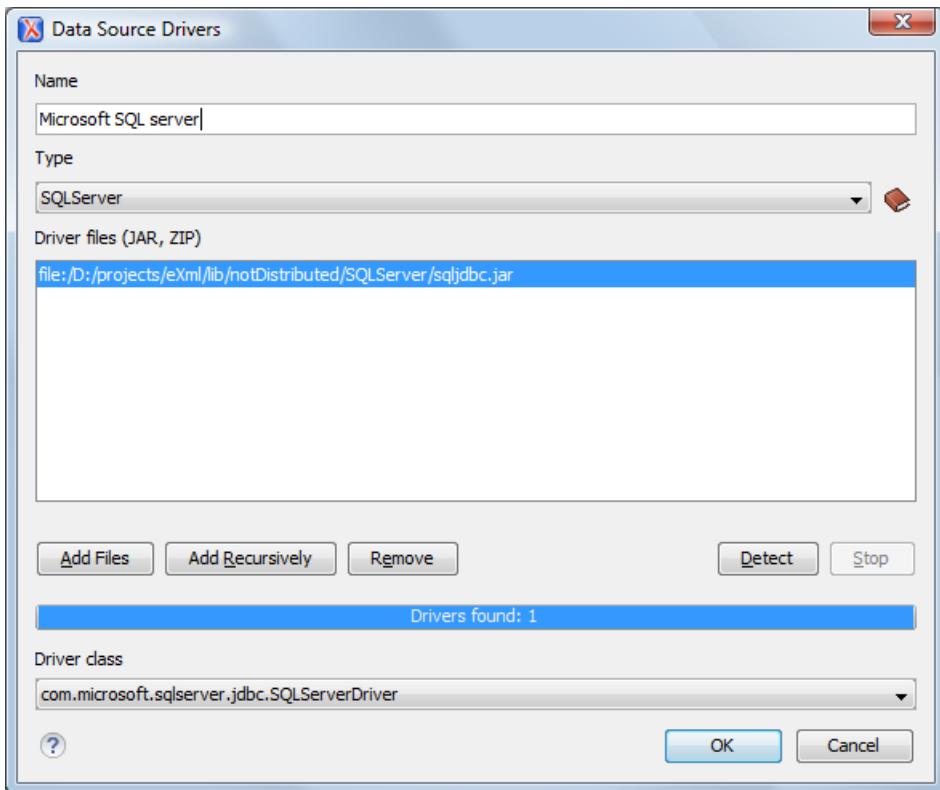

Figure 491: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select **SQLServer** in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded.  
The SQL Server driver file is called `sqljdbc.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Microsoft SQL Server connection](#).

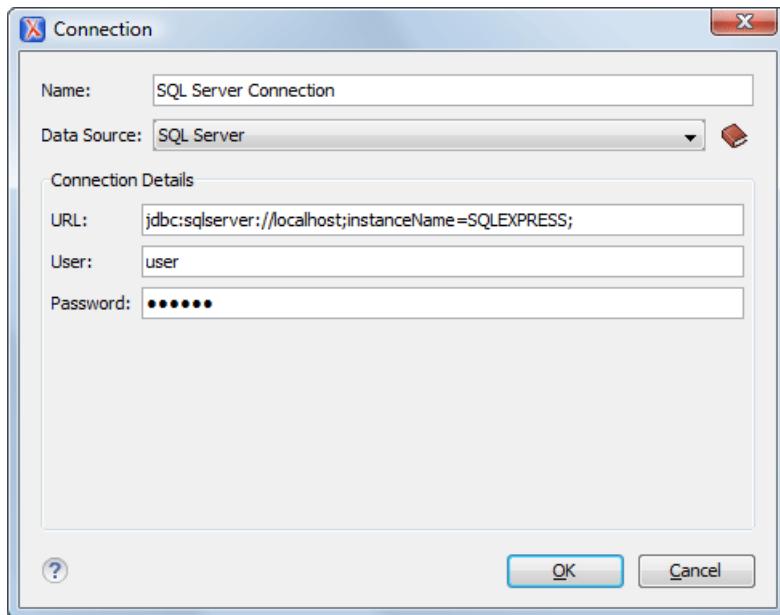

#### How to Configure a Microsoft SQL Server Connection

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **+ New** button.

The dialog box for configuring a database connection is displayed.

**Figure 492: Connection Configuration Dialog Box**

3. Enter a unique name for the connection.
4. Select the SQL Server data source in the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Enter the URL of the SQL Server server.

If you want to connect to the server using Windows integrated authentication, you must add ;integratedSecurity=true to the end of the URL. The URL will look like this:

```
jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
```

**Note:** For integrated authentication, leave the **User** and **Password** fields empty.
  - b) Enter the user name for the connection to the SQL Server.
  - c) Enter the password for the connection to the SQL Server.
6. Click the **OK** button to finish the configuration of the database connection.

#### Microsoft SQL Server Contextual Menu Actions

##### General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

##### ↻ Refresh

Performs a refresh on the selected node.

##### Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

##### ⚙️ Configure Database Sources (available on Connection nodes)

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

##### Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

## Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from Database](#) chapter).

## Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

### XML Schema Repository Level Nodes

#### Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

### Schema Level Nodes

#### Add

Adds a new schema to the XML Schema files.

#### Unregister

Removes the selected schema from the XML Schema Repository.

### View

Opens the selected schema in Oxygen XML Editor.

## Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Editor comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor allows you to browse Oracle repositories in the **Data Source Explorer view**, open tables in the **Table Explorer view**, and perform various operations on the resources in the repository.

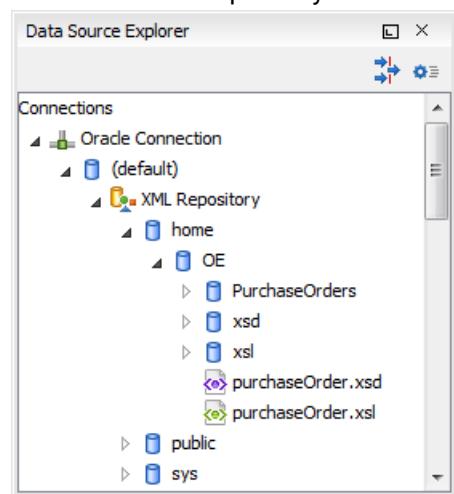

Figure 493: Oracle Database Connection

### Related information

[Using XQuery with Oracle XML DB](#)

### Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

1. Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called ojdbc6.jar.
2. [Configure Oracle 11g Data Source drivers](#).

3. *Configure an Oracle 11g Connection.*
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

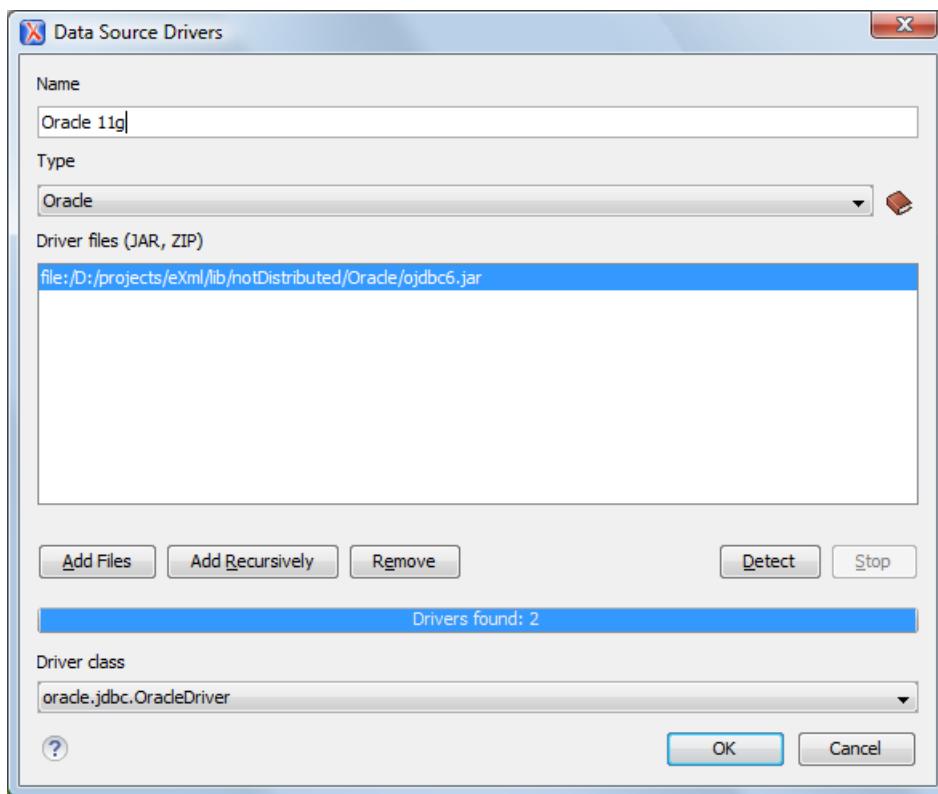

*How to Configure Oracle 11g Data Source Drivers*

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

1. Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called ojdbc6.jar.
2. *Open the Preferences dialog box (**Options > Preferences**) and go to **Data Sources**.*
3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

**Figure 494: Data Source Drivers Configuration Dialog Box**

4. Enter a unique name for the data source.
5. Select **Oracle** in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Oracle driver file that you downloaded.  
The Oracle driver file is called ojdbc5.jar.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to *configure your Oracle connection*.

*How to Configure an Oracle 11g Connection*

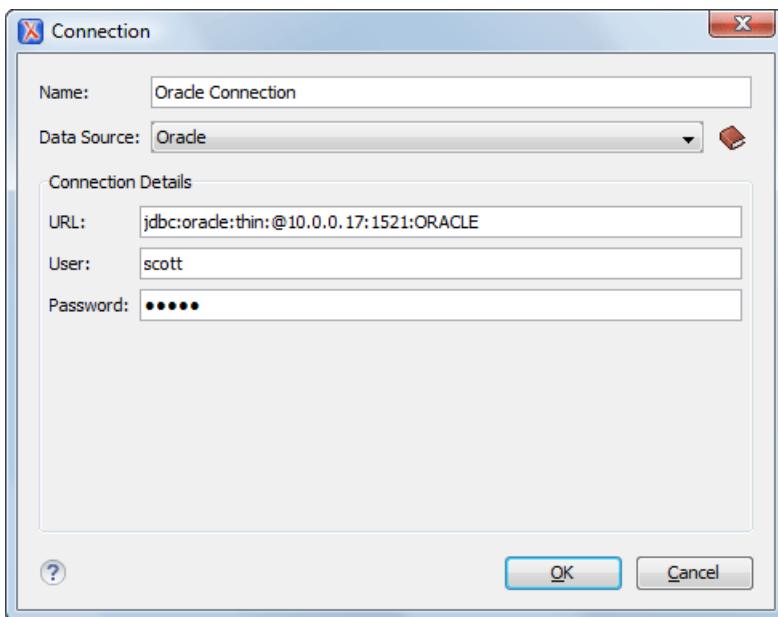

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. *Open the Preferences dialog box (**Options > Preferences**) and go to **Data Sources**.*

2. In the **Connections** panel, click the **+ New** button.

The dialog box for configuring a database connection is displayed.

**Figure 495: Connection Configuration Dialog Box**

3. Enter a unique name for the connection.
4. Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Enter the URL of the Oracle server.
  - b) Enter the user name for the connection to the Oracle server.
  - c) Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the configuration of the database connection.

### Oracle Database Contextual Menu Actions

#### General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

##### Refresh

Performs a refresh on the selected node.

##### Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

##### Configure Database Sources (available on Connection nodes)

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

##### Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

##### Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from Database](#) chapter).

## Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the various nodes in Oracle database connections include the following additional contextual menu actions:

### XML Schema Repository Level Nodes

#### **Register**

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

**Note:** Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

### XML Repository Level Nodes

#### **Add container**

Adds a new child container to the current one.

#### Add resource

Adds a new resource to the folder.

### Container Level Nodes

#### **Add container**

Adds a new child container to the current one.

#### Add resource

Adds a new resource to the folder.

#### Delete

Deletes the current container.

#### Properties

Shows various properties of the current container.

### Resource Level Nodes

#### **Open**

Opens the selected resource in the editor.

#### **Rename**

Renames the current resource

### Move

Moves the current resource to a new container (also available through drag and drop).

### Delete

Deletes the current container.

### Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

### Properties

Shows various properties of the current container.

### Compare

Compares two selected resources using the [Compare Files tool](#).

## PostgreSQL Database Connections

Oxygen XML Editor includes support for PostgreSQL database connections. Oxygen XML Editor allows you to browse the structure of a PostgreSQL database in the [Data Source Explorer view](#), open tables in the [Table Explorer view](#), and perform various operations on the resources in the repository.

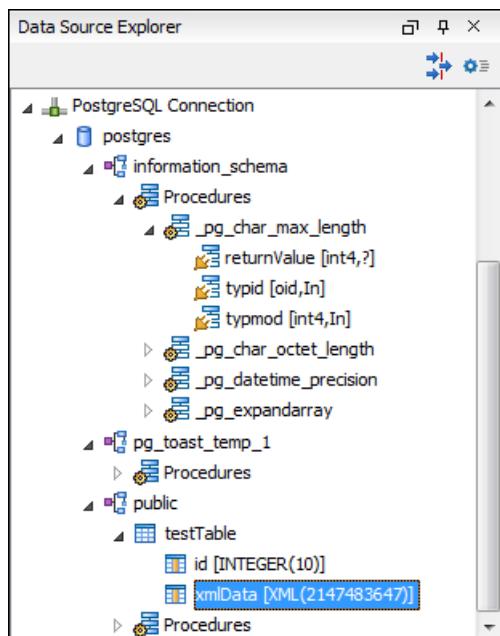

Figure 496: PostgreSQL Database Connection

### Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
2. [Configure PostgreSQL Data Source drivers](#).
3. [Configure a PostgreSQL Connection](#).
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

### How to Configure PostgreSQL 8.3 Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.

3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

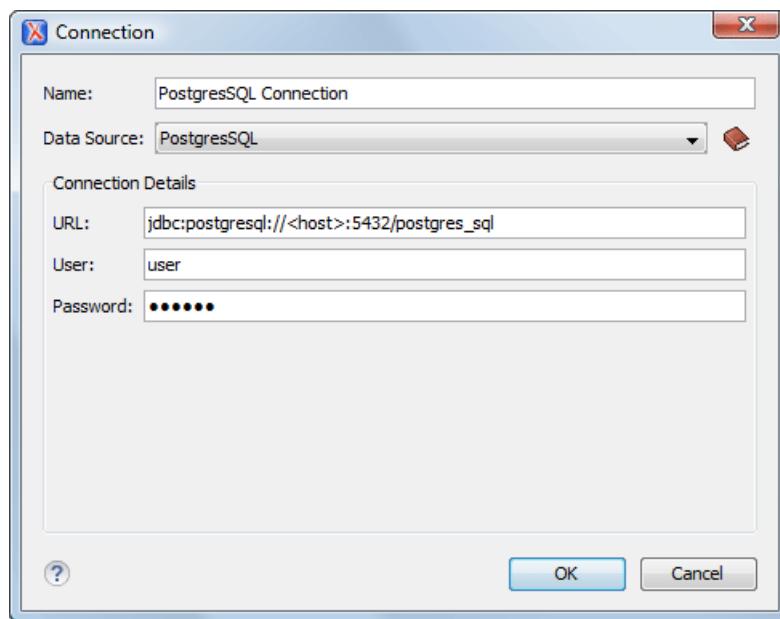

4. Enter a unique name for the data source.
5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.  
The PostgreSQL driver file is called `postgresql-8.3-603.jdbc3.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your PostgreSQL connection](#).

#### *How to Configure a PostgreSQL 8.3 Connection*

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **+ New** button.

The dialog box for configuring a database connection is displayed.

**Figure 497: Connection Configuration Dialog Box**

3. Enter a unique name for the connection.
4. Select the *PostgreSQL 8.3* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Enter the URL of the PostgreSQL 8.3 server.
  - b) Enter the user name for the connection to the PostgreSQL 8.3 server.
  - c) Enter the password for the connection to the PostgreSQL 8.3 server.
6. Click the **OK** button to finish the configuration of the database connection.

#### **PostgreSQL Contextual Menu Actions**

##### **General Contextual Menu Actions**

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

## C Refresh

Performs a refresh on the selected node.

## Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

## Configure Database Sources (available on Connection nodes)

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

## Edit (available on Table nodes)

Opens the selected table in the [Table Explorer](#) view.

## Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from Database](#) chapter).

## Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the [Data Source Explorer](#) view, the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

## Resource Level Nodes

### Compare

Compares two selected resources using the [Compare Files tool](#).

## Berkeley DB XML Database Connections

Oxygen XML Editor includes support for Berkeley DB XML database connections. Oxygen XML Editor allows you to browse the structure of a Berkeley DB XML database in the [Data Source Explorer view](#) and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: <http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html>.

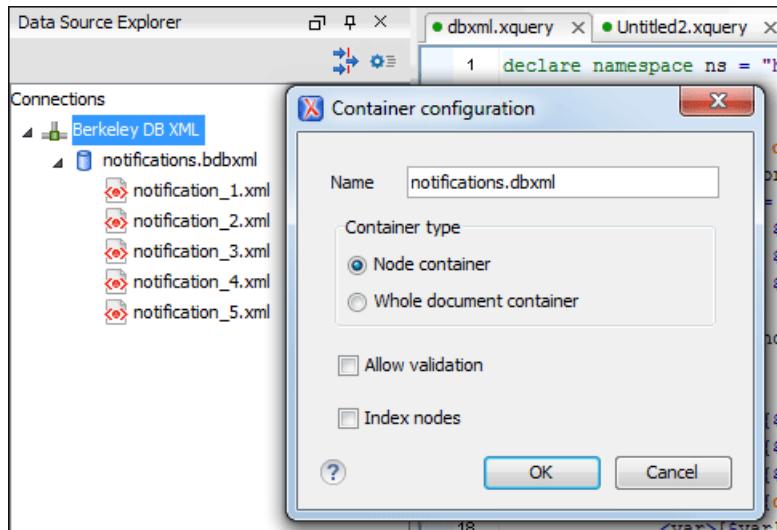

Figure 498: Berkeley DB XML Connection

## Configuring a Berkeley DB XML Database Connection

Follow this procedure to configure the support for a Berkeley DB XML database:

1. [Configure Berkeley DB XML Data Source drivers](#).

2. [Configure a Berkeley DB XML Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### *How to Configure Berkeley DB XML Data Source Drivers*

For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Editor supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Berkeley DBXML* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the Berkeley DB driver files.

The driver files for the Berkeley DB database (and their locations) are as follows:

- db.jar (check for it in [DBXML\_DIR]/lib or [DBXML\_DIR]/jar)
- dbxml.jar (check for it in [DBXML\_DIR]/lib or [DBXML\_DIR]/jar)

Where [DBXML\_DIR] is the Berkeley DB XML database root directory. For example, in Windows it is: C:\\Program Files\\Oracle\\Berkeley DB XML <version>.

6. Click the **OK** button to finish the data source configuration.
7. Continue on to [configure your Berkeley DB XML connection](#).

#### *How to Configure a Berkeley DB XML Connection*

Oxygen XML Editor supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the  **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Set the path to the Berkeley DB XML database directory in the **Environment home directory field**. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
  - b) Select the **Verbosity** level: *DEBUG, INFO, WARNING, or ERROR*.
  - c) Optionally, you can select the **Join existing environment** checkbox.  
If checked, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.
6. Click the **OK** button to finish the connection configuration.

#### **Berkeley DB XML Contextual Menu Actions**

While browsing Berkeley DB XML connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

##### **Connection Level Nodes**

###### **Configure Database Sources**

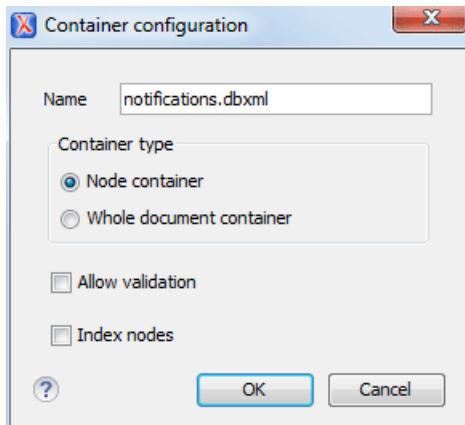

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

###### **Disconnect**

Stops the connection.

## New Collection

Opens a **Container configuration** dialog box that allows you to adds a new container in the repository.

**Figure 499: Container Configuration Dialog Box**

This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
  - **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.
  - **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- **Allow validation** - If checked, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If checked, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

### ↻ Refresh

Performs a refresh on the selected node.

### PropertyParams

Shows various properties of the current container.

### ⌕ Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Container Level Nodes

#### 📁 Import Files

Allows you to add a new file on the connection, in the current folder.

#### Export

Allows you to export the folder on the remote connection to a local folder.

#### ✂ Cut

Removes the current selection and places it in the clipboard.

**Paste**  
Pastes the copied selection.

#### Rename

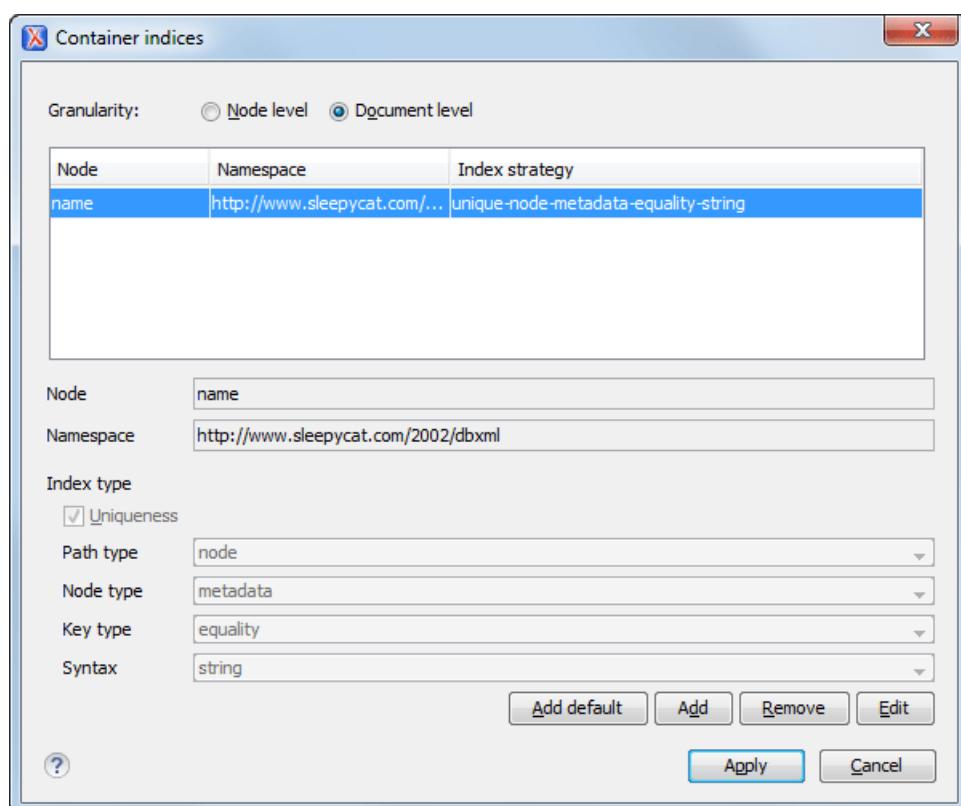

Renames the current resource

Deletes the current container.

#### Edit indices

Opens a **Container Indices** dialog box that allows you to configure indices properties for the selected Berkeley container.

**Figure 500: Container Indices Dialog Box**

This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:
  - **Document level** - Good option for retrieving large documents.
  - **Node level** - Good option for retrieving nodes from within documents.
- **Node** - The name of the node.
- **Namespace** - The index namespace.
- **Index type**:
  - **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
  - **Path type** - Drop-down menu that allows you to select from the following:
    - **node** - Indicates that you want to index a single node in the path.
    - **edge** - Indicates that you want to index the portion of the path where two nodes meet.
  - **Node type** - Drop-down menu that allows you to select from the following:
    - **element** - An element node in the document content.
    - **attribute** - An attribute node in the document content.

- **metadata** - A node found only in the metadata content of a document.
- **Key type** - Drop-down menu that allows you to select from the following:
  - **equality** - Improves the performances of tests that look for nodes with a specific value.
  - **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.
  - **substring** - Improves the performance of tests that look for a node whose value contains a given sub-string.
- **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is **string**.

### Refresh

Performs a refresh on the selected node.

### Properties

Shows various properties of the current container.

### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## Resource Level Nodes

### Open

Opens the selected resource in the editor.

### Cut

Removes the current selection and places it in the clipboard.

### Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

### Rename

Renames the current resource

### Delete

Deletes the current container.

### Refresh

Performs a refresh on the selected node.

### Properties

Shows various properties of the current container.

### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Compare

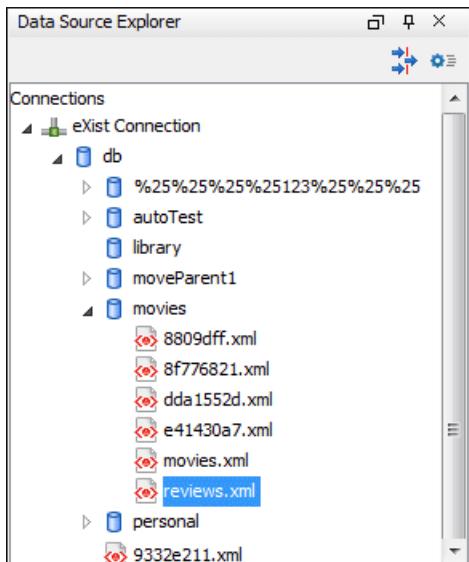

Compares two selected resources using the [Compare Files tool](#).

## Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor XQuery Debugger. [The same restrictions and peculiarities](#) apply for the Berkeley debugger as for the MarkLogic debugger.

## eXist Database Connections

Oxygen XML Editor includes support for eXist database connections. Oxygen XML Editor allows you to browse the structure of a eXist database in the [Data Source Explorer view](#) and perform various operations on the resources in the repository.

**Figure 501: eXist Database Connection**

### Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

1. Use the dedicated **Create eXist-db XML connection** connection wizard.
  - a. [Open the Preferences dialog box \(Options > Preferences\)](#), go to **Data Sources** and click the **Create eXist-db XML connection** link.
  - b. Enter your connection details in the connection wizard and click **OK**.

**Important:** To create an eXist connection using this wizard, Oxygen XML Editor expects the `exist/webstart/exist.jnlp` path to be accessible at the provided **Host** and **Port**.
2. Use the **Data Sources** preferences page to configure your connection.
  - a. [Configure eXist Data Source drivers](#).
  - b. [Configure an eXist Connection](#).
  - c. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### How to Configure eXist Data Source Drivers

For this procedure, you need to already have an eXist database server installed.

Oxygen XML Editor supports eXist database server versions up to and including version 2.2. To configure a data source for an eXist database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select **eXist** from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the eXist driver files.

The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Editor.

- `exist.jar`
- `lib/core/xmlldb.jar`

- lib/core/xmlrpc-client-3.1.x.jar
- lib/core/xmlrpc-common-3.1.x.jar
- lib/core/ws-commons-util-1.0.x.jar
- lib/core/slf4j-api-1.x.x.jar (if available)
- lib/core/slf4j-log4j12-1.x.x.jar (if available)

The version number from the driver file names may be different for your eXist server installation.

6. Click the **OK** button to finish the data source configuration.

7. Continue on to [configure your eXist connection](#).

To watch our video demonstration about running XQuery against an eXist XML database, go to [https://www.oxygenxml.com/demo/eXist\\_Database.html](https://www.oxygenxml.com/demo/eXist_Database.html).

#### *How to Configure an eXist Connection*

To configure a connection to an eXist database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.

2. Click the  **New** button in the **Connections** panel.

3. Enter a unique name for the connection.

4. Select one of the previously configured data sources from the **Data Source** drop-down menu.

5. Enter the connection details.

a) Set the URI to the installed eXist engine in the **XML DB URI** field.

b) Set the user name in the **User** field.

c) Set the password in the **Password** field.

d) Enter the start collection in the **Collection** field.

eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the **OK** button to finish the connection configuration.

To watch our video demonstration about running XQuery against an eXist XML database, go to [https://www.oxygenxml.com/demo/eXist\\_Database.html](https://www.oxygenxml.com/demo/eXist_Database.html).

#### **eXist Contextual Menu Actions**

While browsing eXist database connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

##### **Connection Level Nodes**

###### **Configure Database Sources**

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

###### **Disconnect**

Stops the connection.

###### **Refresh**

Performs a refresh on the selected node.

###### **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

##### **Container Level Nodes**

###### **New File**

Creates a new file on the connection, in the current folder.

###### **New Collection**

Creates a new collection on the connection.

###### **Import Folders**

Imports folders on the server.

## Import Files

Allows you to add a new file on the connection, in the current folder.

## Export

Allows you to export the folder on the remote connection to a local folder.

## Cut

Removes the current selection and places it in the clipboard.

## Paste

Pastes the copied selection.

## Refresh

Performs a refresh on the selected node.

## Properties

Shows various properties of the current container.

## Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## Resource Level Nodes

### Open

Opens the selected resource in the editor.

### Save As

Allows you to save the selected resource as a file on disk.

## Cut

Removes the current selection and places it in the clipboard.

## Copy

Copies the current selection into the clipboard.

## Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

## Rename

Renames the current resource

## Delete

Deletes the current container.

## Refresh

Performs a refresh on the selected node.

## Properties

Shows various properties of the current container.

## Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## Compare

Compares two selected resources using the [Compare Files tool](#).

## MarkLogic Database Connections

Oxygen XML Editor Enterprise edition includes support for MarkLogic database connections. Once you [configure a MarkLogic connection](#), you can use the [Data Source Explorer view](#) to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the [Data Source Explorer](#) view allows you to open and edit these modules.

**Note:** To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to *manual* or *manual-enforced*, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two documents with the /code/modules/main.xqy and /code/modules/imports/import.xqy IDs, run the following query:

```
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: <http://blakeley.com/blogofile/2012/03/19/directory-assistance/>.

## MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

When [debugging XQuery files with MarkLogic](#), you can use the **Data Source Explorer** view to open the files from the application server that is involved in the debugging process. By using the **Data Source Explorer** view, any imported modules are better identified by the MarkLogic server. You can also [use step actions and breakpoints](#) in the modules to help identify problems.

## Modules Container

For each Application server (for example: *Bill (HTTP port:8060)*), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this  **Modules** container.

**Note:** You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

## Requests Container

Each MarkLogic application server includes a  **Requests** container. In this container, Oxygen XML Editor displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the [Cancel all requests action](#).

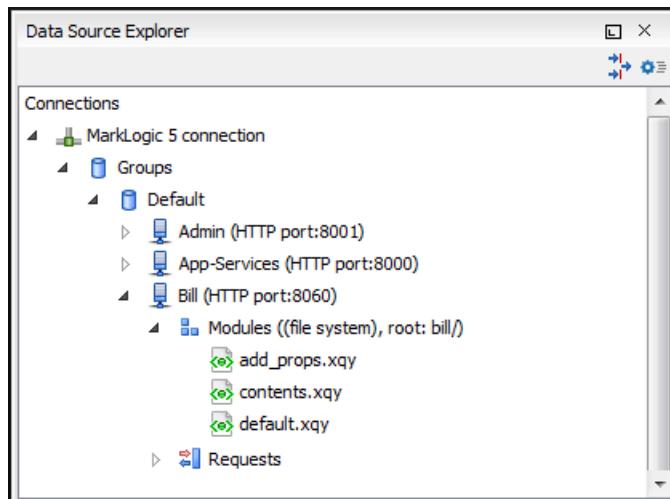

Figure 502: MarkLogic Connection in Data Source Explorer

## Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from [MarkLogic Community site](#).
2. [Configure MarkLogic Data Source drivers](#).
3. [Configure a MarkLogic Connection](#).
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### Related information

[MarkLogic Development in Oxygen XML Editor](#) on page 977

#### How to Configure MarkLogic Data Source Drivers

Available in the Enterprise edition only.

**Note:** Oxygen XML Editor supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

1. Download the **XCC Java distribution** zip file from: <http://developer.marklogic.com/products/xcc>.
2. Unzip the downloaded archive.
3. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
4. Click the New button in the **Data Sources** panel.
5. Enter a unique name for the data source.
6. Select *MarkLogic* from the driver **Type** drop-down list.
7. Click the **Add Files** button and select the MarkLogic driver file from the lib folder of the archive that you downloaded and unzipped. The driver file name is marklogic-xcc-{server\_version}.jar, where {server\_version} is the MarkLogic server version.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MarkLogic Connection](#).

#### How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

**Note:** Oxygen XML Editor supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. Click the New button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.  
Oxygen XML Editor uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.
  - b) Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the [Use it to execute queries action](#) from Data Source Explorer.
  - c) Set the user name to access the MarkLogic engine in the **User** field.
  - d) Set the password to access the MarkLogic engine in the **Password** field.
  - e) Optionally set the URL used for browsing the MarkLogic database in the **Data Source Explorer** view in the **WebDAV URL** field.  
The **Database** field specifies the database for which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.
6. Click the **OK** button to finish the connection configuration.

## MarkLogic Development in Oxygen XML Editor

The Oxygen XML Editor support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an XQuery builder that helps to improve productivity.

### Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the [Outline view](#) collects and displays all the functions from all imported modules. The **Content Completion Assistant** also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the [Data Source Explorer view](#). When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

### XQuery Debugging

Oxygen XML Editor allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

### Working with Modules

MarkLogic has a concept of two types of XQuery modules, *library* and *main* modules. A *library* module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library modules or from main modules. A *main* module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see [XQuery Library Modules and Main Modules](#).

When working with *library* modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor will request the server to validate the modules.

To validate *library* modules stored on a MarkLogic server, follow these steps:

1. [Configure a MarkLogic database connection](#).
2. Expand the MarkLogic connection in the [Data Source Explorer view](#) and open the *library* modules. The *main* module must also be opened from the [Data Source Explorer](#) view.
3. [Configure a validation scenario](#) for each *library* module. Specify the *main* module in the **URL of the file to validate** field.

**Result:** Validation is done on the server that contains the *main* module. The *main* module and all other *library* modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the **Content Completion Assistant** and the [Outline view](#) should now present the functions from all the modules.

### Related information

[Debugging with MarkLogic](#) on page 977

[Configuring a MarkLogic Database Connection](#) on page 975

### Debugging with MarkLogic

Oxygen XML Editor includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a [MarkLogic data source](#) and a [MarkLogic connection](#).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a `DBG-TASKDEBUGALLOW` error.

**Note:** An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor uses to process XQuery expressions by selecting the [Use it to execute queries](#) action from the contextual menu in the **Data Source Explorer** view.

3. Open the XQuery file and start the debugging process.

- If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the [Data Source Explorer](#) view and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
- The MarkLogic XQuery debugger integrates seamlessly into the [XQuery Debugger perspective](#). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to [debug the scenario](#) directly.
- Otherwise, switch to the XQuery Debugger perspective, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the [debug control toolbar](#).

For general information about how a debugging session is started and controlled, see the [Working with the Debugger](#) section.

In a MarkLogic debugging session, you can use step actions and breakpoints to help identify problems. When you add a breakpoint on a line where the debugger never stops, Oxygen XML Editor displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server) or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see [Using Breakpoints for Debugging Queries that Import Modules with MarkLogic](#) on page 978.

## Remote Debugging with MarkLogic

Oxygen XML Editor allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:** When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

To watch our video demonstration about the XQuery debugger for MarkLogic, go to <https://www.oxygenxml.com/demo/XQueryDebuggerforMarkLogic.html>.

## Related information

[MarkLogic Development in Oxygen XML Editor](#) on page 977

[Configuring a MarkLogic Database Connection](#) on page 975

## Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view, open all the modules from the **Modules** container of the [XDBC application server](#) that performs the debugging.
2. Set *breakpoints* in the module as needed.

### 3. Continue debugging the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the [Breakpoints view](#) and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.

## Related information

[MarkLogic Database Connections](#) on page 974

[MarkLogic Development in Oxygen XML Editor](#) on page 977

## Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (*inherited from MarkLogic 3.2*), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of [the Variables view](#) and pasting it in [the XWatch view](#).
- There is no support for [output to source mapping](#).
- There is no support for [showing the trace](#).
- You can only set [breakpoints](#) in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view.
  - When the debugger automatically opens the modules in the Editor.
- No breakpoints are set in modules from the same server that are not involved in the current debugging session.
- No support for [profiling](#) when an XQuery transformation is executed in the debugger.

## MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

### Connection Level Nodes

#### Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

#### Disconnect

Stops the connection.

#### Refresh

Performs a refresh on the selected node.

#### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Container Level Nodes

#### Enable Debug Mode

Switches the server to a debugging mode. For more information, see [MarkLogic debugging sessions](#).

#### Use it to Execute Queries

The server will be used to process XQuery expressions against it.

#### Refresh

Performs a refresh on the selected node.

## **Module or Folder Level Nodes**

### **Export**

Allows you to export the folder on the remote connection to a local folder.

### **Refresh**

Performs a refresh on the selected node.

## **Requests Level Nodes**

### **Refresh**

Performs a refresh on the selected node.

### **Cancel all requests**

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

## **Resource Level Nodes**

### **Open**

Opens the selected resource in the editor.

### **Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

### **Refresh**

Performs a refresh on the selected node.

### **Compare**

Compares two selected resources using the [\*\*Compare Files tool\*\*](#).

### **Related information**

[MarkLogic Development in Oxygen XML Editor](#) on page 977

[Debugging with MarkLogic](#) on page 977

## **Documentum xDB (X-Hive/DB) 10 Database Connections**

Oxygen XML Editor includes support for Documentum xDB (X-Hive/DB) 10 database connections. Oxygen XML Editor allows you to browse the structure of a Documentum xDB (X-Hive/DB) 10 database in the [\*\*Data Source Explorer\*\* view](#) and perform various operations on the resources in the repository.

**Figure 503: Documentum xDB (X-Hive/DB) 10 Connection**

#### Configuring a Documentum xDB (X-Hive/DB) 10 Database Connection

Follow this procedure to configure the support for a Documentum xDB (X-Hive/DB) 10 database:

1. [Configure Documentum xDB Data Source drivers.](#)
2. [Configure a Documentum xDB Connection.](#)
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### How to Configure Documentum xDB (X-Hive/DB) 10 Data Source Drivers

Available in the Enterprise edition only. For this procedure, you need to already have a Documentum xDB server installed.

To configure a data source for Documentum xDB (X-Hive/DB) 10, follow these steps:

1. [Open the Preferences dialog box \(\*\*Options > Preferences\*\*\) and go to \*\*Data Sources\*\*.](#)
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Documentum xDB* from the driver **Type** drop-down menu.
5. Click the **Add** button to add the driver files.

The driver files for the Documentum xDB (X-Hive/DB) 10 database are found in the Documentum xDB (X-Hive/DB) 10 lib directory from the server installation folder:

- antlr-runtime.jar
- aspectjrt.jar
- icu4j.jar
- xhive.jar
- google-collect.jar

6. Click the **OK** button to finish the data source configuration.
7. Continue on to [configure your Documentum xDB \(X-Hive/DB\) 10 connection](#).

## *How to Configure an Documentum xDB (X-Hive/DB) 10 Connection*

To configure a connection to a Documentum xDB (X-Hive/DB) 10 database, follow these steps:

**Note:** The bootstrap type of X-Hive/DB connections is not supported in Oxygen XML Editor. The following procedure explains the `xhive://` protocol connection type.

1. Open the **Preferences** dialog box (**Options > Preferences**) and go to **Data Sources**.
2. Click the  **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured data sources from the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Set the URL property of the connection in the **URL** field.  
If the property is a URL of the form `xhive://host:port`, the Documentum xDB (X-Hive/DB) 10 connection will attempt to connect to a Documentum xDB (X-Hive/DB) 10 server running behind the specified TCP/IP port.
  - b) Set the user name to access the Documentum xDB (X-Hive/DB) 10 engine in the **User** field.
  - c) Set the password to access the Documentum xDB (X-Hive/DB) 10 engine in the **Password** field.
  - d) Set the name of the database to access from the Documentum xDB (X-Hive/DB) 10 engine in the **Database** field.
  - e) Check the **Run XQuery in read / write session (with committing)** checkbox if you want to end the session with a commit. Otherwise, the session ends with a rollback.
6. Click the **OK** button to finish the connection configuration.

## **Documentum xDB (X-Hive/DB) 10 Contextual Menu Actions**

While browsing Documentum xDB (X-Hive/DB) 10 connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

### **Connection Level Nodes**

#### **Configure Database Sources**

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

#### **Disconnect**

Stops the connection.

#### **Add Library**

Allows you to add a new library.

#### **Insert XML Instance**

Allows you to add a new XML resource directly into the database root. See [Documentum xDB \(X-Hive/DB\) 10 Parser Configuration](#) for more details.

#### **Insert non-XML Instance**

Allows you to add a new non-XML resource directly in the database root.

#### **Refresh**

Performs a refresh on the selected node.

#### **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

### **Catalog Level Nodes**

#### **Add AS Models**

Allows you to add a new abstract schema model to the selected catalog.

#### **Export**

Allows you to export the folder on the remote connection to a local folder.

#### **Set Default Schema**

Allows you to set a default DTD to be used for parsing. It is not possible to set a default XML Schema.

## **Clear Default Schema**

Allows you to clear the default DTD. The action is available only if there is a DTD set as default.

## **Refresh**

Performs a refresh on the selected node.

## **Properties**

Shows various properties of the current container.

## **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

## **Container (Library) Level Nodes**

### **New File**

Creates a new file on the connection, in the current folder.

### **Add Library**

Allows you to add a new library.

### **Import Folders**

Imports folders on the server.

### **Add Local Catalog**

Adds a catalog to the selected library. By default, only the root-library has a catalog, and all models are stored there.

## **Insert XML Instance**

Allows you to add a new XML resource directly into the database root. See [Documentum xDB \(X-Hive/DB\) 10 Parser Configuration](#) for more details.

## **Insert non-XML Instance**

Allows you to add a new non-XML resource directly in the database root.

### **Export**

Allows you to export the folder on the remote connection to a local folder.

## **Cut**

Removes the current selection and places it in the clipboard.

## **Copy**

Copies the current selection into the clipboard.

## **Paste**

Pastes the copied selection.

### **Rename**

Renames the current resource

## **Delete**

Deletes the current container.

## **Refresh**

Performs a refresh on the selected node.

## **Properties**

Shows various properties of the current container.

## **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

## Resource Level Nodes

### Open

Opens the selected resource in the editor.

### Save As

Allows you to save the selected resource as a file on disk.

### Cut

Removes the current selection and places it in the clipboard.

### Copy

Copies the current selection into the clipboard.

### Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

### Add AS model

Allows you to add an XML schema to the selected XML resource.

### Set AS model

Allows you to set an active AS model for the selected XML resource.

### Clear AS model

Allows you to clear the active AS model of the selected XML resource.

### Properties

Displays the resource properties. Available only for XML resources.

### Set Default Schema

Allows you to set the selected DTD to be used as default for parsing. The action is available only for DTD.

### Clear Default Schema

Allows you to unset the selected DTD. The action is available only if the selected DTD is the current default to be used for parsing.

### Rename

Renames the current resource

### Delete

Deletes the current container.

### Refresh

Performs a refresh on the selected node.

### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Compare

Compares two selected resources using the [Compare Files tool](#).

## Documentum xDB (X-Hive/DB) 10 Parser Configuration for Adding XML Instances

When an XML instance document is added to a Documentum xDB (X-Hive/DB) 10 connection or library, it is parsed with an internal XML parser of the database server. The following options are available for configuring this parser:

- DOM Level 3 parser configuration parameters. More about each parameter can be found here: [DOM Level 3 Configuration](#).
- Documentum xDB (X-Hive/DB) 10 specific parser parameters (for more information, consult the Documentum xDB (X-Hive/DB) 10 manual):
  - **xhive-store-schema** - If checked, the corresponding DTD or XML schemas are stored in the catalog during validated parsing.

- **xhive-store-schema-only-internal-subset** - Stores only the internal sub-set of the document (not an external sub-set). This option modifies the **xhive-store-schema** (only has a function when that parameter is set to true, and when a DTD is involved). Select this option if you only want to store the internal sub-set of the document (not the external sub-set).
- **xhive-ignore-catalog** - Ignores the corresponding DTD and XML schemas in the catalog during validated parsing.
- **xhive-psvi** - Stores **psvi** information about elements and attributes. Documents parsed with this feature turned on give access to **psvi** information and enable support of data types by XQuery queries.
- **xhive-sync-features** - With this convenience setting turned on, parameter settings of `XhiveDocumentIF` are synchronized with the parameter settings of `LSParser`. Note that parameter settings **xhive-psvi** and **schema-location** are always synchronized.

## Troubleshooting Documentum xDB

**Cannot save the file. DTD factory class org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl does not extend from DTDDVFactory**

### Question:

I am able to access my XML Database in the **Data Source Explorer** and open files for reading but when I try to save changes to a file back into the database, I receive the following error: "Cannot save the file. DTD factory class org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl does not extend from DTDDVFactory." How can I fix this?

### Answer:

`xhive.jar` contains a `MANIFEST.MF` with a classpath:

```
Class-Path: core/antlr-runtime.jar core/aspectjrt.jar core/fastutil-shrinked.jar
core/google-collect.jar core/icu4j.jar core/lucene-regex.jar core/lucene.jar
core/serializer.jar core/xalan.jar core/xercesImpl.jar
```

Since the driver was configured to use `xhive.jar` directly from the `xDB` installation (where many other jars are located), `core/xercesImpl.jar` from the `xDB` installation directory is loaded even though it is not specified in the list of jars from the data source driver configuration (it is in the classpath from `xhive.jar - MANIFEST.MF`). A simple workaround for this issue is to copy **ONLY** the jar files used in the driver configuration to a separate folder and configure the data source driver to use them from there.

## MySQL Database Connections

Oxygen XML Editor includes support for MySQL database connections. Oxygen XML Editor allows you to browse the structure of a SQL Server database in the **Data Source Explorer view**, open tables in the **Table Explorer view**, and perform various operations on the resources in the repository.

### Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. [Configure MySQL Data Source drivers](#).
2. [Configure a MySQL Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

### How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on [the MySQL JDBC driver available on the MySQL website](#).

To configure this data source, follow these steps:

1. Go to [https://www.oxygenxml.com/database\\_drivers.html](https://www.oxygenxml.com/database_drivers.html) and download the appropriate MySQL driver.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
3. Click the  **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

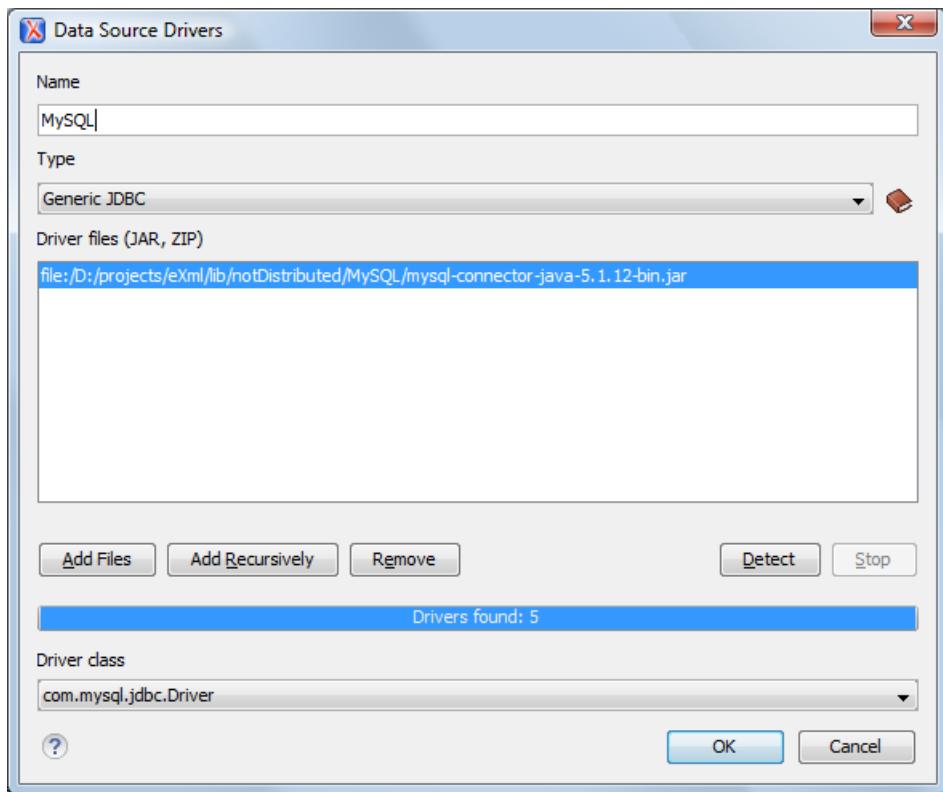

Figure 504: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select **Generic JDBC** in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.  
The driver file for the MySQL server is called `mysql-connec.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MySQL connection](#).

#### How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **+ New** button.

The dialog box for configuring a database connection is displayed.

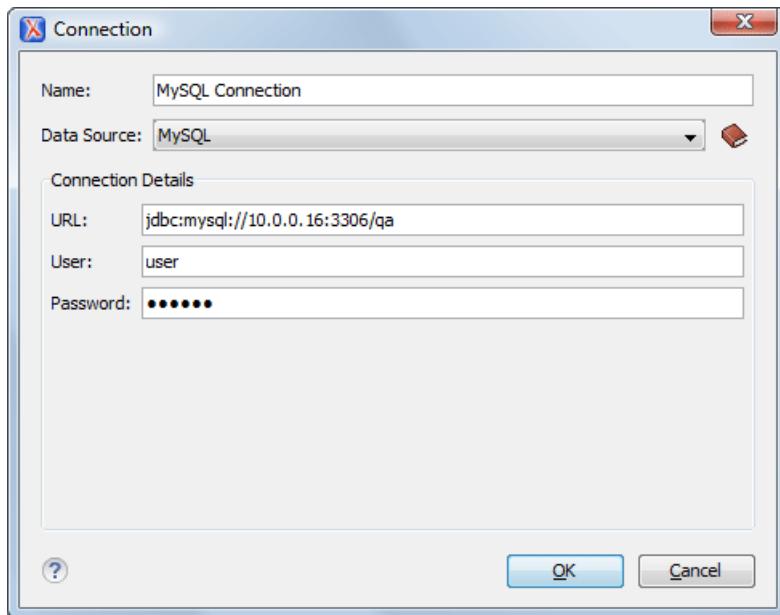

Figure 505: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the **MySQL** data source in the **Data Source** drop-down list.
5. Enter the connection details.
  - a) Enter the URL of the MySQL server.
  - b) Enter the user name for the connection to the MySQL server.
  - c) Enter the password for the connection to the MySQL server.
6. Click the **OK** button to finish the configuration of the database connection.

### Generic JDBC Database Connections

Oxygen XML Editor includes support for Generic JDBC database connections.

#### Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. [Configure Generic JDBC Data Source drivers](#).
2. [Configure a Generic JDBC Connection](#).
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

#### How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. [Open the Preferences dialog box \(\*\*Options > Preferences\*\*\)](#) and go to **Data Sources**.
2. Click the **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select **Generic JDBC** in the driver **Type** drop-down list.
5. Add the driver file(s) using the **Add Files** button.
6. Select the most appropriate **Driver class**.
7. Click the **OK** button to finish the data source configuration.

8. Continue on to [configure a generic JDBC connection](#).

#### How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **+ New** button.
3. Enter a unique name for the connection.
4. Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
  - a) Enter the URL of the generic JDBC database, with the following format: `jdbc : <subprotocol> : <subname>`.
  - b) Enter the user name for the connection to the generic JDBC database.
  - c) Enter the password for the connection to the generic JDBC database.
6. Click the **OK** button to finish the configuration of the database connection.

#### JDBC-ODBC Database Connections

Oxygen XML Editor includes support for JDBC-ODBC database connections.

#### How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Editor comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the **+ New** button.

The dialog box for configuring a database connection is displayed.

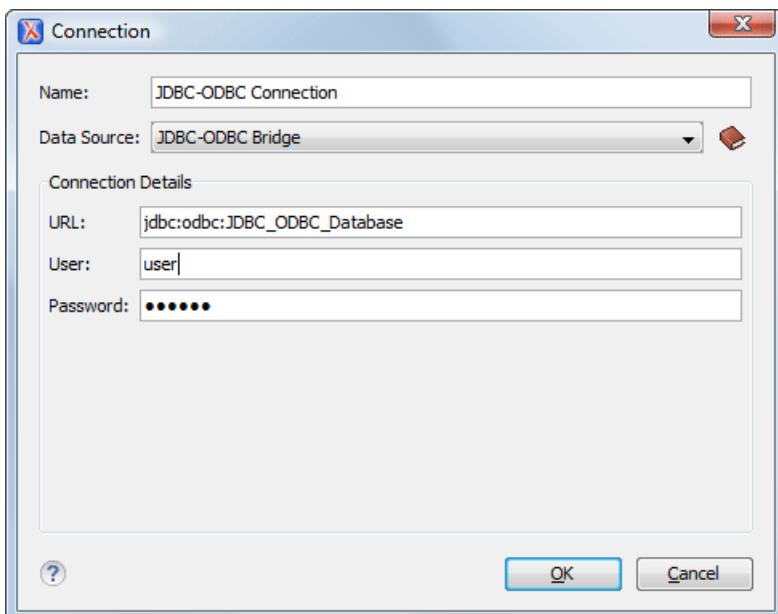

Figure 506: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select *JDBC-ODBC Bridge* in the **Data Source** drop-down list.
5. Enter the connection details.
  - a) Enter the URL of the ODBC source.

- b) Enter the user name of the ODBC source.
  - c) Enter the password of the ODBC source.
6. Click the **OK** button to finish the configuration of the database connection.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

## BaseX Database Connections

Oxygen XML Editor includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor allows you to browse the structure of a BaseX database in the **Data Source Explorer view** and perform XQuery executions.

### How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to [http://docs.basex.org/wiki/Startup#BaseX\\_HTTP\\_Server](http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server). The configuration file for the HTTP server is named .basex and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server is using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor as described in [How to Configure a WebDAV Connection](#) on page 991. The WebDAV URL should resemble this: `http://{hostname}:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
  - WebDAV URL: `http://localhost:8984/webdav`
  - User: admin
  - Password: admin
4. Once the WebDAV connection is created, to view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

## BaseX Contextual Menu Actions

While browsing BaseX connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

### Connection Level Nodes

#### Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

#### Disconnect

Stops the connection.

#### New Folder

Creates a new folder on the connection.

#### Import Files

Allows you to add a new file on the connection, in the current folder.

#### Refresh

Performs a refresh on the selected node.

#### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## **Folder Level Nodes**

### **New File**

Creates a new file on the connection, in the current folder.

### **New Folder**

Creates a new folder on the connection.

### **Import Folders**

Imports folders on the server.

### **Import Files**

Allows you to add a new file on the connection, in the current folder.

### **Export**

Allows you to export the folder on the remote connection to a local folder.

### **Cut**

Removes the current selection and places it in the clipboard.

### **Copy**

Copies the current selection into the clipboard.

### **Paste**

Pastes the copied selection.

### **Rename**

Renames the current resource

### **Delete**

Deletes the current container.

### **Refresh**

Performs a refresh on the selected node.

### **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

## **Resource Level Nodes**

### **Open**

Opens the selected resource in the editor.

### **Cut**

Removes the current selection and places it in the clipboard.

### **Copy**

Copies the current selection into the clipboard.

### **Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

### **Rename**

Renames the current resource

### **Delete**

Deletes the current container.

### **Refresh**

Performs a refresh on the selected node.

## Properties

Shows various properties of the current container.

## Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## Compare

Compares two selected resources using the [Compare Files tool](#).

## Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

### BaseX XQJ Data Source

First of all, create an XQJ data source as described in [How to Configure an XQJ Data Source](#) on page 941. The BaseX XQJ API-specific files that must be added in the configuration dialog box are xqj-api-1.0.jar, xqj2-0.1.0.jar and basex-xqj-1.2.3.jar (the version names of the JAR file may differ). These libraries can be downloaded from [xqj.net/basex/basex-xqj-1.2.3.zip](http://xqj.net/basex/basex-xqj-1.2.3.zip). As an alternative, you can also find the libraries in the BaseX installation directory, in the lib sub-directory.

### BaseX XQJ Connection

The next step is to create an XQJ connection as described in [How to Configure an XQJ Connection](#) on page 941.

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- Port: 1984
- serverName: localhost
- user: admin
- password: admin

### XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor and create a Transformation Scenario as described in [XQuery Transformation](#) on page 799. In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

## WebDAV Connections

Oxygen XML Editor includes support for WebDAV server connections. Oxygen XML Editor allows you to browse the structure of a WebDAV connection in the [Data Source Explorer view](#) and perform various operations on the resources in the repository.

### How to Configure a WebDAV Connection

By default, Oxygen XML Editor contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the [Data Source Explorer view](#).

To configure a WebDAV connection, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel, click the  **New** button.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.
5. Enter the connection details:
  - a) Set the URL to the WebDAV repository in the field **WebDAV URL**.
  - b) Set the user name that is used to access the WebDAV repository in the **User** field.
  - c) Set the password that is used to access the WebDAV repository in the **Password** field.

6. Click the **OK** button.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

To watch our video demonstration about the WebDAV support in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/WebDAV\\_Support.html](https://www.oxygenxml.com/demo/WebDAV_Support.html).

## WebDAV Contextual Menu Actions

While browsing WebDAV connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

### Connection Level Nodes

#### Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

#### Disconnect

Stops the connection.

#### New Folder

Creates a new folder on the connection.

#### Import Files

Allows you to add a new file on the connection, in the current folder.

#### Refresh

Performs a refresh on the selected node.

#### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Folder Level Nodes

#### New File

Creates a new file on the connection, in the current folder.

#### New Folder

Creates a new folder on the connection.

#### Import Folders

Imports folders on the server.

#### Import Files

Allows you to add a new file on the connection, in the current folder.

#### Export

Allows you to export the folder on the remote connection to a local folder.

#### Cut

Removes the current selection and places it in the clipboard.

#### Copy

Copies the current selection into the clipboard.

#### Paste

Pastes the copied selection.

#### Rename

Renames the current resource

#### Delete

Deletes the current container.

## Refresh

Performs a refresh on the selected node.

## Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## Resource Level Nodes

### Open

Opens the selected resource in the editor.

### Cut

Removes the current selection and places it in the clipboard.

### Copy

Copies the current selection into the clipboard.

### Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

### Rename

Renames the current resource

### Delete

Deletes the current container.

### Refresh

Performs a refresh on the selected node.

### Properties

Shows various properties of the current container.

### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Compare

Compares two selected resources using the [Compare Files tool](#).

## SQL Execution Support

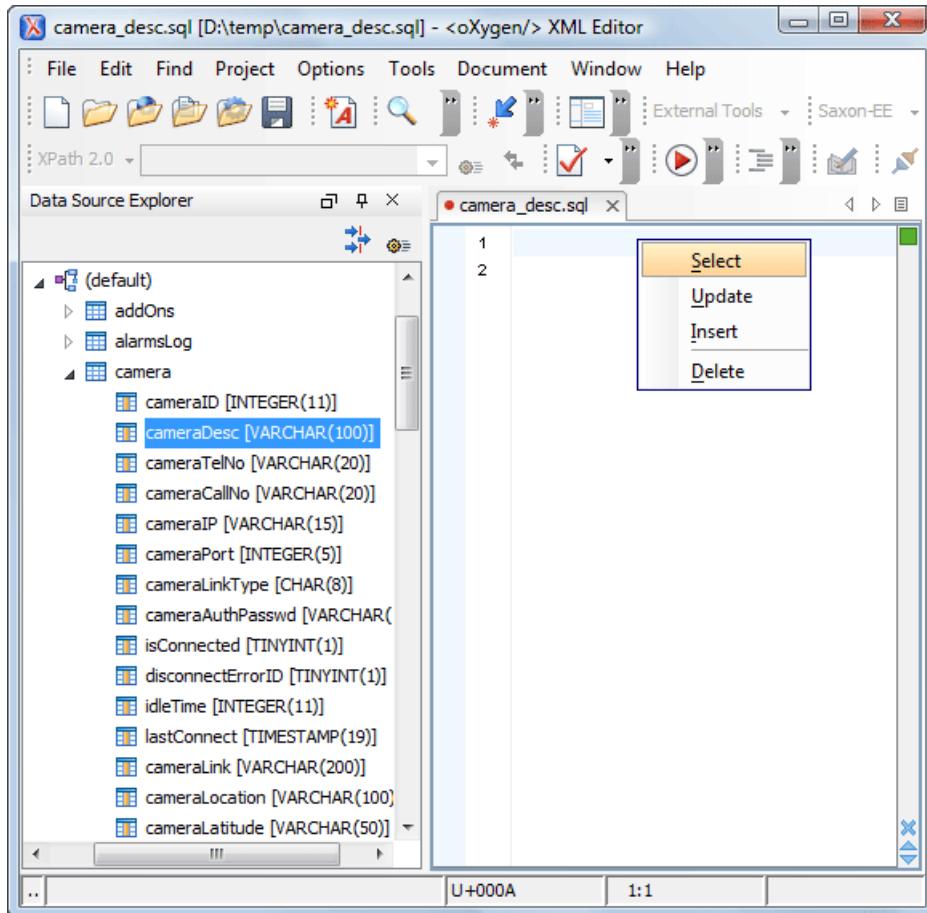

The database support in Oxygen XML Editor includes support for writing SQL statements, syntax highlighting, folding, and dragging and dropping from the [Data Source Explorer view](#). It also includes transformation scenarios for executing the statements, and the results are displayed in the [Table Explorer view](#).

### Drag and Drop from Data Source Explorer View

Drag and drop operations from the **Data Source Explorer** view to the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the [Database Connection Support](#) section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

**Figure 507: SQL Statement Editing with Drag and Drop**

**4. Select the type of statement from the pop-up menu.**

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- `SELECT `field1`, `field2`, ... FROM `catalog`.`table`` (for example: `SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc``)
- `UPDATE `catalog`.`table` SET `field1` = , `field2` = , ...` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` = , `DEPTNAME` = , `LOCATION` =`)
- `INSERT INTO `catalog`.`table` ( `field1`, `field2`, ... ) VALUES ( , , )` (for example: `INSERT INTO `camera`.`cameraDesc` ( `DEPT`, `DEPTNAME`, `LOCATION` ) VALUES ( , , )`)
- `DELETE FROM `catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc``)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- `SELECT `field` FROM `catalog`.`table`` (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc``)
- `UPDATE `catalog`.`table` SET `field` =` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =`)
- `INSERT INTO `catalog`.`table` ( `field1` ) VALUES ()` (for example: `INSERT INTO `camera`.`cameraDesc` ( `DEPT` ) VALUES ()`)
- `DELETE FROM `catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT` =`)

## SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

## Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a *transformation scenario* using the  **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu.

A SQL transformation scenario needs a database connection. You can configure a connection using the  **Preferences** button from the SQL transformation dialog box.

The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box.

For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

**Restriction:** When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing in-line parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

The result of a SQL transformation is *displayed in a view* at the bottom of the Oxygen XML Editor window.

4. View more complex return values of the SQL transformation in a separate editor panel.

A more complex value returned by the SQL query (for example, an `XMLTYPE` or `CLOB` value) cannot be displayed entirely in the result table.

- a) Right-click the cell containing the complex value.
- b) Select the action **Copy cell** from the contextual menu.  
The action copies the value in the clipboard.
- c) Paste the value into an appropriate editor.

For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor.

## XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor offer XQuery support:

- *Native XML Databases*:
  - Berkeley DB XML
  - eXist
  - MarkLogic (validation support available starting with version 5)
  - Documentum xDB (X-Hive/DB) 10
- *Relational Databases*:
  - IBM DB2
  - Microsoft SQL Server (validation support not available)
  - Oracle (validation support not available)

## Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view and dropping them into the editor panel.

1. [Configure the data source drivers](#) for the particular relational database in the [Data Sources preferences page](#).
2. [Configure the connection](#) for the particular relational database in the [Data Sources preferences page](#).
3. Browse the connection in the [Data Source Explorer view](#), expanded to the table or column that you want to insert in the query.
4. Drag the table or column name to the XQuery editor panel.
5. Drop the table or column name where the XPath expression is needed.

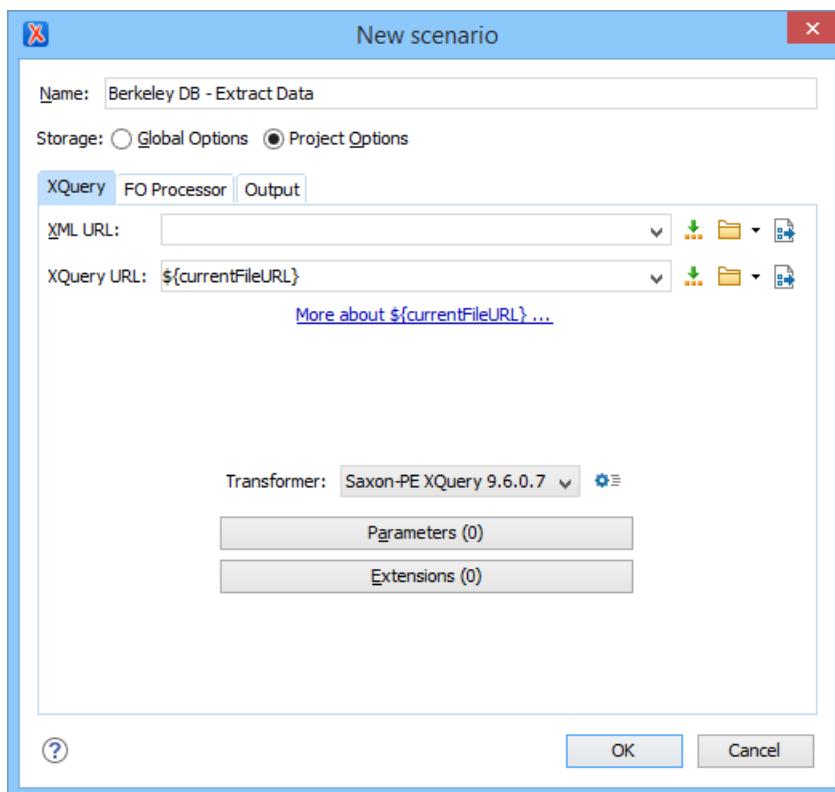

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

## XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. [Configure the data source drivers and the connection](#) for the particular database.
2. Configure an XQuery transformation scenario.
  - a) Click the  **Configure Transformation Scenario** toolbar button or go to menu **Document > Transformation > Configure Transformation Scenario**.  
The **Configure Transformation Scenario** dialog box is opened.
  - b) Click the **New** button toward the bottom of the dialog box.
  - c) Select [XML Transformation with XQUERY](#).

The **New Scenario** dialog box for configuring an XQuery scenario is opened.

**Figure 508: New Scenario Dialog Box**

- d) Insert the scenario name in the dialog box for editing the scenario.

e) Choose the database connection in the **Transformer** drop-down list.

f) Configure any other parameters as needed.

For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the **Size limit on Sequence view option** in the **XQuery** preferences page. If you choose **Perform FO Processing** in the **FO Processor** tab, the **Sequence** option is ignored.

g) Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist and Berkeley DB XML, the **Content Completion Assistant** lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query .

**Note:** An XQuery transformation is executed against a Berkeley DB XML server as a transaction using the query transaction support of the server.

### 3. Run the transformation scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor window (for example, an XMLTYPE or CLOB value), do the following:

- Right-click that table cell.
- Select the **Copy cell** action from the contextual menu to copy the value into the clipboard.
- Paste the value wherever you need it (for example, in an opened XQuery editor panel of Oxygen XML Editor).

#### Related information

[XML Transformation with XQuery](#) on page 774

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

#### XQuery Validation

With Oxygen XML Editor, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 9.6.0.7 PE processor or the 9.6.0.7 EE, IBM DB2, eXist, Berkeley DB XML, Documentum xDB (X-Hive/DB) 10, or MarkLogic (version 5 or newer) if you installed them. Any other XQuery processor that offers an [XQJ API implementation](#) can also be used. This is in conformance with [the XQuery Working Draft](#). The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

The screenshot shows the Oxygen XML Editor interface with a code editor and a messages view. The code editor contains an XQuery script named 'personal.xquery'. The script includes a 'BigBoss\_subordinates' function that iterates over personnel and filters by manager. A syntax error is highlighted in red on the line 'where (\$exists(\$link/@manager) and (\$comparee(\$link/@manager, "Big.Boss"))'. The messages view at the bottom shows a single error: 'F [Saxon-PE XQuery 9.2.1.2] XQuery static error in #...ink/@manager, "Big.Boss") eq 0#: Unknown system function'. The error details table shows the error message and its location (line 7, column 0).

Info	Description - 1 item	Resource	Loca
●	F [Saxon-PE XQuery 9.2.1.2] XQuery static error in #...ink/@manager, "Big.Boss") e... personal.xquery	7:0	

Figure 509: XQuery Validation

**Note:** If you choose a processor that does not support XQuery validation, Oxygen XML Editor displays a warning when trying to validate.

The  **Validation options** button, available in the **Document > Validate** menu, allows quick access to the [XQuery options](#) in the Oxygen XML Editor preferences.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation better resolves imports.

## XQuery Database Debugging

Oxygen XML Editor includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic and Berkeley DB XML databases.

For more information about the debugging support in Oxygen XML Editor, see [Debugging XSLT Stylesheets and XQuery Documents](#) on page 1020.

### Debugging with MarkLogic

Oxygen XML Editor includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a [MarkLogic data source](#) and a [MarkLogic connection](#).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a *DBG-TASKDEBUGALLOW* error.

**Note:** An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor uses to process XQuery expressions by selecting the [Use it to execute queries action](#) from the contextual menu in the **Data Source Explorer** view.
3. Open the XQuery file and start the debugging process.
  - If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the [Data Source Explorer view](#) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
  - The MarkLogic XQuery debugger integrates seamlessly into the [XQuery Debugger perspective](#). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to [debug the scenario](#) directly.
  - Otherwise, switch to the XQuery Debugger perspective, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the [debug control toolbar](#).

For general information about how a debugging session is started and controlled, see the [Working with the Debugger](#) section.

In a MarkLogic debugging session, you can use step actions and breakpoints to help identify problems. When you add a breakpoint on a line where the debugger never stops, Oxygen XML Editor displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server) or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see [Using Breakpoints for Debugging Queries that Import Modules with MarkLogic](#) on page 978.

### Remote Debugging with MarkLogic

Oxygen XML Editor allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:** When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

To watch our video demonstration about the XQuery debugger for MarkLogic, go to <https://www.oxygenxml.com/demo/XQueryDebuggerforMarkLogic.html>.

## Related information

[MarkLogic Development in Oxygen XML Editor](#) on page 977

[Configuring a MarkLogic Database Connection](#) on page 975

### Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view, open all the modules from the  **Modules** container of the [XDBC application server](#) that performs the debugging.
2. Set *breakpoints* in the module as needed.
3. Continue debugging the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the [Breakpoints view](#) and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.

## Related information

[MarkLogic Database Connections](#) on page 974

[MarkLogic Development in Oxygen XML Editor](#) on page 977

### Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (*inherited from MarkLogic 3.2*), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of [the Variables view](#) and pasting it in [the XWatch view](#).
- There is no support for [output to source mapping](#).
- There is no support for [showing the trace](#).
- You can only set *breakpoints* in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view.
  - When the debugger automatically opens the modules in the Editor.
- No breakpoints are set in modules from the same server that are not involved in the current debugging session.
- No support for [profiling](#) when an XQuery transformation is executed in the debugger.

## Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor XQuery Debugger. [The same restrictions and peculiarities](#) apply for the Berkeley debugger as for the MarkLogic debugger.

## Content Management System (CMS) Integration

---

This chapter explains how you can use Oxygen XML Editor with Documentum CMS and Microsoft SharePoint. You can use the [plugin support](#) to develop your own integration with other content management systems..

All the major CMS vendors that are listed in the [CMS Solution Partners section of our website](#) also provide CMS integration with Oxygen XML Editor.

### Related concepts

[General Configuration of an Oxygen XML Editor Plugin](#) on page 1302

### Related information

[Working with Databases](#) on page 950

## Integration with Documentum (CMS) (deprecated)

**Important:** Starting with version 17.0, the support for Documentum (CMS) is deprecated and will no longer be actively maintained.

Oxygen XML Editor provides support for browsing and managing Documentum (CMS) connections in the [Data Source Explorer view](#). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

Oxygen XML Editor supports Documentum (CMS) version 6.5 and 6.6 with *Documentum Foundation Services 6.5 or 6.6* installed.

 **Attention:** It is recommended to use the latest 1.6.x Java version. It is possible that the Documentum (CMS) support will not work properly if you use other Java versions.

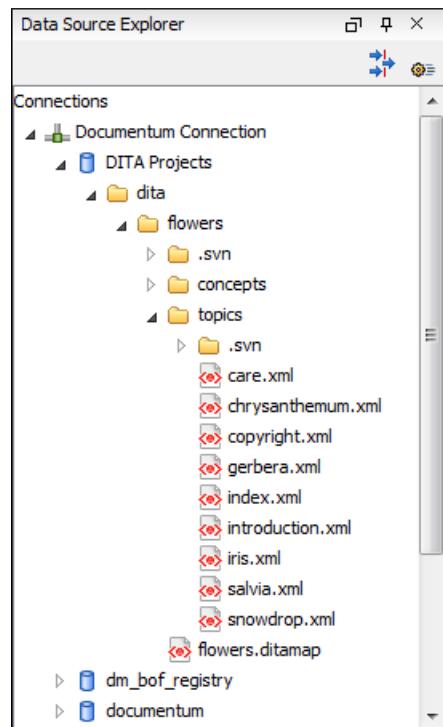

Figure 510: Documentum (CMS) Connection

## Configuring a Documentum (CMS) Database Connection

Follow this procedure to configure the support for a Documentum (CMS) database:

1. [Configure Documentum xDB Data Source drivers.](#)
2. [Configure a Documentum xDB Connection.](#)
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened from the **Window > Show View** menu) or switch to the **Database Perspective** (available from **Window > Open Perspective > Database**).

### How to Configure Documentum (CMS) Data Source Drivers

Available in the Enterprise edition only.

To configure a Documentum (CMS) data source you need the Documentum Foundation Services Software Development Kit (*DFS SDK*) corresponding to your server version. The *DFS SDK* can be found in the Documentum (CMS) server installation kit or it can be downloaded from [EMC Community Network](#).

**Note:** The *DFS SDK* can be found in the form of an archive named for Documentum (CMS) 6.5 (for example, *emc-dfs-sdk-6.5.zip*).

To configure a data source for Documentum (CMS), follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Data Sources** panel click the  **New** button.
3. Enter a unique name for the data source.
4. Select **Documentum (CMS)** from the driver type combo box.
5. Press the **Choose DFS SDK Folder** button.
6. Select the folder where you have unpacked the *DFS SDK* archive file.

If you have indicated the correct folder the following Java libraries (jar files) will be added to the list (some variation of the library names is possible in future versions of the *DFS SDK*):

- lib/java/emc-bpm-services-remote.jar
- lib/java/emc-ci-services-remote.jar
- lib/java/emc-collaboration-services-remote.jar
- lib/java/emc-dfs-rt-remote.jar
- lib/java/emc-dfs-services-remote.jar
- lib/java/emc-dfs-tools.jar
- lib/java/emc-search-services-remote.jar
- lib/java/ucf/client/ucf-installer.jar
- lib/java/commons/\*.jar (multiple jar files)
- lib/java/jaxws/\*.jar (multiple jar files)
- lib/java/utils/\*.jar (multiple jar files)

**Note:** If for some reason the jar files are not found, you can add them manually by using the **Add Files** and **Add Recursively** buttons and navigating to the lib/java folder from the *DFS SDK*.

7. Click the **OK** button to finish the data source configuration.
8. Continue on to [configure your Documentum connection](#).

### How to Configure a Documentum (CMS) Connection

Available in the Enterprise edition only.

To configure a connection for a Documentum (CMS) server, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel click the  **New** button.
3. Enter a unique name for the connection.
4. Select one of the previously configured Documentum (CMS) data sources in the **Data Source** combo box.
5. Fill-in the connection details:

- **URL** - The URL to the Documentum (CMS) server: `http://<hostname>:<port>`
- **User** - The user name to access the Documentum (CMS) repository.
- **Password** - The password to access the Documentum (CMS) repository.
- **Repository** - The name of the repository to log into.

6. Click the **OK** button to finish the configuration of the connection.

### Known Issues with Documentum (CMS)

The following are known issues with the Documentum (CMS):

- There is a known problem in the UCF Client implementation for Mac OS X from Documentum 6.5 that prevents you from viewing or editing XML documents from the repository on Mac OS X. The UCF Client is the component responsible for file transfer between the repository and the local machine. This component is deployed automatically from the server. Documentum 6.6 does not exhibit this problem.

- Note:** This issue was reproduced with Documentum 6.5 SP1. In Documentum 6.6 this is no longer reproducing.
- For the Documentum driver to work faster on Linux, you need to specify to the JVM to use a weaker random generator, instead of the very slow native implementation. This can be done by modifying in the Oxygen XML Editor startup scripts (or in the `*.vmoptions` file) the system property:

```
-Djava.security.egd=file:/dev/./urandom
```

### Documentum (CMS) Contextual Menu Actions

While browsing Documentum (CMS) connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

#### Connection Level Nodes

##### Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

##### Disconnect

Stops the connection.

##### New Cabinet

Creates a new cabinet in the repository. The cabinet properties are:

- **Type** - The type of the new cabinet (default is `dm_cabinet`).
- **Name** - The name of the new cabinet.
- **Title** - The title property of the cabinet.
- **Subject** - The subject property of the cabinet.

##### Refresh

Performs a refresh on the selected node.

##### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

#### Container (Cabinet) Level Nodes

##### New Folder

Creates a new folder in the current cabinet / folder. The folder properties are the following:

- **Path** - Shows the path where the new folder will be created.
- **Type** - The type of the new folder (default is `dm_folder`).
- **Name** - The name of the new folder.
- **Title** - The title property of the folder.
- **Subject** - The subject property of the folder.

## New Document

Creates a new document in the current cabinet / folder. The document properties are the following:

- **Path** - Shows the path where the new document will be created.
- **Name** - The name of the new document.
- **Type** - The type of the new document (default is **dm\_document**).
- **Format** - The document content type format.

## Import

Imports local files / folders in the selected cabinet / folder of the repository. Actions available when performing an import:

- **Add Files** - Opens a file browse dialog box and allows you to select files to add to the list.
- **Add Folders** - Opens a folder browse dialog box that allows you to select folders to add to the list. The subfolders will be added recursively.
- **Edit** - Opens a dialog box where you can change the properties of the selected file / folder from the list.
- **Remove** - Removes the selected files / folders from the list.

## Export

Allows you to export the folder on the remote connection to a local folder.

## Rename

Renames the current resource

## Delete

Deletes the current container.

## Refresh

Performs a refresh on the selected node.

## Properties

Shows various properties of the current container.

## Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

## Resource Level Nodes

### Edit

Checks out and opens the selected resource in the editor (if it is not already checked out).

### Edit with

Checks out and opens the selected resource in the specified editor or tool (if it is not already checked out).

### Open (Read-only)

Opens the selected resource in the editor. The resources are marked as read-only in the editor using a lock icon on the file tab. If you want to edit those resources, enable the **Can edit read only files option** in the **Editor** preferences page.

### Open with

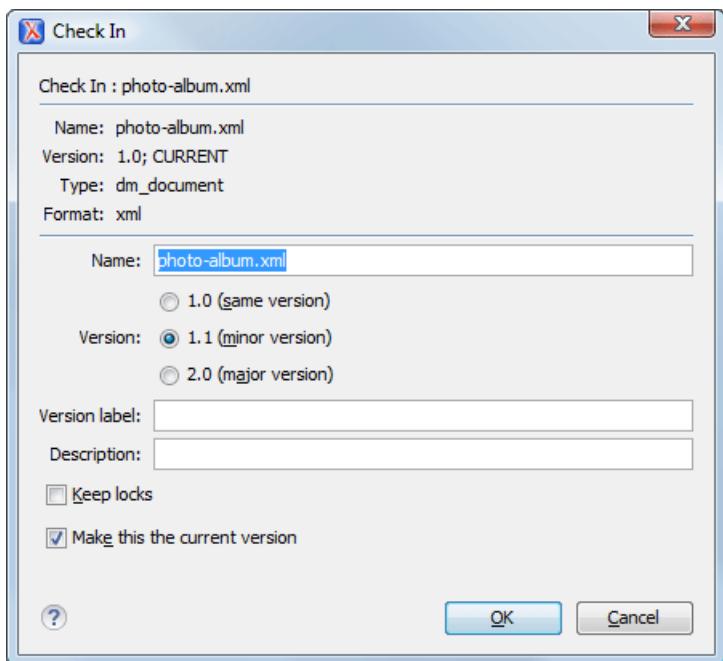

Opens the selected resource in the specified editor or tool.

### Check Out

Checks out the selected resource from the repository. The action is not available if the resource is already checked out.

### Check In

Opens the **Check In** dialog box that allows you to check in the selected resource (commits changes) into the repository and configure some properties for the resource. The action is only available if the resource is checked out.

**Figure 511: Check In Dialog Box**

The following resource properties can be configured in this dialog box:

- **Name** - The resource name in the repository.
- **Version** - Allows you to choose what version the resource will have after being checked in.
- **Version label** - The label of the updated version.
- **Description** - An optional description of the resource.
- **Keep Locks** - When this option is enabled, the updated resource is checked into the repository but it also keeps it locked.
- **Make this the current version** - Makes the updated resource the current version (will have the *CURRENT* version label).

#### **Cancel Checkout**

Cancels the checkout process and loses all modifications since the checkout. Action is only available if the resource is checked out.

#### **Export**

Allows you to export the folder on the remote connection to a local folder.

#### **Copy**

Copies the selected resource to another location in the tree. This action is not available on virtual document descendants. This action can also be performed with drag and drop while holding the **Ctrl** (**Meta on OS X**) key pressed.

#### **Move**

Moves the selected resource to another location in the tree. Action is not available on virtual document descendants and on checked out resources. This action can also be performed with drag and drop.

#### **Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

#### **Rename**

Renames the current resource

#### **✖ Delete**

Deletes the current container.

### Add Relationship

Adds a new relationship for the selected resource. This action can also be performed with drag and drop between resources.

### Convert to Virtual Document

Allows you to convert a simple document to a virtual document. Action is available only if the resource is a simple document.

### Convert to Simple Document

Allows you to convert a virtual document to a simple document. Action is available only if the resource is a virtual document with no descendants.

### Refresh

Performs a refresh on the selected node.

### Properties

Shows various properties of the current container.

### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

### Compare

Compares two selected resources using the [Compare Files tool](#).

## Integration with Microsoft SharePoint

Oxygen XML Editor provides support for browsing and managing SharePoint connections in the [Data Source Explorer view](#). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

**Note:** You can access documents stored on SharePoint Online for Office 365 sites that use either *Cloud identity* (default) or *Federated identity (ADFS)* as the authentication method.

**Restriction:** The SharePoint connection is only available in the Enterprise edition of Oxygen XML Editor.

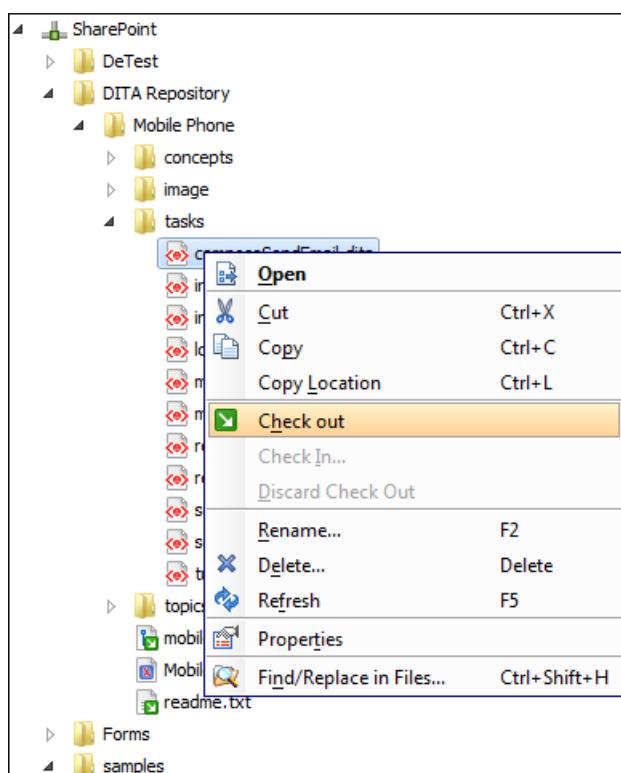

Figure 512: SharePoint Connection

## Related information

[Working with Databases](#) on page 950

## How to Configure a SharePoint Connection

By default, Oxygen XML Editor contains built-in data source drivers for **SharePoint**. Use this data source to create a connection to a SharePoint server that will be available in the [Data Source Explorer view](#).

To configure a SharePoint connection, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**.
2. In the **Connections** panel click the **+ New** button.
3. Enter a unique name for the connection.
4. Select SharePoint in the **Data Source** combo box.
5. Fill-in the connection details:
  - a) Set the URL to the SharePoint repository in the field **SharePoint URL**.
  - b) Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
  - c) Set the user name to access the SharePoint repository in the **User** field.
  - d) Set the password to access the SharePoint repository in the **Password** field.

To watch our video demonstration about connecting to repository located on a SharePoint server, go to [https://www.oxygenxml.com/demo/SharePoint\\_Support.html](https://www.oxygenxml.com/demo/SharePoint_Support.html).

## SharePoint Browser View

The **SharePoint Browser** view allows you to connect to a SharePoint repository and perform SharePoint-specific actions on the available resources. To display this view, go to **Window > Show View > SharePoint Browser**.

The screenshot shows the SharePoint Browser window. At the top, there is a header bar with a close button, a refresh button, and a settings gear icon. Below the header, a 'Site' dropdown menu is set to 'MySharePointSite'. The main interface is split into two sections: a tree view on the left and a table view on the right.

**Tree View (Left):**

- <oXygen/> Team Site
  - Automatic Tests
  - Test Samples
  - Documents [All Documents]
    - Shared Documents
    - MicroFeed
    - Site Assets
    - Site Pages
  - Oxygen XML Author Applet
  - QA Test Site
  - Documents [Only DITA]
    - Shared Documents
  - Form Templates
  - Site Assets
  - Site Pages [All Pages]
    - SitePages
  - Style Library

**Figure 513: SharePoint Browser View**

The view is split in several functional areas:

## Connection Area

The following controls are available:

- The **Site** combo box allows you to select and connect to an already defined *SharePoint connection*.
- The  **Disconnect** action terminates the current connection.
- The  **Settings** drop-down menu contains actions that help you to quickly define a new connection or manage the existing ones from the **Data Source** options page: **New SharePoint Connection** and **Configure Database Sources**. Also, here you can choose one of the predefined view layouts.

## SharePoint Site Navigation Area

If there is no connection selected in the **Site** combo box, this area is left blank and promotes the actions that allow you to quickly add SharePoint connections. Otherwise, the navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

**Note:** The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

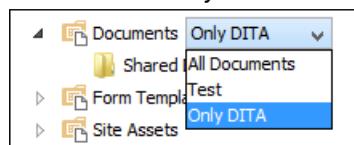

Figure 514: Drop-Down Menu to Select Which Items to Display

## Folder Content Area

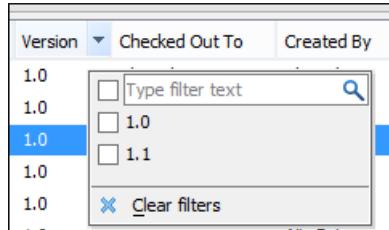

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

Action	Description	Available for	
		folders	documents
 <b>Open</b>	Displays the content of the currently selected folder. Opens the current document for editing.	✓	✓
<b>Rename</b>	Renames the current node on server.	✓	✓
<b>Import</b>	Imports files or folders into the currently selected folder.	✓	✓
 <b>Delete</b>	Deletes the current node from the server.	✓	✓
<b>Copy Location</b>	Copies to clipboard the URL of the current node.	✓	✓
 <b>Check Out</b>	Reserves the current document for your use so that other users cannot change it while you are editing it.		✓
<b>Check In</b>	Commits on the server the changes you made to the document, so that other users can see them. It also makes the document available for editing to other users.		✓
<b>Discard Check Out</b>	Discards the previous checkout operation, making the file available for editing to other users.		✓

Action	Description	Available for	
		folders	documents
Refresh	Queries the server to refresh the available properties of the current node.	✓	✓
Drag and Drop	You can drag documents from the <b>SharePoint Browser</b> view and drop them in the main editor area to open them with ease.		✓

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

**Note:** A column can be filtered or sorted only if it was configured this way on the server side.

**Figure 515: Column Filter**

#### Related tasks

[How to Configure a SharePoint Connection](#) on page 1006

#### SharePoint Contextual Menu Actions

While browsing SharePoint connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

##### Connection Level Nodes

###### Configure Database Sources

Opens the [Data Sources preferences page](#) where you can configure both data sources and connections.

###### Disconnect

Stops the connection.

###### New Folder

Creates a new folder on the connection.

###### Import Files

Allows you to add a new file on the connection, in the current folder.

###### Refresh

Performs a refresh on the selected node.

###### Find/Replace in Files

Allows you to find and replace text in multiple files from the connection.

##### Folder Level Nodes

###### New File

Creates a new file on the connection, in the current folder.

###### New Folder

Creates a new folder on the connection.

###### Import Folders

Imports folders on the server.

 **Import Files**

Allows you to add a new file on the connection, in the current folder.

**Export**

Allows you to export the folder on the remote connection to a local folder.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Copy**

Copies the current selection into the clipboard.

 **Paste**

Pastes the copied selection.

**Rename**

Renames the current resource

 **Delete**

Deletes the current container.

 **Refresh**

Performs a refresh on the selected node.

 **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

 **Resource Level Nodes****Open**

Opens the selected resource in the editor.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Check Out**

Checks out the selected document on the server.

**Check In**

Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to comment on a file that you check in.

**Discard Check Out**

Discards the previous checkout operation, making the file available for editing to other users.

**Rename**

Renames the current resource

 **Delete**

Deletes the current container.

 **Refresh**

Performs a refresh on the selected node.

 **Properties**

Shows various properties of the current container.

 **Find/Replace in Files**

Allows you to find and replace text in multiple files from the connection.

**Compare**

Compares two selected resources using the [\*\*Compare Files tool\*\*](#).

---

## Topics:

- [\*Import from Text Files\*](#)
- [\*Import from MS Excel Files\*](#)
- [\*Import Database Data as an XML Document\*](#)
- [\*Import from HTML Files\*](#)
- [\*Import Content Dynamically\*](#)

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Editor offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the [\*Transform features\*](#).

---

## Import from Text Files

To import a text file into an XML file, follow these steps:

1. Go to **File > Import > Text File**.  
A **Select text file** dialog box is displayed.
2. Select the URL of the text file.
3. Select the encoding of the text file.
4. Click the **Next** button.  
The **Import Criteria** dialog box is displayed.

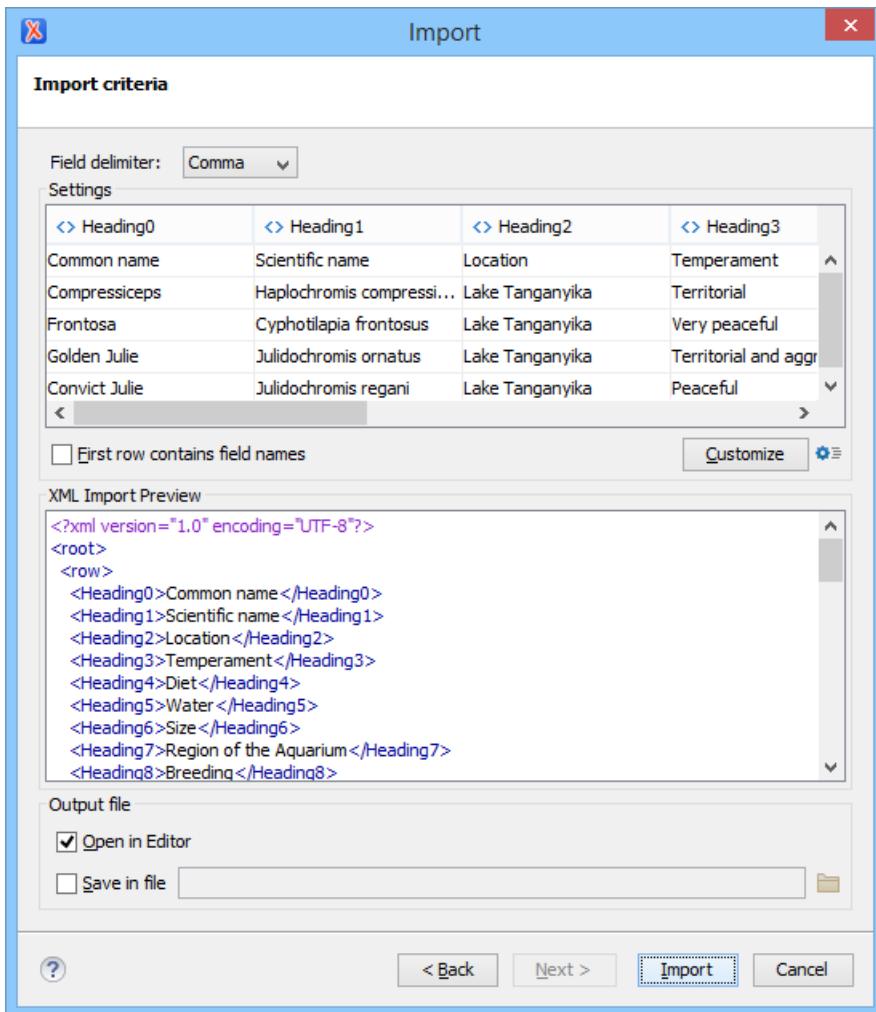

Figure 516: Import Criteria Dialog Box

5. Configure the settings for the conversion.
  - a) Select the **Field delimiter** for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, or Pipe.
  - b) The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (**<>** symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (**=** symbol). Clicking a second time causes the column data to be ignored (**x** symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
  - c) **First row contains field names** - If this option is enabled, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
  - d) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
  - e) **Import Settings** - Clicking this button opens the **Import preferences page** that allows you to configure more import options.
  - f) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
  - g) **Open in editor** - If checked, the new XML document created from the imported text file is opened in the editor.
  - h) **Save in file** - If checked, the new XML document is saved in the specified path.

- Click **Import** to generate the XML document.

## Import from MS Excel Files

By default, importing Excel 97/2000/XP/2003 formats are supported out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See [Import Data from MS Excel 2007 or Newer](#) on page 1014 for instructions on adding more libraries.

Oxygen XML Editor offers support for importing MS Excel Files.

To import an Excel file into an XML file, follow these steps:

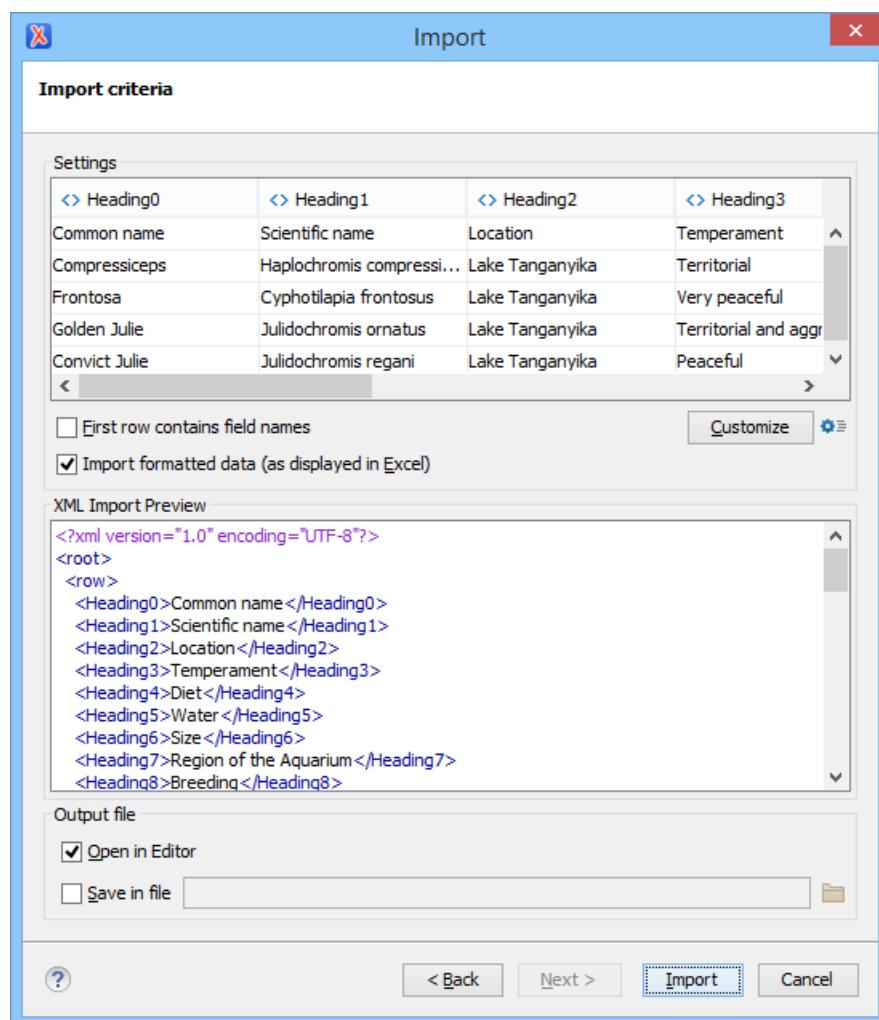

- Go to **File > Import > MS Excel file**.

- Select the URL of the Excel file.

The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.

- Click the **Next** button.

Opens the **Import criteria** dialog box.

**Figure 517: Import Criteria Dialog Box**

- Configure the settings for the conversion.

- The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content ( $\bowtie$  symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( $=$  symbol). Clicking a second time causes the column data to be ignored ( $\times$  symbol) when

generating the XML file. You can cycle through these three options by continuing to click the column header.

- b) **First row contains field names** - If this option is enabled, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
  - c) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
  - d) **Import Settings** - Clicking this button opens the *Import preferences page* that allows you to configure more import options.
  - e) **Import formatted data (as displayed in Excel)** - If this option is selected, the imported data retains the Excel styling. If deselected, the data formatting is not imported.
  - f) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
  - g) **Open in editor** - If checked, the new XML document created from the imported file is opened in the editor.
  - h) **Save in file** - If checked, the new XML document is saved in the specified path.
5. Click **Import** to generate the XML document.

## Import Data from MS Excel 2007 or Newer

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Editor needs additional libraries from the release 3.10 of the Apache POI project.

To add the libraries, follow these steps:

1. Download version 3.10 of the Apache POI project from <http://archive.apache.org/dist/poi/release/bin/>. The specific ZIP file that you need is: poi-bin-3.10-FINAL-20140208.zip.
2. Unpack poi-bin-3.10-FINAL-20140208.zip.
3. Copy the following .jar files in the lib directory of the installation folder of Oxygen XML Editor :
  - dom4j-1.6.1.jar
  - poi-ooxml-3.10-FINAL-20140208.jar
  - poi-ooxml-schemas-3.10-FINAL-20140208.jar
  - xmlbeans-2.3.0.jar

## Import Database Data as an XML Document

---

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File > Import > Database Data** to start the **Import** wizard.

This opens a **Select database table** dialog box that lists all the defined database connections:

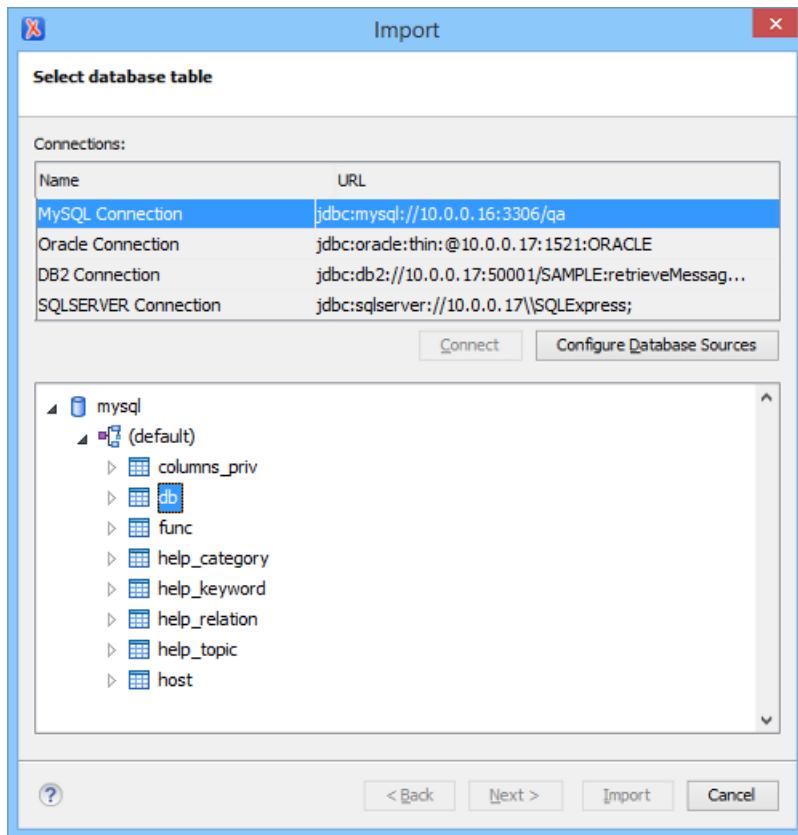

Figure 518: Select Database Table Dialog Box

2. Select the connection to the database that contains the appropriate data.  
Only connections configured in relational data sources can be used to import data.
3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button.  
The **Preferences/Data Sources** option page is opened.
4. Click **Connect**.
5. In the list of sources, expand a schema and choose the required table.
6. Click the **Next** button.

The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

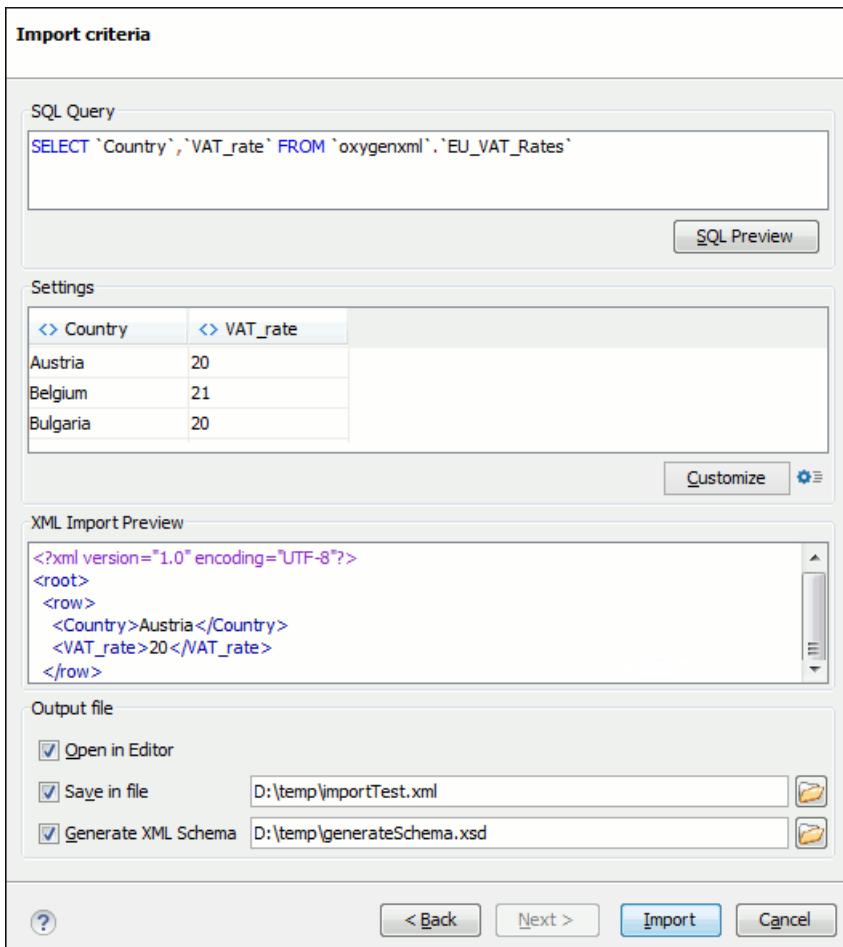

Figure 519: Import from Database Criteria Dialog Box

7. Configure the settings for the conversion.
  - a) **SQL Preview** - If this button is pressed, the **Settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content ( $\bowtie$  symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( $=$  symbol). Clicking a second time causes the column data to be ignored ( $\times$  symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
  - b) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.
  - c) **Import Settings** - Clicking this button opens the **Import preferences page** that allows you to configure more import options.
  - d) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
  - e) **Open in editor** - If checked, the new XML document created from the imported file is opened in the editor.
  - f) **Save in file** - If checked, the new XML document is saved in the specified path.
  - g) **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.
8. Click **Import** to generate the XML document.

## Import from HTML Files

Oxygen XML Editor offers support for importing HTML files as an XML document.

To import from HTML files, follow these steps:

1. Go to **File > Import > HTML File**.  
The **Import HTML** dialog box is displayed.
2. Enter the URL of the HTML document.
3. Select the type of the resulting XHTML document:
  - XHTML 1.0 Transitional
  - XHTML 1.0 Strict
4. Click the **OK** button.

The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML Transitional or XHTML Strict depending on the option you chose when performing the import operation.

## Import Content Dynamically

---

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xls/processor=excel!/
urn:files:sample.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xls`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
 <rewriteURI uriStartString="urn:files:" rewritePrefix=".//resources//"/>
 <rewriteURI uriStartString="urn:processors:" rewritePrefix=".//processors//"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `! /` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the XML Catalog support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the XML catalog.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

*For example*, for a DITA map with a `topicref` such as:

```
<topicref href="convert://.../processor=excel!//resources//sample.xls"/>
```

the `resources/sample.xls` path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a *DITA map*.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: <https://github.com/oxygenxml/dita-glass>.

## Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The ss parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1! /urn:files:sample.xml
```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The ss parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1! /urn:files:sample.xml
```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter sn, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

```
convert:/processor=excel;sn=test! /urn:files:sample.xls
```

- **java Processor** - Converts an input to another format by applying a specific Java method. The jars parameter is a comma-separated list of JAR libraries, or folders that libraries will be loaded from. The ccn parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

```
public void convert(String systemID, String originalSourceSystemID,
InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
throws IOException
```

```
convert:/processor=java;jars=libs;ccn=test.JavaToXML! /urn:files:java/WSEditorBase.java
```

- **js Processor** - Converts an input to another format by applying a JavaScript method. The js parameter indicates the script that will be used. The fn parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal! /urn:files:sample.md
```

- **json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json! /urn:files:personal.json
```

- **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml! /urn:files:test.html
```

- **wrap Processor** - Wraps content in a tag name making it well-formed XML. The rn parameter indicates the name of the root tag to use. By default, it is wrapper. The encoding parameter specifies the encoding that should be used to read the content. By default, it is UTF8. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an xslt processor.

```
convert:/processor=wrap! /urn:files:test.csv
```

- **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote

resource, the cache will need to be invalidated by reloading (**File > Reload (F5)**) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;....!/urn:files:test.csv
```

### Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the h2d.xsl stylesheet and converts DITA to HTML when the content is saved in the application using the d2h.xsl stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/
urn:files:sample.html
```

**Important:** If you are publishing a DITA map that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to *true*. This will instruct Oxygen XML Editor to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libaries** button in the **Advanced** tab of the transformation scenario.

## Topics:

- [Debugger Layout](#)
- [Working with the XSLT / XQuery Debugger](#)
- [Debugging Java Extensions](#)
- [Supported Processors for XSLT / XQuery Debugging](#)
- [Performance Profiling of XSLT Stylesheets and XQuery Documents](#)

Oxygen XML Editor includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

### XSLT Debugger Perspective

The XSLT Debugger perspective allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this perspective, select the  **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

### XQuery Debugger Perspective

The XQuery Debugger perspective allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select the  **XQuery Debugger** button in the top-right corner of the interface or **Window > Open perspective > XQuery Debugger**.

### XSLT/XQuery Debugging Overview

The **XSLT Debugger** and **XQuery Debugger** perspectives enable you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 9.6.0.7 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 9.6.0.7 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated it.
- Breakpoints on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.
- Available templates and hits count.
- Variables view.
- Dynamic output generation.

## Debugger Layout

The XML and XSL files are displayed in **Text mode**. The other modes (**Author mode**, **Grid mode**) are available only in [the Editor perspective](#).

The debugger perspective contains four sections:

- **Source document view (XML)** - Displays and allows the editing of XML files (documents).
- **XSLT/XQuery document view (XSLT/XQuery)** - Displays and allows the editing of XSL files(stylesheets) or XQuery documents.
- **Output view** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed. Several actions are available in the contextual menu for this view, including **Find/Replace**, **Copy**, and **Format and Indent**. There are two types of output views: a text view (with XML syntax highlight) and an XHTML view. For large outputs, the XHTML view can be disabled (see [Debugger Settings](#)).
- **Control view** - The control view is used to configure and control the debugging operations. It also provides a set of **Information views** types. This pane has two sections:
  - [Control toolbar](#)
  - [Information views](#)

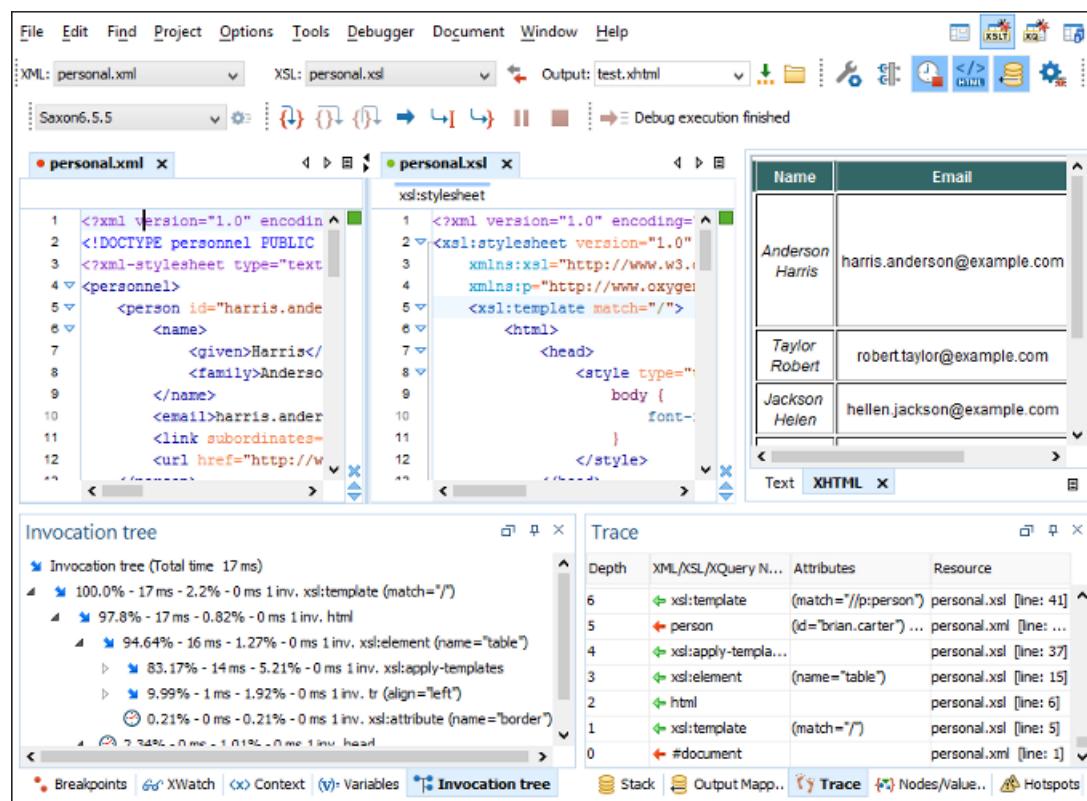

Figure 520: Debugger Mode Interface

XML documents and XSL stylesheets or XQuery documents that were opened in the Editor perspective are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system of the Editor perspective. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the Editor perspective.

When editing in the Editor perspective the editor toolbar is displayed. In Debugger mode this toolbar is not available, however the functions are still accessible from [the Document menu](#) and [the editors contextual menus](#).

Bookmarks are replaced in the Debugger perspective by breakpoints.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

## Control Toolbar

The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

**Figure 521: Control Toolbar**

### XML source selector

The current selection represents the source document used as input by the transformation engine. The selection list contains all opened files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value NONE, because usually XQuery documents do not require an input source.

### XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all opened files (XSLT / XQuery files being emphasized).

### Link with editor

When enabled, the XML and XSLT/XQuery selectors display the names of the files opened in the central editor panels. This button is disabled by default.

### Output selector

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

### Configure parameters

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

### Libraries

Allows you to add and remove the Java classes and jars used as XSLT extensions.

### Turn on/off profiling

Enables / Disables current transformation profiling.

### Enable XHTML output

Enables the rendering of the output in the XHTML output view during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the editor perspective using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

### Turn on/off output to source mapping

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

### Debugger preferences

Quick link to [Debugger preferences page](#).

### XSLT / XQuery engine selector

Lists the [processors available for debugging XSLT and XQuery transformations](#).

## XSLT / XQuery engine advanced options

Advanced options available for Saxon 9.6.0.7.

### Step into

Starts the debugging process and runs until the next instruction is encountered.

### Step over

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

```
12 <xsl:template match="CCC" priority="4">
13 <h3 style="color:blue">
14 <xsl:value-of select="name()"/>
15 <xsl:text> (id=</xsl:text>
16 <xsl:value-of select="@id"/>
17 <xsl:text>)</xsl:text>
18 </h3>
19 <xsl:message>Step over goes here</xsl:message>
20 </xsl:template>
```

Figure 522: Step over

### Step out

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

```
12 <xsl:template match="CCC" priority="4">
13 <h3 style="color:blue">
14 <xsl:value-of select="name()"/>
15 <xsl:text> (id=</xsl:text>
16 <xsl:value-of select="@id"/>
17 <xsl:text>)</xsl:text>
18 </h3>
19 <xsl:message>Step out goes here</xsl:message>
20 </xsl:template>
```

Figure 523: Step out

### Run

Starts the debugging process. The execution of the process is paused when a *breakpoint* is encountered or the transformation ends.

### Run to cursor

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid breakpoint is reached or the execution ends.

### Run to end

Runs the transformation until the end, without taking into account enabled breakpoints, if any.

### Pause

Request to pause the current transformation as soon as possible.

### Stop

Request to stop the current transformation without completing its execution.

### Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering ( ) or leaving ( ) an XML execution node.

- Entering ( ) or leaving ( ) an XSL execution node.
- Entering ( ) or leaving ( ) an XPath execution node.

**Note:** When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.

**Note:** For some of the XSLT processors (Saxon-HE/PE/EE) the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

#### Related information

[Advanced Saxon HE/PE/EE XQuery Transformation Options](#) on page 776

## Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified. The information types include the following:

### Left side information views

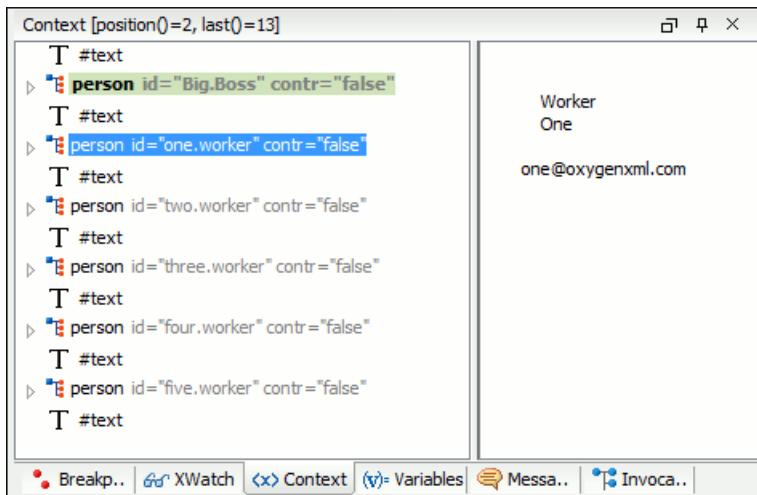

- [Context node view](#)
- [XWatch view](#)
- [Breakpoints view](#)
- [Messages view](#) (XSLT only)
- [Variables view](#)
- [Invocation Tree view](#)

### Right side information views

- [Stack view](#)
- [Output Mapping Stack view](#)
- [Trace view](#)
- [Templates view](#) (XSLT only)
- [Nodes/Values Set view](#)
- [Hotspots view](#)

### Context Node View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in [XWatch view](#). The value of the context node is presented as a tree in the **Context Node** view. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 524: Context node view**

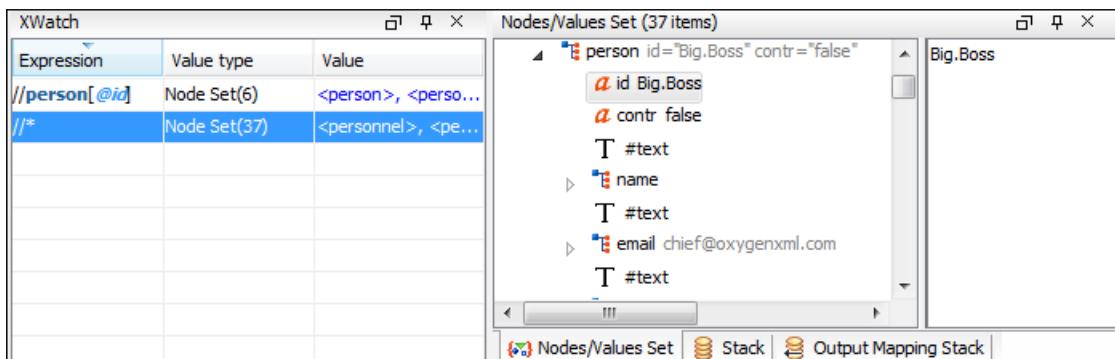

The context node is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

The title bar displays the current element index and the number of elements that compose the current context (this information is not available if you choose Xalan or Saxon 6 as processing engine).

#### XPath Watch (XWatch) View

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Editor supports you with syntax highlight and [content completion assistance](#).

**Figure 525: XPath Watch View**

**Table 38: XWatch columns**

Column	Description
Expression	XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).
Value	Result of XPath expression evaluation. Value has a type (see <a href="#">the possible values</a> in the section <a href="#">Variables View</a> ). For Node Set results, the number of nodes in the set is shown in parenthesis.

**Important:** Remarks about working with the **XWatch** view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing. As an alternative, right-click and select the **Add** action. Press **(Enter)** on the cell to add and evaluate.
- To delete an expression, click its **Expression** column and delete its content. As an alternative, right-click and select the **Remove** action. Press **(Enter)** on the cell to commit changes.
- If the expression result type is a *Node Set*, click it (**Value** column) and its value is displayed in the **Nodes/Values Set view**.
- The **Copy**, **Add**, **Remove** and **Remove All** actions are available in every row's contextual menu.

## Breakpoints View

The **Breakpoints** view lists all breakpoints that are set on opened documents. If the view is not displayed, it can be opened from the **Window > Show View** menu. *Breakpoints can be inserted* in XSLT/XQuery documents and XML documents in XSLT/XQuery debugging sessions.

Once you insert a breakpoint, it is automatically added to the list in the **Breakpoints** view and you can edit its associated breakpoint *condition*. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as **true**.

Breakpoints		
Enabled	Resource	Condition
<input checked="" type="checkbox"/>	(conditional only)	count(preceding::person)=2
<input checked="" type="checkbox"/>	personal.xsl [line:16]	local-name()="person"
<input checked="" type="checkbox"/>	personal.xsl [line:22]	position() >= Last evaluated as: false
<input checked="" type="checkbox"/>	personal.xsl [line:34]	(no condition)
<input checked="" type="checkbox"/>	personal.xsl [line:44]	(no condition)
<input checked="" type="checkbox"/>	personal.xsl [line:50]	(no condition)

Figure 526: Breakpoints View

The **Breakpoints** view contains the following columns:

- **Enabled** - If checked, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the breakpoint is set. The Entire path of resource file is available as tooltip.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the breakpoint line in the document.

**Note:** The breakpoints list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

### Go to

Moves the cursor to the source of the breakpoint.

### Run to Breakpoint

Runs the debugger up to the point of this particular breakpoint and ignores the others (regardless of whether they were previously enabled or disabled).

**Enable**

Enables the breakpoint.

**Disable**

Disables the breakpoint. A disabled breakpoint will not be evaluated by the Debugger.

**Add**

Allows you to add a new breakpoint and breakpoint condition.

**Edit**

Allows you to edit an existing breakpoint.

**Remove**

Deletes the selected breakpoint.

**Enable all**

Enables all breakpoints.

**Disable all**

Disables all breakpoints.

**Remove all**

Removes all breakpoints.

**Related tasks**

[Inserting Breakpoints](#) on page 1034

**Messages View**

xsl:message instructions are one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The **Messages** view is available only for XSLT debugging sessions and shows all xsl:message calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Messages		
Message	Terminate	Resource
Message 1	no	personal.xsl [line: 8]
Message 2	no	personal.xsl [line: 12]
Message 3	no	personal.xsl [line: 29]

**Figure 527: Messages View**

**Table 39: Messages columns**

Column	Description
Message	Message content.
Terminate	Signals if processor terminates the transformation or not once it encounters the message (yes/no respectively).
Resource	Resource file where xsl:message instruction is defined and the message line number. The complete path of the resource is available as tooltip.

The following actions are available in the contextual menu:

**Go to**

Highlight the XSL fragment that generated the message.

**Copy**

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

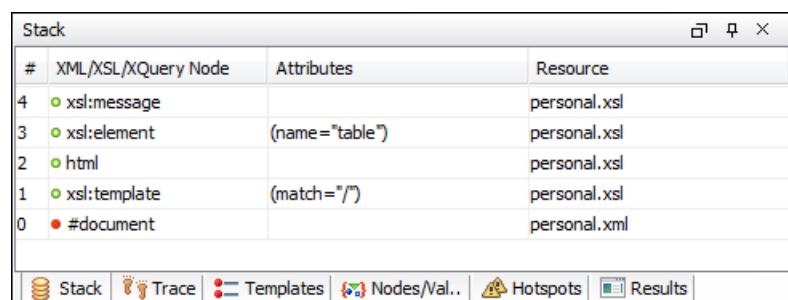

### Important: Remarks

- Clicking a record from the table highlights the `xsl:message` declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

### Stack View

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened from the **Window > Show View** menu.

During transformation two stacks are managed: one of source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor shows both node types into one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

**Figure 528: Stack View**

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

**Table 40: Stack columns**

Column	Description
#	Order number, represents the depth of the node (0 is the stack base).
XML/XSLT/XQuery Node	Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as <b>#document</b> .
Attributes	Attributes of the node (a list of <code>id="value"</code> pairs).
Resource	Resource file where the node is located. The entire path is available as tooltip.

### Important: Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

### Output Mapping Stack View

The **Output Mapping Stack** view displays [context data](#) and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Output Mapping Stack			
#	XML/XSL/XQuery Node	Attributes	Resource
8	xsl:value-of	(select=".//link/@manager")	personal.xsl
7	font	(color="black") (name="verdana") (size="3")	personal.xsl
6	xsl:element	(name="td")	personal.xsl
5	xsl:element	(name="tr")	personal.xsl
4	xsl:template	(match="//person")	personal.xsl
3	xsl:apply-templates		personal.xsl
2	xsl:element	(name="table")	personal.xsl
1	html		personal.xsl
0	xsl:template	(match="/")	personal.xsl

Stack | Output Mapping Stack | Trace | Templates | Nodes/Values Set |

**Figure 529: Output Mapping Stack view**

The **Go to** action of the contextual menu takes you in the editor panel at the line containing the XSLT element displayed in the **Output Mapping Stack** view.

**Table 41: Output Mapping Stack columns**

Column	Description
#	The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.
XSL/XQuery Node	The name of an XSLT template/XQuery element that participated in the generation of the selected output area.
Attributes	The attributes of the XSLT template/XQuery node.
Resource	The name of the file containing the XSLT template/XQuery element.

#### Important: Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.

#### Related tasks

[Identify the XSLT / XQuery Expression that Generated Particular Output](#) on page 1035

#### Related information

[Stack View](#) on page 1028

[Trace History View](#) on page 1029

[Templates View](#) on page 1031

#### Trace History View

Usually the XSLT/XQuery processors signal the following events during transformation:

- - Entering a source (XML) node.
- ← - Leaving a source (XML) node.

- ➡ - Entering an XSLT/XQuery node.
- ⬅ - Leaving an XSLT/XQuery node.

The **Trace History** view catches all these events, so you can see how the process evolved. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document. The action is available on the contextual menu of the view. Thus, you have the possibility of comparing the trace results from multiple debug sessions.

Trace			
Depth	XML/XSL/XQuery Node	Attributes	Resource
0	➡ #document		personal.xml
1	➡ xsl:template	(match="/")	personal.xsl
2	➡ html		personal.xsl
3	➡ xsl:element	(name="table")	personal.xsl
4	➡ xsl:message		personal.xsl
4	➡ xsl:message		personal.xsl
4	➡ xsl:message		personal.xsl

Stack Trace Templates Nodes/Values Set Hotspots Results

**Figure 530: Trace History View**

The contextual menu contains the following actions:

#### Go to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

#### Export to XML

Saves the entire trace list into XML format.

**Table 42: Trace History columns**

Column	Description
Depth	Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.
XML/XSLT/XQuery Node	Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as #document. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).
Attributes	Attributes of the node (a list of id="value" pairs).
Resource	Resource file where the node is located. The complete path of the resource file is provided as tooltip.

#### Important: Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

## Templates View

The `xsl:template` is the basic element for stylesheets transformation. The **Templates** view is only available during XSLT debugging sessions and shows all `xsl:template` instructions used by the transformation. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Being able to see the number of *hits* for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

Templates					
Match	Hits	Priority	Mode	Name	Resource
//person	6				personal.xsl
/	1				personal.xsl

Stack | Outp.. | Trace | Temp.. | Node.. | Hits.. |

**Figure 531: Templates view**

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT template that is displayed on the selected line from the view.

**Table 43: Templates columns**

Column	Description
Match	The match attribute of the <code>xsl:template</code> .
Hits	The number of hits for the <code>xsl:template</code> . Shows how many times the XSLT processor used this particular template.
Priority	The template priority as established by XSLT processor.
Mode	The mode attribute of the <code>xsl:template</code> .
Name	The name attribute of the <code>xsl:template</code> .
Resource	The resource file where the template is located. The complete path of the resource file is available as tooltip.

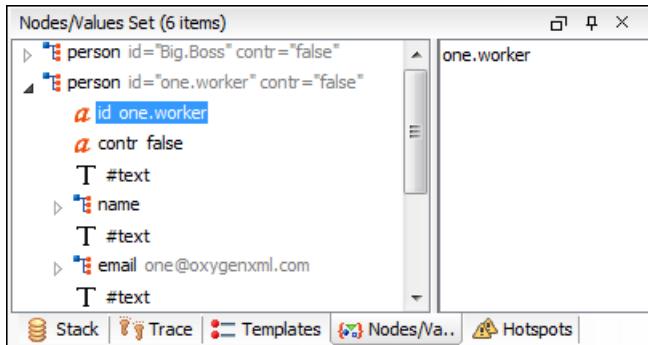

**Important:** Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

## Nodes/Values Set View

The **Nodes/Values Set** view is always used in relation with [The Variables view](#) and [the XWatch view](#). If the view is not displayed, it can be opened from the **Window > Show View** menu. It shows an XSLT node set value in a tree form. The node set view is updated as response to the following events:

- You click a variable having a node set value in one of the above 2 views.
- You click a tree fragment in one of the above 2 views.
- You click an XPath expression evaluated to a node set in one of the above 2 views.

**Figure 532: Node Set view**

The nodes / values set is presented in a tree-like fashion. The total number of items is presented in the title bar. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

**Important:** Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

### Variables View

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor uses the following icons to differentiate variables and parameters:

- - Global variable.
- - Local variable.
- - Global parameter.
- - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**
- **Set**
- **Object**
- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

**Note:**

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
- If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".
- **Document**
- **Element**
- **Attribute**

- **ProcessingInstruction**
- **Comment**
- **Text**
- **Namespace**
- **Evaluating** - Value under evaluation.
- **Not Known** - Unknown types.

Variables			
Variable/Parameter name filter <input type="text"/> <span style="color: blue;">🔍</span>			
	Name	Value type	Value
{V}	val	String	
{P}	rowval	String	1,2
V	trans	String	
P	level	String	1,2
P	image-path	String	Images/

● Breakpoints | ⌚ XWatch | 🔗 Context | 💡 Variables | 💬 Messages | 🕒 Invocation tree

**Figure 533: Variables View**

**Table 44: Variables Columns**

Column	Description
Name	Name of variable / parameter.
Value Type	Type of variable/parameter.
Value	Current value of variable / parameter.

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor area with the action **Copy value** from the contextual menu of the table from the view. This is useful in case of long and complex values that are not easy to remember by looking at them once.

**Important:** Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the **Node Set view** to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

## Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed dynamically while the transformation is running in an output view. There is one view for each `xsl:result-document` instruction so that the output is not mixed while still being presented in multiple views.

## Working with the XSLT / XQuery Debugger

This section describes how to work with the debugger in the most common use cases.

To watch our video demonstration about how you can use the **XSLT Debugger**, go to [https://www.oxygenxml.com/demo/XSLT\\_Debugger.html](https://www.oxygenxml.com/demo/XSLT_Debugger.html).

## Steps in a Typical Debugging Process

To debug a stylesheet or XQuery document, follow this procedure:

1. [Open the source XML document](#) and [the XSLT/XQuery document](#).
2. If you are in the Editor perspective, switch to the XSLT Debugger or XQuery Debugger perspective with one of the following actions:
  - Select Window > Open perspective > **XSLT Debugger/XQuery Debugger** or the  **XSLT Debugger**/ **XQuery Debugger** button in the top-right corner of the interface.
  - Select Document > XML Document > **Debug scenario** or use the  **Debug scenario** action on the toolbar.. This action initializes the Debugger perspective with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.
3. Select the source XML document in the XML source selector of [the Control toolbar](#). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
4. Select the XSLT/XQuery document in the XSLT/XQuery selector of [the Control toolbar](#).
5. Set XSLT/XQuery parameters from the button available on [the Control toolbar](#).
6. [Set one or more breakpoints](#).
7. Step through the stylesheet using the following buttons available on [the Control toolbar](#):
  -  **Step into**
  -  **Step over**
  -  **Step out**
  -  **Run**
  -  **Run to cursor**
  -  **Run to end**
  -  **Pause**
  -  **Stop**
8. Examine the information in the information views to find the bug in the transformation process.  
You may find [the procedure for determining the XSLT template/XQuery element that generated an output section](#) useful for fixing bugs in the transformation.

### Related tasks

[Identify the XSLT / XQuery Expression that Generated Particular Output](#) on page 1035

## Using Breakpoints

The Oxygen XML Editor XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure breakpoints are persistent between work sessions, they are saved at project level. You can set a maximum of 100 breakpoints per project.

### Related information

[Breakpoints View](#) on page 1026

### Inserting Breakpoints

Breakpoints can be set in XSLT/XQuery documents and XML documents in XSLT/XQuery debugging sessions.

To insert a breakpoint, follow these steps:

1. Click the line where you want to insert the breakpoint in the XML source document or the XSLT/XQuery document.

You can only set breakpoints on the XML source in XSLT or XQuery debugging sessions.

Breakpoints are automatically created on the ending line of a start tag, even if you click a different line.

- Click the vertical stripe on the left side of the editor panel or select **Create Breakpoint (Shift+F7)** from the **Edit > Breakpoints** menu.

Once you insert a breakpoint, it is automatically added to the list in the **Breakpoints** view and you can edit its associated breakpoint *condition*. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as **true**.

```

● 4 <title></title>
● 5 <body>
● 6 | <p></p>
● 7 | <table frame="all" rowsep="1"
● 8 | <title>test</title>
● 9 | <tgroup cols="2">

```

**Figure 534: Example: Breakpoints**

#### Related information

[Breakpoints View](#) on page 1026

#### Removing Breakpoints

Only one action is required to remove a breakpoint:

Click the breakpoint icon in the vertical stripe on the left side of the editor panel or right-click the breakpoint and select **Remove** or **Remove all**.

### Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, *Step in*) can be used for this purpose. Using *Step in* you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click the text from the **Text** output view or **XHTML** output view and the editor will select the XML source context and the XSLT template/XQuery element that generated the text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

- Switch to the XSLT Debugger or XQuery Debugger perspective with one of the following actions:
  - Select **Window > Open perspective > XSLT Debugger/XQuery Debugger** or the **XSLT Debugger**/ **XQuery Debugger** button in the top-right corner of the interface.
  - Select **Document > XML Document > Debug scenario** or use the **Debug scenario** action on the toolbar.. This action initializes the Debugger perspective with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.
- Select the source XML document in the XML source selector of [the Control toolbar](#). In the case of XQuery debugging without an implicit source choose the **NONE** value.
- Select the XSLT/XQuery document in the XSLT/XQuery selector of [the Control toolbar](#).
- Select the XSLT/XQuery engine in the XSLT/XQuery engine selector of [the Control toolbar](#).
- Set XSLT/XQuery parameters from the button available on [the Control toolbar](#).
- Apply the XSLT stylesheet or XQuery transformation using the **Run to end** button that is available on [the Control toolbar](#).

7. Inspect the mapping by clicking a section of the output from the **Text** view tab or from the **XHTML** view tab of the *Output document view*.

The screenshot illustrates the inspection of XSLT source mapping. It shows three main components:

- personal.xml**: An XML document containing person elements with attributes like id, name, email, and manager.
- personal.xsl**: An XSLT stylesheet defining templates for the XML data, including styles for the Link column.
- XHTML Output**: A table showing the resulting XHTML output, where the Link column contains values like "one.worker", "two.worker", etc., which map to "Big Boss" in the original XML.

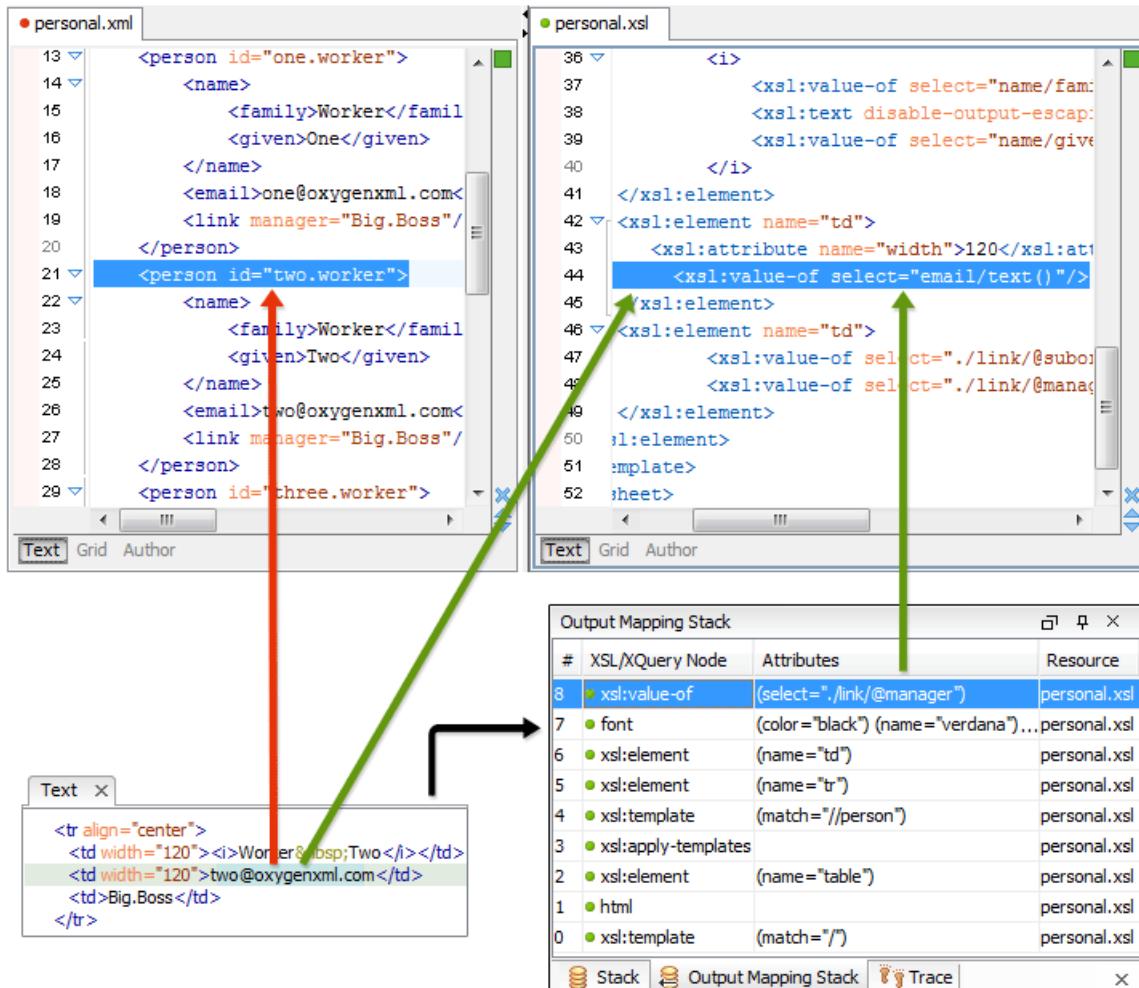

Annotations highlight the mapping process:

- A red arrow points from the "Link" column in the XHTML table to the "manager" attribute in the XML, indicating the source of the value.
- A green arrow points from the "Link" column in the XHTML table to the XSLT code, indicating the transformation rule.
- A black arrow points from the XSLT code in the XSL file to the "Output Mapping Stack" panel, indicating the context of the mapping.

**Output Mapping Stack**

#	XSL/XQuery Node	Attributes	Resource
8	xsl:value-of (select=".//link/@manager")		personal.xsl
7	font (color="black") (name="verdana") ...		personal.xsl
6	xsl:element (name="td")		personal.xsl
5	xsl:element (name="tr")		personal.xsl
4	xsl:template (match="//person")		personal.xsl
3	xsl:apply-templates		personal.xsl
2	xsl:element (name="table")		personal.xsl
1	html		personal.xsl
0	xsl:template (match="/")		personal.xsl

Figure 535: XHTML Output to Source Mapping

**Figure 536: Text Output to Source Mapping**

This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the [Output Mapping Stack](#) view.

#### Related information

[Trace History View](#) on page 1029

[Templates View](#) on page 1031

## Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set breakpoints in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.

- a) Set at least 256 MB as heap memory for the Java virtual machine (recommended 512 MB) by setting the -Xmx parameter in the debug configuration (for example, "-Xmx512m").

- b) Make sure the `[OXYGEN_INSTALL_DIR]/lib/oxygen.jar` file and your Java extension classes are on the Java classpath.  
The Java extension classes should be the same classes that were *set as an extension* of the XSLT/XQuery transformation in the debugging perspective.
  - c) Set the class `ro.sync.exml.Oxygen` as the main Java class of the configuration.  
The main Java class `ro.sync.exml.Oxygen` is located in the `oxygen.jar` file.
2. Start the debug configuration.  
Now you can set breakpoints and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

## Supported Processors for XSLT / XQuery Debugging

---

The following built-in XSLT processors are integrated in the debugger and can be selected in the *Control Toolbar*:

- Saxon 9.6.0.7 HE (Home Edition) - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- Saxon 9.6.0.7 PE (Professional Edition) - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
- Saxon 9.6.0.7 EE (Enterprise Edition) - a schema aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 /3.0 basic ones, XSLT 2.0 / 3.0 schema aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- Saxon 6.5.5 - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- Xalan 2.7.1 - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.

## Performance Profiling of XSLT Stylesheets and XQuery Documents

---

This chapter explains the user interface and how to use the profiler for finding performance problems in XSLT transformations and XQuery ones.

### XSLT/XQuery Performance Profiling Overview

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processors that could be used for debugging and it is available from the debugging perspective.

Enabling and disabling the profiler is controlled by the  **Profiler** button from the *debugger control toolbar*. The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you should set it before starting the transformation.

### Working with XSLT/XQuery Profiler

Profiling activity is linked with debugging activity, so the first step in profiling is to switch to the debugging perspective and follow the corresponding procedure for debugging (see *Steps in a Typical Debugging Process* on page 1034).

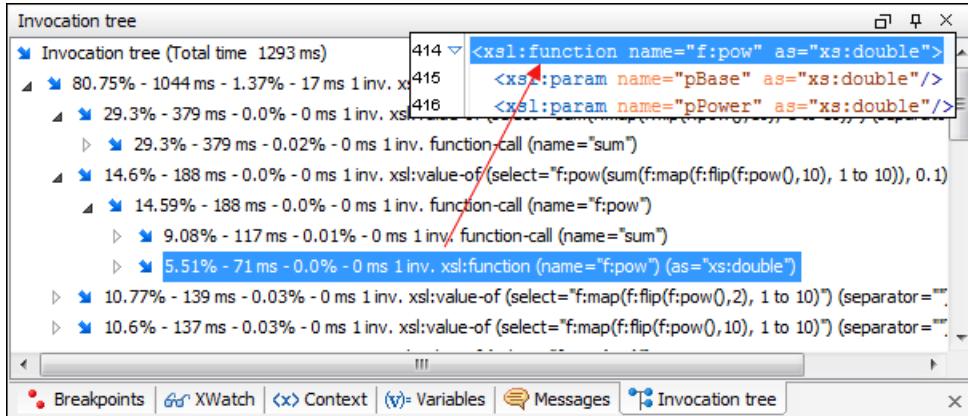

Immediately after turning the profiler on two new information views are added to the current debugger *information views*:

- **Invocation tree view** on left side
- **Hotspots view** on right side

Profiling data is available only after the transformation ends successfully.

Looking to the right side ([Hotspots view](#)), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Looking to the left side ([Invocation tree view](#)), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

**Figure 537: Source backmapping**

In any of the above views you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item cause Oxygen XML Editor to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

When navigating through the trees by opening instruction calls, Oxygen XML Editor automatically expands instructions that are only called by one other instruction themselves.

The profiling data can be saved into XML and HTML format. On any of the above views, use the contextual menu and select the corresponding choice. Basically saving HTML means saving XML and applying an XSLT stylesheet to render the report as XML. These stylesheets are included in the Oxygen XML Editor distribution (see the subfolder `[OXYGEN_INSTALL_DIR]/frameworks/profiler/`) so you can make your own report based on the profiling raw data.

If you want to change the [XSLT/XQuery profiler settings](#), use the contextual menu and choose the corresponding **View settings** entry.

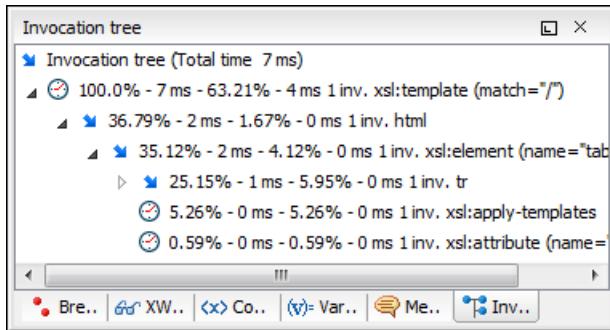

**CAUTION:** Profiling exhaustive transformation may run into an OutOfMemory error due to the large amount of information being collected. If this is the case you can close unused projects when running the profiling or use high values for Java VM options `-Xms` and `-Xmx`. If this does not help you can shorten your source XML file and try again.

To watch our video demonstration about the XSLT/XQuery Profiler, go to [https://www.oxygenxml.com/demo/XSLT\\_Profiling.html](https://www.oxygenxml.com/demo/XSLT_Profiling.html).

### Invocation Tree View

The **Invocation Tree** view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 538: Invocation Tree View**

The entries in the invocation tree include a few possible icons that indicate the following:

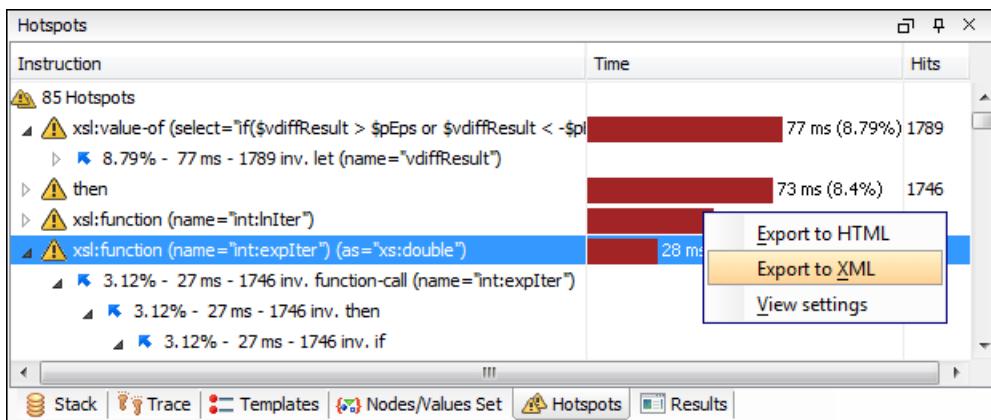

- - Points to a call whose inherent time is insignificant compared to its total time.
- - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the [XSLT/XQuery profiler settings](#):

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

### Hotspots View

The **Hotspots** view displays a list of all instruction calls that lie above the threshold defined in the [XSLT/XQuery profiler settings](#). If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 539: Hotspots View**

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.

- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot, along with a bar whose length is proportional to this value. All calls into this instruction are summed up regardless of the particular call sequence.
- **Hits** - The invocation count of the hotspot entry.

If you click the  handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the [XSLT/XQuery profiler settings](#):

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

**Note:** This is not the number of invocations of this instruction.

- An instruction name that also contains its attributes.

## Topics:

- [Predefined Document Types \(Frameworks\)](#)

A *document type* or *framework* is associated to an XML file according to a set of rules. It also includes a variety of settings that improve editing capabilities in the **Author** mode for its particular file type. These settings include:

- A default grammar used for validation and content completion in both **Author** mode and **Text** mode.
- CSS stylesheets for rendering XML documents in **Author** mode.
- User actions invoked from toolbars or menus in **Author** mode.
- Predefined scenarios used for transformations for the class of XML documents defined by the document type.
- XML catalogs.
- Directories with file templates.
- User-defined extensions for customizing the interaction with the content author in **Author** mode.

Oxygen XML Editor includes built-in support for many common document types. Each document type is defined in a framework. You can [create new frameworks or make changes to existing frameworks](#) to suit your individual requirements.

To see a video on configuring a framework in Oxygen XML Editor, go to <https://www.oxygenxml.com/demo/FrameworkConfiguration.html>.

### Related information

[Document Type Association Advanced Customization](#) on page 1138

## Predefined Document Types (Frameworks)

Oxygen XML Editor includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. The type of documents that are supported include the most popular predefined XML frameworks that include a full set of features as well as other document types that include more generic or common features.

### Predefined Document Types

The following predefined document types (frameworks) are fully supported in Oxygen XML Editor and each of these document types include built-in transformation scenarios, validation, content completion, file templates , default CSS files for rendering content in **Author** mode, and default actions for editing in **Author** mode:

- [DocBook 4](#) - A document type standard for books, articles, and other prose documents (particularly technical documentation).
- [DocBook 5](#) - An enhanced (version 5) document type standard designed for a variety of documents (particularly technical documentation).
- [DITA](#) - An XML-based architecture designed for authoring, producing, and delivering technical information.
- [DITA Map](#) - A document type that collects and organizes references to DITA topics or other maps.
- [XHTML](#) - Extensible HyperText Markup Language includes the same depth of expression as HTML, but also conforms to XML syntax.
- [TEI ODD](#) - Text Encoding Initiative One Document Does it all is an XML-conformant specification that allows you to create TEI P5 schema in a literate programming style.
- [TEI P4](#) - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.

- [TEI P5](#) - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- [JATS](#) - The NISO Journal Article Tag Suite is a technical standard that defines an XML format for scientific literature.

## Other Supported Document Types

Oxygen XML Editor also provides limited support (including file templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Editor include:

- [EPUB \(NCX, OCF, OPF 2.0 & 3.0\)](#) - A standard for e-book files.
- [DocBook Targetset](#) - For resolving cross-references when using *olinks*.
- [Ant Build Scripts](#) - A tool for automating software build processes, written in Java and primarily intended for use with Java.
- [XSLT Stylesheets](#) - A document type that provides a visual mode for editing XSLT stylesheets.
- [WSDL](#) - Web Services Description Language is an XML language for describing the functionality offered by a web service.
- [Schematron](#) - For making assertions about the presence or absence of patterns in XML documents. This document type applies to the ISO Schematron version.
- [Schematron Quick Fixes \(SQF\)](#) - An extension of the ISO standard Schematron, allows developers to define QuickFixes for Schematron errors.
- [StratML \(Part 1 & 2\)](#) - Part 1 and 2 of the Strategy Markup Language specification.
- [XProc](#) - A document type for processing XProc script files.
- [XML Schema](#) - Documents that provide support for editing annotations.
- [SVG](#) - Scalable Vector Graphics is a language for describing two-dimensional graphics in XML.
- [MathML](#) - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- [XLIFF \(1.2 & 2.0\)](#) - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- [XQuery](#) - The common query language for XML.
- [CSS](#) - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- [LESS](#) - A dynamic style sheet language that can be compiled into CSS.
- [Relax NG Schema](#) - A schema language that specifies a pattern for the structure and content of an XML document.
- [NVDL Schema](#) - Namespace Validation Dispatching Language allows you to specify sections of XML documents to be validated against various schemas.
- [JSON](#) - JavaScript Object Notation is a lightweight data-interchange format.
- [JavaScript](#) - Programming language of HTML and the Web.
- [XML Spec](#) - A markup language for W3C specifications and other technical reports.
- [DITAVAL](#) - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- [Daisy](#) - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- [EAD](#) - Encoded Archival Description is an XML standard for encoding archival finding aids.
- [KML](#) - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
- [Maven Project & Settings](#) - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- [Oasis XML Catalog](#) - A document that describes a mapping between external entity references and locally-cached equivalents.

## DocBook 4 Document Type

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

### File Definition

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is `book` or `article`.
- The PUBLIC ID of the document contains the string `- //OASIS//DTD DocBook XML`.

### Default Document Templates

There are a variety of default *DocBook 4* templates available when creating [new documents from templates](#), including **Article**, **Book**, **Chapter**, **Glossary**, **Section**, and more.

The default templates for DocBook 4 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook_4` folder.

### Default Schema

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/4.5/dtd/`.

### Default CSS

The default CSS files used for rendering DocBook content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

### Default XML Catalog

The default XML catalog, `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/`.

### DocBook 4 Author Mode Actions

A variety of actions are available in the DocBook 4 framework that can be added to the **DocBook4** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### DocBook 4 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook4** menu and in various submenus of the contextual menu):

## **B** Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

## *I* Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

## U Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

## Link Actions Drop-Down Menu

The following link actions are available from this menu:

### Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

### Cross reference (xref)

Inserts a cross reference to other parts of the document.

### Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

### Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a [Targetset](#) file.

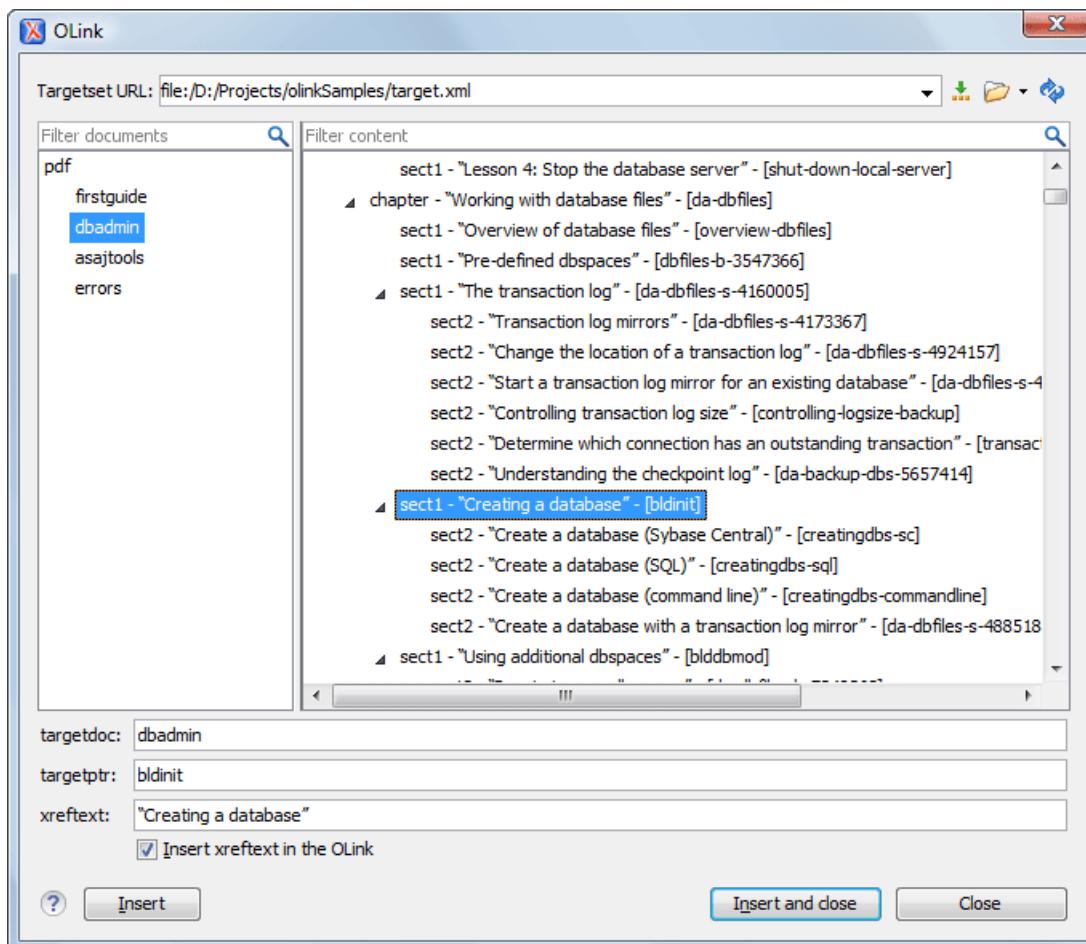

Figure 540: Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed allowing you to easily identify the targetptr for the olink element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an olink using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the olink, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is enabled.

### **Insert URI**

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

### **Insert Image**

*Inserts an image reference* at the cursor position. Depending on the current location, an image-type element is inserted.

### **Insert XInclude**

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

## **Section Drop-Down Menu**

The following actions are available from this menu:

### **Insert Section**

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a para element as a child node. The para element can be deleted if it is not needed.

### **Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))**

Promotes the current node as a sibling of the parent node.

### **Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))**

Demotes the current node a child of the previous node.

### **Insert Paragraph**

Insert a new paragraph element at current cursor position.

### **Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations*.

### **Insert List Item**

Inserts a list item in the current list type.

### **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

### **Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

### **Insert Variable List**

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

### **Insert Procedure List**

Inserts a DocBook procedure element. A step child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

### **Sort**

Sorts cells or list items in a table.

## **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

## **Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

## **Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

## **Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

## **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

## **Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

## **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

## **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

## **DocBook4 Menu Actions**

In addition, the following default actions are available in the **DocBook4** menu when editing in **Author** mode:

### **Paste special submenu**

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

#### **Paste As Xinclude**

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### **Paste as link**

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### **Paste as xref**

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

## **Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

### **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

## Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

## Insert Column Before

Inserts a column before the current one.

## Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

## Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

## ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

### ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor *Editor Variables*.

### Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### Auto generate IDs for elements

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

## Tags display mode Submenu

### Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

### Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

### Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

#### **Inline Tags**

Displays full tag names for inline level elements, while block level elements are not displayed.

#### **Partial Tags**

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

#### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### **Configure Tags Display Mode**

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## **Profiling/Conditional Text Submenu**

### **Edit Profiling Attributes**

Allows you to configure the [profiling attributes](#) and their values.

### **Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

### **Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### **Show Excluded Content**

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

### **List of all profiling condition sets that match the current document type**

You can click a listed condition set to activate it.

#### **Profiling Settings**

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## **DocBook 4 Contextual Menu Actions**

In addition to many of the [DocBook 4 toolbar actions](#) and the [general Author mode contextual menu actions](#), the following DocBook 4 framework-specific actions are also available in the contextual menu when editing in **Author** mode:

### **Paste special submenu**

This submenu includes the following special paste actions that are specific to the DocBook 4 framework:

#### **Paste As XInclude**

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### **Paste as link**

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### **Paste as xref**

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

### **Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

## Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

### Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

### Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### Sort

Sorts cells or list items in a table.

### Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

### Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

### Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the **Insert OLink** action for more information.

### Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## DocBook 4 Drag/Drop Actions

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a DocBook 4 document that is edited in **Author** mode, creates a link to the dragged file (the `ulink` DocBook element) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DocBook 4 document inserts an image element (for example, the `inlinegraphic` DocBook element with a `fileref` attribute) at the drop location, similar to the  **Insert Image** toolbar action.

## DocBook 4 Transformation Scenarios

Default transformation scenarios allow you to convert DocBook 4 to DocBook 5 documents and transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB.

## Related information

[Editing a Transformation Scenario](#) on page 805

## DocBook 4 to WebHelp Output

DocBook 4 documents can be transformed into several types of WebHelp systems.

### WebHelp Classic Output

To publish a DocBook 4 document as a *WebHelp Classic* system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

### WebHelp Classic with Feedback Output

To publish a DocBook 4 document as a *WebHelp Classic with Feedback* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see [Deploying a Feedback-Enabled WebHelp System](#) on page 825.

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback\\_Enabled\\_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

### WebHelp Classic Mobile Output

To publish a DocBook 4 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

### Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### `args.default.language`

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

#### `clean.output`

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

## **I10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is en or for French it is fr, and so on.

## **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

## **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

## **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

## **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

## **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root" />
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

## **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

## **webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

## **webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

## **webhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

## **webhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { }

### webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

### webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

### webhelp.skin.css

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins` directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

## DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
 <mediaobject/>
 <title
 t:named-template="book.verso.title"
 font-size="&hsizet2;"
 font-weight="bold"
 font-family="${title.font.family}" />
 <corpauthor/>
 ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a [DocBook customization layer](#).

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor and set the customization layer in [the XSL URL property of the scenario](#).

## Related information

The book **DocBook XSL: The Complete Guide** by Bob Stayton contains more details about customizing the PDF output.

[Video demonstration for creating a DocBook customization layer in Oxygen XML Editor.](#)

## DocBook to EPUB Transformation

The EPUB specification recommends the use of OpenType fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
 font-family: "MyFont";
 font-weight: bold;
 font-style: normal;
 src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

```
h1 {
 font-size: 20pt;
 margin-bottom: 20px;
 font-weight: bold;
 font-family: "MyFont";
 text-align: center;
}
```

3. Open the **Configure Transformation Scenario(s)** dialog box, select the **DocBook EPUB** transformation scenario, and click **Edit**.
4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

**Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

## DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at [sourceforge.net](#).

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
  - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
  - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

**Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

## Inserting an olink in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.

Each collection of documents has a master target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.

The following is an example of a target database document. It structures a collection of documents in a `sitemap` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
 <targetsetinfo>
 Description of this target database document,
 which is for the examples in olink doc.
 </targetsetinfo>
 <!-- Site map for generating relative paths between documents -->
 <sitemap>
 <dir name="documentation">
 <dir name="guides">
 <dir name="mailuser">
 <document targetdoc="MailUserGuide"
 baseuri="userguide.html">
 &ugtargets;
 </document>
 </dir>
 <dir name="mailadmin">
 <document targetdoc="MailAdminGuide">
 &agtargets;
 </document>
 </dir>
 </dir>
 <dir name="reference">
 <dir name="mailref">
 <document targetdoc="MailReference">
 &reftargets;
 </document>
 </dir>
 </dir>
 </dir>
 </sitemap>
</targetset>
```

```
</sitemap>
</targetset>
```

#### 4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to yes. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

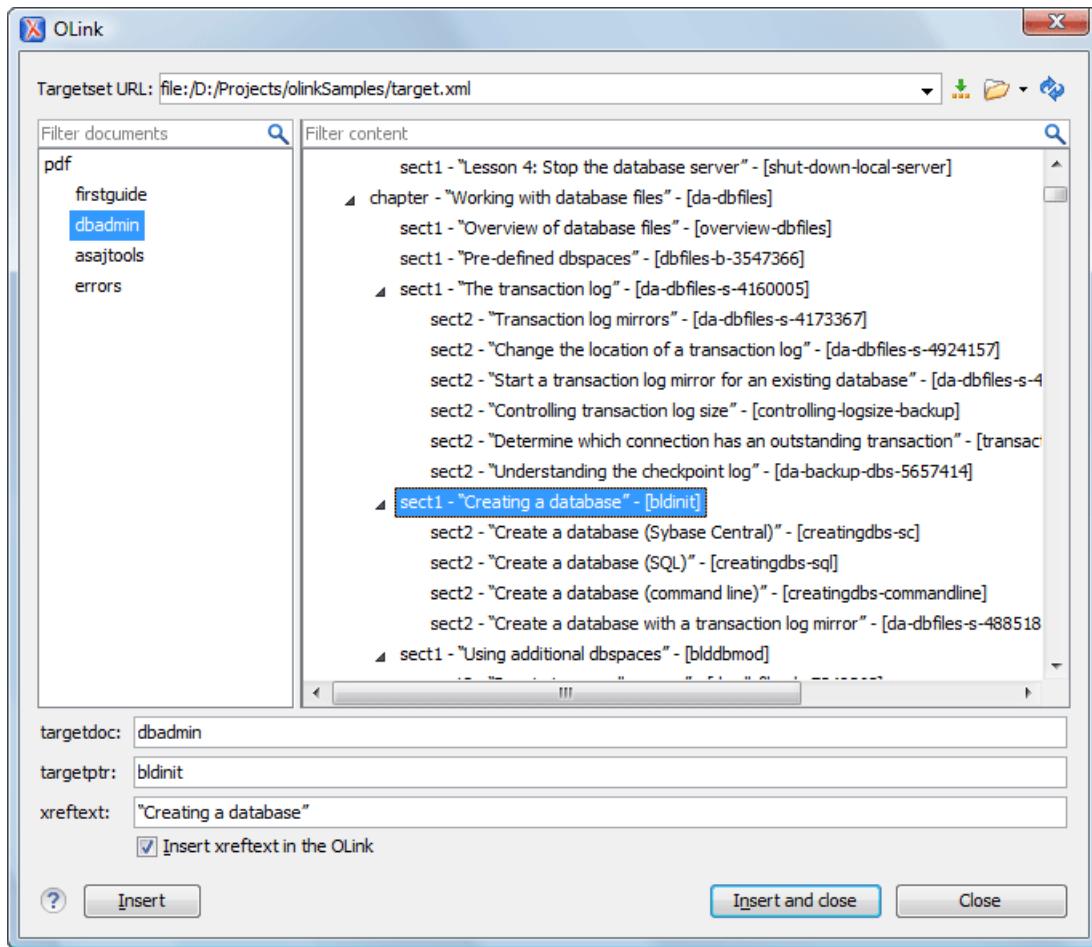

An example of a `target.db` file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
 <ttx>Administering User Accounts</ttx>
 <xreftext>How to administer user accounts</xreftext>
 <div element="part" href="#d5e4" number="I">
 <ttx>First Part</ttx>
 <xreftext>Part I, "First Part"</xreftext>
 <div element="chapter" href="#d5e6" number="1">
 <ttx>Chapter Title</ttx>
 <xreftext>Chapter 1, Chapter Title</xreftext>
 <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
 <ttx>Section1 Title</ttx>
 <xreftext>xreflabel_here</xreftext>
 </div>
 </div>
 </div>
</div>
```

#### 5. Insert olink elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the  **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`targetdoc`), and `bldinit` is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the olink by using the `xreftext` field.

**Figure 541: Insert OLink Dialog Box**

6. Process a DocBook transformation for each document to generate the output.
  - a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
  - b) Apply the transformation scenario.

## DocBook 5 Document Type

*DocBook* is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, block-level, and inline. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

### File Definition

A file is considered to be a DocBook 5 document when the namespace is `http://docbook.org/ns/docbook`.

### Default Document Templates

There are a variety of default *DocBook 5* templates available when creating [new documents from templates](#), including **Article**, **Book**, **Chapter**, **Glossary**, **Section**, and more.

The default templates for DocBook 5 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook 5` folder.

**Note:** Default templates for experimental DocBook 5.1 documents are also available in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook 5.1 (Experimental)` directory.

## Default Schema

The default schema that is used if one is not detected in the DocBook 5 file is `docbookxi.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/`. Other types of schemas are also located in various folders inside the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/` directory (for example, XML Schema files are located in the `xsd` folder).

## Default CSS

The default CSS files used for rendering DocBook content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

## Default XML Catalog

The default XML catalog, `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/`.

**Note:** A default XML catalog and schema files for experimental DocBook 5.1 documents are also available in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/` directory.

## DocBook 5 Author Mode Actions

A variety of actions are available in the DocBook 5 framework that can be added to the **DocBook5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### DocBook 5 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook5** menu and in various submenus of the contextual menu):

#### **B Bold**

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

#### **I Italic**

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

#### **U Underline**

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

#### **L Link Actions Drop-Down Menu**

The following link actions are available from this menu:

##### **Cross reference (link)**

Opens a dialog box that allows you to select a target to insert as a hypertext link.

##### **Cross reference (xref)**

Inserts a cross reference to other parts of the document.

## Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

### Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the **targetdoc** and **targetptr** values that are present in a **Targetset** file.

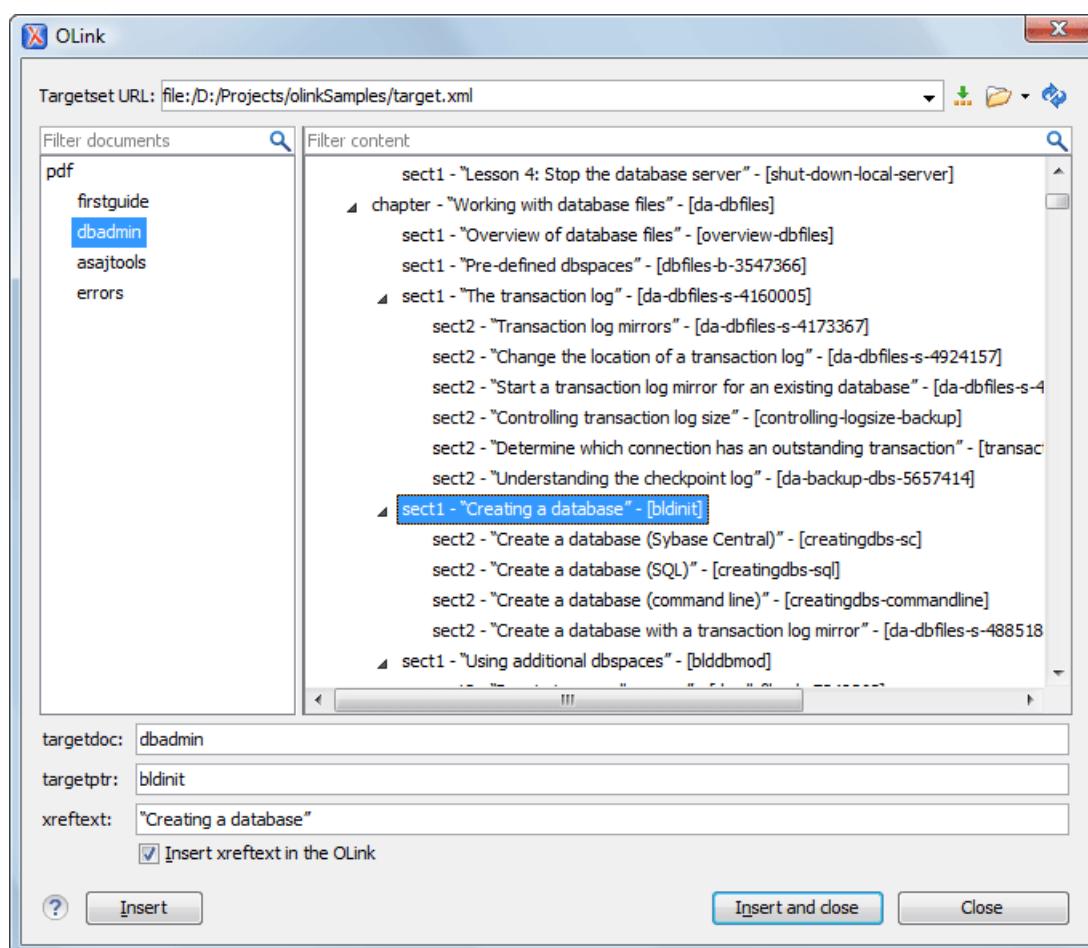

Figure 542: Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (**targetdoc**), its content is displayed allowing you to easily identify the **targetptr** for the **olink** element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an olink using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the olink, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is enabled.

### Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

### Insert Image

*Inserts an image reference* at the cursor position. Depending on the current location, an image-type element is inserted.

### Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

## § Section Drop-Down Menu

The following actions are available from this menu:

### § Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is sect1, then a sect2 is inserted. By default, this action also inserts a para element as a child node. The para element can be deleted if it is not needed.

#### ↳ Promote Section (**Ctrl + Alt + LeftArrow** (**Command + Alt + LeftArrow** on OS X))

Promotes the current node as a sibling of the parent node.

#### ↗ Demote Section (**Ctrl + Alt + RightArrow** (**Command + Alt + RightArrow** on OS X))

Demotes the current node a child of the previous node.

### ¶ Insert Paragraph

Insert a new paragraph element at current cursor position.

### Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#).

### >List Item

Inserts a list item in the current list type.

### Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

### Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

### Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

### Insert Procedure List

Inserts a DocBook procedure element. A step child item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

### Sort

Sorts cells or list items in a table.

### Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

### Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

### **Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

### **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

### **Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

### **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

### **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

## **DocBook5 Menu Actions**

In addition, the following default actions are available in the **DocBook5** menu when editing in **Author** mode:

### **Paste special submenu**

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

#### **Paste As XInclude**

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### **Paste as link**

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### **Paste as xref**

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

## **Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

### **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

### **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

### **Insert Column Before**

Inserts a column before the current one.

### **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

### **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

## ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

### ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor *Editor Variables*.

### Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### Auto generate IDs for elements

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

## Tags display mode Submenu

### Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

### Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

### Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

### Inline Tags

Displays full tag names for inline level elements, while block level elements are not displayed.

### Partial Tags

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

### No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

## Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## Profiling/Conditional Text Submenu

### Edit Profiling Attributes

Allows you to configure the [profiling attributes](#) and their values.

### Show Profiling Colors and Styles

Select this option to turn on conditional styling.

### Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

### List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

### Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## DocBook 5 Contextual Menu Actions

In addition to many of the [DocBook 5 toolbar actions](#) and the [general Author mode contextual menu actions](#), the following DocBook 5 framework-specific actions are also available in the contextual menu when editing in **Author** mode:

### Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 framework:

#### Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

#### Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

### Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

### Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

#### Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

#### Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### Sort

Sorts cells or list items in a table.

### Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

### Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

### Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the **Insert OLink** action for more information.

### Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## DocBook 5 Drag/Drop Actions

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a DocBook 5 document that is edited in **Author** mode, creates a link to the dragged file (the `link` DocBook element) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DocBook 5 document inserts an image element (the `imageobject` DocBook element with an `imagedata` child element and a `fileref` attribute) at the drop location, similar to the  [Insert Image](#) toolbar action.

## DocBook 5 Transformation Scenarios

Default transformation scenarios allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB.

### Related information

[Editing a Transformation Scenario](#) on page 805

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

## DocBook 5 to WebHelp Output

DocBook 5 documents can be transformed into several types of WebHelp systems.

## WebHelp Classic Output

To publish a DocBook 5 document as a *WebHelp Classic* system, follow these steps:

- Click the  [Configure Transformation Scenario\(s\)](#) action from the toolbar (or the **Document > Transformation** menu).

2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

### WebHelp Classic with Feedback Output

To publish a DocBook 5 document as a *WebHelp Classic with Feedback* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see *Deploying a Feedback-Enabled WebHelp System* on page 825.

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback\\_Enabled\\_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

### WebHelp Classic Mobile Output

To publish a DocBook 5 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

### Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

#### **clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

#### **I10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

#### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

#### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

#### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

#### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

## **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

## **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

## **webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

## **webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

## **webhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

## **webhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

## **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

## **webhelp.search.ranking**

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

## **webhelp.skin.css**

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the OXYGEN\_INSTALL\_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins directory, or it can be a custom skin CSS generated with the *Oxygen Skin Builder* web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

[Customizing WebHelp Classic Mobile Systems](#) on page 898

## DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

You should start from a copy of the file `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found [here](#).

An example of spec file:

```
<t:titlepage-content t:side="recto">
 <mediaobject/>
 <title
 t:named-template="book.verso.title"
 font-size="&hsize2;"
 font-weight="bold"
 font-family="${title.font.family}"/>
 <corpauthor/>
 ...
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a [DocBook customization layer](#).

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

The path to the logo image must be inserted in the book /info/mediaobject element of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor and set the customization layer in [the XSL URL property of the scenario](#).

## Related information

The book **DocBook XSL: The Complete Guide** by Bob Stayton contains more details about customizing the PDF output.

[Video demonstration for creating a DocBook customization layer in Oxygen XML Editor](#).

## DocBook to EPUB Transformation

The EPUB specification recommends the use of OpenType fonts (recognized by their .otf file extension) when possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
 font-family: "MyFont";
 font-weight: bold;
 font-style: normal;
 src: url(fonts/MyFont.otf);
}
```

- In the CSS, specify where this font is used. To set it as default for h1 elements, use the font-family rule, as in the following example:

```
h1 {
 font-size:20pt;
 margin-bottom:20px;
 font-weight: bold;
 font-family: "MyFont";
 text-align: center;
}
```

- Open the **Configure Transformation Scenario(s)** dialog box, select the **DocBook EPUB** transformation scenario, and click **Edit**.
- In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

**Note:** The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

- Run the transformation scenario.

### DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at [sourceforge.net](#).

To convert a DocBook document to DITA, follow these steps:

- Use one of the following two methods to begin the transformation process:
  - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
  - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.
- Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
- Click the **Apply associated** button to run the transformation.

**Step Result:** The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

- Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

### Inserting an olink in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

- Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an olink. It is usually added as an id (or xml:id for DocBook5) attribute to the root element of the document.

- Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: <dir name="directory\_name">, in the target database document.

- Create the target database document.

Each collection of documents has a master target database document that is used to resolve all olinks from that collection. The target database document is an XML file that is created once. It provides a framework that pulls in the target data for each document. The database document is static and all the document data is pulled in dynamically.

The following is an example of a target database document. It structures a collection of documents in a sitemap element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
 <targetsetinfo>
 Description of this target database document,
 which is for the examples in olink doc.
 </targetsetinfo>
 <!-- Site map for generating relative paths between documents -->
 <sitemap>
 <dir name="documentation">
 <dir name="guides">
 <dir name="mailuser">
 <document targetdoc="MailUserGuide"
 baseuri="userguide.html">
 &ugtargets;
 </document>
 </dir>
 <dir name="mailadmin">
 <document targetdoc="MailAdminGuide">
 &agtargets;
 </document>
 </dir>
 </dir>
 <dir name="reference">
 <dir name="mailref">
 <document targetdoc="MailReference">
 &reftargets;
 </document>
 </dir>
 </dir>
 </sitemap>
 </targetset>
```

- Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the collect.xref.targets parameter is set to yes. The default name of a target data file is target.db, but it can be changed by setting an absolute file path in the targets.filename parameter.

An example of a target.db file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
 <ttl>Administering User Accounts</ttl>
 <xreftext>How to administer user accounts</xreftext>
 <div element="part" href="#d5e4" number="I">
 <ttl>First Part</ttl>
 <xreftext>Part I, "First Part"</xreftext>
 <div element="chapter" href="#d5e6" number="1">
 <ttl>Chapter Title</ttl>
 <xreftext>Chapter 1, Chapter Title</xreftext>
 <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
 <ttl>Section1 Title</ttl>
 <xreftext>xreflabel_here</xreftext>
```

```

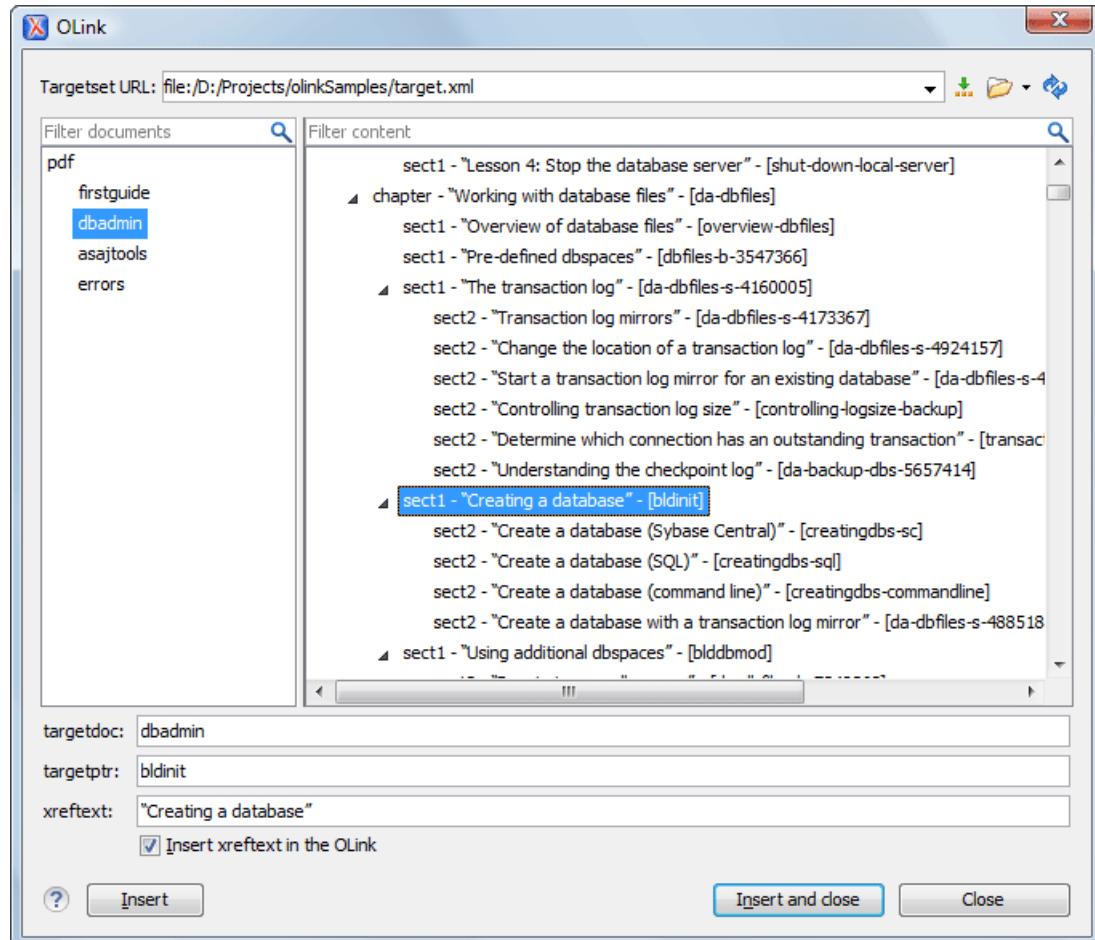

</div>
</div>
</div>
</div>

```

## 5. Insert olink elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an olink from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (targetdoc), its content is displayed, allowing you to easily identify the appropriate targetptr. You can also use the search fields to quickly identify a target. If you already know the values for the targetdoc and targetptr attributes, you can insert them directly in the corresponding fields.

In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`targetdoc`), and `bldinit` is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the olink by using the `xreftext` field.

**Figure 543: Insert OLink Dialog Box**

## 6. Process a DocBook transformation for each document to generate the output.

- Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
- Apply the transformation scenario.

## DocBook Targetset Document Type

DocBook Targetset documents are used to resolve cross references with the DocBook olink.

## File Definition

A file is considered to be a *Targetset* when the root name is targetset.

## Default Document Templates

A default **DocBook Targetset - Map** document template is available when creating [new documents from templates](#).

The default template for DocBook Targetset documents is located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset` folder.

## Default Schema

The default schema, `targetdatabase.dtd`, for this type of document is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/common/`.

## Resources

- [DocBook Specifications](#)

## DITA Topics Document Type

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (*task, concept, reference, glossary entry*).

## File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `concept`, `task`, `reference`, `dita`, or `topic`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has an attribute named `DITAArchVersion` for the “<http://dita.oasis-open.org/architecture/2005/>” namespace. This enhanced case of matching is only applied when the [Enable DTD/XML Schema processing in document type detection](#) option is enabled from the [Document Type Association preferences page](#).

## Default Document Templates

There are a variety of default *DITA topic* templates available when creating [new documents from templates](#), including **Concept**, **Glossentry**, **Reference**, **Task**, **Topic**, and many more.

The default templates for DITA topic documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/templates/topic` folder.

## Default Schema

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside `DITA_OT_DIR/dtd/` or `DITA_OT_DIR/schema/`.

## Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

## Default XML Catalogs

The default catalogs for the DITA topic document type are as follows:

- `DITA_OT_DIR/catalog-dita.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/plugin/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/styleguide/catalog.xml`

## DITA Author Mode Actions

A variety of actions are available in the DITA framework that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### DITA Toolbar Actions

The following default actions are readily available on the **DITA (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

**B Bold**  
Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.

**I Italic**  
Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

**U Underline**  
Surrounds the selected text with a `u` tag. You can use this action on multiple non-contiguous selections.

### Link Actions Drop-Down Menu

The following link actions are available from this menu:

#### Cross Reference

Opens the [Cross Reference \(xref\) dialog box](#) that allows you to insert a link to a target resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see [Linking in DITA Topics](#) on page 1609.

#### File Reference

Opens the [File Reference dialog box](#) that allows you to insert a link to a target file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see [Linking in DITA Topics](#) on page 1609.

#### Web Link

Opens the [Web Link dialog box](#) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see [Linking in DITA Topics](#) on page 1609.

### **Related Link to Topic**

Opens the [Cross Reference \(xref\) dialog box](#) that allows you to insert a link to a target resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1609.

### **Related Link to File**

Opens the [File Reference dialog box](#) that allows you to insert a link to a target file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1609.

### **Related Link to Web Page**

Opens the [Web Link dialog box](#) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) on page 1609.

## **Insert Image**

Opens the [Insert Image dialog box](#) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

## **Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

### **Insert Section**

Inserts a new section element in the document, depending on the current context.

### **Insert Concept**

Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

### **Insert Task**

Inserts a new task element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will enable a user to perform a task.

### **Insert Topic**

Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

### **Insert Reference**

Inserts a new reference element, depending on the current context. A reference is a top-level container for a reference topic.

## **Insert Paragraph**

Inserts a new paragraph at current cursor position.

## **Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the [Reuse Content dialog box](#) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include [content references \(conref\)](#), [content key references \(conkeyref\)](#), or [key references to metadata \(keyref\)](#).

## **Insert step or list item**

Inserts a new list or step item in the current list type.

## **Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

## **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

## **Sort**

Sorts cells or list items in a table.

## **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

## **Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

## **Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

## **Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

## **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

## **Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

## **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

## **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

## **DITA Menu Actions**

In addition to the [DITA toolbar actions](#), the following default actions are available in the **DITA** menu when editing in **Author** mode:

## **Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the [Reuse Content dialog box](#) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include [content references \(conref\)](#), [content key references \(conkeyref\)](#), or [key references to metadata \(keyref\)](#).

## **Push Current Element**

Opens the [Push current element dialog box](#) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

## Edit Content Reference

This action is available for elements with a conref or conkeyref attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (conref/conkeyref and conrefend attributes). For more information, see [Reuse Content Dialog Box](#) on page 1597.

## Replace Reference with content

Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

## Remove Content Reference

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

## Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see [Creating a Reusable Content Component](#) on page 1604.

## Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see [Inserting a Reusable Content Component](#) on page 1605.

## Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

### Paste as content reference

Inserts a content reference (a DITA element with a conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

### Paste as content key reference

Allows you to indirectly reference content using the conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

### Paste as link

Inserts a link element or an xref (depending on the location of the paste operation) that points to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The href attribute of link/href will point to this ID value.

### Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

## Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

## **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

## **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

## **Insert Column Before**

Inserts a column before the current one.

## **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

## **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

## **Insert > $\Sigma$ Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#).

## **ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

### **ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor [Editor Variables](#).

### **Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### **Auto generate IDs for elements**

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### **Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## **Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## **Browse DITA Style Guide**

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the **Content Completion Assistant**.

## Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

## Tags display mode Submenu

### Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

### Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

### Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

### Inline Tags

Displays full tag names for inline level elements, while block level elements are not displayed.

### Partial Tags

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

### No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

## Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## Profiling/Conditional Text Submenu

### Edit Profiling Attributes

Allows you to configure the [profiling attributes](#) and their values.

### Show Profiling Colors and Styles

Select this option to turn on conditional styling.

### Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

### List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

### Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## DITA Contextual Menu Actions

In addition to many of the [DITA toolbar actions](#) and the [general Author mode contextual menu actions](#), the following DITA framework-specific actions are also available in the contextual menu when editing in **Author** mode:

## Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

### Paste as content reference

Inserts a content reference (a DITA element with a conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

### Paste as content key reference

Allows you to indirectly reference content using the conkeyref attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

### Paste as link

Inserts a link element or an xref (depending on the location of the paste operation) that points to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The href attribute of link/href will point to this ID value.

### Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

### Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

### Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

#### Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

#### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

#### Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

#### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

#### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

#### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sorts cells or list items in a table.

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

#### Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

### Insert > $\Sigma$ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#).

### Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### Reuse submenu

This submenu includes the following actions in regards to reusing content in DITA:

#### Push Current Element

Opens the [Push current element dialog box](#) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

#### Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see [Reuse Content Dialog Box](#) on page 1597.

#### Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

#### Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

#### Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see [Creating a Reusable Content Component](#) on page 1604.

#### Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see [Inserting a Reusable Content Component](#) on page 1605.

### Search References (Ctrl + Shift + G)

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (opened in the **DITA Maps Manager** view). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

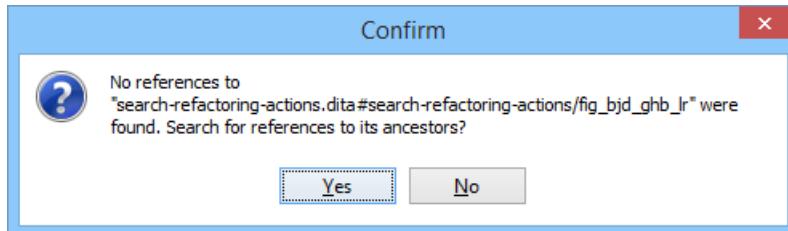

Figure 544: Search References to Ancestors Dialog Box

#### Show Key Definition

Available for elements that have a conkeyref or keyref attribute set (or elements with an ancestor element that has a conkeyref or keyref attribute). It computes the key name and opens the DITA map that contains the definition of the key with the element that defines that key selected.

#### About Element submenu

This submenu includes the following actions:

##### Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the **Content Completion Assistant**.

##### Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

##### Show Definition

Moves the cursor to the definition of the current element.

#### DITA Drag/Drop Actions

Dragging a file from the **Project view** or **DITA Maps Manager view** and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the xref DITA element with the href attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a DITA document inserts an image element (the image DITA element with the href attribute) at the drop location.

#### DITA Topic Transformation Scenarios

The following default transformation scenarios are available for individual DITA topics:

- **DITA XHTML** - Transforms a DITA topic to XHTML using DITA Open Toolkit.
- **DITA PDF** - Transforms a DITA topic to PDF using the DITA Open Toolkit and the Apache FOP engine.

#### Related information

[Editing a Transformation Scenario](#) on page 805

#### DITA Map Document Type

DITA maps are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. DITA maps allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

## File Definition

A file is considered to be a DITA map document when one of the following conditions are true:

- The root element name is one of the following: map, bookmap.
- The public id of the document is - //OASIS//DTD DITA Map or - //OASIS//DTD DITA BookMap.
- The root element of the file has an attribute named class that contains the value map/map and a DITAArchVersion attribute from the <http://dita.oasis-open.org/architecture/2005/> namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection option** from the [Document Type Association preferences page](#) is enabled.

## Default Document Templates

There are a variety of default *DITA map* templates available when creating [new documents from templates](#), including **Bookmap**, **Classification Map**, **Map**, **Sugject Schme**, and more.

The default templates for DITA map documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/sita/templates/map` folder.

## Default Schema

Default schemas that are used if one is not detected in the DITA map document are stored in the various folders inside `DITA_OT_DIR/dtd/` or `DITA_OT_DIR/schema/`.

## Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

## Default XML Catalogs

The default catalogs for the *DITA map* document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `DITA_OT_DIR/catalog-dita.xml`

## DITA Map Author Mode Actions

A variety of actions are available in the DITA Map framework that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

## DITA Map Toolbar and Menu Actions

When a DITA map is opened in **Author** mode, the following default actions are available on the **DITA Map Author Custom Actions** toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

 **Insert New Topic**

Opens a [New DITA topic dialog box](#) that allows you to create a new topic and inserts a reference to it at the cursor position.

 **Insert Topic Reference**

Opens the [Insert Reference dialog box](#) that allows you to insert and configure a reference to a topic at the cursor position.

 **Reuse Content**

Opens the [Reuse Content dialog box](#) that allows you to insert and configure a content reference (conref), or a content key reference (conkeyref) at the cursor position.

 **Insert Topic Heading**

Opens the [Insert Reference dialog box](#) that allows you to insert a topic heading at the cursor position.

 **Insert Topic Group**

Opens the [Insert Reference dialog box](#) that allows you to insert a topic group at the cursor position.

 **Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

 **Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

 **Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

 **Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

 **Delete Relationship Column**

Deletes the table column where the cursor is located.

 **Delete Relationship Row**

Deletes the table row where the cursor is located.

 **Move Up**

Moves the selected node up one position on its same level.

 **Move Down**

Moves the selected node down one position on its same level.

 **Promote(Alt + LeftArrow)**

Moves the selected node up one level to the level of its parent node.

 **Demote(Alt + RightArrow)**

Moves the selected node down one level to the level of its child nodes.

**DITA Menu Actions**

In addition, the following default actions are available in the **DITA** menu when editing a DITA map in **Author** mode:

 **Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

## Tags display mode Submenu

### ☒ Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

### ☒ Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

### ☒ Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

### ☒ Inline Tags

Displays full tag names for inline level elements, while block level elements are not displayed.

### ☒ Partial Tags

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

### ☒ No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

## Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## Profiling/Conditional Text Submenu

### Edit Profiling Attributes

Allows you to configure the [profiling attributes](#) and their values.

### Show Profiling Colors and Styles

Select this option to turn on conditional styling.

### Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

### List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

### ⚙ Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

### ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor [Editor Variables](#).

### Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### Auto generate IDs for elements

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

## **Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## **Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## **DITA Map Contextual Menu Actions**

In addition to many of the [DITA Map toolbar actions](#) and the [general Author mode contextual menu actions](#), the following DITA map framework-specific actions are also available in the contextual menu when editing in **Author** mode:

### **Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box](#) on page 1559.

### **Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### **Search References**

Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the **DITA Maps Manager** view). The current topic/map reference element must have an `href` or `keys` attribute defined to complete the search.

### **Show Key Definition**

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the DITA map that contains the definition of the key with the element that defines that key selected.

## **DITA Map Drag/Drop Actions**

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a DITA map document that is edited in **Author** mode creates a link to the dragged file (a `topicref` element, chapter, part, etc.) at the drop location.

## **Open Topic from DITA Map in Author Mode**

When a DITA map is opened in **Author** mode, you can click the  icon to the left of a topic to open that particular topic in the editor.

## DITA Map Transformation Scenarios

The following types of transformations scenarios are available for DITA maps:

- Predefined transformation scenarios allow you to transform a DITA map to a variety of outputs, such as PDF, ODF, XHTML, WebHelp, EPUB, and CHM files.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to [integrate a DITA-OT plugin](#). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. They contain information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Words count.
  - Information types such as number of containing maps, bookmaps, or topics.

## DITA Map to WebHelp Output

DITA maps can be transformed into a variety of WebHelp systems designed to suit your specific needs. This section contains the procedures for obtaining the output for the variants of the WebHelp system.

### Related information

[WebHelp System Output](#) on page 819

### WebHelp Responsive Output

To publish a DITA map as a *WebHelp Responsive* system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
  - **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
  - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
  - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
  - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

### Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

**fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

**webhelp.search.ranking**

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is true).

**webhelp.show.changes.and.comments**

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

**webhelp.sitemap.base.url**

Base URL for all the loc elements in the generated sitemap.xml file. The value of a loc element is computed as the relative file path from the href attribute of a topicref element from the DITA map, appended to this base URL value. The loc element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

**webhelp.sitemap.change.frequency**

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

**Parameters Specific to WebHelp Responsive Output**

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo\_and\_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top\_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo\_and\_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top\_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.head**

In the generated output it displays a given XHTML fragment as a page header. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

**webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is yes.

**webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

**webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

**webhelp.show.side.toc**

Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

**webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

**Related information**

[Customizing the WebHelp Responsive Output](#) on page 842

[WebHelp Responsive System](#) on page 820

**WebHelp Responsive with Feedback Output**

To publish a DITA map as a *WebHelp Responsive with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
  - **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
  - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
  - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
  - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
  5. Enter the documentation product ID (value for the webhelp.product.id parameter) and the documentation version (value for the webhelp.product.version parameter).

When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the [instructions to complete the system deployment](#).

## Parameters for Customizing WebHelp Responsive with Feedback Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

### **clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

### **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

### **webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

### **webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '`*`' (matches zero or more characters) or '`?`' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

### **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

### **webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

### **webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

### **webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the changefreq element in the generated sitemap.xml file. The changefreq element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the changefreq element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the priority element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The priority element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the priority element is not added in sitemap.xml.

**Parameters Specific to WebHelp Responsive with Feedback Output****webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.logo\_and\_title**

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top\_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo\_and\_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc\_or\_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top\_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.head**

In the generated output it displays a given XHTML fragment as a page header. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

### **webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

### **webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

### **webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

### **webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

### **webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

### **webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

### **webhelp.show.navigation.links**

Specifies if navigation links will be presented in the output. The default value is yes.

### **webhelp.show.print.link**

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

### **webhelp.show.related.links**

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

### **webhelp.show.side.toc**

Specifies if a side table of contents will be presented on the right side of each topic in the output. The default value is yes.

### **webhelp.show.top.menu**

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

### **webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 2.

## **WebHelp Classic Output**

To publish a DITA map as a *WebHelp Classic* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- [Skins Tab](#) - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.

- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

**4. Click **Apply associated** to process the transformation.**

When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

### **Parameters for Customizing WebHelp Classic Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

#### **clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

#### **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

#### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

#### **webhelp.body.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

#### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

#### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

#### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

#### **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root" />
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs); }-->
```

```

 (document, 'script', 'facebook-jssdk'))); -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
</div>

```

#### **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

#### **webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `linkTarget` attribute to `frm` for frameless (`iframe`) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

#### **webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

#### **webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

#### **webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

#### **webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

#### **webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

#### **webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

#### **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

#### **webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

#### **webhelp.show.changes.and.comments**

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

#### **webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

## **webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

## **webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

*WebHelp Classic With Feedback Output*

To publish a DITA map as a *WebHelp Classic with Feedback* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
  - **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
  - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
  - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
  - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
  5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the [instructions to complete the system deployment](#).

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback\\_Enabled\\_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

## **Parameters for Customizing WebHelp Classic with Feedback Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

### **clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

## **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

### **webhelp.body.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

### **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

### **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

### **webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommended to set the linkTarget attribute to frm for frameless (*iframe*) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is \_blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used <gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>

### **webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

### **webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

**webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

**WebHelp Classic Mobile Output**

To publish a DITA map as a *WebHelp Classic Mobile* system, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic Mobile** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Parameters Tab** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

### Parameters for Customizing WebHelp Classic Mobile Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

#### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is en-us.

#### **clean.output**

Deletes all files from the output folder before the transformation is performed (only no and yes values are valid and the default value is no).

#### **fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)**

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).

#### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

#### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

#### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

#### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

#### **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
 <div id="fb-root"/>
 <script>
 <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
 if (d.getElementById(id)) return;
 js = d.createElement(s); js.id = id;
 js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
 fjs.parentNode.insertBefore(js, fjs);
 (document, 'script', 'facebook-jssdk')) -->
 </script>
 <div data-share="true" data-show-faces="true" data-action="like"
 data-layout="standard" class="fb-like"/>
 </div>
```

**webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

**webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `linkTarget` attribute to `frm` for frameless (`iframe`) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '\*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

## DITA Map to PDF Output Customization

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps to PDF output. There are numerous ways that you can customize the PDF output and the topics in this section discuss some of those possibilities.

### Creating a DITA Map to PDF Transformation Scenario

To create a *DITA Map to PDF* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your framework is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
  - `show.changes.and.comments` - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
  - `customization.dir` - Specifies the path to a customization directory.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

### Creating a Customization Directory for PDF Output

DITA Open Toolkit PDF output can be customized in several ways:

- Creating a DITA Open Toolkit plugin that adds extensions to the PDF plugin. More details can be found in the [DITA Open Toolkit Documentation](#).
- Creating a customization directory and using it from the PDF transformation scenario. A small example of this procedure can be found below.

### How to Create a Customization Directory for PDF Output

The following procedure explains how to do a basic customization of the PDF output by setting up a customization directory. An example of a common use case is embedding a company logo image in the front matter of the book.

1. Copy the entire directory: `DITA_OT_DIR\plugins\org.dita.pdf2\Customization` to another location (for instance, `C:\Customization`).
2. Copy your logo image to: `C:\Customization\common\artwork\logo.png`.
3. Rename `C:\Customization\catalog.xml.orig` to: `C:\Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: `C:\Customization\fo\xsl\custom.xsl.orig` to: `C:\Customization\fo\xsl\custom.xsl`
6. Open the `custom.xsl` file in Oxygen XML Editor and create the template called `createFrontCoverContents` for DITA-OT 2.3.3 (or `createFrontMatter_1.0` for DITA-OT 1.8.5).

**Tip:** You can copy the same template from `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

#### DITA OT 2.3.3 Example:

For example, if you are using DITA OT 2.3.3, the `custom.xsl` could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format"
```

```

version="2.0">

<xsl:template name="createFrontCoverContents">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class, ' topic/title ')][1]">
 <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')][1]" />
 </xsl:when>
 <xsl:when test="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]" />
 </xsl:when>
 <xsl:when test="//*[contains(@class, ' map/map ')][@title]">
 <xsl:value-of select="//*[contains(@class, ' map/map ')][@title]" />
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]" />
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>

 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/booktitlealt ')][1]" />
 <fo:block xsl:use-attribute-sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')][1]" />
 </fo:block>

 <!-- Load the image logo -->
 <fo:block text-align="center" width="100%">
 <fo:external-graphic
 src="url({concat($artworkPrefix,
 '/Customization/OpenTopic/common/artwork/logo.png')})" />
 </fo:block>
</xsl:template>
</xsl:stylesheet>

```

### DITA OT 1.8.5 Example:

For example, if you are using DITA OT 1.8.5, the `custom.xsl` could look like this:

```

<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format"
 version="1.1">

<xsl:template name="createFrontMatter_1.0">
 <fo:page-sequence master-reference="front-matter"
 xsl:use-attribute-sets="__force__page__count">
 <xsl:call-template name="insertFrontMatterStaticContents"/>
 <fo:flow flow-name="xsl-region-body">
 <fo:block xsl:use-attribute-sets="__frontmatter">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class, ' topic/title ')][1]">
 <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')][1]" />
 </xsl:when>
 <xsl:when test="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]" />
 </xsl:when>
 <xsl:when test="//*[contains(@class, ' map/map ')][@title]">
 <xsl:value-of select="//*[contains(@class, ' map/map ')][@title]" />
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/descendant::*[contains(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]" />
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>
 </fo:block>
 </fo:flow>
 </fo:page-sequence>
 <xsl:apply-templates select="<!--<xsl:call-template name="createPreface"/>-->" />

```

```

 </fo:flow>
</fo:page-sequence>
<xsl:call-template name="createNotices"/>
</xsl:template>
</xsl:stylesheet>

```

7. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab, set the customization.dir parameter to C:\Customization.

#### Related information

[Automatic PDF plugin customization generator by Jarno Elovirta.](#)

[DITA OT Documentation - PDF Customization Plugin](#)

#### Customizing the Header and Footer in PDF Output

The XSLT stylesheet [DITA\\_OT\\_DIR/plugins/org.dita.pdf2/xsl/static-content.xsl](#) contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is [DITA\\_OT\\_DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml](#). These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory as explained in [Creating a Customization Directory for PDF Output](#).

#### Adding a Watermark to PDF Output

To add a watermark to the PDF output of a DITA map transformation, create a DITA-OT customization directory and use it from a DITA Map to PDF transformation scenario, as in the following procedure:

1. Copy the entire directory: [DITA\\_OT\\_DIR\plugins\org.dita.pdf2\Customization](#) to another location (for instance, C:\Customization).
2. Copy your watermark image (for example, `watermark.png`) to: C:\Customization\common\artwork\watermark.png.
3. Rename the C:\Customization\catalog.xml.orig file to: C:\Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

The uncommented line should look like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: C:\Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl
6. Open the C:\Customization\fo\xsl\custom.xsl file in Oxygen XML Editor to overwrite two XSLT templates:

- The first template is located in the XSLT stylesheet [DITA\\_OT\\_DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl](#) and we override it specifying a watermark image for every page in the PDF content, using a *block-container* element that references the watermark image file:

```

<fo:static-content flow-name="odd-body-header">
 <fo:block-container absolute-position="absolute"
 top="-2cm" left="-3cm" width="21cm" height="29.7cm"
 background-image="{concat($artworkPrefix,
 '/Customization/OpenTopic/common/artwork/watermark.png')}">
 <fo:block/>
 </fo:block-container>
 <fo:block xsl:use-attribute-sets="_body__odd__header">
 <xsl:call-template name="insertVariable">
 <xsl:with-param name="theVariableID" select="'Body odd header'" />
 <xsl:with-param name="theParameters">
 <prodname>

```

```

 <xsl:value-of select="$productName" />
 </prodname>
 <heading>
 <fo:inline xsl:use-attribute-sets="__body__odd__header__heading">
 <fo:retrieve-marker retrieve-class-name="current-header"/>
 </fo:inline>
 </heading>
 <pagenum>
 <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">
 <fo:page-number/>
 </fo:inline>
 </pagenum>
 </xsl:with-param>
 </xsl:call-template>
</fo:block>
</fo:static-content>
</xsl:template>

```

- The second template that we override is located in the XSLT stylesheet `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. We also override it by copying the original template content in our `custom.xsl` and adding the `block-container` element that references the watermark image file:

```

<xsl:template name="createFrontMatter_1.0">
 <fo:page-sequence master-reference="front-matter"
 xsl:use-attribute-sets="__force__page__count">
 <xsl:call-template name="insertFrontMatterStaticContents" />
 <fo:flow flow-name="xsl-region-body">
 <fo:block-container absolute-position="absolute"
 top="-2cm" left="-3cm" width="21cm" height="29.7cm"
 background-image="{concat($artworkPrefix,
 '/Customization/OpenTopic/common/artwork/watermark.png')}">
 <fo:block>
 </fo:block>
 </fo:block-container>
 <fo:block xsl:use-attribute-sets="__frontmatter">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
 <xsl:choose>
 <xsl:when test="$map/*[contains(@class, ' topic/title ')][1]">
 <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')][1]" />
 </xsl:when>
 <xsl:when test="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]">
 <xsl:apply-templates select="$map//*[contains
(@class, ' bookmap/mainbooktitle ')][1]" />
 </xsl:when>
 <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
 <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title" />
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="/descendant::*[contains
(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]" />
 </xsl:otherwise>
 </xsl:choose>
 </fo:block>
 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains
(@class, ' bookmap/booktitlealt ')]" />
 <fo:block xsl:use-attribute-sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains
(@class, ' bookmap/bookmeta ')]" />
 </fo:block>
 </fo:flow>
 </fo:page-sequence>
 <xsl:if test="not($retain-bookmap-order)">
 <xsl:call-template name="createNotices" />
 </xsl:if>
 </xsl:template>

```

- Edit your **DITA Map PDF** transformation scenario. In the **Parameters** tab, set the `customization.dir` parameter to `C:\Customization`.

## Related tasks

[Adding a Watermark in DITA Map to XHTML Output](#) on page 1632

*Force Page Breaks Between Two Block Elements in PDF Output*

Suppose that in your DITA content you have two block level elements, such as two paragraphs:

```
<p>First para</p>
```

```
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```
<p>First para</p>
<?pagebreak?>
<p>Second para</p>
```

2. Locate the **DITA Open Toolkit** distribution and in the `plugins` directory create a new plugin folder (for example, `DITA_OT_DIR/plugins/pdf-page-break`).
3. In this new folder, create a new `plugin.xml` file with the following content:

```
<plugin id="com.yourpackage.pagebreak">
 <feature extension="package.support.name" value="Force Page Break Plugin"/>
 <feature extension="package.support.email" value="support@youremail.com"/>
 <feature extension="package.version" value="1.0.0"/>
 <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
 <xsl:template match="processing-instruction('pagebreak')">
 <fo:block break-after="page" />
 </xsl:template>
</xsl:stylesheet>
```

5. *Install your plugin in the DITA Open Toolkit.*

#### *Customizing note Images in PDF*

To customize the images that appear next to each type of note in the PDF output, use a [PDF customization folder](#) with the following procedure:

1. Copy the `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml` file to the `[CUSTOMIZATION_DIR]\common\vars` folder.
2. Edit the copied `en.xml` file and modify, for example, the path to the image for `<note>` element with the `type` attribute set to `notice` from:

```
<variable id="notice Note Image Path">Configuration/OpenTopic/cfg/common/artwork/
important.png</variable>
```

to:

```
<variable id="notice Note Image Path">Customization/OpenTopic/common/artwork/
notice.gif</variable>
```

3. Add your custom `notice` image to `[CUSTOMIZATION_DIR]\common\artwork\notice.gif`.
4. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab set the path for the `customization.dir` property to point to the customization folder.

#### *Show Comments and Tracked Changes in PDF Output*

To make comments and tracked changes (stored within your DITA topics) appear in the PDF output, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your framework is read-only).
3. In the **Parameters** tab, set the value of the `show.changes.and.comments` parameter to `yes`.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

**Result:** Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

## Set a Font for PDF Output Generated with FO Processor

When a DITA map is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor](#) on page 817.

### DITA OT PDF Font Mapping

The DITA OT contains a file `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```
<aliases>
 <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *Monospaced* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
 <physical-font char-set="default">
 <font-face>Courier New, Courier</font-face>
 </physical-font>

</logical-font>
```

#### Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

### Related information

#### DITA Map to PDF WYSIWYG Transformation

Oxygen XML Editor comes bundled with a DITA OT plugin that converts DITA maps to PDF using a CSS layout processor. Oxygen XML Editor supports the following processors (not included in the Oxygen XML Editor installation kit):

- **Prince Print with CSS** - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

The DITA-OT plugin is located in the following directory: `DITA_OT_DIR/plugins/com.oxygenxml.pdf.css`.

Although it includes a set of CSS files in its `css` subfolder, when this plugin is used in Oxygen XML Editor, the CSS files located in the `Frameworks` directory take precedence.

### Creating the Transformation Scenario

To create an experimental DITA map to PDF WYSIWYG transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG - Experimental**.
3. In the **Parameters** tab, configure the following parameters:

- `css.processor.path.prince` (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- `css.processor.path.antenna-house` (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- `show.changes.and.comments` - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
- `dita.css.list` - Allows you to specify a list of CSS URLs to be used by the PDF processor. The files must have URL syntax and be separated using semicolons. If the value is empty, the current selection from the **Styles** drop-down menu is used.
- `args.css` - Allows you to specify a list of CSS URLs to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

4. Click **OK** and run the transformation scenario.

### **Customizing the Styles (for Output and Editing)**

If you need to change the styles in the associated CSS, make sure you install Oxygen XML Editor in a folder where you have full read and write privileges (for instance, your user home directory). This is due to the fact that the installed files are usually placed in a read-only folder (for instance, in Windows, Oxygen XML Editor is installed in the **Program Files** folder where the users do not have change rights).

To change the styles of an element you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in *Customizing the Main CSS of a Document Type* on page 1204.
  2. Once you have configured your CSS as an additional layer, you can *select it from the **Styles** drop-down menu (on the toolbar)*.
  3. Run the **DITA Map PDF - WYSIWYG - Experimental** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and rendering **Author** mode while editing.

- Use the `args.css` parameter that allows you to specify a list of CSS URLs to be used in addition to the `dita.css.list` parameter:

1. Configure a *DITA map to PDF WYSIWYG* transformation scenario, as described in the procedure [above](#).
2. In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.
3. Click **OK** and run the transformation scenario.

This method is appropriate if you just want to apply the styling customization to the output.

### **Using the CSS Inspector to See Style Associated with an Element**

To find the styles associated with an element, follow this procedure:

1. Open a document in the editor and select **Inspect Styles** from the contextual menu. This opens the *CSS Inspector view* that shows all the CSS rules that apply to the selected element.
2. Click the particular link for the CSS selector that you need to change and Oxygen XML Editor will open the CSS file and position the cursor at that selector.
3. After you identify the source of the styles you want to modify, copy the CSS rule in your customization CSS file and modify it according to your needs.

To see the changes in **Author** mode, press **F5** to reload the document.

## How to Make Remote Resources Appear in the Output When Using the Prince Processor

If your documentation references external resources (such as images that are stored on a Web-based repository) and your system is behind an HTTP(S) proxy, you may find that they do not appear in the output when using the **Prince Print with CSS** processor. To solve this, follow this procedure:

1. Edit the **build.xml** file that is located in [DITA\\_OT\\_DIR/plugins/com.oxygenxml.pdf.css](#).
2. There are two instances in the file where a pair of arguments are commented out:

```
<!-- Please remove the comment wrapping the following two arguments
if you are behind a proxy and your documentation refers remote resources,
for example images.

Note: You also need to remove the backslash '\' that appears before the
property name: "http-proxy". That backslash is there because a sequence of
two dashes ('-') is not permitted inside a comment.
-->
<!--
<arg value="-\http-proxy=${http.proxyHost}:${http.proxyPort}"/>
<arg value="-\https-proxy=${https.proxyHost}:${https.proxyPort}"/>
-->
```

3. Remove the comment in both instances.
4. Make sure you also remove the slash that appears before the property name **http-proxy** in each instance.

**Step Result:** The arguments should now look like this:

```
<arg value="--http-proxy=${http.proxyHost}:${http.proxyPort}"/>
<arg value="--https-proxy=${https.proxyHost}:${https.proxyPort}"/>
```

5. Save the **build.xml** file.
6. Run the [DITA map to PDF WYSIWYG transformation scenario](#).

**Result:** Your external resources should now appear in your output.

### Related information

## Compiled HTML Help (CHM) Output Format

To perform a **Compiled HTML Help (CHM)** transformation Oxygen XML Editor needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor automatically detects HTML Help Workshop and uses it.

**Note:** HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

### Changing the Output Encoding

Oxygen XML Editor uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the **Compiled HTML Help (CHM)** transformation. The **Compiled HTML Help (CHM)** default scenario that comes bundled with Oxygen XML Editor has the `htmlhelp.locale` parameter set to `en-US`.

The default value of the `htmlhelp.locale` is `en-US`. To customize this parameter, go to  [Configure](#)

**Transformation Scenarios** and click the  [Edit](#) button. In the parameter tab search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`US`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

## Kindle Output Format

Oxygen XML Editor requires KindleGento generate Kindle output from DITA maps. To install KindleGen for use by Oxygen XML Editor, follow these steps:

1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor and open a DITA map in the **DITA Maps Manager** view.
4. In the **DITA Maps Manager** view, open the  **Configure Transformation Scenario(s)** dialog box.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the **kindlegen.executable** parameter as the path to the *KindleGen* directory.
7. Accept the changes.

## XHTML Document Type

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

### File Definition

A file is considered to be an XHTML document when the root element name is `html`.

### Default Document Templates

There are a variety of default XHTML templates available when creating [new documents from templates](#), including **1.0 Strict**, **1.0 Transitional**, **1.1 DTD Based**, **1.1 Schema Based**, and more.

The default templates for XHTML documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/templates/` folder.

### Default Schema

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/`.
- XHTML 5 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/xhtml15 (epub3)/`.

### Default CSS

The default CSS files used for rendering XHTML content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

### Default XML Catalogs

The default catalogs for the XHTML document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/relaxng/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/nvdl/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/xhtml15 (epub3)/catalog-compat.xml`

## XHTML Author Mode Actions

A variety of actions are available in the XHTML framework that can be added to the **XHTML** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### XHTML Toolbar Actions

The following default actions are readily available on the **XHTML (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **XHTML** menu and some of them are in various submenus of the contextual menu):

#### **Bold**

Changes the style of the selected text to **bold** by surrounding it with **b** tag. You can use this action on multiple non-contiguous selections.

#### **Italic**

Changes the style of the selected text to **italic** by surrounding it with **i** tag. You can use this action on multiple non-contiguous selections.

#### **Underline**

Changes the style of the selected text to **underline** by surrounding it with **u** tag. You can use this action on multiple non-contiguous selections.

#### **Link**

Inserts an **a** element with an **href** attribute at the cursor position. You can type the URL of the reference you want to insert or use the  **Browse** drop-down menu to select it using one of the following options:

- **Browse for local file** - Displays the **Open** dialog box to select a local file.
- **Browse for remote file** - Displays the **Open URL** dialog box to select a remote file.
- **Browse for archived file** - Opens the **Archive Browser** to select a file from an archive.
- **Browse Data Source Explorer** - Open the **Data Source Explorer** to select a file from a connected data source.
- **Search for file** - Opens the **Find Resource** dialog box to search for a file.

#### **Insert Image**

Inserts a graphic object at the cursor position. This is done by inserting an **img** element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

#### **H** **→Headings Drop-down Menu**

A drop-down menu that includes actions for inserting **h1**, **h2**, **h3**, **h4**, **h5**, **h6** elements.

#### **Insert Paragraph**

Insert a new paragraph element at current cursor position.

#### **Σ Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#).

#### **≡ Insert List Item**

Inserts a list item in the current list type.

### **Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

### **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

### **Insert a definition list at the cursor position**

Inserts a definition list (dl element) with one list item (a dt child element and a dd child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

### **Sort**

Sorts cells or list items in a table.

### **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

### **Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

### **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

### **Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

### **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

### **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

### **Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

### **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

### **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

## **XHTML Menu Actions**

In addition, the following default actions are available in the **XHTML** menu when editing in **Author** mode (some of them are also available in the contextual menu):

## Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

### Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

### Insert Column Before

Inserts a column before the current one.

### Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

## Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

## Tags display mode Submenu

### Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

### Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

### Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

### Inline Tags

Displays full tag names for inline level elements, while block level elements are not displayed.

### Partial Tags

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

### No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

## Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## Profiling/Conditional Text Submenu

### Edit Profiling Attributes

Allows you to configure the [profiling attributes](#) and their values.

### Show Profiling Colors and Styles

Select this option to turn on conditional styling.

### Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

### List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

## Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## XHTML Contextual Menu Actions

In addition to many of the [XHTML toolbar actions](#) and the [general Author mode contextual menu actions](#), the following XHTML framework-specific actions are also available in the contextual menu when editing in **Author** mode:

### **Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

### **Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

#### **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

#### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

#### **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

#### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

#### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

#### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

#### Sort

Sorts cells or list items in a table.

#### Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

#### **Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

## XHTML Drag/Drop Actions

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into an XHTML document that is edited in **Author** mode creates a link to the dragged file (the `a` element with the `href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into an XHTML document inserts an image element (the `img` element with the `src` attribute) at the drop location, similar to the  [Insert Image](#) toolbar action.

## XHTML Transformation Scenarios

The following default transformation scenarios are available for XHTML:

- **XHTML to DITA concept** - Converts an XHTML document to a DITA concept document.
- **XHTML to DITA reference** - Converts an XHTML document to a DITA reference document.
- **XHTML to DITA task** - Converts an XHTML document to a DITA task document.
- **XHTML to DITA topic** - Converts an XHTML document to a DITA topic document.

## TEI ODD Document Type

The *TEI ODD* (*Text Encoding Initiative - One Document Does it all*) document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called *Roma* was created by the TEI Consortium for manipulating the ODD files.

#### File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is .odd.
- The document namespace is <http://www.tei-c.org/ns/1.0>.

#### Default Document Templates

There is a default *TEI ODD* document template available when creating [new documents from templates](#).

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI_ODD` folder.

#### Default Schema

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

#### Default CSS

The default CSS files used for rendering TEI ODD content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

#### Default XML Catalogs

The default catalogs for the TEI ODD document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/catalog.xml`

#### Resources

#### TEI ODD Author Mode Actions

A variety of actions are available in the TEI ODD framework that can be added to the **TEI ODD** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

## TEI ODD Toolbar Actions

The following default actions are readily available on the **TEI ODD (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI ODD** menu and some of them are in various submenus of the contextual menu):

### **B Bold**

Changes the style of the selected text to **bold** by surrounding it with **hi** tag and setting the **rend** attribute to **bold**. You can use this action on multiple non-contiguous selections.

### **I Italic**

Changes the style of the selected text to **italic** by surrounding it with **hi** tag and setting the **rend** attribute to **italic**. You can use this action on multiple non-contiguous selections.

### **U Underline**

Changes the style of the selected text to **underline** by surrounding it with **hi** tag and setting the **rend** attribute to **u1**. You can use this action on multiple non-contiguous selections.

### **S Insert Section**

Inserts a new section or subsection, depending on the current context. For example, if the current context is **div1**, then a **div2** is inserted. By default, this action also inserts a paragraph element as a child node.

### **T Insert Paragraph**

Insert a new paragraph element at current cursor position.

### **Insert Image**

*Inserts an image reference* at the cursor position. Depending on the current location, an image-type element is inserted.

### **Insert List Item**

Inserts a list item in the current list type.

### **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

### **Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

### **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

### **Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

### **Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

### **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

### **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

### **Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

### **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

### **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

## **TEI ODD Menu Actions**

In addition, the following default actions are available in the **TEI ODD** menu when editing in **Author** mode (some of them are also available in the contextual menu):

### **Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

#### **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

#### **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

#### **Insert Column Before**

Inserts a column before the current one.

#### **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

## **ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

### **ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor [Editor Variables](#).

### **Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### **Auto generate IDs for elements**

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### **Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## **Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

### Tags display mode Submenu

#### Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

#### Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

#### Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

#### Inline Tags

Displays full tag names for inline level elements, while block level elements are not displayed.

#### Partial Tags

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

#### No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

### Profiling/Conditional Text Submenu

#### Edit Profiling Attributes

Allows you to configure the [profiling attributes](#) and their values.

#### Show Profiling Colors and Styles

Select this option to turn on conditional styling.

#### Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

#### Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

#### List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

#### Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

### TEI Contextual Menu Actions

In addition to many of the [TEI toolbar actions](#) and the [general Author mode contextual menu actions](#), the following TEI framework-specific actions are also available in the contextual menu when editing in **Author** mode:

## Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

e:

### Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

### Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### Sort

Sorts cells or list items in a table.

### Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

### Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

## TEI ODD Drag/Drop Actions

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a TEI ODD document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

## TEI ODD Transformation Scenarios

The following default transformations are available for TEI ODD document types:

- **TEI ODD XHTML** - Transforms a TEI ODD document into an XHTML document
- **TEI ODD PDF** - Transforms a TEI ODD document into a PDF document using the Apache FOP engine
- **TEI ODD EPUB** - Transforms a TEI ODD document into an EPUB document
- **TEI ODD DOCX** - Transforms a TEI ODD document into a DOCX document
- **TEI ODD ODT** - Transforms a TEI ODD document into an ODT document
- **TEI ODD RelaxNG XML** - Transforms a TEI ODD document into a RelaxNG XML document
- **TEI ODD to DTD** - Transforms a TEI ODD document into a DTD document
- **TEI ODD to XML Schema** - Transforms a TEI ODD document into an XML Schema document
- **TEI ODD to RelaxNG Compact** - Transforms a TEI ODD document into an RelaxNG Compact document

### Related information

## TEI P4 Document Type

The *TEI (Text Encoding Initiative)* document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

### File Definition

A file is considered to be a TEI P4 document when one of the following conditions are true:

- The local name of the root is `TEI .2`.
- The public id of the document is `-//TEI P4`.

### Default Document Templates

Some default *TEI P4* templates are available when creating [new documents from templates](#), including **Lite** and **P4 Document**.

The default templates for TEI P4 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI_P4` folder.

### Default Schema

The default schema that is used if one is not detected in the TEI P4 document is `tei2.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/schema/dtd/`.

### Default CSS

The default CSS files used for rendering TEI content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

### Default XML Catalogs

The default catalogs for the TEI P4 document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/teip4/stylesheets/catalog.xml`

### TEI P4 Author Mode Actions

A variety of actions are available in the TEI P4 framework that can be added to the **TEI P4** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### TEI P4 Toolbar Actions

The following default actions are readily available on the **TEI P4 (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI P4** menu and some of them are in various submenus of the contextual menu):

## **B** Bold

Changes the style of the selected text to **bold** by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

## **I** Italic

Changes the style of the selected text to **italic** by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

## **U** Underline

Changes the style of the selected text to **underline** by surrounding it with `hi` tag and setting the `rend` attribute to `u1`. You can use this action on multiple non-contiguous selections.

## **S** Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

## **T** Insert Paragraph

Insert a new paragraph element at current cursor position.

## **LI** Insert List Item

Inserts a list item in the current list type.

## **LO** Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

## **LI** Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

## **Sort**

Sorts cells or list items in a table.

## **IT** Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

## **IRB** Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

## **ICA** Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

## **IC** Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

## **DCS** Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

## **DRS** Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

## **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

## **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

## **TEI P4 Menu Actions**

In addition, the following default actions are available in the **TEI P4** menu when editing in **Author** mode (some of them are also available in the contextual menu):

### **Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

#### **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

#### **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

#### **Insert Column Before**

Inserts a column before the current one.

#### **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

## **ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

### **ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor [Editor Variables](#).

### **Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### **Auto generate IDs for elements**

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### **Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## **Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

### Tags display mode Submenu

#### Full Tags with Attributes

Displays full tag names with attributes for both block level and in-line level elements.

#### Full Tags

Displays full tag names without attributes for both block level and in-line level elements.

#### Block Tags

Displays full tag names for block level elements and simple tags without names for in-line level elements.

#### Inline Tags

Displays full tag names for inline level elements, while block level elements are not displayed.

#### Partial Tags

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

#### No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

### Profiling/Conditional Text Submenu

#### Edit Profiling Attributes

Allows you to configure the [profiling attributes](#) and their values.

#### Show Profiling Colors and Styles

Select this option to turn on conditional styling.

#### Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

#### Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

#### List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

#### Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

### TEI Contextual Menu Actions

In addition to many of the [TEI toolbar actions](#) and the [general Author mode contextual menu actions](#), the following TEI framework-specific actions are also available in the contextual menu when editing in **Author** mode:

#### Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

### **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

### **Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

### **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

### **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

### **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

### **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### **Sort**

Sorts cells or list items in a table.

### **Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

### **Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

## **TEI P4 Drag/Drop Actions**

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a TEI P4 document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

## **TEI P4 Transformation Scenarios**

The following default transformations are available for TEI P4 documents:

- **TEI HTML** - Transforms a TEI document into an HTML document.
- **TEI P4 - TEI P5 Conversion** - Convert a TEI P4 document into a TEI P5 document.
- **TEI PDF** - Transforms a TEI document into a PDF document using the Apache FOP engine.

### **Related information**

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

## **Customization of TEI Frameworks Using the Latest Sources**

The [TEI P4](#) and [TEI P5](#) frameworks are available as a public project at the following SVN repository: <https://github.com/TEIC/oxygen-tei>. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.

This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.

2. Customize the TEI framework in Oxygen XML Editor.

a) Set the Oxygen XML Editor frameworks folder to the `oxygen/frameworks` subfolder of the folder of the SVN working copy.

[Open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set the path of the SVN working copy in the **Use custom frameworks** option.

- b) [Open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association > Locations**, and select **Custom**.
3. Build a jar file with the TEI framework.

The SVN project includes a build.xml file that can be used for building a jar file using the Ant tool. The command that should be used:

```
ant -f build.xml
```

4. Distribute the jar file to the users that need the customized TEI framework.

The command from the above step creates a file tei.zip in the dist subfolder of the SVN project. Each user that needs the customized TEI framework will receive the tei.zip file and will unzip it in the frameworks folder of the Oxygen XML Editor install folder.

## TEI P5 Document Type

The *TEI* (*Text Encoding Initiative*) document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

### File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is <http://www.tei-c.org/ns/1.0>.
- The public id of the document is -//TEI P5.

### Default Document Templates

There are a variety of default *TEI P5* templates available when creating [new documents from templates](#), including **Bare**, **Lite**, **Math**, **Speech**, and more.

The default templates for TEI P5 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI_P5` folder.

### Default Schema

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

### Default CSS

The default CSS files used for rendering TEI content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

### Default XML Catalogs

The default catalogs for the TEI P5 document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheets/catalog.xml`

## TEI P5 Author Mode Actions

A variety of actions are available in the TEI P5 framework that can be added to the **TEI P5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### TEI P5 Toolbar Actions

The following default actions are readily available on the **TEI P5 (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI P5** menu and some of them are in various submenus of the contextual menu):

#### **B Bold**

Changes the style of the selected text to bold by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

#### **I Italic**

Changes the style of the selected text to italic by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

#### **U Underline**

Changes the style of the selected text to underline by surrounding it with `hi` tag and setting the `rend` attribute to `u1`. You can use this action on multiple non-contiguous selections.

#### **§ Insert Section**

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

#### **¶ Insert Paragraph**

Insert a new paragraph element at current cursor position.

#### **Insert Image**

[Inserts an image reference](#) at the cursor position. Depending on the current location, an image-type element is inserted.

#### **Insert List Item**

Inserts a list item in the current list type.

#### **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

#### **Insert Itemized List**

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

#### **Sort**

Sorts cells or list items in a table.

#### **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content – text + markup – that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

#### **Insert Row Below**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

#### **Insert Column After**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

#### **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor adds a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

#### **Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

#### **Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

#### **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

#### **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

### **TEI P5 Menu Actions**

In addition, the following default actions are available in the **TEI P5** menu when editing in **Author** mode (some of them are also available in the contextual menu):

#### **Table submenu**

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

##### **Insert Row Above**

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

##### **Insert Rows**

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

##### **Insert Column Before**

Inserts a column before the current one.

##### **Insert Columns**

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

#### **ID Options**

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

##### **ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor [Editor Variables](#).

### **Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### **Auto generate IDs for elements**

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### **Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

## **Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

## **Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

## **Tags display mode Submenu**

### **Full Tags with Attributes**

Displays full tag names with attributes for both block level and in-line level elements.

### **Full Tags**

Displays full tag names without attributes for both block level and in-line level elements.

### **Block Tags**

Displays full tag names for block level elements and simple tags without names for in-line level elements.

### **Inline Tags**

Displays full tag names for inline level elements, while block level elements are not displayed.

### **Partial Tags**

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

## **Configure Tags Display Mode**

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## **Profiling/Conditional Text Submenu**

### **Edit Profiling Attributes**

Allows you to configure the [profiling attributes](#) and their values.

### **Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

### **Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

## Show Excluded Content

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

## List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

## Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## TEI Contextual Menu Actions

In addition to many of the [TEI toolbar actions](#) and the [general Author mode contextual menu actions](#), the following TEI framework-specific actions are also available in the contextual menu when editing in **Author** mode:

### Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

### Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

#### Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

#### Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

#### Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

#### Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

#### Join Cells

Joins the content of the selected cells (both horizontally and vertically).

#### Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

#### Sort

Sorts cells or list items in a table.

#### Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

#### Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

## TEI P5 Drag/Drop Actions

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a TEI P5 document that is edited in **Author** mode, creates a link to the dragged file (the `p|t|r` element with the `target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or

Finder on Mac OS X, for example) and dropping it into a TEI P5 document inserts a graphic element (the graphic element with the `url` attribute) at the drop location, similar to the  **Insert Image** toolbar action.

## TEI P5 Transformation Scenarios

The following default transformations are available for TEI P5 documents:

- **TEI P5 XHTML** - Transforms a TEI P5 document into an XHTML document.
- **TEI P5 PDF** - Transforms a TEI P5 document into a PDF document using the Apache FOP engine.
- **TEI EPUB** - Transforms a TEI P5 document into an EPUB output. The EPUB output will contain any images referenced in the TEI XML document.
- **TEI DOCX** - Transforms a TEI P5 document into a DOCX (OOXML) document. The DOCX document will contain any images referenced in the TEI XML document.
- **TEI ODT** - Transforms a TEI P5 document into an ODT (ODF) document. The ODT document will contain any images referenced in the TEI XML document.

## Customization of TEI Frameworks Using the Latest Sources

The [TEI P4](#) and [TEI P5](#) frameworks are available as a public project at the following SVN repository: <https://github.com/TEIC/oxygen-tei>. This project is the base for customizing a TEI framework.

To customize a TEI framework, follow this procedure:

1. Check out the project on a local computer from the SVN repository.  
This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.
2. Customize the TEI framework in Oxygen XML Editor.
  - a) Set the Oxygen XML Editor frameworks folder to the `oxygen/frameworks` subfolder of the folder of the SVN working copy.  
*Open the Preferences dialog box ([Options > Preferences](#)), go to **Global**, and set the path of the SVN working copy in the **Use custom frameworks** option.*
  - b) *Open the Preferences dialog box ([Options > Preferences](#)), go to **Document Type Association > Locations**, and select **Custom**.*
3. Build a jar file with the TEI framework.

The SVN project includes a `build.xml` file that can be used for building a jar file using the Ant tool. The command that should be used:

```
ant -f build.xml
```

4. Distribute the jar file to the users that need the customized TEI framework.

The command from the above step creates a file `tei.zip` in the `dist` subfolder of the SVN project. Each user that needs the customized TEI framework will receive the `tei.zip` file and will unzip it in the `frameworks` folder of the Oxygen XML Editor install folder.

## Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI framework for Oxygen XML Editor.

1. Go to <https://code.google.com/p/oxygen-tei/>;
2. Go to **Downloads**;
3. Download the latest uploaded .zip file;
4. Unpack the .zip file and copy its content in the Oxygen XML Editor frameworks folder.

## JATS Document Type

The JATS (*NISO Journal Article Tag Suite*) document type is a technical standard that defines an XML format for scientific literature.

### File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string - / /NLM//DTD.

### Default Document Templates

There are some default JATS templates available when creating [new documents from templates](#), including **Archiving**, **Authoring**, **Book**, and **Publishing**.

The default templates for JATS documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/jats/templates/` folder.

### Default Schema

Default schemas that are used if one is not detected in the JATS document are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

### Default CSS

The default CSS files used for rendering JATS content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/author-css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

### Default XML Catalog

The default XML catalog, `jatskit-catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

### Resources

- [Oxygen Video Tutorial: Configuring a JATS Framework](#)
- [NLM Journal Archiving and Interchange Tag Suite](#)

### Related information

[Editing XML Documents in Author Mode](#) on page 320

[Editing XML Documents in Text Mode](#) on page 282

### JATS Author Mode Actions

A variety of actions are available in the JATS framework that can be added to the **JATS** menu, the **Author Custom Actions** toolbar, the contextual menu, and the **Content Completion Assistant**.

### JATS Toolbar Actions

The following default actions are readily available on the **JATS (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **JATS** menu and in various submenus of the contextual menu):

#### Paragraph Level Drop-Down Menu

**Insert Paragraph**

Insert a new paragraph element at current cursor position.

## **Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

## **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

## **Boxed Text**

Inserts or wraps content in a box with a shaded background.

## **Code**

Inserts or wraps content in a code element.

## **Display Quote**

Inserts or wraps content in a disp-quote element.

## **Figure**

Inserts a fig element with a title (inside a caption element). This action opens a dialog box that allows you to enter the text for the title for the figure.

## **Graphic Figure**

Inserts a fig element with a title (inside a caption element), and a graphic element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

## **Bold**

Surrounds the selected text with a bold tag. You can use this action on multiple non-contiguous selections.

## **Italic**

Surrounds the selected text with an italic tag. You can use this action on multiple non-contiguous selections.

## **Underline**

Surrounds the selected text with an underline tag. You can use this action on multiple non-contiguous selections.

## **Monospace**

Inserts or wraps content with a monospace element.

## **Insert Image**

*Inserts an image reference* at the cursor position. Depending on the current location, an image-type element is inserted.

## **Insert List Item**

Inserts a list item in the current list type.

## **Insert MathML**

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations*.

## **JATS Menu Actions**

In addition, the following default actions are available in the **JATS** menu when editing in **Author** mode:

## **Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

## **Tags display mode Submenu**

### **Full Tags with Attributes**

Displays full tag names with attributes for both block level and in-line level elements.

#### **Full Tags**

Displays full tag names without attributes for both block level and in-line level elements.

#### **Block Tags**

Displays full tag names for block level elements and simple tags without names for in-line level elements.

#### **Inline Tags**

Displays full tag names for inline level elements, while block level elements are not displayed.

#### **Partial Tags**

Displays simple tags without names for in-line level elements, while block level elements are not displayed.

#### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### **Configure Tags Display Mode**

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

## **Profiling/Conditional Text Submenu**

### **Edit Profiling Attributes**

Allows you to configure the *profiling attributes* and their values.

### **Show Profiling Colors and Styles**

Select this option to turn on conditional styling.

### **Show Profiling Attributes**

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### **Show Excluded Content**

When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

### **List of all profiling condition sets that match the current document type**

You can click a listed condition set to activate it.

### **Profiling Settings**

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

## **JATS Drag/Drop Actions**

Dragging a file from the [Project view](#) or [DITA Maps Manager view](#) and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the ext-link element with the xlink:href attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a JATS document inserts an image element (the inline-graphic element with the xlink:href attribute) at the drop location, similar to the **Insert Image** toolbar action.

## **JATS Transformation Scenarios**

The following default transformation scenario is available for JATS documents:

- **JATS Preview (simple HTML)** - Converts a JATS document to a simple HTML document.

### **Related information**

[Editing a Transformation Scenario](#) on page 805

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

## EPUB Document Type

**EPUB** is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. Oxygen XML Editor includes an [Archive Browser view](#) that allows you to view the contents and structure of this type of file.

Three distinct frameworks are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

**Note:** Oxygen XML Editor supports both OPF 2.0 and OPF 3.0.

### File Definition

A file is considered to be an *EPUB* document if it has a file extension of `.epub`.

### Default Document Templates

There are a variety of default *EPUB* templates available when creating [new documents from templates](#), including **NCX - Toc**, **OCF - Container**, **OCF - Encryption**, **OCF - Signatures**, **OPF 2.0 - Content**, and **OPF 3.0 - Content**.

The default templates for the *NCX* document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ncx/templates` folder.

The default templates for the *OCF* document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ocf/templates` folder.

The default template for the *OPF 2.0* document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/2.0` folder.

The default template for the *OPF 3.0* document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/3.0` folder.

# Author Mode Customization

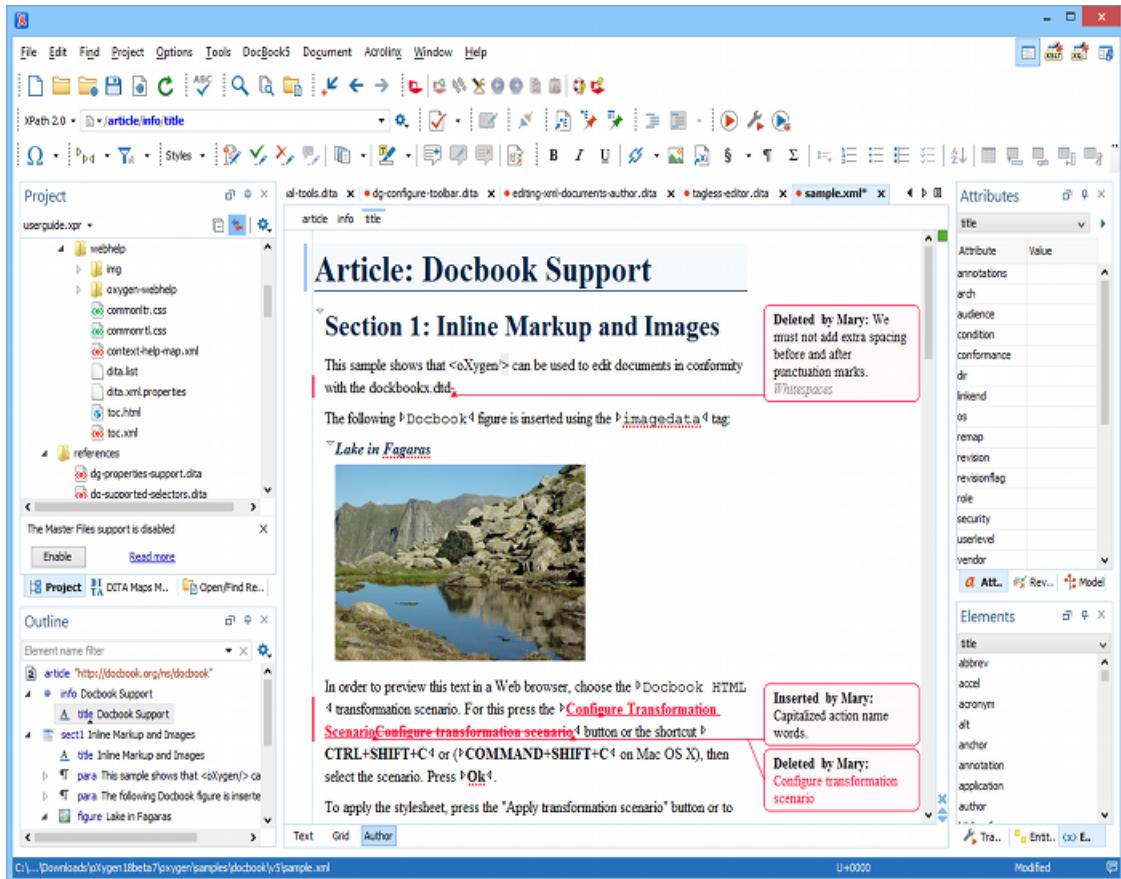

## Topics:

- [Author Mode Customization Guide](#)
- [CSS Support in Author Mode](#)
- [Creating and Running Automated Tests](#)
- [API Frequently Asked Questions \(API FAQ\)](#)

This section contains an [Author Mode Customization Guide](#) on page 1132, [CSS Support in Author Mode](#) on page 1222, a collection of [Frequently Asked Questions regarding the Oxygen XML Editor API](#), and other topics in regards to customizing the **Author** mode.

## Author Mode Customization Guide

The **Author** mode editor of Oxygen XML Editor was designed to provide a friendly user interface for editing XML documents. **Author** combines the power of source editing with the intuitive interface of a word processor. You can customize the **Author** mode editor to support new custom XML formats or to change how standard XML formats are edited.

**Figure 545:** Oxygen XML Editor Author Visual Editor

Although Oxygen XML Editor includes built-in, configured frameworks for DocBook, DITA, TEI, and XHTML you might need to create a customization of the editor to handle other types of documents. A common use case is when your organization holds a collection of XML document types used to define the structure of internal documents and they need to be visually edited by people with no experience working with XML files.

There are several ways to customize the editor:

1. Create a CSS file defining styles for the XML elements you will work with, and create XML files that reference the CSS through an `xmlstylesheet` processing instruction.
2. Fully configure a document type association. This involves putting together the CSS stylesheets, XML schemas, actions, menus, bundling them, and distributing an archive. The CSS and GUI elements are settings for the Oxygen XML Editor **Author** mode. The other settings such as the templates, catalogs, and transformation scenarios are general settings and are enabled whenever the association is active, regardless of the editing mode (**Text**, **Grid**, or **Author**).

## Simple Customization Tutorial

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

### XML Schema

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor needs an XML grammar (XML Schema, DTD, or RelaxNG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor detects the schema, see [Associating a Schema to XML Documents](#) on page 464.

Consider a use-case in which several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for these kind of documents. The following XML Schema, `test_report.xsd` defines a report with results of a testing session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```
<?xml version="1.0" encoding="UTF-8"?>
<xss:schema xmlns:xss="http://www.w3.org/2001/XMLSchema">
 <xss:element name="report">
 <xss:complexType>
 <xss:sequence>
 <xss:element ref="title"/>
 <xss:element ref="description"/>
 <xss:element ref="results"/>
 </xss:sequence>
 </xss:complexType>
 </xss:element>
 <xss:element name="title" type="xs:string"/>
 <xss:element name="description">
 <xss:complexType>
 <xss:sequence maxOccurs="unbounded">
 <xss:element name="line">
 <xss:complexType mixed="true">
 <xss:sequence minOccurs="0"
 maxOccurs="unbounded">
 <xss:element name="important"
 type="xs:string"/>
 </xss:sequence>
 </xss:complexType>
 </xss:element>
 </xss:sequence>
 </xss:complexType>
 </xss:element>
 <xss:element name="results">
 <xss:complexType>
 <xss:sequence maxOccurs="unbounded">
 <xss:element name="entry">
 <xss:complexType>
 <xss:sequence>
 <xss:element name="test_name"
 type="xs:string"/>
 <xss:element name="passed"
 type="xs:boolean"/>
 </xss:sequence>
 </xss:complexType>
 </xss:element>
 </xss:sequence>
 </xss:complexType>
 </xss:element>
</xss:schema>
```

```
</xs:element>
</xs:schema>
```

## CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in **Author** mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called in-line boxes. There are also other type of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contains in-line boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as in-line boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a `table-row` style. Similarly, the `row` elements must contain elements with a `table-cell` style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

### report

This element is the root element of a report document. It should be rendered as a box that contains all other elements. To achieve this the display type is set to **block**. Additionally, some margins are set for it. The CSS rule that matches this element is:

```
report{
 display:block;
 margin:1em;
}
```

### title

The title of the report. Usually titles have a large font. The **block** display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```
title {
 display:block;
 font-size:2em;
}
```

### description

This element contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the **block** display. Also, the background color is changed to make it standout.

```
description {
 display:block;
 background-color:#EEEEFF;
 color:black;
}
```

### line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be **block** style.

```
line {
 display:block;
}
```

## important

The **important** element defines important text from the description. Since it can be mixed with text, its **display** property must be set to **inline**. Also, the text is emphasized with **bold** to make it easier to spot.

```
important {
 display:inline;
 font-weight:bold;
}
```

## results

The **results** element displays the list of *test\_names* and the results for each one. To make it easier to read, it is displayed as a **table**, with a green border and margins.

```
results{
 display:table;
 margin:2em;
 border:1px solid green;
}
```

## entry

An item in the **results** element. The results are displayed as a table so the entry is a row in the table. Thus, the **display** is **table-row**.

```
entry {
 display:table-row;
}
```

## test\_name, passed

The name of the individual test, and its result. They are cells in the results table with the **display** set to **table-cell**. Padding and a border are added to emphasize the table grid.

```
test_name, passed{
 display:table-cell;
 border:1px solid green;
 padding:20px;
}
passed{
 font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```
report {
 display:block;
 margin:1em;
}

description {
 display:block;
 background-color:#EEEEFF;
 color:black;
}

line {
 display:block;
}

important {
 display:inline;
 font-weight:bold;
}

title {
 display:block;
 font-size:2em;
}

results{
 display:table;
 margin:2em;
 border:1px solid green;
}

entry {
 display:table-row;
}
```

```

}
test_name, passed{
 display:table-cell;
 border:1px solid green;
 padding:20px;
}
passed{
 font-weight:bold;
}

```

The screenshot shows the Oxygen XML Editor interface in Author mode. At the top, there's a toolbar with buttons for report, description, line, and important. Below that is a code editor window containing an XML stylesheet with a processing instruction and some descriptive text. The main content area displays an "Automated test report" with a message about daily runs and failed tests. A table lists three test results: Database connection test (true), XSLT Transformation test (true), and DTD validation test (false). At the bottom of the content area, there are tabs for Text, Grid, and Author, with Author being the active tab.

Database connection test	true
XSLT Transformation test	true
DTD validation test	false

**Figure 546: Report Rendered in Author Mode**

**Note:** You can edit attributes in-place in the **Author** mode using *form-based controls*.

### Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `<?xml-stylesheet type="text/css" href="test.css"?>` processing instruction with the type attribute at the beginning of the XML document. If you do not want to alter your XML documents, [you should create a new document type \(framework\)](#).

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```
<?xml-stylesheet type="text/css" href="test.less"?>
```

**Note:** XHTML documents need a link element, with the href and type attributes in the head child element, as specified in the [W3C CSS specification](#). XHTML example:

```
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

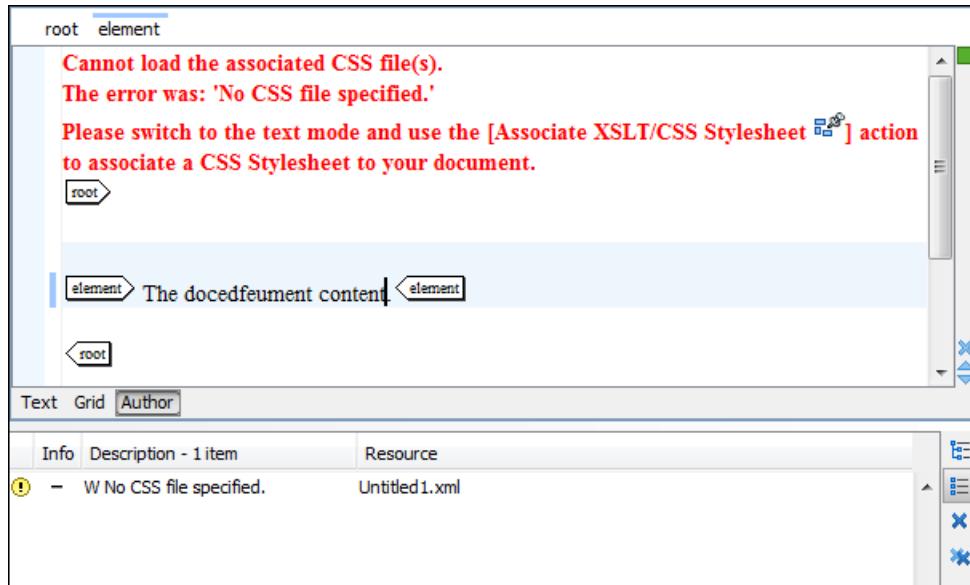

**Tip:** You can also insert the `<?xml-stylesheet type="text/css" href="test.css"?>` processing instruction by using the **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **Document > XML Document** menu.

2. Configure a *Document Type Association* by adding a new CSS or LESS file in the settings. To do so, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Edit the appropriate framework, open the **Author** tab, then the **CSS** tab. Press the **+ New** button to add a new CSS or LESS file.

**Note:** The Document Type Associations are read-only, so you need to extend an existing one.

You can read more about associating a CSS to a document in the section about [customizing the CSS of a document type](#).

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

**Figure 547: Document with no CSS association default rendering**

### XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor can help the content author in loading, editing, and validating the test reports. An XML file template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="test_report.xsd">
<title>Automated test report</title>
<description>
<line>This is the report of the test automatically ran.
 Each test suite is ran at 20:00h each day.
 Please <important>check</important> the failed ones!</line>
</description>
<results>
<entry>
<test_name>Database connection test</test_name>
<passed>true</passed>
</entry>
<entry>
<test_name>XSLT Transformation test</test_name>
<passed>true</passed>
</entry>
<entry>
<test_name>DTD validation test</test_name>
<passed>false</passed>
</entry>
</results>
</report>
```

The processing instruction `xmlstylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In our case the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css"
 href="http://www.mysite.com/reports/test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:noNamespaceSchemaLocation=
 "http://www.mysite.com/reports/test_report.xsd">
 <title>Test report title</title>
 <description>

```

If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.

## Document Type Association Advanced Customization

Oxygen XML Editor supports individual document types and classes of document types through frameworks. A framework associates a document type or a class of documents with CSS stylesheets, validation schemas, catalog files, new files templates, transformation scenarios and custom actions.

In this tutorial, we create a framework for a set of documents. As an example, we create a light documentation framework (similar to DocBook), then we set up a complete customization of the **Author** mode.

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the `oxygen-sample-framework` module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

### Related information

[Document Types \(Frameworks\)](#) on page 1042

[Predefined Document Types \(Frameworks\)](#) on page 1042

### Adding or Editing a Document Type Association (Framework)

To add or edit a *Document Type Association*, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. From this [Document Type Association preferences page](#) you can use the **New**, **Edit**, **Duplicate**, or **Extend** buttons to open a [Document Type configuration dialog box](#) that allows you to customize a new or existing document type (framework).

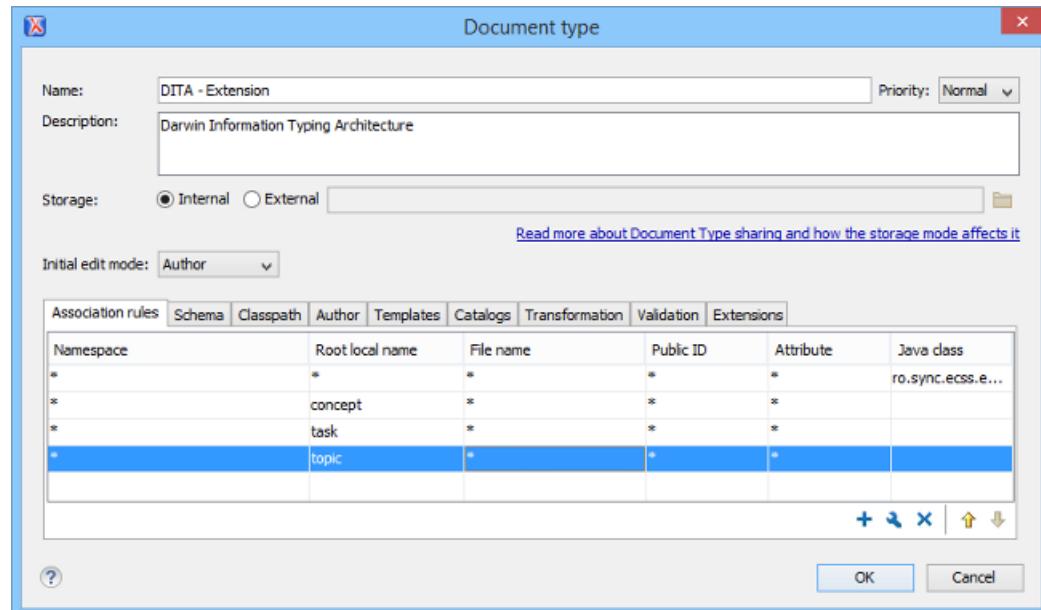

Figure 548: Document Type Configuration Dialog Box

You can specify the following properties for a document type:

- **Name** - The name of the document type.
  - **Priority** - When multiple document types match the same document, the priority determines the order in which they are applied. It can be one of the following: Lowest, Low, Normal, High, Highest. The predefined document types that are already configured when the application is installed on the computer have the default Low priority.
- Note:** Frameworks that have the same priority are sorted alphabetically.
- **Description** - The document type description displayed as a tool tip in the [Document Type Association preferences page](#).
  - **Storage** - The location where the document type is saved. If you select the **External** storage option, the document type is saved in the specified file with a mandatory framework extension, located in a subdirectory of the current frameworks directory. If you select the **Internal** storage option, the document type data is saved in the current .xpr Oxygen XML Editor project file (for Project-level Document Type Association options) or in the Oxygen XML Editor internal options (for Global-level Document Type Association Options). You can change the Document Type Association options level in the [Document Type Association preferences page](#).
  - **Initial edit mode** - Allows you to select the initial editing mode for this document type: **Editor specific**, **Text**, **Author**, **Grid** and **Design** (available only for the W3C XML Schema editor). If the **Editor specific** option is selected, the initial editing mode is determined based upon the editor type. You can find the mapping between editors and edit modes in the [Edit modes preferences page](#). You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the **Author** mode you can set it in the **Initial edit mode** combo box.

**Note:** You can also customize the initial mode for a document type in the **Edit modes** preferences page. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes**.

You can specify the **Association rules** used for determining a document type for an opened XML document. A rule can define one or more conditions. All conditions need to be fulfilled for a specific rule to be chosen. Conditions can specify:

- **Namespace** - The namespace of the document that matches the document type.
- **Root local name of document** - The local name of the document that matches the document type.
- **File name** - The file name (including the extension) of the document that matches the document type.
- **Public ID** (for DTDs) - The PUBLIC identifier of the document that matches the document type.
- **Attribute** - This field allows you to associate a document type depending on a certain value of the attribute in the root.
- **Java class** - Name of the Java class that is called to determine if the document type should be used for an XML document. Java class must either implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface or extend the `ro.sync.ecss.extensions.api.DocumentTypeAdvancedCustomRuleMatcher` abstract class from the **Author API**.

In the **Schema** tab, you can specify the type and URI of schema used for validation and content completion of all documents from the document type, when there is no schema detected in the document.

You can choose one of the following schema types:

- DTD
- Relax NG schema (XML syntax)
- Relax NG schema (XML syntax) + Schematron
- Relax NG schema (compact syntax)
- XML Schema
- XML Schema + Schematron rules
- NVDL schema

## Configure Actions, Menus, and Toolbars for a Framework

You can configure actions, menus, and toolbars that are specific to a document type in the **Author** mode to gain a productive editing experience, by using the [Document Type configuration dialog box](#).

To add or configure actions, menus, or toolbars follow this procedure:

1. Open the [Preferences dialog box \(Options > Preferences\)](#), go to **Document Types Association**, and click the framework for which you want to create an action.
2. Click **Edit** and in the [Document Type configuration dialog box](#) go to the **Author** tab, then go to **Actions**.
3. Click the **+ New** button and use the [Action dialog box](#) to create an action.

### Configure the Insert Section Action for a Framework

This section presents all the steps that you need to follow, to define the **Insert Section** action. It is assumed that the icon files, (Section16.gif) for the menu item and (Section20.gif) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in the frameworks/sdf directory.

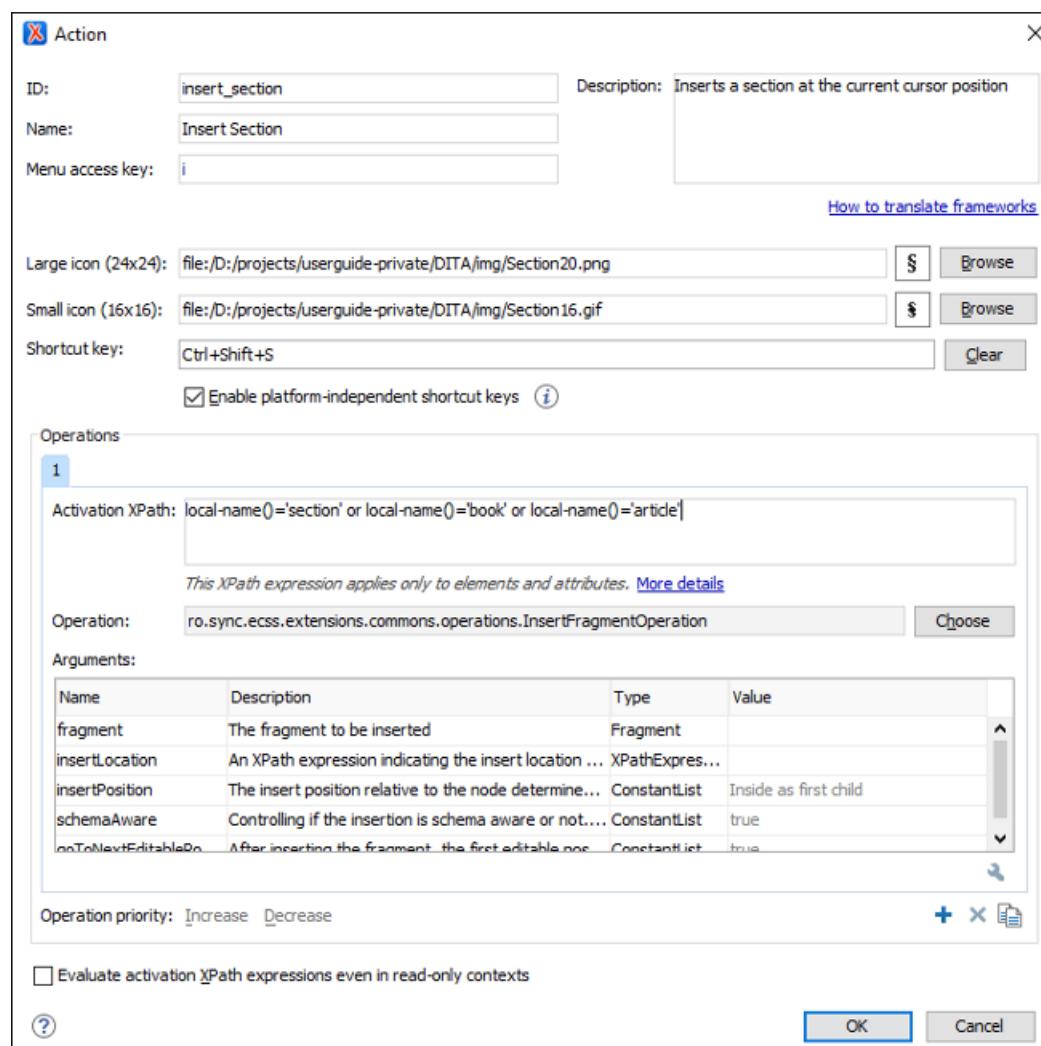

Figure 549: Action Dialog Box

1. Set the **ID** field to **insert\_section**. This is a unique action identifier.
2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.

3. Set the **Menu access key** to **i**. On Windows, the menu items can be accessed using **ALT+letter** keys combination, when the menu is visible. The letter is visually represented by underlining the first letter from the menu item name having the same value.
4. Add a **Description**.
5. Set the **Large icon (20x20)** field to \${frameworks}/sdf/Section20.gif. A good practice is to store the image files inside the framework directory and use **editor variable** \${framework} to make the image relative to the framework location.

If the images are bundled in a jar archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

If the image file Section20.gif is located in the **images** directory inside the jar archive, you can reference it by using **/images/Section20.gif**. The jar file must be added into the **Classpath** list.

6. Set the **Small icon (16x16)** field to \${frameworks}/sdf/Section16.gif.
7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S (Meta+Shift+S on Mac OS)**. This will be the key combination to trigger the action using the keyboard only.

The shortcut is enabled only by [adding the action to the main menu of Author mode](#), which contains all the actions that the author will have in a menu for the current document type.

8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The Xpath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example we'll suppose you want allow the action to add a section only if the current element is either a book, article or another section.

- a) Set the XPath expression field to:

```
local-name()='section' or local-name()='book' or
local-name()='article'
```

- b) Set the **invoke operation** field to **InsertFragmentOperation** built-in operation, designed to insert an XML fragment at cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the [Author Default Operations](#) section. This set can be expanded with your own Java operation implementations.
- c) Configure the arguments section as follows:

```
<section xmlns=
"http://www.oxygenxml.com/sample/documentation">
 <title/>
</section>
```

**insertLocation** - leave it empty. This means the location will be at the cursor position.

**insertPosition** - select "**Inside**".

#### Configure the Insert Table Action for a Framework

The procedure described below will create an action that inserts a table with three rows and three columns into a document. The first row is the table header. As with [the insert section action](#), you will use the **InsertFragmentOperation** built-in operation.

Place the icon files for the menu item, and for the toolbar, in the frameworks/sdf directory.

1. Set **ID** field to **insert\_table**.
2. Set **Name** field to **Insert table**.
3. Set **Menu access key** field to **t**.
4. Set **Description** field to **Adds a table element**.
5. Set **Toolbar icon** to \${framework} / toolbarIcon.png.
6. Set **Menu icon** to \${framework} / menulcon.png.
7. Set **Shortcut key** to **Ctrl + Shift + T (Command + Shift + T on OS X)**.
8. Set up the action's functionality:

- a) Set **XPath expression** field to `true()`.  
`true()` is equivalent with leaving this field empty.
- b) Set **Invoke operation** to use **InsertFragmentOperation** built-in operation that inserts an XML fragment to the cursor position.
- c) Configure operation's arguments as follows:

**fragment** - set it to:

```
<table xmlns=
"http://www.oxygenxml.com/sample/documentation">
<header><td/><td/><td/></header>
<tr><td/><td/><td/></tr>
<tr><td/><td/><td/></tr>
</table>
```

**insertLocation** - to add tables at the end of the section use the following code:

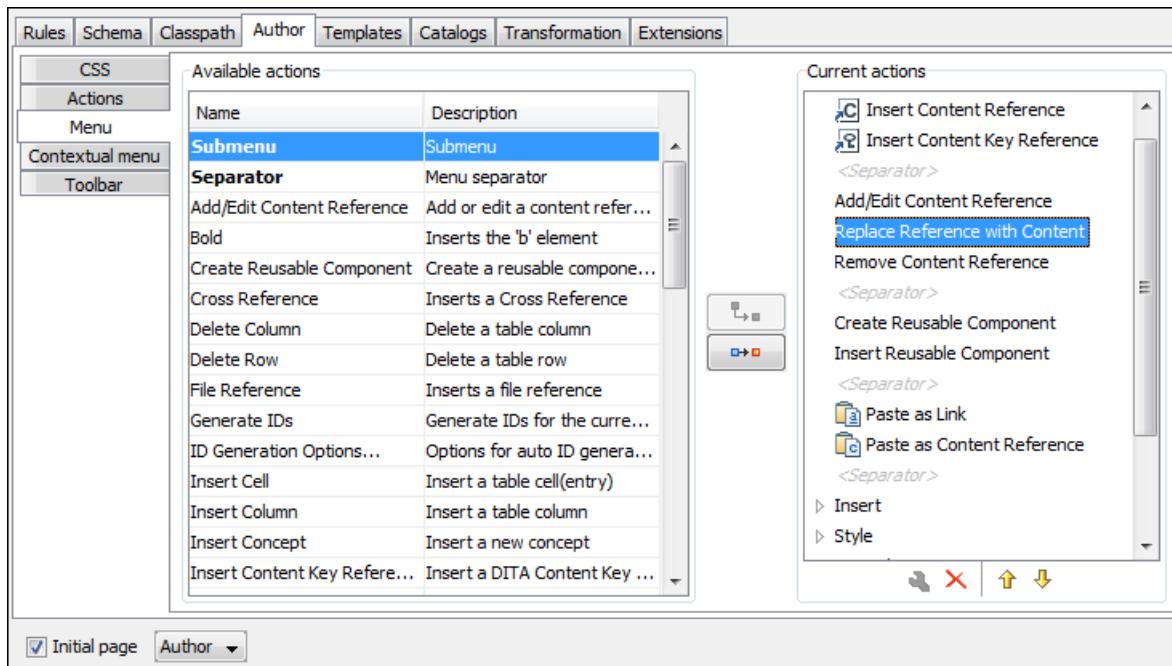

```
ancestor::section/*[last()]
```

**insertPosition** - Select **After**.

#### Configure the Main Menu for a Framework

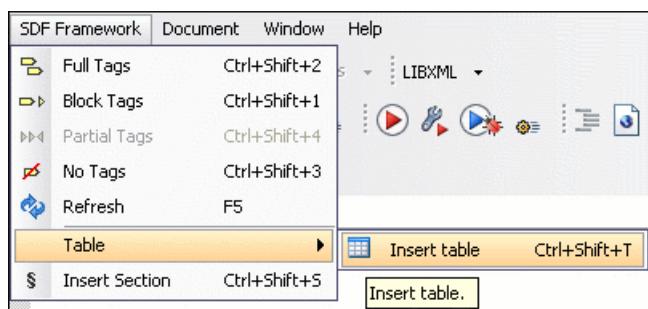

Defined actions can be grouped into customized menus in the Oxygen XML Editor menu bar.

1. Open the **Document Type configuration dialog box** for the **SDF framework** and go to the **Author** tab.
2. Go to the **Menu** subtab. In the left side you have the list of actions and some special entries:
  - **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
  - **Separator** - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the menu tree with **Menu** entry as root. To change its name, click this label to select it, then press the **Edit** button. Enter **SD Framework** as name, and **D** as menu access key.
4. Select the **Submenu** label in the left panel section and the **SD Framework** label in the right panel section, then press the **Add as child** button. Change the submenu name to **Table**, using the **Edit** button.
5. Select the **Insert section** action in the left panel section and the **Table** label in the right panel section, then press the **Add as sibling** button.
6. Now select the **Insert table** action in the left panel section and the **Table** in the right panel section. Press the **Add as child** button.

**Figure 550: Configuring the Menu**

When opening a custom framework test document in **Author** mode, the menu you created is displayed in the editor menu bar, between the **Tools** and the **Document** menus. The upper part of the menu contains generic **Author** mode actions (common to all document types) and the two actions created previously (with **Insert table** under the **Table** submenu).

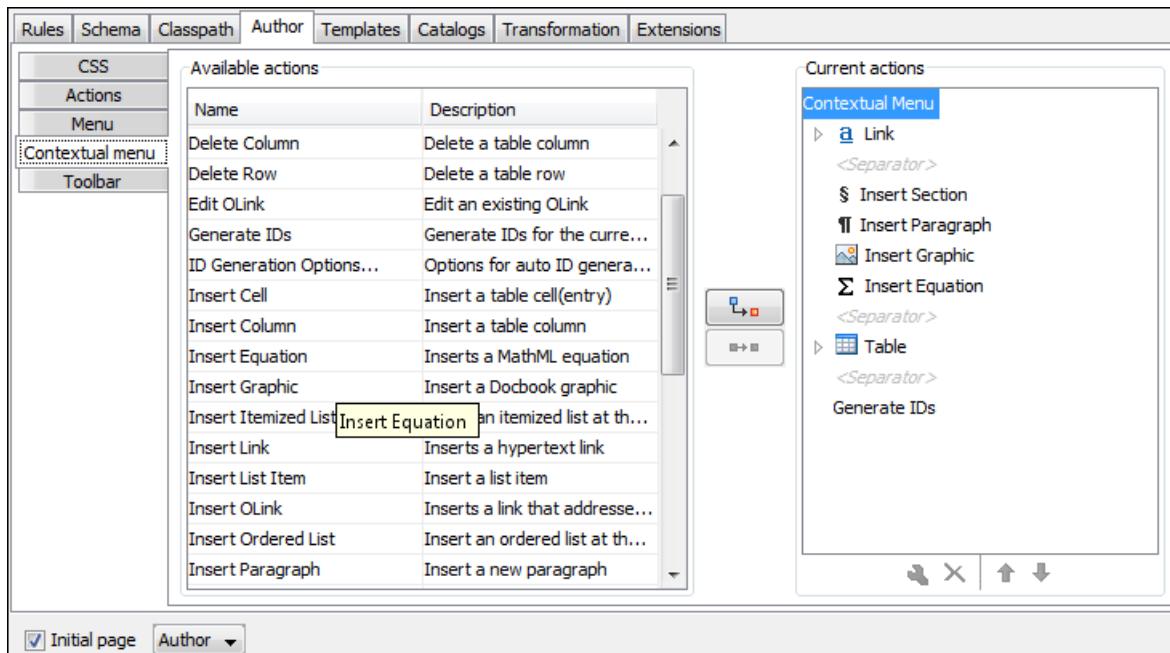

**Figure 551: Author Mode Menu**

#### Configure the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the **Author** editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the **Document Type configuration dialog box** for the particular framework and go to the **Author** tab. Next, go to the **Contextual Menu** subtab.
2. Follow the same steps as explained in the [Configuring the Main Menu](#), except changing the menu name because the contextual menu does not have a name.

**Note:** You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and document type-specific ones) are grouped together under the same submenu.

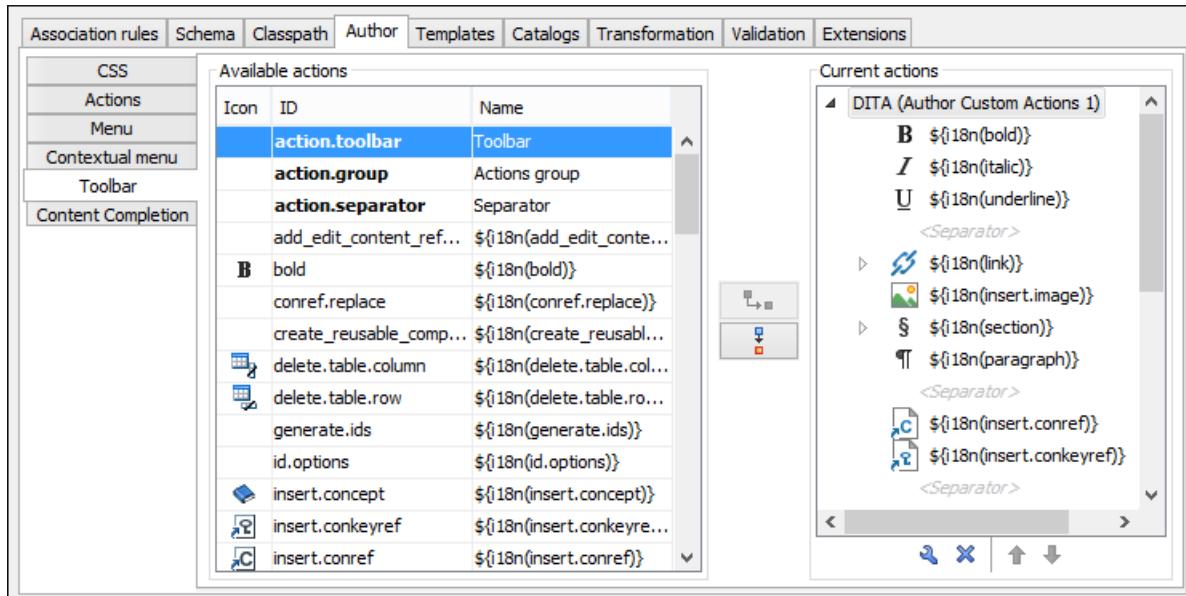

**Figure 552: Configuring the Contextual Menu**

To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** sub-menu and the **Insert section** action.

#### Configure the Toolbars for a Framework

The procedure below describes how to add defined actions to a toolbar. These steps use examples from the two previous help topics that described how to define the **Insert Section** and **Insert Table** actions. You can also configure additional toolbars to add other custom actions.

1. Open the **Document Type configuration dialog box** for the **SDF framework** and select the **Author** tab. Next, go to the **Toolbar** subtab.

**Figure 553: Configuring the Toolbar**

The panel is divided in two sections: the left side contains a list of actions, while the right one contains an action tree, displaying the list of actions added in the toolbar. The special entry called **Separator** allows you to visually separate the actions in the toolbar.

- Select the **Insert section** action in the left panel section and the **Toolbar** label in the right panel section, then press the **Add as child** button.
- Select the **Insert table** action in the left panel section and the **Insert section** in the right panel section. Press the **Add as sibling** button.

When opening a document of the particular framework in **Author** mode, the toolbar with the new buttons will be displayed in the toolbar area.

**Tip:** If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the **Author** mode, right-click the main toolbar, select **Configure Toolbars**, and make sure the appropriate toolbar (such as the **Author Custom Actions** toolbar) is enabled.

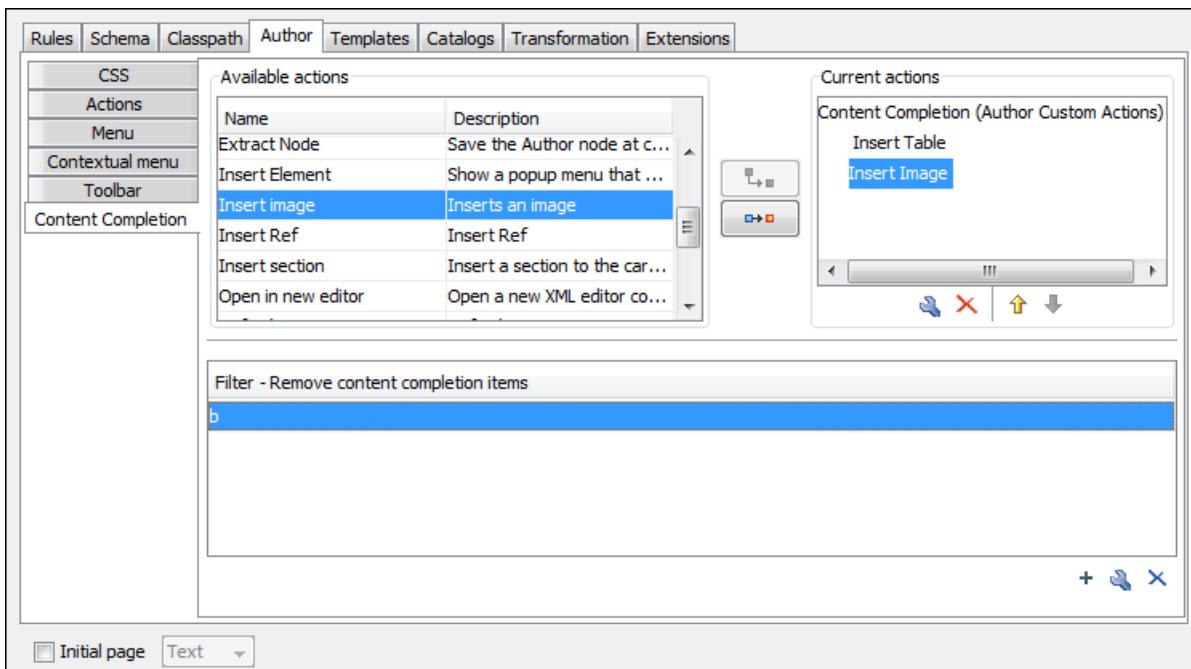

#### Configure Content Completion for a Framework

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- Content Completion** window
- Elements** view
- Element Insert** menus (from the **Outline** view or breadcrumb contextual menus)

You can use the content completion customization support in a custom framework by following this procedure:

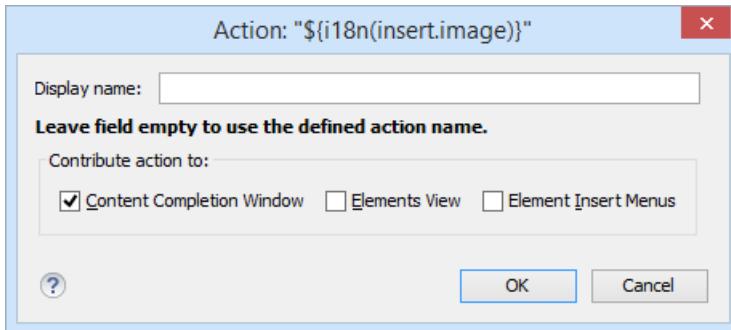

- Open the **Document type configuration dialog box** for the **SDF framework** and select the **Author** tab. Next, go to the **Content Completion** tab.

**Figure 554: Customize Content Completion**

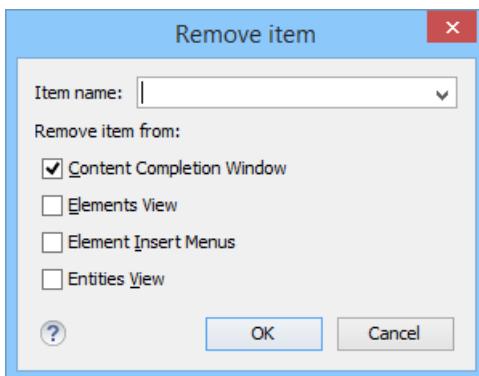

The top side of the **Content Completion** section contains the list with all the actions defined within the custom framework and the list of actions that you decided to include in the **Content Completion Assistant** list of proposals. The bottom side contains the list with all the items that you decided to remove from the **Content Completion Assistant** list of proposals.

- If you want to add a custom action to the list of current **Content Completion** proposals, select the action item from the **Available actions** list and press the **Add as child** or **Add as sibling** button to include it in the **Current actions** list. An **Insert Action** dialog box appears, giving you the possibility to select where to provide the selected action.

**Figure 555: Insert Action Dialog Box**

3. If you want to exclude a certain item from the **Content Completion** proposals, you can use the **+ Add** button from the **Filter - Remove content completion items** list. The **Remove item** dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

**Figure 556: Remove Item Dialog Box**

#### *Author Mode Default Operations*

The default operations for the **Author** mode, along with their arguments are as follows:

- **ChangeAttributeOperation**

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom **Author** mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

- **name** - The attribute local name.
- **namespace** - The attribute namespace.
- **elementLocation** - The XPath location that identifies the element.
- **value** - The new value for the attribute. If empty or null the attribute will be removed.
- **editAttribute** - If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.
- **removeIfEmpty** - The possible values are **true** and **false**. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

- **ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations** - An XPath expression indicating a list of nodes for which the specified list of pseudo-classes will be set. If it is not defined, then the element at the cursor position will be used.
- **setPseudoClassNames** - A space-separated list of pseudo-class names that will be set on the matched nodes.

- **removeLocations** - An XPath expression indicating a list of nodes from which the specified list of pseudo-classes will be removed. If it is not defined, then the element at the cursor position will be used.
- **removePseudoClassNames** - A space-separated list of pseudo-class names that will be removed from the matched nodes.

- **DeleteElementOperation**

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

- **DeleteElementsOperation**

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

- **ExecuteCommandLineOperation**

This operation allows you to start a process executing a given command line. It has the following arguments:

- `name` - The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).
- `workingDirectory` - The path to the directory where the command line is executed. The default value is `"."` (current directory).
- `cmdLine` - The command line to be executed (accepts [editor variables](#)).
- `showconsole` - If set to `true`, the console panel will be displayed in Oxygen XML Editor. The default value is `false`.

- **ExecuteMultipleActionsOperation**

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Editor.

- **actionIDs** - The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

- **ExecuteMultipleWebappCompatibleActionsOperation**

An implementation of an operation that runs a sequence of Oxygen XML Web Author Component-compatible actions, defined as a list of IDs.

- **ExecuteTransformationScenariosOperation**

This operation allows running one or more transformation scenarios defined in the current document type association. It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

- **scenarioNames** - The list of scenario names that will be executed, separated by new lines.

- **InsertEquationOperation**

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

- **fragment** - The XML fragment containing the MathML content that should be inserted.

- **InsertFragmentOperation**

Inserts an XML fragment at the current cursor position. The selection - if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see [Arguments of InsertFragmentOperation Operation](#) on page 1155.

- **InsertOrReplaceFragmentOperation**

Similar to **InsertFragmentOperation**, except it removes the selected content before inserting the fragment. For more details about its list of parameters, see [Arguments of InsertFragmentOperation Operation](#).

- **InsertOrReplaceTextOperation**

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

- **text** - The text section to insert.

- **InsertXIncludeOperation**

Insert an **XInclude** element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

- **JSOperation**

Allows you to call the Java API from custom JavaScript content. For some sample JSOperation implementations, see <https://github.com/oxygenxml/javascript-sample-operations>.

**Notice:** For the Oxygen XML Web Author Component, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

- **script**

The JavaScript content to execute. It must have a function called doOperation(), which can use the predefined authorAccess variable. The authorAccess variable has access to the entire `ro.sync.ecss.extensions.api.AuthorAccess` Java API.

The following example is a script that retrieves the current value of the **type** attribute on the current element, allows the end user to edit its new value and sets the new value in the document:

```
function doOperation(){
 //The current node is either entirely selected...
 currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
 if(currentNode == null){
 //or the cursor is placed in it
 caretOffset = authorAccess.getEditorAccess().getCaretnOffset();
 currentNode = authorAccess.getDocumentController().getNodeAtOffset(
 (caretOffset));
 }
 //Get current value of the @type attribute
 currentTypeValue = "";
 currentTypeValueAttr = currentNode.getAttribute("type");
 if(currentTypeValueAttr != null){
 currentTypeValue = currentTypeValueAttr.getValue();
 }
 //Ask user for new value for attribute.
 newValue = javax.swing.JOptionPane.showInputDialog(
 "Input @type value", currentTypeValue);
 if(newValue != null){
 //Create and set the new attribute value for the @type attribute.
 attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(
 newValue);
 authorAccess.getDocumentController().setAttribute(
 ("type", attrValue, currentNode));
 }
}
```

**Tip:** You can call functions defined inside a script called commons.js from your custom script content so that you can use that external script file as a library of functions. Note that this commons.js file must be placed in the root of the framework directory (for example, [OXYGEN\_INSTALL\_DIR]/frameworks/dita/commons.js) because that is the only location where Oxygen XML Editor will look for it.

- **MoveCaretOperation**

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

- **xpathLocation** - An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.
- **position** - The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:
  - Before - Places the cursor at the beginning of the selection.
  - Inside, at the beginning - Places the cursor at the beginning of the selection.
  - After - Places the cursor at the end of the selection.
  - Inside, at the end - Places the cursor at the end of the selection.
- **selection** - Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: None, Element, and Content.

- **MoveElementOperation**

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

- **sourceLocation** - XPath expression that identifies the content to be moved.
- **deleteLocation** - XPath expression that identifies the node to be removed. This parameter is optional. If missing, the **sourceLocation** parameter will also identify the node to be deleted.
- **surroundFragment** - A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.
- **targetLocation** - XPath expression that identifies the location where the node must be moved to.
- **insertPosition** - Argument that indicates the insert position.
- **moveOnlySourceContentNodes** - When true, only the content of the source element is moved.
- **processTrackedChangesForXpathLocations** - When nodes are located via an XPath expression and the nodes are deleted with change tracking enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to true and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).

- **OpenInSystemAppOperation**

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation is:

- **resourcePath** - An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables are expanded in the value of this parameter, before the expression is executed.
- **isUnparsedEntity** - Possible values are true or false. If the value is true, the value of the **resourcePath** argument is treated as the name of an unparsed entity.

- **RemovePseudoClassOperation**

An operation that removes a pseudo-class from an element. Accepts the following parameters:

- **name** - Name of the pseudo-class to be removed.
- **elementLocation** - The XPath location that identifies the element. Leave it empty for the current element. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

**Example:**

Suppose that there is a pseudo-class called myClass on the element paragraph and there are CSS styles matching the pseudo-class.

```
paragraph:myClass{
 font-size:2em;
 color:red;
}
paragraph{
 color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the paragraph is rebuilt by matching the other rules (in this case, the foreground color of the paragraph element will become blue).

- **RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName** - The new element name
- **elementLocation** - The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

- **SetPseudoClassOperation**

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation** - An XPath expression indicating the element for which the pseudo-class will be set. If it is not defined, then the element at cursor position will be used.
- **name** - The pseudo-class local name.

- **ShowElementDocumentationOperation**

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

- **SurroundWithFragmentOperation**

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to [Arguments of SurroundWithFragmentOperation](#) on page 1157.

- **SurroundWithTextOperation**

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header** - The text that is placed before the selection.
- **footer** - The text that is placed after the selection.

- **TogglePseudoClassOperation**

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

- **name** - Name of the pseudo-class to be toggled on/off.
- **elementLocation** - The XPath location that identifies one or more elements for which the pseudo class will be toggled. Leave it empty for the current element.

**Example:**

```
paragraph:myClass{
 color:red;
}
paragraph{
 color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that we have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered paragraph element.

- **ToggleSurroundWithElementOperation**

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

- **element** - The element to wrap or unwrap content.
- **schemaAware** - This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the `paragraph` instead, since it would be valid at that position.

- **UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is

- **unwrapElementLocation** - An XPath expression indicating the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

- **XQueryUpdateOperation**

Allows you to execute an XQuery Update script directly over content in **Author** mode.

**Notice:** This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author Component.

It has one argument:

- **script**

The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the \${framework} or \${frameworkDir} editor variables to refer the scripts from the framework directory.

The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

```
declare variable $oxyxq:selection external;
```

An example of an XQuery Update Script that converts paragraphs to list items:

```
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";
(: This variable will be linked to the selected nodes assuming that there are
actually fully selected nodes. For example this selection will return null:
<p>{SEL_START}text{SEL_END}</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.
:)
declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
 (.)
else
 ($oxyxq:selection)

returnif (not(empty($toProcess))) then
(
 (: Create the list :)
 let $ul :=

 {
 for $sel in $toProcess
 return
 {$sel}
 }

 return
 (
 (: Delete the processed nodes :)
 for $sel in $toProcess
 return
 delete node $sel,
 (: Inserts the constructed list :)
 insert node $ul
 before $toProcess[1]
)
)
else
()
```

- **XSLT0peration and XQueryOperation**

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

**Notice:** For the Oxygen XML Web Author Component, these operations cannot be invoked using the [JavaScript API](#).

These operations have the following parameters:

- **sourceLocation**

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations in which you want to look at an ancestor of the current element and take decisions in the script based on this. To do this, you can set the sourceLocation to point to an ancestor node then declare a parameter called `currentElementLocation` in your script and use it to re-position in the current element, as in the following example:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
 xpath-default-namespace="http://docbook.org/ns/docbook"
```

```

xmlns:saxon="http://saxon.sf.net/" exclude-result-prefixes="saxon">
 <!-- This is an XPath location to be sent by the operation to the script -->
 <xsl:param name="currentElementLocation"/>

 <xsl:template match="/">
 <!-- Evaluate the XPath of the current element location -->
 <xsl:apply-templates
 select="saxon:eval(saxon:expression($currentElementLocation))"/>
 </xsl:template>

 <xsl:template match="para">
 <!-- And the context is again inside the current element,
 but we can use information from the entire XML -->
 <xsl:variable
 name="keyImage" select="//imagedata[@fileref='images/lake.jpeg']
 /ancestor::inlinemediaobject[@xml:id/string()"/>
 <xref linkend="{{$keyImage}}" role="key_include"
 xmlns="http://docbook.org/ns/docbook">
 <xsl:value-of
 select="$currentElementLocation"></xsl:value-of>
 </xref>
 </xsl:template>
 </xsl:stylesheet>

```

- **targetLocation**

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

- **script**

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported `xslt_operation.xsl` needs to be located in the current framework directory.

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 version="1.0">
 <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>

```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The  `${framework}`  editor variable can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, `http://www.oxygenxml.com/fr/testy.xsl`) and map it in the `catalog.xml` file from the framework directory to a resource from the framework.

- **action**

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

- **caretPosition**

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the  `${caret}`  editor variable in the inserted content.

- **expandEditorVariables**

Parameter controlling the expansion of editor variables returned by the script processing. Expansion is enabled by default.

## Editor Variables in Author Mode Operations

**Author** mode operations can include parameters that contain the following editor variables:

- `${caret}`  - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${selection}`  - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

- `${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}`
  - To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:
  - 'message' - The displayed message. Note the quotes that enclose the message.
  - type - Optional parameter, with one of the following values:

**Note:** The title of the dialog box will be determined by the type of parameter and as follows:

- For `url` and `url_relative` parameters, the title will be the name of the parameter and the value of the 'message'.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Parameter	
url	<p><b>Format:</b> <code> \${ask('message', url, 'default_value')}</code></p> <p><b>Description:</b> Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Input URL', url)}</code> - The displayed dialog box has the name Input URL. The expected input type is URL.</li> <li>• <code> \${ask('Input URL', url, 'http://www.example.com')}</code> <ul style="list-style-type: none"> <li>- The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value <code>http://www.example.com</code>.</li> </ul> </li> </ul>
password	<p><b>Format:</b> <code> \${ask('message', password, 'default')}</code></p> <p><b>Description:</b> The input is hidden with bullet characters.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Input password', password)}</code> - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.</li> <li>• <code> \${ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.</li> </ul>
generic	<p><b>Format:</b> <code> \${ask('message', generic, 'default')}</code></p> <p><b>Description:</b> The input is considered to be generic text that requires no special handling.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Hello world!')}</code> - The dialog box has a Hello world! message displayed.</li> <li>• <code> \${ask('Hello world!', generic, 'Hello again!')}</code> - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.</li> </ul>
relative_url	<p><b>Format:</b> <code> \${ask('message', relative_url, 'default')}</code></p> <p><b>Description:</b> Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.</p> <p><b>Note:</b> If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.</p>

Parameter	
	<p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('File location', relative_url, 'C:/example.txt')}</code> - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.</li> </ul>
combobox	<p><b>Format:</b> <code> \${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).</p> <p><b>Note:</b> The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.</li> </ul> <p><b>Note:</b> In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}</code></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}</code></li> </ul>
editable_combobox	<p><b>Format:</b> <code> \${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p><b>Description:</b> Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</p> <p><b>Note:</b> The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</li> </ul>
radio	<p><b>Format:</b> <code> \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p>

Parameter	
	<p><b>Description:</b> Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated 'real_value'.</p> <p><b>Note:</b> The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p><b>Example:</b></p> <ul style="list-style-type: none"> <li>• <code> \${ask('Operating System', radio, ('win':'Microsoft Windows'; 'osx':'Mac OS X'; 'lnx':'Linux/UNIX'), 'osx') } </code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</li> </ul> <p><b>Note:</b> In this example Mac OS X is the default selected value and if selected it would return osx for the output.</p>

- 'default-value' - optional parameter. Provides a default value.
- `${timeStamp}`  - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- `${uuid}`  - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java [UUID](#) class.
- `${id}`  - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `${cfn}`  - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- `${cfne}`  - Current file name with extension. The current file is the one currently opened and selected.
- `${cf}`  - Current file as file path, that is the absolute file path of the current edited document.
- `${cfdf}`  - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- `${frameworksDir}`  - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${pd}`  - The file path for the parent folder of the current project selected in the **Project** view.
- `${oxygenInstallDir}`  - Oxygen XML Editor installation folder as file path.
- `${homeDir}`  - The path (as file path) of the user home folder.
- `${pn}`  - Current project name.
- `${env(VAR_NAME)}`  - Value of the VAR\_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the  `${system(var.name)}`  editor variable.
- `${system(var.name)}`  - Value of the var.name Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the  `${env(VAR_NAME)}`  editor variable instead.
- `${date(pattern)}`  - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:**  `yyyy-MM-dd` ;

**Note:** This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about xs:datetime, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

[Arguments of InsertFragmentOperation Operation](#)

[Arguments of SurroundWithFragmentOperation](#)

Arguments of InsertFragmentOperation Operation

## fragment

This argument has a textual value. This value is parsed by Oxygen XML Editor as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

### 1. Prefixes that are not bound explicitly

For instance, the fragment:

```
<x:item id="dty2" />
&ent;
<x:item id="dty3" />
```

Can be correctly inserted in the document: ('|' marks the insertion point):

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [
 <!ENTITY ent "entity">
]>
<x:root xmlns:x="nsp">
|
</x:root>
```

Result:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [
 <!ENTITY ent "entity">
]>
<x:root xmlns:x="nsp">
 <x:item id="dty2" />
 &ent;
 <x:item id="dty3" />
</x:root>
```

### 2. Default namespaces

If there is a default namespace declared in the document and the document fragment does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

For instance, the fragment:

```
<item id="dty2" />
<item id="dty3" />
```

Inserted in the document:

```
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
|
</root>
```

Gives the result document:

```
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
 <item xmlns="" id="dty2" />
 <item xmlns="" id="dty3" />
</root>
```

## insertLocation

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

## **insertPosition**

Specifies where the insertion is made relative to the reference node selected by the `insertLocation`. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

## **goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `cursorEditor` variable. The possible values of this action are **true** and **false**.

## **schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

## Arguments of `SurroundWithFragmentOperation`

The **Author** mode operation `SurroundWithFragmentOperation` has only one argument:

- `fragment`

The XML fragment that will surround the selection. For example, consider the fragment:

```
<F>
 <A>

 <C></C>

</F>
```

and the document:

```
<doc>
 <X></X>
 <Y></Y>
 <Z></Z>
<doc>
```

Considering the selected content to be surrounded is the sequence of elements X and Y, then the result is:

```
<doc>
 <F>
 <A>
 <X></X>
 <Y></Y>

 <C></C>

 </F>
 <Z></Z>
<doc>
```

Since the element A was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

## *Add a Custom Operation to an Existing Framework*

This task explains how to add a custom **Author** mode operation to an existing document type.

1. Setup a sample project by following the [instructions for installing the SDK](#). The framework project is oxygen-sample-framework.

2. A number of classes in the `simple.documentation.framework.operations` package implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java jar library.
4. Copy the jar library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. Open the **Preferences dialog box (Options > Preferences)**, go to **Document Type Association**, and edit the document type (you need write access to the `[OXYGEN_INSTALL_DIR]`) to open the **Document Type configuration dialog box**.
  - a) In the **Classpath** tab, add a new entry similar to:  `${framework}/customAction.jar`.
  - b) In the **Author** tab, add a new action that uses your custom operation.
  - c) Mount the action to the toolbars or menus.
6. Share the modifications with your colleagues. The files that should be shared are your `customAction.jar` library and the `.framework` configuration file from the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.

#### Related information

##### *Adding Retina/HiDPI Icons in a Framework*

Higher resolution icons can also be included in customized frameworks for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type customization (from the **Action dialog box** or from an API (`ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer`)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include @2x in the name (for example, `myIcon@2x.png`).

Developers should not specify the path of the alternate icons (@2x or @3x) in the **Action dialog box** or the **XML NodeRendererCustomizer API**. When using a Retina or HiDPI display, Oxygen XML Editor automatically searches the folder of the *normal* icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the *normal* icon is scaled and used instead.

#### Java API - Extending Author Functionality through Java

Oxygen XML Editor **Author** mode has a built-in set of operations covering the insertion of text and XML fragments (see the **Author Default Operations**) and the execution of XPath expressions on the current document edited in **Author** mode. However, there are situations in which you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor **Author** mode functionality through Java, you will need the **Oxygen SDK** available [on the Oxygen XML Editor website](#). It includes the source code of the **Author** mode operations in the predefined document types and the full documentation (in Javadoc format) of the public API available for **Author** mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

 **Attention:** Make sure the Java classes of your custom **Author** mode operations are compiled with the same Java version used by Oxygen XML Editor. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Editor with a Java 1.6 virtual machine but the Java

classes of your custom **Author** mode operations are compiled with a Java 1.7 virtual machine then the custom operations cannot be loaded and used by the Java 1.6 virtual machine.

## Related information

### Example 1- Simple Use of a Dialog Box from an Author Mode Operation

In this example, we start adding functionality for inserting images in the **Simple Documentation Framework**. The images are represented by the `image` element. The location of the image file is represented by the value of the `href` attribute. In the Java implementation, a dialog box will be displayed with a text field, in which the user can enter a full URL or browse for a local file.

1. Setup a sample project following [this set of instructions](#). The framework project is **oxygen-sample-framework**.
2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this methods can be one of the following combinations:
  - an object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map
  - argument names and values
- The `getArguments` method is used by Oxygen XML Editor when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
- The `getDescription` method is used by Oxygen XML Editor when the operation is configured. It returns a description of the operation.

Here is the implementation of these three methods:

```
/**
 * Performs the operation.
 */
public void doOperation(
 AuthorAccess authorAccess,
 ArgumentsMap arguments)
throws IllegalArgumentException,
 AuthorOperationException {

 JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame()
 ;
 String href = displayURLDialog(oxygenFrame);
 if (href.length() != 0) {
 // Creates the image XML fragment.
 String imageFragment =
 "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='"
 + href + "'/>";

 // Inserts this fragment at the cursor position.
 int caretPosition = authorAccess.getEditorAccess().getCareOffset();
 authorAccess.getDocumentController().insertXMLFragment
(imageFragment, caretPosition);
 }
}

/**
 * Has no arguments.
 *
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
 return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
 return "Inserts an image element. Asks the user for a URL reference.";
}
```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

**Important:**

Make sure you always specify the namespace of the inserted fragments.

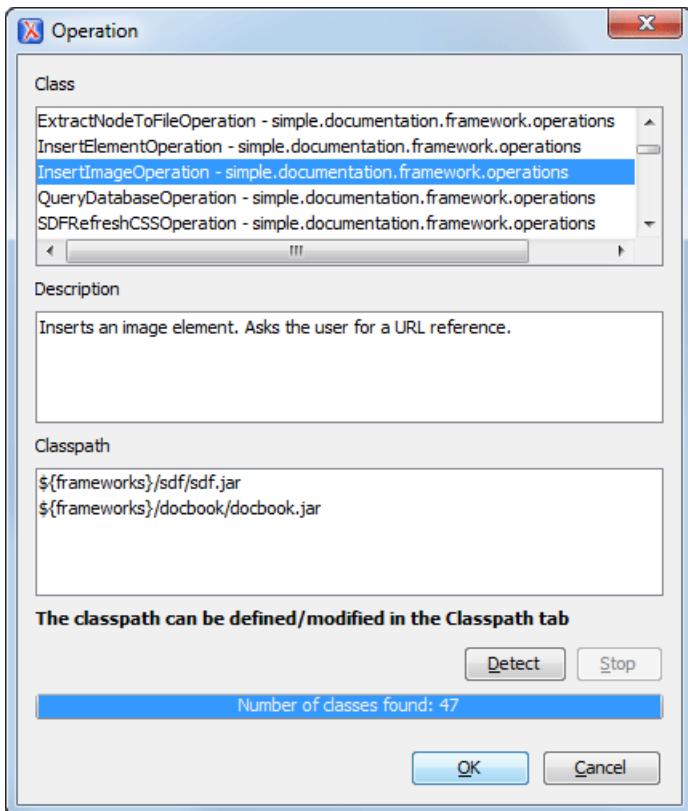

```
<image xmlns='http://www.oxygenxml.com/sample/documentation'
 href='path/to/image.png' />
```

3. Package the compiled class into a jar file. An example of an Ant script that packages the classes folder content into a jar archive named sdf.jar is listed below:

```
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
 <target name="dist">
 <jar destfile="sdf.jar" basedir="classes">
 <fileset dir="classes">
 <include name="**/*" />
 </fileset>
 </jar>
 </target>
</project>
```

4. Copy the sdf.jar file into the frameworks/sdf folder.
5. Add the sdf.jar to the class path. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, select **SDF**, and press the **Edit** button.
6. Select the **Classpath** tab in the lower part of the [Document Type configuration dialog box](#) and press the **+ Add** button. In the displayed dialog box, enter the location of the jar file, relative to the Oxygen XML Editor frameworks folder.
7. We now create the action that will use the defined operation. Go to the **Actions** subtab. Copy the icon files for the menu item and for the toolbar in the frameworks/sdf folder.
8. Define the action's properties:
  - Set **ID** to **insert\_image**.
  - Set **Name** to **Insert image**.
  - Set **Menu access key** to letter i.
  - Set **Toolbar action** to \${framework}/toolbarImage.png.
  - Set **Menu icon** to \${framework}/menuImage.png.
  - Set **Shortcut key** to **Ctrl (Meta on Mac OS)+Shift+i**.
9. Next, we set up the operation. You want to add images only if the current element is a section, book or article.
  - Set the value of **XPath expression** to

```
local-name()='section' or local-name()='book'
or local-name()='article'
```
  - Set the **Invoke operation** field to simple.documentation.framework.InsertImageOperation.

**Figure 557: Selecting the Operation**

#### 10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, you can open the [sdf\\_sample.xml](#) sample, then place the cursor inside a section between two para elements (for instance). Press the button associated with the action from the toolbar. In the dialog box, select an image URL and press **OK**. The image is inserted into the document.

#### *Example 2- Operations with Arguments. Report from Database Operation*

In this example you will create an operation that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the *database connection string*, the *user name*, the *password* and the *SQL expression*.

1. Setup a sample project following [this set of instructions](#). The framework project is **oxygen-sample-framework**.
2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implements the [`ro.sync.ecss.extensions.api.AuthorOperation`](#) interface.

```
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation{
```

3. Now define the operation's arguments. For each of them you will use a String constant representing the argument name:

```
private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";
```

4. You must describe each of the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

```

public ArgumentDescriptor[] getArguments() {
 ArgumentDescriptor args[] = new ArgumentDescriptor[] {
 new ArgumentDescriptor(
 ARG_JDBC_DRIVER,
 ArgumentDescriptor.TYPE_STRING,
 "The name of the Java class that is the JDBC driver."),
 new ArgumentDescriptor(
 ARG_CONNECTION,
 ArgumentDescriptor.TYPE_STRING,
 "The database URL connection string."),
 new ArgumentDescriptor(
 ARG_USER,
 ArgumentDescriptor.TYPE_STRING,
 "The name of the database user."),
 new ArgumentDescriptor(
 ARG_PASSWORD,
 ArgumentDescriptor.TYPE_STRING,
 "The database password."),
 new ArgumentDescriptor(
 ARG_SQL,
 ArgumentDescriptor.TYPE_STRING,
 "The SQL statement to be executed.")
 };
 return args;
}

```

These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

5. When the operation is invoked, the implementation of the doOperation method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```

public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
 throws IllegalArgumentException, AuthorOperationException {

 // Collects the arguments.
 String jdbcDriver =
 (String)map.getArgumentValue(ARG_JDBC_DRIVER);
 String connection =
 (String)map.getArgumentValue(ARG_CONNECTION);
 String user =
 (String)map.getArgumentValue(ARG_USER);
 String password =
 (String)map.getArgumentValue(ARG_PASSWORD);
 String sql =
 (String)map.getArgumentValue(ARG_SQL);

 int caretPosition = authorAccess.getCaretOffset();
 try {
 authorAccess.getDocumentController().insertXMLFragment(
 getFragment(jdbcDriver, connection, user, password, sql),
 caretPosition);
 } catch (SQLException e) {
 throw new AuthorOperationException(
 "The operation failed due to the following database error: "
 + e.getMessage(), e);
 } catch (ClassNotFoundException e) {
 throw new AuthorOperationException(
 "The JDBC database driver was not found. Tried to load '"
 + jdbcDriver + "'", e);
 }
}

```

6. The getFragment method loads the JDBC driver, connects to the database and extracts the data. The result is a table element from the <http://www.oxygenxml.com/sample/documentation> namespace. The header element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '&lt;' and '&amp;' character entities to ensure the fragment is well-formed.

```

private String getFragment(
 String jdbcDriver,
 String connectionURL,
 String user,
 String password,
 String sql) throws
 SQLException,
 ClassNotFoundException {

 Properties pr = new Properties();
 pr.put("characterEncoding", "UTF8");
 pr.put("useUnicode", "TRUE");
 pr.put("user", user);
 pr.put("password", password);
}

```

```

// Loads the database driver.
Class.forName(jdbcDriver);
// Opens the connection
Connection connection =
 DriverManager.getConnection(connectionURL, pr);
java.sql.Statement statement =
 connection.createStatement();
ResultSet resultSet =
 statement.executeQuery(sql);

StringBuffer fragmentBuffer = new StringBuffer();
fragmentBuffer.append(
 "<table xmlns=" +
 "http://www.oxygenxml.com/sample/documentation'>");

//
// Creates the table header.
//
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
 fragmentBuffer.append("<td>");
 fragmentBuffer.append(
 xmlEscape(metaData.getColumnName(i)));
 fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
 fragmentBuffer.append("<tr>");
 for (int i = 1; i <= columnCount; i++) {
 fragmentBuffer.append("<td>");
 fragmentBuffer.append(
 xmlEscape(resultSet.getObject(i)));
 fragmentBuffer.append("</td>");
 }
 fragmentBuffer.append("</tr>");
}
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();
}

```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

7. Package the compiled class into a jar file.
8. Copy the jar file and the JDBC driver files into the frameworks/sdf directory.
9. Add the jars to the class path. To do this, open the [Document Type Association preferences page](#), select **SDF** and press the **Edit** button. Select the **Classpath** tab in the lower part of the [Document Type configuration dialog box](#) and press the  **Add** button . In the displayed dialog box, enter the location of the jar file, relative to the Oxygen XML Editor frameworks folder.
10. Go to the **Actions** subtab. The action properties are:
  - Set **ID** to **clients\_report**.
  - Set **Name** to **Clients Report**.
  - Set **Menu access key** to letter **r**.
  - Set **Description** to **Connects to the database and collects the list of clients**.
  - Set **Toolbar icon** to **TableDB20.png** (image  TableDB20.png is already stored in the frameworks / sdf folder).
  - Leave empty the **Menu icon**.
  - Set **shortcut key** to **Ctrl + Shift + C (Command + Shift + C on OS X)**.
11. The action will work only if the current element is a **section**. Set up the operation as follows:
  - Set **XPath expression** to:
 

```
local-name()='section'
```

- Use the Java operation defined earlier to set the **Invoke operation** field. Press the **Choose** button, then select `simple.documentation.framework.QueryDatabaseOperation`. Once selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax :`jdbc://<database_host>:<database_port>/<database_name>`.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

#### 12. Add the action to the toolbar, using the **Toolbar** panel.

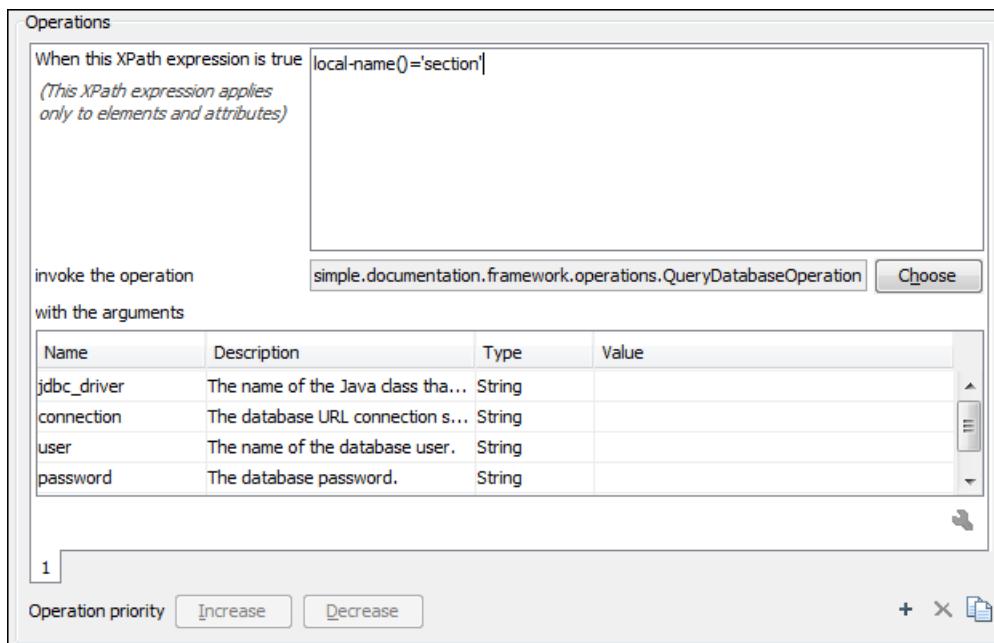

Figure 558: Java Operation Arguments Setup

To test the action, you can open the `sdf_sample.xml` sample and place the cursor inside a section between two para elements (for instance). Press the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

The screenshot shows the XML document editor with the following table content:

userID	Connects to the database and collects the list of client
204473	michael@test-oxy.ro
204477	mary@test-oxy.ro
204478	adrian@test-oxy.ro
204479	will@test-oxy.ro

Figure 559: Table Content Extracted from the Database

## Localizing Frameworks

Oxygen XML Editor supports framework localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Editor in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```
<translation>
 <languageList>
 <language description="English" lang="en_US"/>
 <language description="German" lang="de_DE"/>
 <language description="French" lang="fr_FR"/>
 </languageList>
 <key value="list">
 <comment>List menu item name.</comment>
 <val lang="en_US">List</val>
 <val lang="de_DE">Liste</val>
 <val lang="fr_FR">Liste</val>
 </key>

</translation>
```

Oxygen XML Editor matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `languageList` tag for the corresponding framework is used.

Add the directory where this file is located to the **Classpath** list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Framework actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Use the **New** or **Edit** button to open the [Document type configuration dialog box](#), go to **Author > Actions**, and rename the bold action to  `${i18n(translation_key)}`. Actions with a name format other than  `${i18n(translation_key)}` are not localized. `Translation_key` corresponds to the key from the `translation.xml` file.

Now open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the `translation.xml` file:

```
<key value="translation_key">
 <comment>Bold action name.</comment>
 <val lang="en_US">Bold</val>
 <val lang="de_DE">Bold</val>
 <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the `translation.xml` file in the Java code used by your custom framework, use the new `ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()` API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```
title:before{
 content: "${i18n(title.key)} : ";
```

**Note:** You can enter any language you want in the `languageList` tag and any number of keys.

The `translation.xml` file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the **Classpath** list corresponding to the DocBook document type the following entry was added:  `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association > Author > Actions**. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the [Oxygen SDK](#) Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

## Packing and Deploying Plugins or Frameworks as Add-ons

### Packing a Plugin or Framework as an Add-on

This procedure is suitable for developers who want a better control over the add-on package or those who want to automate some of the steps:

1. Pack the plugin or framework as a ZIP file or a Java Archive. Note that you should pack the entire root directory not just its contents.
2. Digitally sign the package. Note that you can perform this step only if you have created a at the previous step. You will need a certificate signed by a trusted authority. To sign the jar you can either use the `jarsigner` command line tool inside Oracle's Java Development Kit. (`[JDK_DIR]/bin/jarsigner.exe`) or, if you are working with Apache Ant, you can use the `signjar` task (a front for the `jarsigner` command line tool).  
**Note:** The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the `keytool` command line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.
3. Create a descriptor file. You can use a template that Oxygen XML Editor provides. To use this template, go to **File > New** and select the **Oxygen add-ons update site** template. Once deployed, this descriptor file is referenced as *update site*.

Alternatively, you can use the **Add-ons Packager** plugin by following this procedure:

1. Install the **Add-ons Packager** plugin from <https://www.oxygenxml.com/InstData/Addons/optional/updateSite.xml> as described in the [Installing Add-ons procedure](#).
2. Restart Oxygen XML Editor. If the add-on is correctly installed, the **Add-ons packager** toolbar action is available.
3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.
4. Press **OK** to complete the packaging process.

### Deploying an Add-on

To deploy an add-on, copy the ZIP/ file and the descriptor file to an HTTP server. The URL to this location serves as the *Update Site URL*.

### Creating the Basic Association

Let us go through an example of creating a custom document type (framework) and editing an XML document of this type. We will call our document type **Simple Documentation Framework**.

#### First Step - XML Schema

Our sample custom framework is very simple. The documents are either articles or books, both composed of sections. The sections may contain titles, paragraphs, figures, tables, and other sections. To complete the picture, each section includes a def element from another namespace.

The first schema file:

```
<?xml version="1.0" encoding="UTF-8"?>
```

```

<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
 targetNamespace="http://www.oxygenxml.com/sample/documentation"
 xmlns:doc="http://www.oxygenxml.com/sample/documentation"
 xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
 elementFormDefault="qualified">

 <xs:import namespace=
 "http://www.oxygenxml.com/sample/documentation/abstracts"
 schemaLocation=
 "abs.xsd"/>

```

The namespace of the documents will be <http://www.oxygenxml.com/sample/documentation>. The namespace of the def element is <http://www.oxygenxml.com/sample/documentation/abstracts>.

Next, we define the structure of the sections. They all start with a title, then have the optional def element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```

<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
 <xs:sequence>
 <xs:element name="title" type="xs:string"/>
 <xs:element ref="abs:def" minOccurs="0"/>
 <xs:choice>
 <xs:sequence>
 <xs:element ref="doc:section" maxOccurs="unbounded"/>
 </xs:sequence>
 <xs:choice maxOccurs="unbounded">
 <xs:element ref="doc:para"/>
 <xs:element ref="doc:image"/>
 <xs:element ref="doc:table"/>
 </xs:choice>
 </xs:choice>
 </xs:sequence>
</xs:complexType>

```

The paragraph contains text and other styling markup, such as bold (b) and italic (i) elements.

```

<xs:element name="para" type="doc:paragraphType"/>

<xs:complexType name="paragraphType" mixed="true">
 <xs:choice minOccurs="0" maxOccurs="unbounded">
 <xs:element name="b"/>
 <xs:element name="i"/>
 </xs:choice>
</xs:complexType>

```

The image element has an attribute with a reference to the file containing image data.

```

<xs:element name="image">
 <xs:complexType>
 <xs:attribute name="href" type="xs:anyURI" use="required"/>
 </xs:complexType>
</xs:element>

```

The table contains a header row and then a sequence of rows (tr elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```

<xs:element name="table">
 <xs:complexType>
 <xs:sequence>
 <xs:element name="header">
 <xs:complexType>
 <xs:sequence>
 <xs:element name="td" maxOccurs="unbounded"
 type="doc:paragraphType"/>
 </xs:sequence>
 </xs:complexType>
 </xs:element>
 <xs:element name="tr" maxOccurs="unbounded">
 <xs:complexType>
 <xs:sequence>
 <xs:element name="td" type="doc:tdType"
 maxOccurs="unbounded"/>
 </xs:sequence>
 </xs:complexType>
 </xs:element>
 <xs:sequence>
 <xs:element name="td" type="doc:tdType"
 maxOccurs="unbounded"/>
 </xs:sequence>
 </xs:complexType>
 </xs:element>
</xs:complexType>

```

```
<xs:complexType name="tdType">
```

```

<xs:complexContent>
 <xs:extension base="doc:paragraphType">
 <xs:attribute name="row_span" type="xs:integer"/>
 <xs:attribute name="column_span" type="xs:integer"/>
 </xs:extension>
</xs:complexContent>
</xs:complexType>

```

The def element is defined as a text only element in the imported schema abs .xsd:

```

<?xml version="1.0" encoding="UTF-8"?>
<xss:schema xmlns:xss="http://www.w3.org/2001/XMLSchema"
 targetNamespace=
 "http://www.oxygenxml.com/sample/documentation/abstracts">
 <xss:element name="def" type="xss:string"/>
</xss:schema>

```

Now the XML data structure will be styled.

### Schema Settings

In the bottom section of the [Document Type configuration dialog box](#), there are a series of tabs. The first one refers to the schema that is used for validation of the documents that match the defined **Association Rules**.

**Important:** If the document refers a schema using a DOCTYPE declaration or a xsi:schemaLocation attribute, the schema from the document type association will not be used when validating.

### Schema Type

Select from the combo box the value **XML Schema**.

### Schema URI

Enter the value of the schema location (for example, \${frameworks}/sdf/schema/sdf .xsd). Use the \${frameworks} editor variable in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor installations.

**Important:** The \${frameworks} variable is expanded at the validation time into the absolute location of the directory containing the frameworks.

### Second Step - CSS

If you read the [Simple Customization Tutorial](#) then you already have some basic notions about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the **Author** mode layout engine) to associate specific properties with that element.

### Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```

/* Vertical flow */
book,
section,
para,
title,
image,
ref {
 display:block;
}

/* Horizontal flow */
b,i {
 display:inline;
}

```

**Important:** Having block display children in an inline display parent results in Oxygen XML Editor changing the style of the parent to block display.

## Styling the section Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The \* operator matches any element, it can be used to match titles having progressive depths in the document.

```
title{
 font-size: 2.4em;
 font-weight:bold;
}
* * title{
 font-size: 2.0em;
}
* * * title{
 font-size: 1.6em;
}
* * * * title{
 font-size: 1.2em;
}
```

It's useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo elements will be used, plus the CSS counters.

First declare a counter named sect for each book or article. The counter is set to zero at the beginning of each such element:

```
book,
article{
 counter-reset:sect;
}
```

The sect counter is incremented with each section, that is a direct child of a book or an article element.

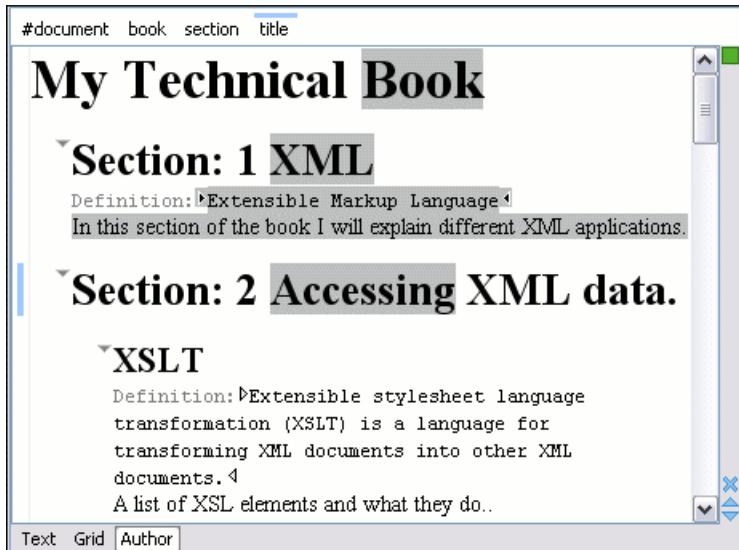

```
book > section,
article > section{
 counter-increment:sect;
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the sect counter and a dot.

```
book > section > title:before,
article > section > title:before{
 content: "Section " counter(sect) ". ";
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```
section{
 margin-left:1em;
 margin-top:1em;
}
```

**Figure 560: A sample of nested sections and their titles.**

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

### Styling the Inline Elements

The "bold" style is obtained by using the `font-weight:bold` CSS property, while the "italic" style is specified by the `font-style:italic` property:

```
b { font-weight:bold;
}
i { font-style:italic;
}
```

### Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor.

```
image{
 display:block;
 content: attr(href, url);
 margin-left:2em;
}
```

Our `image` element has the required attribute `href` of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor handles both absolute and relative specified URLs. If the image has an *absolute* URL location (for example: "[http://www.oasis-open.org/images/standards/oasis\\_standard.jpg](http://www.oasis-open.org/images/standards/oasis_standard.jpg)") then it is loaded directly from this location. If the image URL is *relative* specified to the XML document (for example: "images/my\_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity **graphic** that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

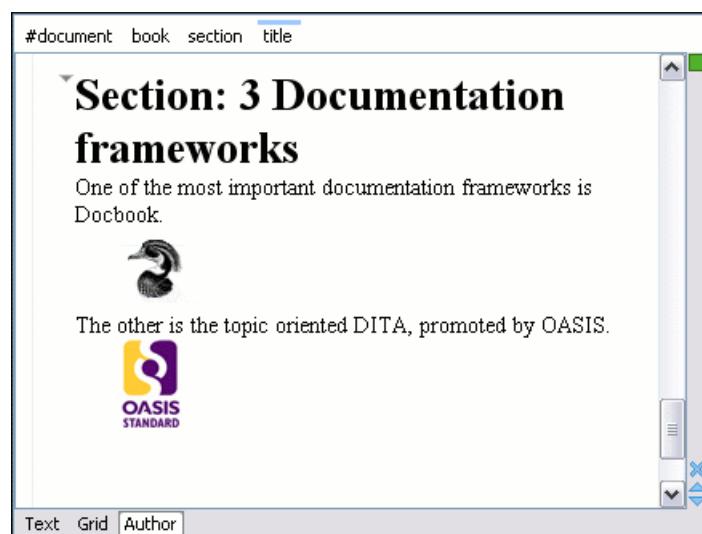

```
<mediaobject>
 <imageobject>
 <imagedata entityref="graphic" scale="50"/>
 </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the **Author** mode:

```
imagedata[entityref]{
 content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
 width:attr(width, length);
}
```

**Figure 561: Samples of images in Author**

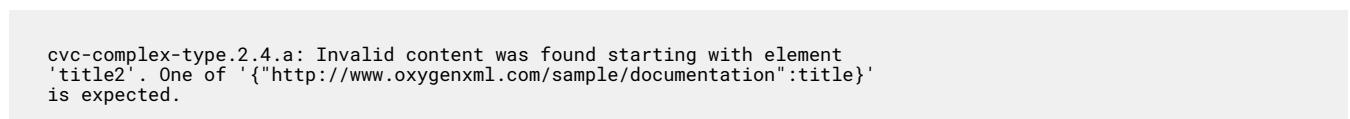

### Testing the Document Type Association

To test the new Document Type create an XML instance that is conforming with the *Simple Documentation Framework* association rules. You will not specify an XML Schema location directly in the document, using an `xsi:schemaLocation` attribute; Oxygen XML Editor will detect instead its associated document type and use the specified schema.

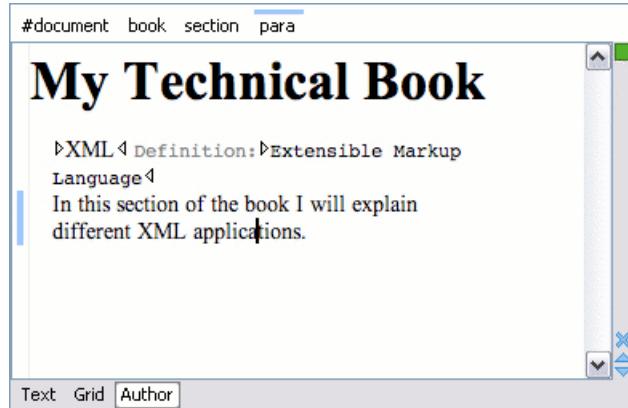

```
<book xmlns="http://www.oxygenxml.com/sample/documentation"
 xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">

 <title>My Technical Book</title>
 <section>
 <title>XML</title>
 <abs:def>Extensible Markup Language</abs:def>
 <para>In this section of the book I will
 explain different XML applications.</para>
 </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be one error:

Undo the tag name change. Press on the **Author** button at the bottom of the editing area. Oxygen XML Editor should load the CSS from the document type association and create a layout similar to this:

**Figure 562: Example: Document Type Association**

### Organizing the Framework Files

First, create a new folder called sdf (for "Simple Documentation Framework") in `[OXYGEN_INSTALL_DIR]/frameworks`. This folder will be used to store all files related to the documentation framework. The following folder structure will be created:

```
oxygen
 frameworks
 sdf
 schema
 css
```

The frameworks directory is the container where all the Oxygen XML Editor framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Editor by running the provided start-up script files.

You should copy the created schema files `abs.xsd` and `sdf.xsd`, `sdf.xsd` being the master schema, to the schema directory and the CSS file `sdf.css` to the css directory.

### Packaging and Deploying

Using a file explorer, go to the Oxygen XML Editor `[OXYGEN_INSTALL_DIR]/frameworks` directory. Select the `sdf` directory and make an archive from it. Move it to another Oxygen XML Editor installation (eventually on another computer). Extract it in the `[OXYGEN_INSTALL_DIR]/frameworks` directory. Start Oxygen XML Editor and test the association as explained above.

When deploying your customized `sdf` directory, make sure that your `sdf` directory contains the `sdf.framework` file (that is the file defined as External Storage in the [Document Type Association preferences page](#) shall always be stored inside the `sdf` directory). If your external storage points somewhere else Oxygen XML Editor will not be able to update the Document Type Association options automatically on the deployed computers.

## Configuring New File Templates

Describes how to create a set of document templates that the content authors will use as a starting point for creating books and articles.

Each Document Type Association can point to a directory, usually named **templates**, that contains the file templates. All files found here are considered templates for the respective document type. The template name is taken from the file name, and the template type is detected from the file extension.

1. Go to your custom framework directory (`[OXYGEN_INSTALL_DIR]\frameworks\[\CUSTOM_FRAMEWORK_DIR]`) and create a directory named **templates**.

The directory tree of the documentation framework should be something like this:

```
[OXYGEN_INSTALL_DIR]
 frameworks
 [\CUSTOM_FRAMEWORK_DIR]
 schema
 css
 templates
```

2. In the **templates** directory, create two files. A file for the *book* template and another one for the *article* template.

An example for the *Book.xml* file:

```
<?xml version="1.0" encoding="UTF-8"?>
<book xmlns="http://www.oxygenxml.com/sample/documentation"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
 <title>Book Template Title</title>
 <section>
 <title>Section Title</title>
 <abs:def/>
 <para>This content is copyrighted:</para>
 <table>
 <header>
 <td>Company</td>
 <td>Date</td>
 </header>
 <tr>
 <td/>
 <td/>
 </tr>
 </table>
 </section>
</book>
```

An example for the *Article.xml* file:

```
<?xml version="1.0" encoding="UTF-8"?>
<article
 xmlns="http://www.oxygenxml.com/sample/documentation"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
 <title></title>
 <section>
 <title></title>
 <para></para>
 <para></para>
 </section>
</article>
```

You can also use **editor variables** in the content of the template files and they will be expanded when the files are opened.

**Note:** You should avoid using the  `${cfid}`, `${cf}`, `${currentFileURL}`, and  `${cfdu}` editor variables when you save your documents in a data base.

3. Open the **Document Type configuration dialog box** for your custom framework and click the **Templates** tab. In the **Templates directory** text field, introduce the  `${frameworkDir}/templates` path. It is recommended that all the file references made from a Document Type Association to be relative to the  `${frameworkDir}` directory. Binding a Document Type Association to an absolute file (e. g.: `C:\some_dir\templates`) makes the association difficult to share between users.
4. To test the templates settings, go to **File > New** to display the **New** document dialog box. You should see the new templates in the folder for your custom framework (in the **Framework templates** section). The names of the two templates are prefixed with the name of the framework. Selecting one of them should create a new XML file with the content specified in the template file.

## Related information

[Editor Variables](#) on page 164

[Custom Editor Variables](#) on page 169

## Configuring XML Catalogs

In the XML sample file for **SDF** you did not use a xsi:schemaLocation attribute, but instead you let the editor use the schema from the association. However, there are cases in which you must reference the location of a schema file from a remote web location and an Internet connection may not be available. In such cases an XML catalog may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalogs, by modifying our sdf .xsd XML Schema file from the [Example Files Listings](#).

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

Create a new XML file called catalog.xml and save it into the `[OXYGEN_INSTALL_DIR]/frameworks/sdf` directory. The content of the file should be:

```
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:catalog">
 <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
 uri="schema/abs.xsd"/>
 <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
 uri="schema/abs.xsd"/>
</catalog>
```

2. Add catalog files to your Document Type Association using the **Catalogs tab** from the [Document Type configuration dialog box](#).

To test the catalog settings, restart Oxygen XML Editor and try to validate a new sample custom framework document. There should be no errors.

The sdf .xsd schema that validates the document refers the other file abs .xsd through an import element:

```
<xsi:import namespace=
 "http://www.oxygenxml.com/sample/documentation/abstracts"
 schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd" />
```

The schemaLocation attribute references the abs .xsd file:

```
xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
 http://www.oxygenxml.com/SDF/abs.xsd" />
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to `http://www.oxygenxml.com/SDF/abs.xsd` must be resolved to the abs .xsd file located in the schema directory. The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

## Configuring Transformation Scenarios for a Framework

When distributing a framework to the users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. Being contained in the **Document Type Association**, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

1. Create an xsl folder inside the frameworks/sdf folder.

The folder structure for the documentation framework should be:

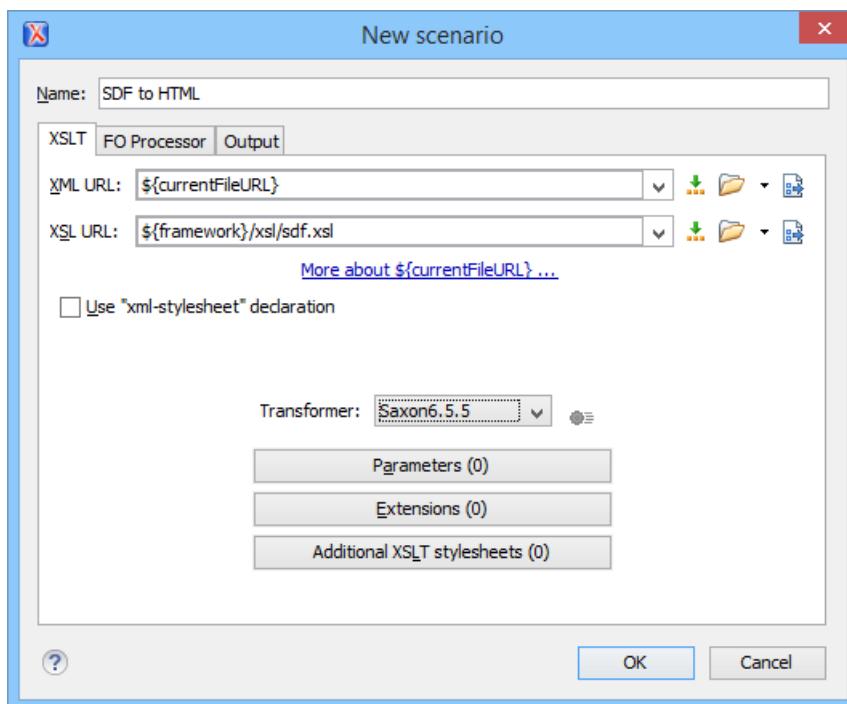

```
oxygen
 frameworks
```

```

sdf
 schema
 css
 templates
 xs1

```

2. Create the sdf.xsl file in the xs1 folder. The complete content of the sdf.xsl file is found in the [Example Files Listings](#).
3. Open the **Preferences dialog box (Options > Preferences)** and go to **Document Type Associations**. Open the **Document Type** dialog for the **SDF** framework then choose the **Transformation** tab. Click the **+ New** button and choose the appropriate type of transformation (for example, **XML transformation with XSLT**).  
In the **New scenario** dialog box, fill in the following fields:
  - Fill in the **Name** field with **SDF to HTML**. This will be the name of your transformation scenario.
  - Set the **XSL URL** field to \${framework}/xs1/sdf.xsl.

**Figure 563: Configuring a New XSLT Transformation Scenario**

4. Change to the **Output** tab. Configure the fields as follows:
  - Set the **Save as** field to \${cfid}/\${cfn}.html. This means the transformation output file will have the name of the XML file and the *html* extension and will be stored in the same folder.
  - Enable the **Open in Browser/System Application** option.

**Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:

Association rules	Schema	Classpath	Author	Templates	Catalogs	Transformation	Validation	Extensions
Type filter text								
Default	Scenario							
<input type="checkbox"/>	SDF to HTML							

**Figure 564: Transformation Tab**

To test the transformation scenario that you just created, open the **SDF XML** sample from the [Example Files Listings](#). Click the **Apply Transformation Scenario(s)** button to display the **Transform with** dialog box. The scenario list contains the scenario you defined earlier. Select the *SDF to HTML* scenario that you just defined and click the **Apply associated** button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

### Configuring Validation Scenarios for a Framework

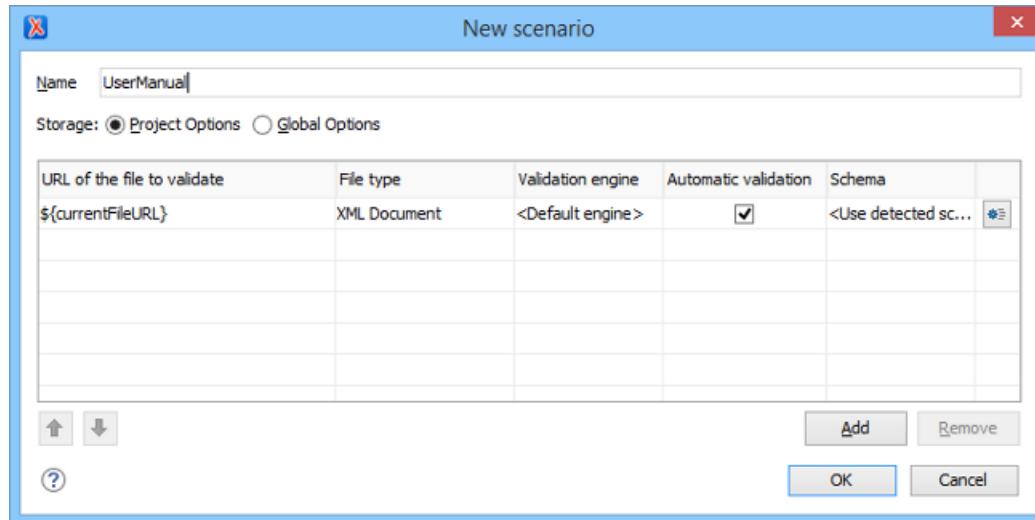

You can distribute a framework with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

**Note:** If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Master Files Support](#) on page 279 or [Working with Modular XML Files in the Master Files Context](#) on page 472.

To associate a validation scenario with a specific framework, follow these steps:

1. Open the **Preferences** dialog box ([Options > Preferences](#)) and go to **Document Type Association**.
2. Select the document type and click the **Edit** button to open the **Document Type configuration dialog box**, then choose the **Validation** tab. This tab displays a list of document types in which you can define validation scenarios. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the **Default** box for that specific document type.
3. To add a new scenario, press the **New** button.

The **New scenarios** dialog box is displayed. It lists all the validation units for the scenario.

**Figure 565: Create New Validation Scenario**

This scenario configuration dialog box allows you to configure the following information and options:

#### Name

The name of the validation scenario.

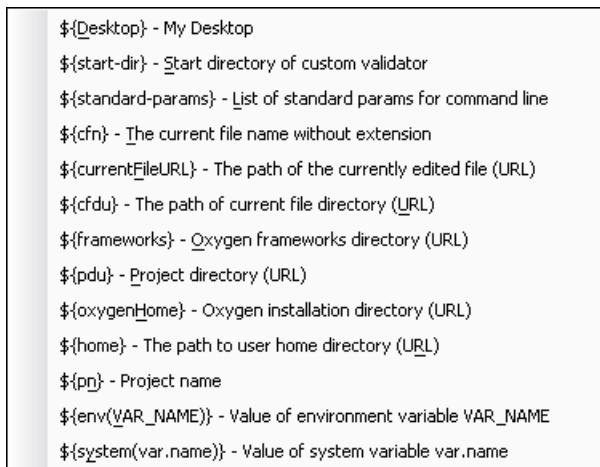

#### Storage

You can choose between storing the scenario in the **Project Options** or **Global Options**.

#### URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

**Figure 566: Insert an Editor Variable**

#### File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

#### Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XQuery preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map [Validate and Check for Completeness action](#), but for a local file rather than an entire DITA map).

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#) on page ).

#### Automatic validation

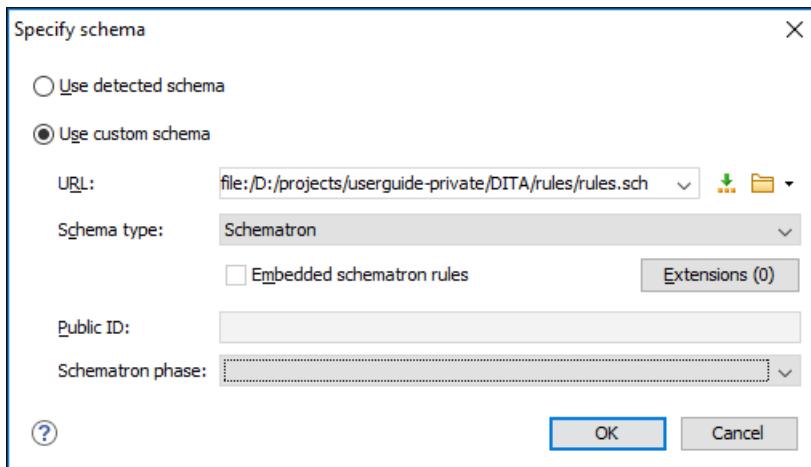

If this option is checked, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#), then this option is ignored, as the preference setting has a higher priority.

#### Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

#### Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

**Figure 567: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

#### **Use detected schema**

Uses the *schema detected for the particular document*.

#### **Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

#### **Move Up**

Moves the selected scenario up one spot in the list.

#### **Move Down**

Moves the selected scenario down one spot in the list.

#### **Add**

Adds a new validation unit to the list.

#### **Remove**

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the *validation phase*.

5. Press **Ok**.

The newly created validation scenario is now included in the list of scenarios in the **Validation tab**. You can use the **Default** checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

## Customizing Smart Paste Support

The *Smart Paste* feature preserves certain style and structure information when copying content from some of the most common applications and pasting into *document types that support Smart Paste* in Oxygen XML Editor. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

### How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named **resources** in the following path structure:

`[OXYGEN_INSTALL_DIR]/frameworks/[Document Type]/resources`

2. Create an XSLT file named `xhtml2content.xsl` and save it in the **resources** folder for the particular framework.

For example: `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/xhtml2content.xsl`

3. Add your customized styling in the XSLT file.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor.

**Result:** When you paste content from external applications (such as a web browser or and Office document) to a document that is opened in **Author** mode, and that matches the particular framework, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

### Related information

[Smart Paste Support](#) on page 335

[oXygen XML Blog: How Special Paste Works in oXygen](#)

## Configuring Extensions

You can add extensions to your frameworks (Document Type Association) by using the **Extensions** tab from the [Document Type configuration dialog box](#).

**Note:** It is possible for a plugin to share the same classes with a framework. For further details, go to [How to Share the Classloader Between a Framework and a Plugin](#).

### Configuring an Extensions Bundle

All extensions that are provided by Oxygen XML Editor are includes in a single bundle.

**Note:** The individual extensions can still be set ([open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the `ro.sync.ecss.extensions.api.ExtensionsBundle` class. The provided implementation of the `ExtensionsBundle` is instantiated when the rules of the *Document Type Association* defined for the custom framework matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another `ExtensionsBundle` instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a `lib` folder in the Java project folder and copy in it the `oxygen.jar` file from the `[OXYGEN_INSTALL_DIR]/lib` folder.

2. Create the class (for example, `simple.documentation.framework.SDFExtensionsBundle`) to extend the abstract class `ro.sync.ecss.extensions.api.ExtensionsBundle`.

For example:

```
public class SDFExtensionsBundle extends ExtensionsBundle {
```

3. A **Document Type ID** and a short description should be defined first by implementing the methods `getDocumentTypeID` and `getDescription`. The **Document Type ID** is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.

For example:

```
public String getDocumentTypeID() {
 return "Simple.Document.Framework.document.type";
}

public String getDescription() {
 return "A custom extensions bundle used for the Simple Document" +
 "Framework document type";
}
```

4. To be notified about the activation of the custom *Author Extension* in relation with an opened document, `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` should be implemented. The **activation** and **deactivation** events received by this listener should be used to perform custom initializations and to register or remove listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`. The custom *Author Extension* state listener should be provided by implementing the `createAuthorExtensionStateListener` method.

For example:

```
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
 return new SDFAuthorExtensionStateListener();
}
```

The `AuthorExtensionStateListener` is instantiated and notified about the activation of the framework when the rules of the *Document Type Association* match a document opened in the **Author** editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in [Implementing an Author Extension State Listener](#).

If *Schema Aware mode* is active in Oxygen XML Editor, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

See [Implementing a Schema-Aware Editing Handler Adapter](#) on page 1182 for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the *Document Type Association* that contains the filter declaration.

For example:

```
public SchemaManagerFilter createSchemaManagerFilter() {
 return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the [Configuring a Content Completion Handler](#) section.

6. The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the

**id** attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```
public ElementLocatorProvider createElementLocatorProvider() {
 return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the [Configuring a Link Target Element Finder](#) section.

7. The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Editor Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Editor Eclipse plugin. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

```
public AuthorDnDListener createAuthorAWTDndListener() {
 return new SDFAuthorDndListener();
}
```

For more details about the **Author** mode drag and drop listeners, see the [Configuring a custom Drag and Drop Listener](#) section.

8. Another extension that can be included in the bundle is the reference resolver. In our example, the references are represented by the **ref** element and the attribute indicating the referenced resource is **location**. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another Document Type is activated as result of the detection process.

For example:

```
public AuthorReferenceResolver createAuthorReferenceResolver() {
 return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the [Configuring a References Resolver](#) section.

9. To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of `ro.sync.ecss.extensions.api.StylesFilter` can be provided. The extensions bundle method responsible for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another Document Type is activated as a result of the detection process.

For example:

```
public StylesFilter createAuthorStylesFilter() {
 return new SDFStylesFilter();
}
```

See the [Configuring CSS Styles Filter](#) section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be

provided. The two methods from the `ExtensionsBundle` specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`.

For example:

```
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
 return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider
 createAuthorTableColumnWidthProvider() {
 return new TableColumnWidthProvider();
}
```

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in [Configuring a Table Cell Span Provider](#) and [Configuring a Table Column Width Provider](#) sections.

If the functionality related to one of the previous extension point does not need to be modified, then the developed `ro.sync.ecss.extensions.api.ExtensionsBundle` should not override the corresponding method and leave the default base implementation to return `null`.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.LinkTextResolver` interface should be returned by the `createLinkTextResolver` method. This implementation is used each time [the oxy\\_link-text\(\) function](#) is encountered in the CSS styles associated with an element.

For example:

```
public LinkTextResolver createLinkTextResolver() {
 return new DitaLinkTextResolver();
}
```

Oxygen XML Editor offers built-in implementations for DITA and DocBook:

`ro.sync.ecss.extensions.dita.link.DitaLinkTextResolver` and

`ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` respectively.

12. Pack the compiled class into a jar file.

13. Copy the jar file into your custom framework directory (for example, `frameworks/sdf`).

14. Add the jar file to the class path. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, select the document type (for example, `SDF`), press the **Edit** button, select the **Classpath** tab, and press the **+ Add** button. In the displayed dialog box, enter the location of the jar file relative to the Oxygen XML Editor frameworks folder.

15. Register the Java class by going to the **Extensions** tab. Press the **Choose** button and select the name of the class (for example, `SDFExtensionsBundle`).

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the `oxygen-sample-framework` module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

## Related information

### Customize Profiling Conditions

For each document type, you can configure the phrase-type elements that wrap the profiled content by setting a custom `ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider`. This configuration is set by default for DITA and DocBook frameworks.

### Implementing a Schema-Aware Editing Handler Adapter

The `AuthorSchemaAwareEditingHandlerAdapter` extension point allows you to handle certain **Author** mode actions in various ways. For example, implementing the `AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection,

join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor when pasting content (through the use of [some specific methods](#)).

## How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the [Schema Aware Editing option](#) must be set to **On** or **Custom** in the [Schema-Aware preferences page](#). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `InvalidEditException`.

To implement your own `AuthorSchemaAwareEditingHandlerAdapter`, follow this procedure:

1. Implement the [`ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter`](#) extension.
2. To instruct Oxygen XML Editor to use this newly created implementation, [configure an extensions bundle](#) and return the `AuthorSchemaAwareEditingHandlerAdapter` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter()` method.

## Example

Typing events can be handled using the `handleTyping` method. For example, the `AuthorSchemaAwareEditingHandler` checks if the schema is not a learned one, was loaded successfully, and if the [Smart paste and drag and drop option](#) is enabled. If these conditions are met, the event will be handled.

```
public class AuthorSchemaAwareEditingHandlerAdapter
 extends AuthorSchemaAwareEditingHandler {

 /**
 * @see AuthorSchemaAwareEditingHandler#handleTyping
 (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
 */
 public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
 throws InvalidEditException {
 boolean handleTyping = false;
 AuthorSchemaManager authorSchemaManager =
 authorAccess.getDocumentController().getAuthorSchemaManager();
 if (!authorSchemaManager.isLearnSchema() &&
 !authorSchemaManager.hasLoadingErrors() &&
 authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
 try {
 AuthorDocumentFragment characterFragment =
 authorAccess.getDocumentController().createNewDocumentTextFragment
 (String.valueOf(ch));
 handleTyping = handleInsertionEvent
 (offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
 } catch (AuthorOperationException e) {
 throw new InvalidEditException
 (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
 }
 }
 return handleTyping;
 }
}
```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the `oxygen-sample-framework` module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

## Methods for Improving the Paste Mechanism

### getAncestorDetectionOptions

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Editor will propose solutions to make it valid. As a possible solution, Oxygen XML Editor might surround the pasted content in a sequence of ancestor elements. This `getAncestorDetectionOptions` method allows you to choose which parent elements might be a possible solution.

### canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor. For example, when pasting an element inside an empty element with the same name, this `canBeReplaced` method allows Oxygen XML Editor to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

### [AuthorDocumentFragment Class](#)

## Implementing an Edit Properties Handler for Author Mode

The `EditPropertiesHandler` extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in **Author** mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

## How to Implement an `EditPropertiesHandler`

To implement your own `EditPropertiesHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.EditPropertiesHandler` interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
  - a. If you have [configured an extensions bundle](#), you can return the `EditPropertiesHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()` method.
  - b. Specify the `EditPropertiesHandler` in the **Author edit properties handler** individual extension in the [Extensions tab](#) of the **Document Type** configuration dialog box for your particular document type.

## Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an image tag in **Author** mode (with tags displayed from the **\*Tags display mode** drop-down menu):

```
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

 /**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
 @Override
 public String getDescription() {
 return "Sample implementation that handles properties for a table element.";
 }

 /**
 * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
(ro.sync.ecss.extensions.api.node.AuthorNode)
 */
 @Override
 public boolean canEditProperties(AuthorNode authorNode) {
 // If this node is an image element we can edit its properties.
 return "image".equals(authorNode.getDisplayName());
 }

 /**
 * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
(ro.sync.ecss.extensions.api.node.AuthorNode,
 ro.sync.ecss.extensions.api.AuthorAccess)
 */
 @Override
 public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
 // If we receive this call then it surely an image.
 AuthorElement imageElement = (AuthorElement) authorNode;
 String currentValue = "";
 AttrValue altValue = imageElement.getAttribute("alt");
 if (altValue != null) {
 currentValue = altValue.getValue();
 }
 String newValue = JOptionPane.showInputDialog(
 (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
 "Alternate text",
 currentValue);

 if (newValue != null) {
 authorAccess.getDocumentController().setAttribute
("alt", new AttrValue(newValue), imageElement);
 }
 }
}
```

**Example result:** If a user were to double-click an image tag icon ( in **Author** mode, the following dialog box would be displayed that allows the user to edit the *alternate text* property for the image:

## Implementing an Author Mode Action Event Handler

The `AuthorActionEventHandler` extension point allows you to handle certain **Author** mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press **Enter** instead of it opening the **Content Completion Assistant**.

### How to Implement an `AuthorActionEventHandler`

To implement your own `AuthorActionEventHandler`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
  - a. If you have [configured an extensions bundle](#), you can return the `AuthorActionEventHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
  - b. Specify the `AuthorActionEventHandler` in the **Author action event handler** individual extension in the [Extensions tab](#) of the **Document Type** configuration dialog box for your particular document type.

### Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses **Enter** in **Author** mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the new-line character. Then the `handleEvent` method inserts the new line at the current cursor position.

```
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler
{
 /**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
 * (AuthorAccess, AuthorEventType)
 */
 @Override
 public boolean canHandleEvent(AuthorAccess authorAccess,
 AuthorEventType type) {
 boolean canHandle = false;

 if (type == AuthorEventType.ENTER) {
 AuthorDocumentController documentController =
 authorAccess.getDocumentController();
 int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
 try {
 AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
 if (nodeAtOffset instanceof AuthorElement) {
 AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
 AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
 if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
 canHandle = true;
 }
 }
 } catch (BadLocationException ex) {
 if (logger.isDebugEnabled()) {
 logger.error(ex.getMessage(), ex);
 }
 }
 }

 return canHandle;
 }

 /**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
 * (ro.sync.ecss.extensions.api.AuthorAccess,
 * ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorEventType)
 */
 @Override
 public boolean handleEvent(AuthorAccess authorAccess,
```

```

 AuthorActionEventType eventType) {
 int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
 // Insert a new line
 authorAccess.getDocumentController().insertText(caretOffset, "\n");
 return true;
 }

 /**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
 @Override
 public String getDescription() {
 return "Insert a new line";
 }
 }
}

```

## Implementing an Image Decorator for Author Mode

The `AuthorImageDecorator` extension point allows you to add a custom decorator over images in **Author** mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

### How to Implement an `AuthorImageDecorator`

To implement your own `AuthorImageDecorator`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorImageDecorator` interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
  - a. If you have [configured an extensions bundle](#), you can return the `AuthorImageDecorator` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()` method.
  - b. Specify the `AuthorImageDecorator` in the **Author image decorator** individual extension in the [Extensions tab](#) of the **Document Type** configuration dialog box for your particular document type.

### Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```

/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

 /**
 * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
 (ro.sync.xml.view.graphics.Graphics, int, int, int, int,
 ro.sync.xml.view.graphics.Rectangle,
 ro.sync.ecss.extensions.api.node.AuthorNode,
 ro.sync.ecss.extensions.api.AuthorAccess, boolean)
 */

 @Override
 public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
 Rectangle originalSize, AuthorNode element,
 AuthorAccess authorAccess, boolean wasAnnotated) {
 if ("image".equals(CommonsOperationsUtil.getLocalName(element.getName()))) {
 g.drawString(
 "[Double-click to edit image]",
 // Draw near the top-left corner
 x + 15,
 y + 15);
 }
 }
}

```

**Example result:** In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

### Implementing a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the **Author** mode extension (where the listener is defined) is activated or deactivated in the Document Type detection process.

```

import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements

```

```

AuthorExtensionStateListener {
 private AuthorListener sdfAuthorDocumentListener;
 private AuthorMouseListener sdfMouseListener;
 private AuthorCaretListener sdfCaretListener;
 private OptionListener sdfOptionListener;
}

```

When the rules of the *Document Type Association* match a document opened in the **Author** editing mode, the *activation* event received by this listener should be used to perform custom initializations and to register listeners such as [ro.sync.ecss.extensions.api.AuthorListener](#), [ro.sync.ecss.extensions.api.AuthorMouseListener](#), or [ro.sync.ecss.extensions.api.AuthorCaretListener](#).

```

public void activated(AuthorAccess authorAccess) {
 // Get the value of the option.
 String option = authorAccess.getOptionsStorage().getOption(
 "sdf.custom.option.key", "");
 // Use the option for some initializations...

 // Add an OptionListener.
 authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

 // Add author DocumentListeners.
 sdfAuthorDocumentListener = new SDFAuthorListener();
 authorAccess.getDocumentController().addAuthorListener(
 sdfAuthorDocumentListener);

 // Add MouseListener.
 sdfMouseListener = new SDFAuthorMouseListener();
 authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

 // Add CaretListener.
 sdfCaretListener = new SDFAuthorCaretListener();
 authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

 // Other custom initializations...
}

```

The `authorAccess` parameter received by the `activated` method can be used to gain access to specific **Author** mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed *Author Extension* need to be stored or retrieved, a reference to the [ro.sync.ecss.extensions.api.OptionsStorage](#) can be obtained by calling the `getOptionsStorage` method from the `authorAccess`. The same object can be used to register [ro.sync.ecss.extensions.api.OptionListener](#) listeners. An option listener is registered in relation with an option **key** and will be notified about the value changes of that option.

An **AuthorListener** can be used if events related to the **Author** mode document modifications are of interest. The listener can be added to the [ro.sync.ecss.extensions.api.AuthorDocumentController](#). A reference to the document controller is returned by the `getDocumentController` method from the `authorAccess`. The document controller can also be used to perform operations involving document modifications.

To provide access to the **Author** mode component-related functionality and information, the `authorAccess` has a reference to the [ro.sync.ecss.extensions.api.access.AuthorEditorAccess](#) that can be obtained when calling the `getEditorAccess` method. At this level, `AuthorMouseListener` and `AuthorCaretListener` can be added to provide notification of mouse and cursor events that occur in the **Author** editor mode.

The *deactivation* event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The `deactivate` method is typically used to unregister the listeners previously added on the `activate` method and to perform other actions. For example, options related to the deactivated *Author Extension* can be saved at this point.

```

public void deactivated(AuthorAccess authorAccess) {
 // Store the option.
 authorAccess.getOptionsStorage().setOption(
 "sdf.custom.option.key", optionValue);

 // Remove the OptionListener.
 authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

 // Remove DocumentListeners.
 authorAccess.getDocumentController().removeAuthorListener(
 sdfAuthorDocumentListener);
}

```

```

 // Remove MouseListener.
 authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

 // Remove CaretListener.
 authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

 // Other actions...
}

}

```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

## Configuring a Content Completion Handler

You can filter or contribute to proposals offered for content completion by implementing the [`ro.sync.contentcompletion.xml.SchemaManagerFilter`](#) interface.

```

import java.util.List;

import ro.sync.contentcompletion.xml.CIAtribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

```

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the `filterAttributes` method and changing the default content completion list of [`ro.sync.contentcompletion.xml.CIAtribute`](#) for the element provided by the current [`ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext`](#) context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```

/**
 * Filter attributes of the "table" element.
 */
public List<CIAtribute> filterAttributes(List<CIAtribute> attributes,
 WhatAttributesCanGoHereContext context) {
 // If the element from the current context is the 'table' element add the
 // attribute named 'frame' to the list of default content completion proposals
 if (context != null) {
 ContextElement contextElement = context.getParentElement();
 if ("table".equals(contextElement.getQName())) {
 CIAtribute frameAttribute = new CIAtribute();
 frameAttribute.setName("frame");
 frameAttribute.setRequired(false);
 frameAttribute.setFixed(false);
 frameAttribute.setDefaultValue("void");
 if (attributes == null) {
 attributes = new ArrayList<CIAtribute>();
 }
 attributes.add(frameAttribute);
 }
 }
 return attributes;
}

```

The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```

public List<CIElement> filterElements(List<CIElement> elements,
 WhatElementsCanGoHereContext context) {
 // If the element from the current context is the 'header' element remove the
 // 'td' element from the list of content completion proposals and add the
 // 'th' element.
 if (context != null) {
 Stack<ContextElement> elementStack = context.getElementStack();
 if (elementStack != null) {
 ContextElement contextElement = context.getElementStack().peek();
 if ("header".equals(contextElement.getQName())) {
 if (elements != null) {
 for (Iterator<CIElement> iterator =
elements.iterator(); iterator.hasNext();) {

```

```

 CIElement element = iterator.next();
 // Remove the 'td' element
 if ("td".equals(element.getQName())) {
 elements.remove(element);
 break;
 }
 } else {
 elements = new ArrayList<CIElement>();
 }
 // Insert the 'th' element in the list of content completion proposals
 CIElement thElement = new SDFElement();
 thElement.setName("th");
 elements.add(thElement);
}
} else {
 // If the given context is null then the given list of content completion
 // elements contains global elements.
}
return elements;
}

```

The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Editor website*.

### Configuring a Link Target Element Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the `DefaultElementLocatorProvider` implementation will be used by default. The interface that should be implemented for a custom link target reference finder is [ro.sync.ecss.extensions.api.link.ElementLocatorProvider](#). As an alternative, the [ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider](#) implementation can also be extended.

The used `ElementLocatorProvider` will be queried for an `ElementLocator` when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained `ElementLocator` will be queried for each element from the document.

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Editor website*.

#### *DefaultElementLocatorProvider Implementation*

The `DefaultElementLocatorProvider` implementation offers support for the most common types of links:

- Links based on ID attribute values.
- XPointer element() scheme.

The method `getElementLocator` determines what `ElementLocator` should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null `IDTypeVerifier` will always be provided if a schema is associated with the document type.

The link string argument is the "anchor" part of the URL that is composed from the value of the link property specified for the link element in the CSS.

```

public ElementLocator getElementLocator(IDTypeVerifier idVerifier,
 String link) {
 ElementLocator elementLocator = null;
 try {
 if(link.startsWith("element")){
 // xpointer element() scheme
 elementLocator = new XPointerElementLocator(idVerifier, link);
 } else {
 // Locate link element by ID
 elementLocator = new IDEElementLocator(idVerifier, link);
 }
 } catch (ElementLocatorException e) {
 logger.warn("Exception when create element locator for link: "
 + link + ". Cause: " + e, e);
 }
}

```

```

 }
 return elementLocator;
}

```

## XPointerElementLocator Implementation

XPointerElementLocator is an implementation of the abstract class [ro.sync.ecss.extensions.api.link.ElementLocator](#) for links that have one of the following XPointer element() scheme patterns:

### **element (elementID)**

Locate the element with the specified id.

### **element (/1/2/3)**

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

### **element (elementID/3/4)**

A child sequence appearing after a NCName identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the id/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```

public XPointerElementLocator(IDTypeVerifier idVerifier, String link)
 throws ElementLocatorException {
 super(link);
 this.idVerifier = idVerifier;
 link = link.substring("element(".length(), link.length() - 1);
 StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
 xpointerPath = new String[stringTokenizer.countTokens()];
 int i = 0;
 while (stringTokenizer.hasMoreTokens()) {
 xpointerPath[i] = stringTokenizer.nextToken();
 boolean invalidFormat = false;
 // Empty xpointer component is not supported
 if(xpointerPath[i].length() == 0){
 invalidFormat = true;
 }
 if(i > 0){
 try {
 Integer.parseInt(xpointerPath[i]);
 } catch (NumberFormatException e) {
 invalidFormat = true;
 }
 }
 if(invalidFormat){
 throw new ElementLocatorException(
 "Only the element() scheme is supported when locating XPointer links."
 + "Supported formats: element(elementID), element(/1/2/3),"
 + "element(elementID/3/4).");
 }
 i++;
 }
 if(Character.isDigit(xpointerPath[0].charAt(0))){
 // This is the case when xpointer have the following pattern /1/5/7
 xpointerPathDepth = xpointerPath.length;
 } else {
 // This is the case when xpointer starts with an element ID
 xpointerPathDepth = -1;
 startWithElementID = true;
 }
}

```

The method `startElement` will be invoked at the beginning of every element in the XML document(even when the element is empty). The arguments it takes are

### ***uri***

The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

### ***localName***

Local name of the element.

### ***qName***

Qualified name of the element.

### ***atts***

Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns **true** if the processed element is found to be the one indicated by the link.

The XPointerElementLocator implementation of the `startElement` will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```
public boolean startElement(String uri, String localName,
 String name, Attr[] attrs) {
 boolean linkLocated = false;
 // Increase current element document depth
 startElementDepth++;

 if (endElementDepth != startElementDepth) {
 // The current element is the first child of the parent
 currentElementIndexStack.push(new Integer(1));
 } else {
 // Another element in the parent element
 currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
 }

 if (startsWithElementID) {
 // This the case when xpointer path starts with an element ID.
 String xpointerElement = xpointerPath[0];
 for (int i = 0; i < attrs.length; i++) {
 if(xpointerElement.equals(attrs[i].getValue())){
 if(idVerifier.hasIDType(
 localName, uri, attrs[i].getQName(), attrs[i].getNamespace())){
 xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
 break;
 }
 }
 }
 }

 if (xpointerPathDepth == startElementDepth){
 // check if xpointer path matches with the current element path
 linkLocated = true;
 try {
 int xpointerIdx = xpointerPath.length - 1;
 int stackIdx = currentElementIndexStack.size() - 1;
 int stopIdx = startWithElementID ? 1 : 0;
 while (xpointerIdx >= stopIdx && stackIdx >= 0) {
 int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
 int currentElementIndex =
 ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
 if(xpointerIndex != currentElementIndex) {
 linkLocated = false;
 break;
 }

 xpointerIdx--;
 stackIdx--;
 }
 } catch (NumberFormatException e) {
 logger.warn(e,e);
 }
 }
 return linkLocated;
}
```

The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The XPointerElementLocator implementation of the endElement updates the depth of the current element path and the index of the element in its parent.

```
public void endElement(String uri, String localName, String name) {
 endElementDepth = startElementDepth;
 startElementDepth--;
 lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

## IDElementLocator Implementation

The IDElementLocator is an implementation of the abstract class [ro.sync.ecss.extensions.api.link.ElementLocator](#) for links that use an **id**.

The constructor only assigns field values and the method endElement is empty for this implementation.

The method startElement checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- the qualified name of the attribute is `xml:id`
- the attribute type is ID

The attribute type is checked with the help of the method `IDTypeVerifier.hasIDType`.

```
public boolean startElement(String uri, String localName,
 String name, Attr[] attrs) {
 boolean elementFound = false;
 for (int i = 0; i < attrs.length; i++) {
 if (link.equals(attrs[i].getValue())) {
 if ("xml:id".equals(attrs[i].getQName())) {
 // xml:id attribute
 elementFound = true;
 } else {
 // check if attribute has ID type
 String attrLocalName =
 ExtensionUtil.getLocalName(attrs[i].getQName());
 String attrUri = attrs[i].getNamespace();
 if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
 elementFound = true;
 }
 }
 }
 }
 return elementFound;
}
```

## Creating a Customized Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the [ro.sync.ecss.extensions.api.link.ElementLocatorProvider](#) interface. As an alternative, your class could extend [ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider](#), the default implementation.

**Note:** The complete source code of the [ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider](#), [ro.sync.ecss.extensions.commons.IDElementLocator](#) or [ro.sync.ecss.extensions.commons.XPointerElementLocator](#) can be found in the **oxygen-sample-framework** project.

## Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the framework with the Eclipse plugin or the standalone version of the application or if you want to add the handler for the **Text** or **Author** modes.

### Interfaces for the Drag and Drop Listener

[ro.sync.xml.editor.xmleditor.pageauthor.AuthorDnDListener](#)

Receives callbacks from the standalone application for Drag And Drop in **Author** mode.

[com.oxygenxml.editor.editors.author.AuthorDnDListener](#)

Receives callbacks from the Eclipse plugin for Drag And Drop in **Author** mode.

## [com.oxygenxml.editor.editors.TextDnDListener](#)

Receives callbacks from the Eclipse plugin for Drag And Drop in **Text** mode.

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype *on the Oxygen XML Editor website*.

### Configuring a References Resolver

You need to provide a handler for resolving references and obtain the content they reference. In our case the element that has references is **ref** and the attribute indicating the referenced resource is **location**. You will have to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the [ro.sync.ecss.extensions.api.AuthorReferenceResolver](#) interface.

```
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
 implements AuthorReferenceResolver {
```

2. The `hasReferences` method verifies if the handler considers the node to have references. It takes as argument an `AuthorNode` that represents the node that will be verified. The method will return `true` if the node is considered to have references. In our case, to be a reference the node must be an element with the name `ref` and it must have an attribute named `location`.

```
public boolean hasReferences(AuthorNode node) {
 boolean hasReferences = false;
 if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
 AuthorElement element = (AuthorElement) node;
 if ("ref".equals(element.getLocalName())) {
 AttrValue attrValue = element.getAttribute("location");
 hasReferences = attrValue != null;
 }
 }
 return hasReferences;
}
```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes as argument an `AuthorNode` that represents the node for which the display name is needed. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In our case, the display name is the value of the `location` attribute from the `ref` element.

```
public String getDisplayName(AuthorNode node) {
 String displayName = "ref-fragment";
 if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
 AuthorElement element = (AuthorElement) node;
 if ("ref".equals(element.getLocalName())) {
 AttrValue attrValue = element.getAttribute("location");
 if (attrValue != null) {
 displayName = attrValue.getValue();
 }
 }
 }
 return displayName;
}
```

4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes as arguments an `AuthorNode` that represents the node for which the reference needs resolving, the `systemID` of the node, the `AuthorAccess` with access methods to the **Author** mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the XML catalog. In the implementation you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```
public SAXSource resolveReference(
 AuthorNode node,
 String systemID,
 AuthorAccess authorAccess,
 EntityResolver entityResolver) {
 SAXSource saxSource = null;

 if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
```

```

 AuthorElement element = (AuthorElement) node;
 if ("ref".equals(element.getLocalName())) {
 AttrValue attrValue = element.getAttribute("location");
 if (attrValue != null) {
 String attrStringVal = attrValue.getValue();
 try {
 URL absoluteUrl = new URL(new URL(systemID),
 authorAccess.getUtilAccess().correctURL(attrStringVal));
 InputSource inputSource = entityResolver.resolveEntity(null,
 absoluteUrl.toString());
 if(inputSource == null) {
 inputSource = new InputSource(absoluteUrl.toString());
 }
 XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
 xmlReader.setEntityResolver(entityResolver);
 saxSource = new SAXSource(xmlReader, inputSource);
 } catch (MalformedURLException e) {
 logger.error(e, e);
 } catch (SAXException e) {
 logger.error(e, e);
 } catch (IOException e) {
 logger.error(e, e);
 }
 }
 }
}

return saxSource;
}

```

5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes as argument an `AuthorNode` that represents the node with the reference. In the implementation the unique identifier is the value of the `location` attribute from the `ref` element.

```

public String getReferenceUniqueID(AuthorNode node) {
 String id = null;
 if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
 AuthorElement element = (AuthorElement) node;
 if ("ref".equals(element.getLocalName())) {
 AttrValue attrValue = element.getAttribute("location");
 if (attrValue != null) {
 id = attrValue.getValue();
 }
 }
 }
 return id;
}

```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes as arguments an `AuthorNode` that represents the node with the reference and the `AuthorAccess` with access methods to the **Author** mode data model. In the implementation you use the value of the `location` attribute from the `ref` element and resolve it relatively to the XML base URL of the node.

```

public String getReferenceSystemID(AuthorNode node,
 AuthorAccess authorAccess) {
 String systemID = null;
 if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
 AuthorElement element = (AuthorElement) node;
 if ("ref".equals(element.getLocalName())) {
 AttrValue attrValue = element.getAttribute("location");
 if (attrValue != null) {
 String attrStringVal = attrValue.getValue();
 try {
 URL absoluteUrl = new URL(node.getXMLBaseURL(),
 authorAccess.getUtilAccess().correctURL(attrStringVal));
 systemID = absoluteUrl.toString();
 } catch (MalformedURLException e) {
 logger.error(e, e);
 }
 }
 }
 }
 return systemID;
}

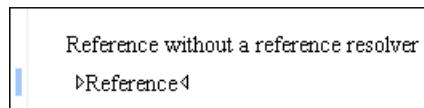

```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

In the listing below, the XML document contains the `ref` element:

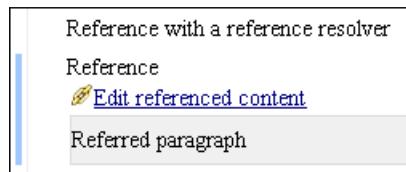

```
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

**Figure 568: Reference with no specified reference resolver**

When the above implementation is configured, the reference has the expected layout:

**Figure 569: Reference with reference resolver**

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype [on the Oxygen XML Editor website](#).

### Configuring CSS Styles Filter

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the **Author** mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in our simple document example the filter can change the value of the `KEY_FONT` property for the `table` element:

```
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

 public Styles filter(Styles styles, AuthorNode authorNode) {
 if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType()
 && "table".equals(authorNode.getName())) {
 styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
 }
 return styles;
 }
}
```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype [on the Oxygen XML Editor website](#).

### Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```
table{
 display:table;
 border:1px solid navy;
 margin:1em;
 max-width:1000px;
 min-width:150px;
}

table[width]{
 width:attr(width, length);
}

tr, header{
 display:table-row;
}

header{
 background-color: silver;
 color:inherit
}

td{
 display:table-cell;
 border:1px solid navy;
 padding:1em;
}
```

Since in the [schema](#), the td tag has the attributes **row\_span** and **column\_span** that are not automatically recognized by Oxygen XML Editor, a Java extension will be implemented that will provide information about the cell spanning. See the section [Configuring a Table Cell Span Provider](#).

The column widths are specified by the attributes **width** of the elements **customcol** that are not automatically recognized by Oxygen XML Editor. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see [Configuring a Table Column Width Provider](#).

The table from our example does not make use of the attributes **colsep** and **rowsep** (which are automatically recognized) but we still want the rows to be separated by horizontal lines. It is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see [Configuring a Table Cell Row and Column Separator Provider](#) on page 1201.

#### Configuring a Table Column Width Provider

In a custom framework, the table element as well as the table columns can have specified widths. For these widths to be considered by **Author** mode we need to provide the means to determine them. As explained in [Configuring Tables](#) on page 1195, if you use the table element attribute **width** Oxygen XML Editor can determine the table width automatically. In this example the table has col elements with **width** attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the [`ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider`](#) interface.

```
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider
 implements AuthorTableColumnWidthProvider {
```

2. Method `init` is taking as argument an [`ro.sync.ecss.extensions.api.node.AuthorElement`](#) that represents the XML table element. In our case the column widths are specified in col elements from the table element. In such cases you must collect the span information by analyzing the table element.

```
public void init(AuthorElement tableElement) {
 this.tableElement = tableElement;
 AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
 if (colChildren != null && colChildren.length > 0) {
 for (int i = 0; i < colChildren.length; i++) {
 AuthorElement colChild = colChildren[i];
 if (i == 0) {
 colsStartOffset = colChild.getStartOffset();
 }
 if (i == colChildren.length - 1) {
 colsEndOffset = colChild.getEndOffset();
 }
 }
 }
}
```

```

 // Determine the 'width' for this col.
 AttrValue colWidthAttribute = colChild.getAttribute("width");
 String colWidth = null;
 if (colWidthAttribute != null) {
 colWidth = colWidthAttribute.getValue();
 // Add WidthRepresentation objects for the columns this 'customcol'
 // specification spans over.
 colWidthSpecs.add(new WidthRepresentation(colWidth, true));
 }
 }
}

```

- The method `isTableAcceptingWidth` should check if the table cells are `td`.

```

public boolean isTableAcceptingWidth(String tableCellsTagName) {
 return "td".equals(tableCellsTagName);
}

```

- The method `isTableAndColumnsResizable` should check if the table cells are `td`. This method determines if the table and its columns can be resized by dragging the edge of a column.

```

public boolean isTableAndColumnsResizable(String tableCellsTagName) {
 return "td".equals(tableCellsTagName);
}

```

- Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the `width` attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```

public WidthRepresentation getTableWidth(String tableCellsTagName) {
 WidthRepresentation toReturn = null;
 if (tableElement != null && "td".equals(tableCellsTagName)) {
 AttrValue widthAttr = tableElement.getAttribute("width");
 if (widthAttr != null) {
 String width = widthAttr.getValue();
 if (width != null) {
 toReturn = new WidthRepresentation(width, true);
 }
 }
 }
 return toReturn;
}

```

```

public List<WidthRepresentation>
getCellWidth(AuthorElement cellElement, int colNumberStart,
 int colSpan) {
 List<WidthRepresentation> toReturn = null;
 int size = colWidthSpecs.size();
 if (size >= colNumberStart && size >= colNumberStart + colSpan) {
 toReturn = new ArrayList<WidthRepresentation>(colSpan);
 for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
 // Add the column widths
 toReturn.add(colWidthSpecs.get(i));
 }
 }
 return toReturn;
}

```

- Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```

public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
 int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
 if ("td".equals(tableCellsTagName)) {
 if (newTableWidth > 0) {
 if (tableElement != null) {
 String newWidth = String.valueOf(newTableWidth);

 authorDocumentController.setAttribute(
 "width",
 new AttrValue(newWidth),
 tableElement);
 } else {
 throw new AuthorOperationException("Cannot find the table element.");
 }
 }
 }
}

```

```

}

public void commitColumnWidthModifications
 (AuthorDocumentController authorDocumentController,
 WidthRepresentation[] colWidths, String tableCellsTagName)
throws AuthorOperationException {
 if ("td".equals(tableCellsTagName)) {
 if (colWidths != null && tableElement != null) {
 if (colsStartOffset >= 0 && colsEndOffset >= 0
 && colsStartOffset < colsEndOffset) {
 authorDocumentController.delete(colsStartOffset,
 colsEndOffset);
 }
 }
 String xmlFragment = createXMLFragment(colWidths);
 int offset = -1;
 AuthorElement[] header = tableElement.getElementsByLocalName("header");
 if (header != null && header.length > 0) {
 // Insert the cols elements before the 'header' element
 offset = header[0].getStartOffset();
 }
 if (offset == -1) {
 throw new AuthorOperationException("No valid offset to insert column width");
 }
 authorDocumentController.insertXMLFragment(xmlFragment, offset);
 }
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
 StringBuffer fragment = new StringBuffer();
 String ns = tableElement.getNamespace();
 for (int i = 0; i < widthRepresentations.length; i++) {
 WidthRepresentation width = widthRepresentations[i];
 fragment.append("<customcol");
 String strRepresentation = width.getWidthRepresentation();
 if (strRepresentation != null) {
 fragment.append(" width=\"" + width.getWidthRepresentation() + "\"");
 }
 if (ns != null && ns.length() > 0) {
 fragment.append(" xmlns=\"" + ns + "\"");
 }
 fragment.append("/>");
 }
 return fragment.toString();
}

```

- The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

```

public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
 return true;
}

public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
 return true;
}

public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
 return true;
}

```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

In the listing below, the XML document contains the table element:

```

<table width="300">
 <customcol width="50.0px"/>
 <customcol width="1*"/>
 <customcol width="2*"/>
 <customcol width="20%"/>
 <header>
 <td>C1</td>
 <td>C2</td>
 <td>C3</td>
 <td>C4</td>
 </header>
 <tr>
 <td>cs=1, rs=1</td>
 <td>cs=1, rs=1</td>
 <td row_span="2">cs=1, rs=2</td>
 <td row_span="3">cs=1, rs=3</td>
 </tr>
 <tr>
 <td>cs=1, rs=1</td>
 <td>cs=1, rs=1</td>

```

```

</tr>
<tr>
 <td column_span="3">cs=3, rs=1</td>
</tr>
</table>

```

When no table column width provider is specified, the table has the following layout:

C1	C2	C3	C4
cs=1, rs=1	cs=1, rs=1	cs=1, rs=2	cs=1, rs=3
cs=1, rs=1	cs=1, rs=1		
cs=3, rs=1			

**Figure 570: Table layout when no column width provider is specified**

When the above implementation is configured, the table has the correct layout:

C1	C2	C3	C4
cs=1, rs=1	cs=1, rs=1	cs=1, rs=2	cs=1, rs=3
cs=1, rs=1	cs=1, rs=1		
cs=3, rs=1			

**Figure 571: Columns with custom widths**

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype [on the Oxygen XML Editor website](#).

#### Configuring a Table Cell Span Provider

In a custom framework, the table element can have cells that span over multiple columns and rows. As explained in [Configuring Tables](#) on page 1195, you need to indicate Oxygen XML Editor a method to determine the cell spanning. If you use the cell element attributes rowspan and colspan or rows and cols, Oxygen XML Editor can determine the cell spanning automatically. In our example the td element uses the attributes row\_span and column\_span that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```

import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
 implements AuthorTableCellSpanProvider {

```

2. The init method is taking as argument the `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML table element. In our case the cell span is specified for each of the cells so you

leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the table element. In such cases, you must collect the span information by analyzing the table element.

```
public void init(AuthorElement table) {
}
```

3. The getColSpan method is taking as argument the table cell. The table layout engine will ask this AuthorTableSpanSupport implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return null for all the cells that do not change the span specification.

```
public Integer getColSpan(AuthorElement cell) {
 Integer colSpan = null;

 AttrValue attrValue = cell.getAttribute("column_span");
 if(attrValue != null) {
 // The attribute was found.
 String cs = attrValue.getValue();
 if(cs != null) {
 try {
 colSpan = new Integer(cs);
 } catch (NumberFormatException ex) {
 // The attribute value was not a number.
 }
 }
 }
 return colSpan;
}
```

4. The row span is determined in a similar manner:

```
public Integer getRowSpan(AuthorElement cell) {
 Integer rowSpan = null;

 AttrValue attrValue = cell.getAttribute("row_span");
 if(attrValue != null) {
 // The attribute was found.
 String rs = attrValue.getValue();
 if(rs != null) {
 try {
 rowSpan = new Integer(rs);
 } catch (NumberFormatException ex) {
 // The attribute value was not a number.
 }
 }
 }
 return rowSpan;
}
```

5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```
public boolean hasColumnSpecifications(AuthorElement tableElement) {
 return true;
}
```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

6. In the listing below, the XML document contains the table element:

```
<table>
 <header>
 <td>C1</td>
 <td>C2</td>
 <td>C3</td>
 <td>C4</td>
 </header>
 <tr>
 <td>cs=1, rs=1</td>
 <td column_span="2" row_span="2">cs=2, rs=2</td>
 <td row_span="3">cs=1, rs=3</td>
 </tr>
 <tr>
 <td>cs=1, rs=1</td>
 </tr>
 <tr>
 <td column_span="3">cs=3, rs=1</td>
 </tr>
```

```
</table>
```

When no table cell span provider is specified, the table has the following layout:

The screenshot shows the Oxygen XML Editor interface with a document tree on the left and a main workspace on the right. The workspace contains a table with four columns labeled C1, C2, C3, and C4. The table has four rows. The first row contains four cells. The second row contains three cells, with the third cell spanning two rows. The third row contains one cell. The fourth row contains one cell. The table is defined by the following XML code:

```
#document article section para
```

Table showing different values for the column and row span when no span provider is specified.

C1	C2	C3	C4
cs=1, rs=1	cs=2, rs=2	cs=1, rs=3	
cs=1, rs=1			
cs=3, rs=1			

Text Grid Author

**Figure 572: Table layout when no cell span provider is specified**

When the above implementation is configured, the table has the correct layout:

The screenshot shows the Oxygen XML Editor interface with a document tree on the left and a main workspace on the right. The workspace contains a table with four columns labeled C1, C2, C3, and C4. The table has four rows. The first row contains four cells. The second row contains three cells, with the first cell spanning two rows and the third cell spanning two rows. The third row contains one cell. The fourth row contains one cell. The table is defined by the following XML code:

```
#document article section para
```

Table showing different values for the column and row span.

C1	C2	C3	C4
cs=1, rs=1	cs=2, rs=2	cs=1, rs=3	
cs=1, rs=1			
cs=3, rs=1			

Text Grid Author

**Figure 573: Cells spanning multiple rows and columns.**

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the *Oxygen SDK*, available as a Maven archetype [on the Oxygen XML Editor website](#).

#### Configuring a Table Cell Row and Column Separator Provider

In a custom framework, the table element has separators between rows. As explained in [Configuring Tables](#) on page 1195, you need to indicate a method to determine the way rows and columns are separated. If you use the `rowsep` and `colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

- Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider{
```

- The `init` method is taking as argument the `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML table element. In our case the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the `table` element. In such cases, you should initialize your provider based on the given argument.

```
public void init(AuthorElement table) {
}
```

- The `getColSep` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. In our case we choose to return `false` since we do not need column separators.

```
/**
 * @return false - No column separator at the right of the cell.
 */
@Override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
 return false;
}
```

- The row separators are determined in a similar manner. This time the method returns `true`, forcing a separator between the rows.

```
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
 return true;
}
```

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

- In the example below, the XML document contains the `table` element:

```
<table>
 <header>
 <td>H1</td>
 <td>H2</td>
 <td>H3</td>
 <td>H4</td>
 </header>
 <tr>
 <td>C11</td>
 <td>C12</td>
 <td>C13</td>
 <td>C14</td>
 </tr>
 <tr>
 <td>C21</td>
 <td>C22</td>
 <td>C23</td>
 <td>C24</td>
 </tr>
 <tr>
 <td>C31</td>
 <td>C32</td>
 <td>C33</td>
 <td>C34</td>
 </tr>
</table>
```

When the borders for the `td` element are removed from the CSS, the row separators become visible:

H1	H2	H3	H4
C11	C12	C13	C14
C21	C22	C23	C24
C31	C32	C33	C34

**Figure 574: Row separators provided by the Java implementation.**

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

#### Configuring a Unique Attributes Recognizer

The [\*ro.sync.ecss.extensions.api.UniqueAttributesRecognizer\*](#) interface can be implemented if you want to provide for your framework the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks. The following methods can be implemented to accomplish this: `assignUniqueIDs(int startOffset, int endOffset)`, `isAutoIDGenerationActive()`
- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

**Tip:** The [\*ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer\*](#) class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework. You can also check out the DITA and DocBook implementations of [\*ro.sync.ecss.extensions.api.UniqueAttributesRecognizer\*](#) to see how they were implemented and connected to the extensions bundle.

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

#### Configuring an XML Node Renderer Customizer

You can use this API extension to customize the way an XML node is rendered in the **Outline** view in **Author** mode, breadcrumb navigation bar in **Author** mode, **Outline** view in **Text** mode, Content Completion Assistant window, or **DITA Maps Manager** view.

**Note:** Oxygen XML Editor uses `XMLNodeRendererCustomizer` implementations for the following frameworks: DITA, DITA Map, DocBook 4, DocBook 5, TEI P4, TEI P5, XHTML, XSLT, and XML Schema.

There are two methods to provide an implementation of

[\*ro.sync.eml.workspace.api.node.customizer.XMLNodeRendererCustomizer\*](#):

- As a part of a bundle, returning it from the `createXMLNodeCustomizer()` method of the `ExtensionsBundle` associated with your document type in the [Document type configuration dialog box \(Extensions bundle field in the Extensions tab\)](#).
- As an individual extension, associated with your document type in the [Document type configuration dialog box \(XML node renderer customizer field in the Individual extensions section of the Extensions tab\)](#).

## Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the `XMLNodeRendererCustomizer` should be backed up by a copy of larger size using the proper [Retina/HiDPI naming convention](#).

For example, for the `title` element, if the `XMLNodeRendererCustomizer` returns the path  `${framework}/images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file `(myImg@2x.png)` should be added to the same images directory ( `${framework}/images/myImg@2x.png`). If the higher resolution icon (the `@2x` file) does not exist, the *normal* icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the [Using Retina/HiDPI Images in Author Mode](#) section.

**Note:** The complete source code for the examples can be found in the Simple Documentation Framework project, included in the `oxygen-sample-framework` module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor website](#).

## Adding Custom Persistent Highlights

The [Author API](#) includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```
<?oxy_custom_start prop1="val1" . . . ?> xml content <?oxy_custom_end?>
```

This functionality is available through the `AuthorPersistentHighlighter` class that is accessible through the `AuthorEditorAccess#getPersistentHighlighter()` method.

For more information, see the JavaDoc details for this class at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html>.

## Customizing the Main CSS of a Document Type

The easiest way to customize the *main* CSS stylesheet of a document type is to create a new CSS stylesheet, save it as an *alternate* CSS file that will be applied as an additional layer to the *main* CSS, and then select it from the **Styles** drop-down menu in **Author** mode.

For example, suppose that you want to customize the *main* CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/edit` folder (where the default *main* stylesheet named `style-basic.css` is located).
2. Edit the DITA framework and go to its **CSS** subtab:
  - a) [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.
  - b) Select the DITA document type and press the **Edit** button.

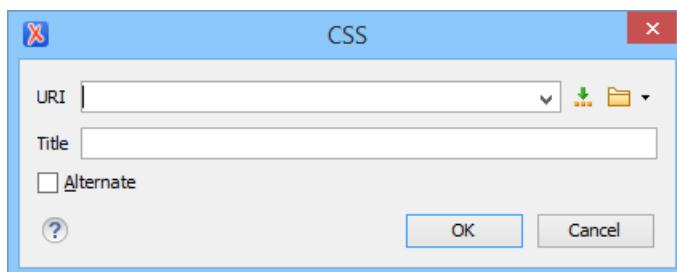

**Tip:** If you do not have write permissions to modify the document type, use the **Extend** button to create an extension of the framework.

- a) Go to the **CSS** subtab of the **Author** tab.

Association rules	Schema	Classpath	Author	Templates	Catalogs	Transformation	Validation	Extensions
CSS	URI				Title			Alternate
Actions								
Menu	<code>\$(framework)/css/edit/style-basic.css</code>				Basic			no
Contextual menu	<code>\$(framework)/css/edit/style-century.css</code>				Century			no
Toolbar	<code>\$(framework)/css_classed/dita.css</code>				<Old - Compatibility Mode>			no
Content Completion	<code>\$(framework)/css/edit/alternate-full-width-layout.css</code>				+ Full width			yes
	<code>\$(framework)/css/edit/alternate-map-print-preview-layout.css</code>				+ Print ready			yes
	<code>\$(framework)/css/edit/alternate-coloured-revisions.css</code>				+ Colored revision changes			yes
	<code>\$(framework)/css/edit/alternate-syntax-highlight.css</code>				+ Codeblock syntax highlight			yes
	<code>\$(framework)/css/edit/alternate-table-show-colspec.css</code>				+ Show table column speci...			yes

**Figure 575: CSS Subtab of the Document Type Association Author Tab**

3. Add the new stylesheet as an *alternate* CSS stylesheet:
    - a) Click the  **Add** button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
    - b) Check the **Alternate** option to define it as an *alternate* stylesheet that will applied as an additional layer to the *main* CSS.

**Figure 576: Add CSS Stylesheet Dialog Box**

4. Press **OK** in all the dialog boxes to validate the changes.
  5. Select your newly created CSS stylesheet from the **Styles** drop-down menu on the toolbar in **Author** mode. You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the **Author** mode by using the  **Refresh** action that is available on the **Author** toolbar and in the **DITA** menu.

## **Related information**

[Selecting and Combining Multiple CSS Styles](#) on page 1222

## Sharing a Document Type (Framework)

Oxygen XML Editor allows you to share customizations of a specific XML type by creating your own [Document Type \(framework\)](#) in the [Document Type Association preferences page](#).

A document type (framework) can be shared with other authors by using any of the following methods:

#### **Save it in a Custom Folder**

To share your customized framework with other members of your team, you can save it to a separate folder inside the `[OXYGEN_INSTALL_DIR]/frameworks` directory by following these steps:

**Important:** For this approach to work, the application must be installed in a folder with full write access.

1. Go to `[OXYGEN_INSTALL_DIR]/frameworks` and create a directory for your new framework (for example, `custom_framework`). This directory will contain the resources for your customized framework. See the **DocBook** framework structure from `[OXYGEN_INSTALL_DIR]/frameworks/docbook` as an example.
2. Create your custom document type (framework) and specify the `custom_framework` directory for the **External** storage option.
3. Configure the custom document type according to your needs. Take special care to make all file references relative to the `[OXYGEN_INSTALL_DIR]/frameworks` directory by using the  `${frameworks}` editor variable. See the [Author Mode Customization](#) section for more details on creating and configuring a new document type (framework).
4. Add any additional resources (CSS files, new file templates, schemas used for validation, catalogs, etc.) to the directory you created in step 1.
5. After completing your customizations in the [Document Type Association preferences page](#), you should have a new configuration file saved in: `[OXYGEN_INSTALL_DIR]/frameworks/custom_framework/custom.framework`.
6. To share the new framework directory with other users, have them copy it to their `[OXYGEN_INSTALL_DIR]/frameworks` directory. The new framework will be available in the list of Document Types when Oxygen XML Editor starts.

**Note:** If you have a frameworks directory stored on your local drive, you can also go to the [Document Type Association > Locations preferences page](#) and add your frameworks directory in the **Additional frameworks directories** list.

### Save it at Project Level

You can also share customized frameworks by saving it at project level in the [Document Type Association preferences page](#). To do so, follow these steps:

1. On your local drive, create a directory with full write access. This directory will contain the resources for your customized framework and the project file.
2. Start Oxygen XML Editor, go to the [Project view](#) and create a project. Save it in the newly created directory.
3. In the [Document Type Association preferences page](#), select **Project Options** at the bottom of the page.
4. Create your custom document type (framework) and use the default **Internal** storage option. It will actually be saved in the project file (.xpr).
5. Configure the custom document type according to your needs. Take special care to make all file references relative to the project directory by using the  `${pd}` editor variable. See the [Author Mode Customization](#) section for more details on creating and configuring a new document type (framework).
6. Add any additional resources (CSS files, new file templates, schemas used for validation, catalogs, etc.) to your project.
7. You can then share the new project directory with other team members. When they open the customized project file in the [Project view](#), the new framework becomes available in the list of Document Types.

### Deploy it as an Add-on

You can also share your customized framework by deploying it as an add-on. To do so, follow the procedures in [Packing and Deploying Plugins or Frameworks as Add-ons](#) on page 1166.

#### Related information

[Sharing an Extended Document Type \(Framework\)](#) on page 1206

### Sharing an Extended Document Type (Framework)

You can extend a predefined, built-in document type (such as **DITA** or **DocBook**) using the [Document Type Association preferences page](#), make modifications to it, and then share the extension with your team.

### Extending a Framework to be Shared

For the purpose of providing specific instructions for sharing an extended framework, suppose that you want to share an extension of the **DITA** framework in which you have removed certain elements from the content completion list. The follow steps describe how you can create an extended framework that can be shared with others:

1. In a location where you have full write access, create a folder structure similar to this: custom\_frameworks/dita-extension.
2. Open the **Preferences** dialog box (**Options > Preferences**) and go to **Document Type Association > Locations**. In this preferences page, add the path to your custom\_frameworks folder in the **Additional frameworks directories** list.
3. Go to the **Document Type Association** preferences page and select the **DITA** document type configuration and use the **Extend** button to create an extension for it.
4. Give the extension an appropriate name (for example, DITA - Custom), select **External** for the **Storage** option, and specify an appropriate path (for example, path/to/.../custom\_frameworks/dita-extension/dita-extension.framework).
5. Make your changes to the extension. For example, you could go to the **Content Completion** subtab of the **Author** tab and in the **Filter - Remove content completion items** list, add elements that you do not want to be presented to the end users.
6. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page.

## Results

After you perform these steps you will have a fully functional framework in the dita-extension folder and it can be shared with others.

## Sharing the Extended Framework

There are several ways that you can share the extended framework with others:

- Copy it to their `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- Create a `custom_frameworks` folder (anywhere on disk) and copy the extended framework into it. Then add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list in the **Document Type Association > Locations** preferences page.
- Distribute the extended framework along with a project by following these steps:
  1. On your local drive, create a directory (with full write access) that contains the project files and a `custom_frameworks` folder with your extended framework inside.
  2. Start Oxygen XML Editor, go to the **Project view** and create a project. Save it in the newly created directory.
  3. In the **Document Type Association > Locations** preferences page, select **Project Options** at the bottom of the page.
  4. In the **Additional frameworks directories** list, add an entry like this: `$(pd)/custom_frameworks`.
  5. Add other resources to your project (for example, you can have all your DITA content located inside the project folder).
  6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in the **Project view**, the new framework becomes available in the list of Document Types.
- Deploy the extended framework configuration *as an add-on*.

After your team members install the framework they can check the list of Document Types in the **Document Type Association** preferences page to see if the framework is present and if it appears before the bundled **DITA** framework (meaning that it has higher priority).

## Related information

[Sharing a Document Type \(Framework\)](#) on page 1205

## Customizing the Content Completion Assistant

Oxygen XML Editor gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the **Content Completion Assistant**. Oxygen XML Editor also includes support that allows you to customize the **Content Completion Assistant** to suit your specific needs.

There are two ways to customize the **Content Completion Assistant** in Oxygen XML Editor:

- You can add, modify, or remove actions that are proposed for each particular document type (framework) by using the **Content Completion subtab** in the **Document Type Association** configuration dialog box. To access

- this subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Content Completion** subtab.
- You can use a cc\_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

### Configuring the Proposals for Attribute and Element Values

Oxygen XML Editor includes support for configuring the proposed values that appear in the **Content Completion Assistant**. To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the **Content Completion Assistant**.

For an example of a specific use-case, suppose that you want the **Content Completion Assistant** to propose several possible values for the language code when you use an `xml:lang` attribute.

### Setting up the Content Completion Configuration File

To customize the configuration file for the **Content Completion Assistant**, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN\_INSTALL\_DIR/frameworks/dita/resources).
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath tab** add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
  - a. To easily create a new configuration file, you can use the *Content Completion Configuration* file template that is included in Oxygen XML Editor ([File > New > Framework templates > Oxygen Extensions > Content Completion Configuration](#)). The file template includes details about how each element and attribute is used in the configuration file.
  - b. If a configuration file (cc\_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc\_config.xml (for example, OXYGEN\_INSTALL\_DIR/frameworks/dita/resources/cc\_config.xml).
6. Restart the application and open an XML document. In the **Content Completion Assistant** you should see your customizations.

**Tip:** In some cases, you can simply use the  [Refresh \(F5\)](#) action to test your customizations, without having to restart the application.

### Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (cc\_config.xml) includes a series of match instructions that will match an element or attribute name. You also have the possibility of using an attribute called `editable` on the `match` element to specify the editable state of the attribute values, as reflected in the [Attributes view](#) and the [In-place Attributes Editor](#). The possible values for the `editable` attribute are:

- `true` - The attribute values can be edited by choosing from a combo box or manually providing a value.
- `false` - The attribute values cannot be edited.
- `onlyAllowedItems` - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

A new value is specified inside one or more `item` elements, which are grouped inside an `items` element. The behavior of the `items` element is specified with the help of the `action` attribute, which can have any of the following values:

- `append` - Adds new values to appear in the proposals list (default value).
- `addIfEmpty` - Adds new values to the proposals list only if no other values are contributed by the schema.

- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

## Other Important Notes About the Configuration File

### Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

### Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```
<!-- Replaces the values for an element with the local name "lg",
 from the given namespace -->
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
 <items action="replace">
 <item value="stanza"/>
 <item value="refrain"/>
 </items>
</match>

<!-- Adds two values for an attribute with the local name "type",
 from any namespace -->
<match attributeName="type" editable="onlyAllowedItems">
 <items>
 <item value="stanza"/>
 <item value="refrain"/>
 </items>
</match>
```

### Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

**Note:** A comprehensive XSLT sample is included in the **Content Completion Configuration** file template.

### Configuring Proposed Values in the Context that the Content Completion was Invoked

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element in which the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, `color`) and other values for another property (for example, `shape`). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```
<sampleArticle>
 <!-- The possible values for @value should be "red" and "blue" -->
 <property name="color" value="" />
 <!-- The possible values for @value should be "square" and "rectangle" -->
 <property name="shape" value="" />
</sampleArticle>
```

The content completion configuration file:

```
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
 <match elementName="property" attributeName="value">
 <xslt href="get_values.xsl" useCache="false" action="replace"/>
 </match>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```
<xsl:stylesheet
 xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 xmlns:saxon="http://saxon.sf.net/"
 exclude-result-prefixes="xs"
 version="2.0">

 <xsl:param name="documentSystemID" as="xs:string"></xsl:param>
 <xsl:param name="contextElementXPathExpression" as="xs:string"></xsl:param>

 <xsl:template name="start">
 <xsl:apply-templates select="doc($documentSystemID)" />
 </xsl:template>

 <xsl:template match="/">
 <xsl:variable name="propertyElement"
 select="saxon:eval(saxon:expression($contextElementXPathExpression, ./*))" />

 <items>
 <xsl:if test="$propertyElement/@name = 'color'">
 <item value='red' />
 <item value='blue' />
 </xsl:if>
 <xsl:if test="$propertyElement/@name = 'shape'">
 <item value='rectangle' />
 <item value='square' />
 </xsl:if>
 </items>
 </xsl:template>
</xsl:stylesheet>
```

The contextElementXPathExpression parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

## Related information

[Configuring the Proposals for Elements](#) on page 1210

[Customizing the Rendering of Elements](#) on page 1214

## Configuring the Proposals for Elements

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (`li`) accepts more than 60 child elements. Oxygen XML Editor includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want restrict DITA list item elements (`li`) to only accept paragraph elements (`p`). In this case, the **Content Completion Assistant** should not offer any element other than a paragraph (`p`) when a list item (`li`) is inserted into a document. It would also be helpful if the required child element (`p`) was automatically inserted whenever a list item (`li`) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Editor offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

## Setting up the Content Completion Configuration File

To customize the configuration file for the **Content Completion Assistant**, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath tab** add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
  - a. To easily create a new configuration file, you can use the *Content Completion Configuration* file template that is included in Oxygen XML Editor ([File > New > Framework templates > Oxygen Extensions > Content Completion Configuration](#)). The file template includes details about how each element and attribute is used in the configuration file.

- b. If a configuration file (cc\_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
  5. Save the file in the resources folder for the particular document type, using the fixed name: cc\_config.xml (for example, OXYGEN\_INSTALL\_DIR/frameworks/dita/resources/cc\_config.xml).
  6. Restart the application and open an XML document. In the **Content Completion Assistant** you should see your customizations.

**Tip:** In some cases, you can simply use the  Refresh (F5) action to test your customizations, without having to restart the application.

### Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (cc\_config.xml) uses elementProposals elements. This element allows you to customize or filter the child elements and attributes for an element.

#### Elements:

To control the **elements** that are proposed for an element, you can use the following attributes for the elementProposals element:

- path - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the title elements in the document, while "chapter/title" matches only the title elements that are direct children of the chapter element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/ OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- element[@attr] - Matches all instances of the specified element that include the specified attribute.
- element[not(@attr)] - Matches all instances of the specified element that do not include the specified attribute.
- element[@attr = "value"] - Matches all instances of the specified element that include the specified attribute with the given value.
- element[@attr != "value"] - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- elementName
- //elementName
- /elementName1/elementName2/elementName3
- //xs:localName Note: Using a namespace prefix requires that you declare it in the configuration file. For example: <elementProposals xmlns:db5="http://docbook.org/ns/docbook" path="db5:listitem" insertElements="db5:para" />
- //xs:documentation[@lang="en"]

**Note:** If the path attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use *possibleElements* or *rejectElements* to specify or restrict elements for an entire framework.

For example, suppose that in your DITA documents, you want to restrict your users from using image elements (`image`) because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image" />
```

Since the path attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- `insertElements` - A space-separated sequence of child element names. Each time the element specified in the path attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one `b` element, followed by an `i` element. An empty value (" ") means that no child elements should be inserted.

**Note:** If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.
- `possibleElements` - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the path attribute. For example, "bold italic codeph ph" means that the **Content Completion Assistant** will contain these four elements when invoked on the element specified in the path attribute. The following other possible values are also supported:
  - **NONE** - There will be no proposals in the content completion list.
  - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - **INSERTED** - The proposals will be the same list of elements that are defined in the `insertElements` attribute.
- `rejectElements` - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the path attribute is inserted into the document, the list of proposals in the **Content Completion Assistant** will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

#### Attributes:

To control the **attributes** that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- `path` - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `title` elements in the document, while "chapter/title" matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the [note in XML Preferences](#).

**Note:** If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleAttributes` or `rejectAttributes` to specify or restrict attributes for an entire framework.

For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```
<elementProposals possibleAttributes="
 id domains href scope format type conref
 props keyref class"/>
```

Since the path attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- `insertAttributes` - A space-separated sequence of attribute names that will be inserted along with the element.
- `possibleAttributes` - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the path attribute.
- `rejectAttributes` - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the path attribute is inserted into the document, the list of proposals in the **Content Completion Assistant** will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

## Other Important Notes About the Configuration File

### Important:

- By default, the element names that do not have a namespace prefix are considered from *no-namespace*. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the elementPath and model attributes.
- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the  Refresh (F5) action to test your customizations.
- When an XML element from the document is matched against a list of configured elementProposals, the first one in sequence takes precedence. Therefore, make sure you place the more specific elementProposals (those with a longer path) first in your configuration file.
- Regular expression patterns can be used in the following attributes: possibleElements, rejectElements, possibleAttributes, and rejectAttributes. For example, code\*, \*block, con\*ref, \*\_.
- Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex elementProposals patterns are defined, you should avoid *infinite recursions*.

### Examples: Configuring the Element Proposals

- **Example 1: Automatically Insert Elements**

Suppose that you want to automatically insert a paragraph element (p) whenever a DITA ordered list item element (ol/li) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```
<elementProposals path="ol/li" insertElements="p"
 possibleElements="_INSERTED_" />
```

- **Example 2: Insert Complex Element Structure**

For a more complex example, suppose that you want to insert a complex structure whenever a DITA prolog element is inserted.

For instance, if you need to insert the following structure inside prolog elements:

```
<prolog>
 <author></author>
 <metadata>
 <keywords>
 <keyword></keyword>
 <keyword></keyword>
 </keywords>
 </metadata>
</prolog>
```

The configuration file should include the following:

```
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/keywords"
 insertElements="keyword, keyword"/>
```

- **Example 3: Limit Possible Elements**

Suppose that you also want to limit the proposals for the keywords element to only allow the user to insert audience or keyword elements. The configuration file should include the following:

```
<elementProposals path="prolog/metadata" insertElements="keywords"
 possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting image elements inside DITA list item elements (li), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="li" rejectElements="image" />
```

## Examples: Configuring the Attributes Proposals

- **Example 1: Automatically Insert Attributes**

Suppose that you want to insert an `id` attribute (with an empty value) whenever a DITA list item element (`li`) is inserted. The configuration file should include the following:

```
<elementProposals path="li" insertAttributes="id"/>
```

- **Example 2: Limit Possible Attributes**

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (`li`) is inserted. The configuration file should look like this:

```
<elementProposals path="li" insertAttributes="id"
 possibleAttributes="id product platform audience"/>
```

Suppose that you want to simply restrict your users from inserting `conref` attributes inside DITA topics (topic element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="topic" rejectAttributes="conref" />
```

### Related information

[Configuring the Proposals for Attribute and Element Values](#) on page 1208

[Customizing the Rendering of Elements](#) on page 1214

## Customizing the Rendering of Elements

In addition to the support for configuring the proposals that appear in the **Content Completion Assistant**, Oxygen XML Editor also includes support for customizing how the elements are rendered. You can do this by using the [XMLNodeRendererCustomizer API extension](#), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`p`) to be rendered as "Paragraph" instead of "`p`" in the various components in **Author** mode (such as in the **Outline** view, **Elements** view, **Attributes** view, and the breadcrumb navigation bar). To achieve this, you can use the `elementRenderings` element in the configuration file.

## Setting up the Content Completion Configuration File

To customize the configuration file for the **Content Completion Assistant**, follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath tab** add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
  - a. To easily create a new configuration file, you can use the *Content Completion Configuration* file template that is included in Oxygen XML Editor ([File > New > Framework templates > Oxygen Extensions > Content Completion Configuration](#)). The file template includes details about how each element and attribute is used in the configuration file.
  - b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the **Content Completion Assistant** you should see your customizations.

**Tip:** In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

## Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the render element inside a elementRenderings element to specify how element names, their annotations, and their icons are rendered.

You can use the following attributes for the render element:

- element - Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from noNamespace.
- as - Provides the name (label) that will be displayed for the element in various components in **Author** mode (such as in the **Content Completion Assistant**, the breadcrumb navigation bar, the **Full Tags** display mode, and the **Outline**, **Elements**, and **Attributes** views). This attribute is optional. If it is missing, the name of the element is used.
- iconPath - Optional attribute that specifies the icon for the element. This is shown in the **Content Completion Assistant** and the **Outline** view in **Author** mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Editor to load "frameworks/\$ {framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/" , and the image file will be searched for in the Oxygen XML Editor classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Editor JAR file resources).
- xml:lang - Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple render elements for the same element attribute (element name) and the xml:lang attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

**Note:** The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (p) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```
<elementRenderings>
 <render element="p" as="Paragraph" />
 <render element="p" as="Paragraphe" xml:lang="fr" />
 <render element="p" as="Absatz" xml:lang="de" />
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the render element also accepts the following element to change the tooltip annotations for an element (in both **Author** mode and **Text** mode):

- annotation - This element can be used within the render element to customize the tooltip annotations that are displayed for the element in various components in **Author** mode (such as tooltips shown in the **Content Completion Assistant** documentation window, the breadcrumb navigation bar, the **Full Tags** display mode, and the **Outline**, **Elements**, and **Attributes** views), as well as the tooltips that are displayed when you hover over elements in **Text** mode. You can use HTML content to style the annotations (see the [example below](#)).

**Note:** If this element is missing, the [styling for the annotations for that element is collected from the associated schema](#).

## Other Important Notes About the Configuration File for Rendering Elements

### Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the Refresh (F5) action to test your customizations.

- If the framework has an associated *styleguide*, then the annotations defined in the configuration file will take precedence over those defined in the *styleguide*. To check to see if your framework uses a *styleguide*, look for the following folder: \${oxygenInstallDir}frameworks/\${framework}/styleguide/. If that folder exists, it is recommended that you make your annotation changes directly in the *styleguide*, rather than in the configuration file.
- If an *XMLNodeRendererCustomizer API extension* has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the XMLNodeRendererCustomizer implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also applies to aspects of the Oxygen XML Web Author Component interface.

### Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA *title* element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in **Author** mode. The configuration file should look like this:

```
<elementRenderings>
 <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
 <annotation>
 <html xmlns="http://www.w3.org/1999/xhtml">
 <head>
 <title>Documentation for the Title Element</title>
 </head>
 <body>
 <p>A <i>heading</i> or label for the main parts of a topic</p>
 </body>
 </html>
 </annotation>
 </render>
</elementRenderings>
```

[Schema Annotations in Author Mode](#) on page 339

### Annotations for XML Elements and Attributes in Content Completion Assistant

Oxygen XML Editor gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the **Content Completion Assistant** for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the **Elements** view. If you hover over attributes in the **Attributes** view you also see information about each attribute, gathered from the same schema.

If you have a document type configuration set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to specification web pages for certain elements and attributes.

To provide this additional information in the **Content Completion Assistant**, follow these steps:

1. Create a new folder in the configuration directory for the document type.  
OXYGEN\_INSTALL\_DIR/frameworks/dita/styleguide
2. Use the **New** document wizard to create a file using the Oxygen content completion styleguide file template.
3. Save the file in the folder created in step 1, using the fixed name: contentCompletionElementsMap.xml.

4. Open the **Preferences** dialog box (**Options > Preferences**), go to **Document Type Association**, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor will locate your mapping file by doing one of the following:
- In the **Classpath** tab add a link to the newly created folder.
  - In the **Catalogs** tab *add a new catalog file*. The selected file needs to contain the following:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
 "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
 <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/
 contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
</catalog>
```

where *{processed\_dt\_name}* is the name of the document type in lower case and with spaces replaced by underscores.

**Note:** If Oxygen XML Editor finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

You can look at how the DITA mapping file is configured:`OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml`

The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

In the **Content Completion Assistant** you should see the additional annotations for each element.

```

## CSS Support in Author Mode

---

**Author** editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language. Also, some custom functions and properties that extend the W3C CSS specification, and are useful for URL and string manipulation, are available to developers who create **Author** editing frameworks.

### Selecting and Combining Multiple CSS Styles

Oxygen XML Editor provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate)* CSS style and multiple *alternate* CSS styles. This makes it easy to change the look of the document.

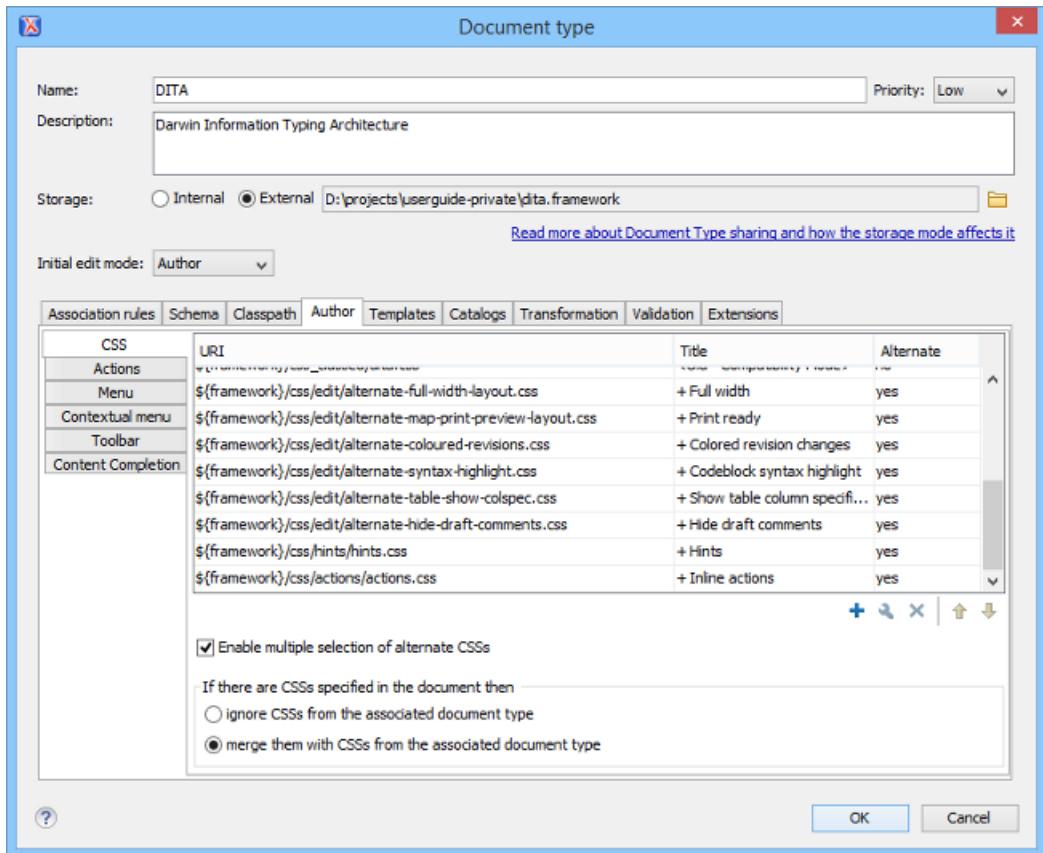

An example of a common use case is when content authors want to use custom styling within a document. You can select a *main* CSS stylesheet that styles the whole document and then apply *alternate* styles, as layers, to specific parts of the document.

### Managing the CSS Styles

The *main* and *alternate* styles that are listed in the **Styles** drop-down menu can be controlled in the [Document Type configuration dialog box](#). To access it, follow these steps:

1. [Open the Preferences dialog box](#).
2. Go to **Document Type Association**.
3. Select the appropriate document type and press the **Edit** button.

The CSS styles (CSS files) associated with the particular document type are listed in the **CSS** subtab of the **Author** tab.

**Figure 577: Main and Alternate CSS Styles in the Document Type Association Dialog Box**

You can **Add**, **Edit**, or **Delete** styles from this dialog box to manage the *main* and *alternate* styles associated to the particular document type. You can also change the order of the styles by using the **Move Up** and **Move Down** buttons. This will also change the order that they appear in the **Styles** drop-down menu. The *alternate* styles are combined with the *main* CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last *alternate* style in this list will take precedence, since it is the last one to be combined (applied as a layer).

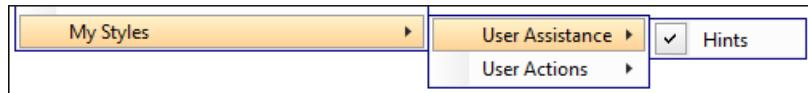

The **URI** column shows the path of each CSS file. The names listed in the **Styles** drop-down menu match the values in the **Title** column. The value in the **Alternate** column determines whether it is a *main* or *alternate* CSS. If the value is *no* it is a *main* CSS. If the value is *yes* it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the **Styles** drop-down menu.

**Note:** To group alternate styles into categories (submenus), use a vertical bar character (|) in the **Title** column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the **Styles** drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.

**Example:** Suppose that you want to add two alternate stylesheets in separate submenus, with the **Title** column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.

URI	Title	Alternate
\$(framework)/css/hints/hints.css	My Styles User Assistance Hints	yes
\$(framework)/css/actions/actions.css	My Styles User Actions Inline actions	yes

Oxygen XML Editor will add a **My Styles** submenu with two submenus (**User Assistance** that contains the **Hints** style, and **User Actions** that contains the **Inline Actions** style) in the **Styles** drop-down menu.

The **Enable multiple selection of alternate CSSs** box at the bottom of the pane must be checked for the *alternate* styles to be combined. They are applied like layers and you can activate any number of them. If this option is disabled, the *alternate* styles are treated like *main* CSS styles and you can only select one at a time. By default, this option is enabled. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to *ignore* or *merge* them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

### Using the Styles Drop-Down Menu

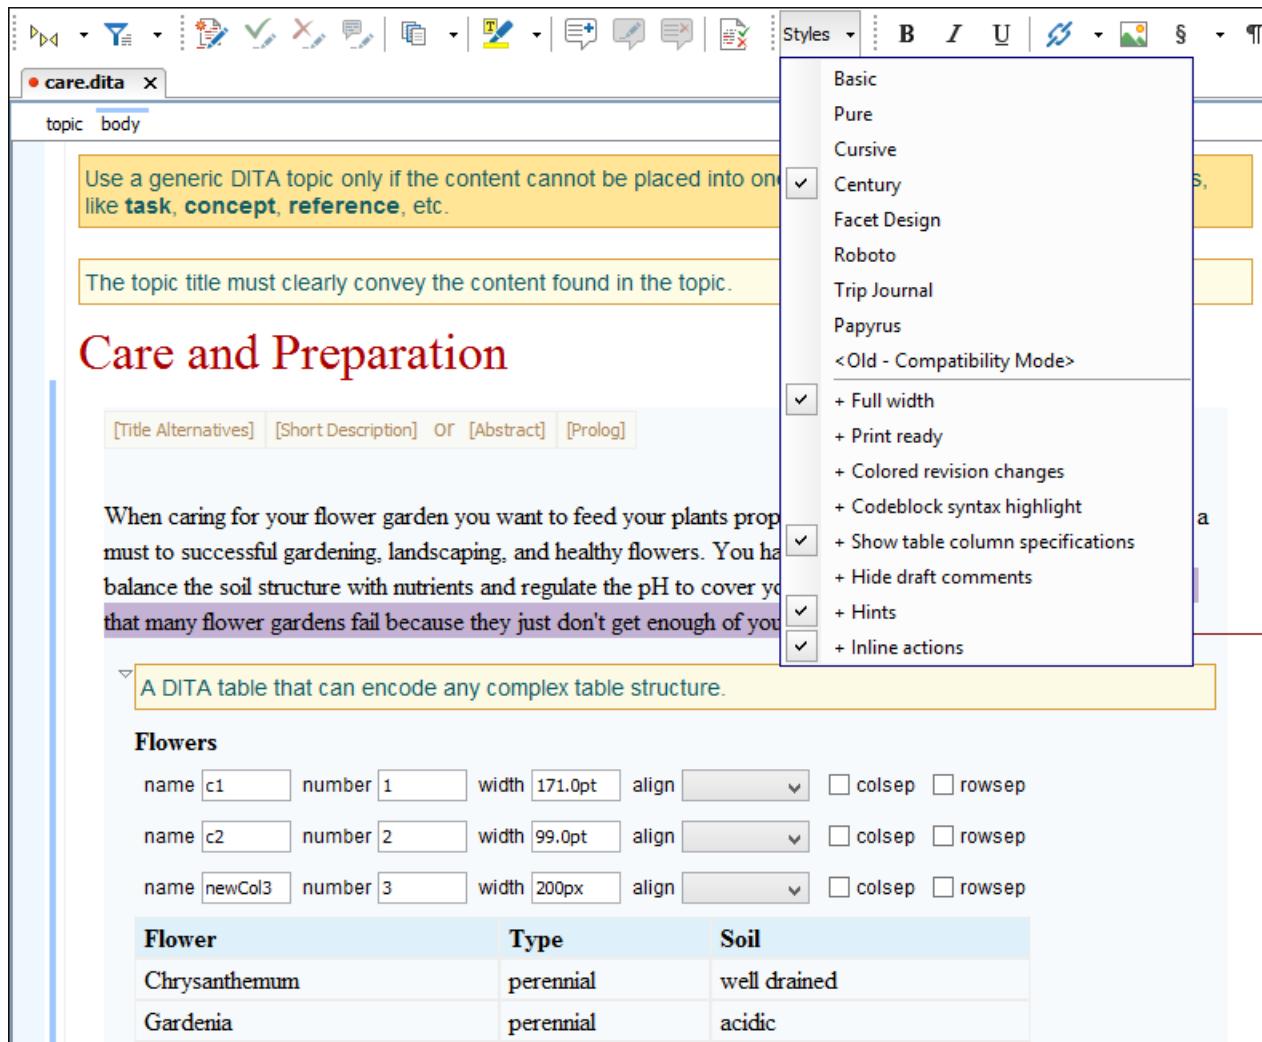

You can use the **Styles** drop-down menu to select a *main* style that applies to the whole document and then select one or more *alternate* styles that behave like layers and are merged sequentially with the *main* style. The *main* styles are listed in the top section, while the *alternate* styles are listed in the bottom section.

The selections from the **Styles** drop-down menu are persistent, meaning that Oxygen XML Editor will remember the selections when subsequent documents are opened.

### EXAMPLE: CSS Styles in DITA

Oxygen XML Editor comes with a set of predefined CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps). In the subsequent figure, a DITA document has the **Century** style selected for the *main* CSS and the *alternate* styles **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

**Tip:** The **Hints** style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The **Inline actions** style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

**Figure 578: Styles Drop-down Menu in a DITA Document**

### Related information

[CSS Subtab](#) on page 58

## Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML catalog URI mappings to determine an indirect CSS referenced location.

For example, if you can have a CSS import, such as:

```
@import "http://host/path/to/location/custom.css";
```

and then add your own XML catalog file that maps the location to a custom CSS in the [XML Catalog preferences page](#):

```
<uri name="http://host/path/to/location/custom.css"
 uri="path/to/custom.css"/>
```

## Add a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog file that looks like this:

```
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

## Editor Variables in CSS Imports

You can use various editor variables in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

For example, the following editor variable:

```
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework folder where the custom.css is placed.

## oxygen Media Type

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Editor **Author** mode and ignored in other media types. This can be accomplished by using the oxygen media type.

```
b{
 font-weight:bold;
 display:inline;
}

@media oxygen{
 b{
 text-decoration:underline;
 }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize @media oxygen, while the text is bold and underlined when opened in Oxygen XML Editor **Author** mode.

You can also use the oxygen media type to specify CSS selectors to be applied in certain operating systems or platforms by using the os and platform properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
- **platform** - The possible values are: standalone, eclipse, or webapp.

```
@media oxygen AND (os:"win") AND (platform:"standalone") {
 p{
 content:"PPP";
 }
}
```

### Related information

[@media Rule on page 1227](#)

## CSS At-Rules

Oxygen XML Editor supports some of the standard at-rules specified by CSS Level 2.1 and 3. The @media rule also include support for some style rules that are specific to Oxygen XML Editor.

### @font-face At-Rule

Oxygen XML Editor allows you to use custom fonts in the **Author** mode by specifying them in the CSS using the @font-face media type. Only the src and font-family CSS properties can be used for this media type.

```
@font-face{
 font-family:"Baroque Script";
 /*The location of the loaded TTF font must be relative to the CSS*/
 src:url("BaroqueScript.ttf");
}
```

### @media Rule

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.).

#### Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode. For more information, see [oxygen Media Type](#) on page 1226.
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode when a dark theme is used (for example, *Graphite*).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor **Author** mode on a Windows High Contrast Theme with a white background.

```
@media oxygen{
 b{
 text-decoration:underline;
 }
}
@media oxygen-high-contrast-white{
 b{
 font-weight:bold;
 }
}
```

#### Supported Properties

Oxygen XML Editor also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.

- **max-width** - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

```
@media (min-width:500px){
 p{
 content:'XXX';
 }
}
@media (max-width:700px){
 p:after{
 content:'yyy';
 }
}
```

## Standard W3C CSS Supported Features

Oxygen XML Editor supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

### Supported CSS Selectors

The following table lists the CSS selectors that are supported in Oxygen XML Editor:

Expression	Name	CSS Level	Description / Example
*	Universal selector	CSS Level 2	Matches any element
E	Type selector	CSS Level 2	Matches any E element (i. e. an element with the local name E)
E F	Descendant selector	CSS Level 2	Matches any F element that is a descendant of an E element.
E > F	Child selectors	CSS Level 2	Matches any F element that is a child of an element E.
E:lang(c)	Language pseudo-class	CSS Level 2	Matches element of type E if it is in (human) language c (the document language specifies how language is determined).
E + F	Adjacent selector	CSS Level 2	Matches any F element immediately preceded by a sibling element E.
E ~ F	General sibling selector	CSS Level 3	Matches any F element preceded by a sibling element E.
E[foo]	Attribute selector	CSS Level 2	Matches any E element with the "foo" attribute set (whatever the value).
E[foo="warning"]	Attribute selector with value	CSS Level 2	Matches any E element whose "foo" attribute value is exactly equal to "warning".
E[foo~= "warning"]	Attribute selector containing value	CSS Level 2	Matches any E element whose "foo" attribute value is a list of space-separated values, one of which is exactly equal to "warning".
E[lang = "en"]	Attribute selector containing hyphen separated values	CSS Level 2	Matches any E element whose "lang" attribute has a hyphen-separated list of values beginning (from the left) with "en".

Expression	Name	CSS Level	Description / Example
E:before and E:after	Pseudo elements	CSS Level 2	The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.
E:before(n) and E:after(n)	Pseudo elements	CSS Level 3	Multiple ':before(n)' and ':after(n)' pseudo-elements can be used to insert content before or after the content of an element (or other pseudo-element). For more information, see <a href="#">the W3C CSS3 pseudo elements site</a> .
E:first-child	The first-child pseudo-class	CSS Level 2	Matches element E when E is the first child of its parent.
E:not(s)	Negation pseudo-class	CSS Level 2	An E element that does not match simple selector s.
E:has	Relational pseudo-class	CSS Level 4	The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see <a href="#">:has Relational Pseudo-Class</a> on page 1233.
E:hover	The hover pseudo-class	CSS Level 2	The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.
E:focus	The focus pseudo-class	CSS Level 2	The :focus pseudo-class applies while an element has the focus (accepts keyboard input).
E:focus-within	The generalized input focus pseudo-class	CSS Level 4	The :focus-within pseudo-class applies to elements for which the :focus pseudo-class applies. Additionally, the ancestors of an element that matches :focus-within also match.
E#myid	The ID selector	CSS Level 2	Matches any E element with ID equal to "myid". <b>Important:</b> Limitation: In Oxygen XML Editor the match is performed only taking into account the attributes with the exact name: "id".
E[att^="val"]	Substring matching attribute selector	CSS Level 3	An E element whose att attribute value begins exactly with the string val.

Expression	Name	CSS Level	Description / Example
E[att\$="val"]	Substring matching attribute selector	CSS Level 3	An E element whose att attribute value ends exactly with the string val.
E[att*="val"]	Substring matching attribute selector	CSS Level 3	An E element whose att attribute value contains the substring val.
E:root	Root pseudo-class	CSS Level 3	Matches the root element of the document. In HTML, the root element is always the HTML element.
E:empty	Empty pseudo-class	CSS Level 3	An E element that has no text or child elements.
E:nth-child(n)	The nth-child pseudo-class	CSS Level 3	An E element, the nth child of its parent.
E:nth-last-child(n)	The nth-last-child pseudo-class	CSS Level 3	An E element, the nth child of its parent, counting from the last one.
E:nth-of-type(n)	The nth-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type.
E:nth-last-of-type(n)	The nth-last-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type, counting from the last one.
E:last-child	The last-child pseudo-class	CSS Level 3	An E element, last child of its parent.
E:first-of-type	The first-of-type pseudo-class	CSS Level 3	An E element, first sibling of its type.
E:last-of-type	The last-of-type pseudo-class	CSS Level 3	An E element, last sibling of its type.
E:only-child	The only-child pseudo-class	CSS Level 3	An E element, only child of its parent.
E:only-of-type	The only-of-type pseudo-class	CSS Level 3	An E element, only sibling of its type.
ns E	Element namespace selector	CSS Level 3	An element that has the local name E and the namespace given by the prefix ns. The namespace prefix can be bound to a URI by the at-rule:  @namespace ns "http://some_namespace_uri";  See <a href="#">Namespace Selector</a> on page 1230.
E!>F	The subject selector	CSS Level 4 (experimental)	An element that has the local name E and has a child F. See <a href="#">Subject Selector</a> on page 1232.

## Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1 the name tokens from selectors are matching all elements from ANY namespace that have the same local name. Example:

```
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3 you can create selectors that are namespace aware.

### Defining both prefixed namespaces and the default namespace

Given the namespace declarations:

```
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

In a context where the default namespace applies:

**sync|A**

represents the name A in the http://sync.example.org namespace.

**|B**

represents the name B that belongs to NO NAMESPACE.

**\*|C**

represents the name C in ANY namespace, including NO NAMESPACE.

**D**

represents the name D in the http://example.com/foo namespace.

### Defining only prefixed namespaces

Given the namespace declaration:

```
@namespace sync "http://sync.example.org";
```

Then:

**sync|A**

represents the name A in the http://sync.example.org namespace.

**|B**

represents the name B that belongs to NO NAMESPACE.

**\*|C**

represents the name C in ANY namespace, including NO NAMESPACE.

**D**

represents the name D in ANY namespace, including NO NAMESPACE.

### Defining prefixed namespaces combined with pseudo-elements

To match the def element its namespace will be declared, bind it to the abs prefix, and then write a CSS rule:

```
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

**abs|def**

represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**abs|def:before**

represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**Subject Selector**

Oxygen XML Editor supports the subject selector described in CSS Level 4 (currently a working draft at W3C <http://www.w3.org/TR/selectors4/>). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!"") instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.*

```
table! > caption {
 border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```
table > caption {
 border: 1px solid red;
}
```

This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
 color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
 <title>A title</title>
 <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

**Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a! b c
```

and:

```
a! > b > c
```

## Related information

[:has Relational Pseudo-Class](#) on page 1233

### :has Relational Pseudo-Class

Oxygen XML Editor supports the CSS Level 4 subject selector (currently a working draft at W3C <http://www.w3.org/TR/selectors4/>), as described in [Subject Selector](#) on page 1232. Oxygen XML Editor also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see <https://drafts.csswg.org/selectors-4/#relational>.

You can create conditions that take into account the structure of the matching element.

```
table:has(tbody > thead){
 border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a thead element in the tbody element.

### Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
chapter! > oxy|processing-instruction[important][level="high"]{
 color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
 <title>A title</title>
 <?important level='high'?>
</chapter>
```

### Descendant Selectors Limitation

**Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a! b c
```

and:

```
a! > b > c
```

### Supported CSS Properties

Oxygen XML Editor validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor-specific (extension) CSS properties, see [Oxygen XML Editor CSS Extensions](#) on page 1240.

Name	Rendered Values	Ignored Values
'background-attachment'	NONE	
'background-color'	<color>   inherit	transparent
'background-image'	<uri>   none   inherit	
'background-position'	top   right   bottom   left   center	<percentage>   <length>

Name	Rendered Values	Ignored Values
'background-repeat'	repeat   repeat-x   repeat-y   no-repeat   inherit	
'background'	background-color   background-image   background-position   background-repeat	
'border-collapse'	NONE	
'border-color'	<color>   inherit	transparent
'border-spacing'	NONE	
'border-style'	<border-style>   inherit	
'border-top' 'border-right' 'border-bottom' 'border-left'	[ <border-width>    <border-style>    <border-color> ]   inherit	
'border-top-color' 'border-right-color' 'border-bottom-color' 'border-left-color'	<color>   inherit	transparent
'border-top-style' 'border-right-style' 'border-bottom-style' 'border-left-style'	<border-style>   inherit	
'border-top-width' 'border-right-width' 'border-bottom-width' 'border-left-width'	<border-width>   inherit	
'border-width'	<border-width>   inherit	
'border'	[ <border-width>    <border-style>    <border-color> ]   inherit	
'bottom'	<length>   <percentage>   inherit	auto
'caption-side'	NONE	
'clear'	NONE	
'clip'	NONE	
'color'	<color>   inherit	
'content'	normal   none   [ <string>   <URI>   <counter>   attr( <identifier> )   open-quote   close-quote ]+   inherit	no-open-quote   no-close-quote
'counter-increment'	[ <identifier> <integer> ? ]+   none   inherit	
'counter-reset'	[ <identifier> <integer> ? ]+   none   inherit	
'cursor'	NONE	

Name	Rendered Values	Ignored Values
'direction'	ltr   rtl   inherit

'font'	[ [ 'font-style'    'font- weight' ]? 'font-size' [ / 'line-height' ]? 'font- family' ]   inherit	'font-variant' 'line- height' caption   icon   menu   message-box   small-caption   status- bar
'height'	NONE	
'left'	< <a href="#">length</a> >   <percentage>   inherit	auto
'letter-spacing'	normal   < <a href="#">length</a> >   inherit	
'line-height'	normal   <number>   < <a href="#">length</a> >   <percentage>   inherit	
'list-style-image'	NONE	
'list-style-position'	NONE	
'list-style-type'	disc   circle   square   decimal   lower-roman   upper-roman   lower-latin   upper-latin   lower-alpha   upper-alpha   -oxy-lower- cyrillic-ru   -oxy-lower- cyrillic-uk   -oxy-upper- cyrillic-ru   -oxy-upper-	lower-greek   armenian   georgian

Name	Rendered Values	Ignored Values
	cyrillic-uk   box   diamond   check   hyphen   none   inherit	
'list-style'	[ 'list-style-type' ]   inherit	'list-style-position'    'list-style-image'
'margin-right' 'margin-left'	<margin-width>   inherit   auto	
'margin-top' 'margin-bottom'	<margin-width>   inherit	
'margin'	<margin-width>   inherit   auto	
'max-height'	NONE	
'max-width'	<length>   <percentage>   none   inherit-supported for inline, block-level, and replaced elements (such as images, tables, table cells)	
'min-height'	Absolute values, such as 230px, 1in, 7pt, 12em.	Values proportional to the parent element height, such as 30%
'min-width'	<length>   <percentage>   inherit-supported for inline, block-level, and replaced elements (such as images, tables, table cells)	
'outline-color'	[ <color>   invert   inherit	
'outline-style'	[ <border-style>   inherit	
'outline-width'	[ <border-width>   inherit	
'outline'	[ <outline-width>    <outline-style>    <outline-color> ]   inherit	
'overflow'	NONE	
'padding-top' 'padding-right' 'padding-bottom' 'padding-left'	<padding-width>   inherit	
'padding'	<padding-width>   inherit	
'position'	absolute   fixed-supported for block display elements, relative-supported for block and inline display elements	absolute   fixed not supported for inline display elements
'quotes'	NONE	
'right'	<length>   <percentage>   inherit	auto
'table-layout'	auto	fixed   inherit

Name	Rendered Values	Ignored Values
'text-align'	left   right   center   inherit	justify
'text-decoration'	none   [ underline    overline    line-through ]   inherit	blink
'text-decoration-style'	solid   double   dotted   dashed   wavy   inherit	
'text-indent'	<length>   <percentage>   inherit	
'text-transform'	none   capitalize   uppercase   lowercase   inherit	
'top'	<length>   <percentage>   inherit	auto
'unicode-bidi'	bidi-override  normal  embed  inherit	
'vertical-align'	baseline   sub   super   top   text-top   middle   bottom   text-bottom   inherit	<percentage>   <length>
'visibility'	visible   hidden   inherit   -oxy-collapse-text	collapse
'white-space'	normal   pre   nowrap   pre-wrap   pre-line	
'width'	<length>   <percentage>   auto   inherit-supported for inline, block-level, and replaced elements (such as images, tables, table cells)	
'word-spacing'	NONE	
'z-index'	NONE	

**<length>** - Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px. For more information, see [the W3 CSS Level 3 length type specifications](#).

## Related concepts

[Oxygen XML Editor CSS Extensions](#)

## Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a *real* number between 0 and 1, or a percent.

### RGBA color

```
personnel:before {
 display:block;
 padding: 1em;
 font-size: 1.8em;
 content: "Employees";
 font-weight: bold;
 color:#EEEEEE;
 background-color: rgba(50, 50, 50, 0.6);
```

```
}
```

## attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content *only* for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
 content: "[Audience Level: " attr(audience) "]";
}
```

If the title element from the XML document is:

```
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

### [Audience Level: Expert] Changing the Timimg Belt

In Oxygen XML Editor, the use of attr() function is available not only for the content property, but also for any other property. This is similar to the CSS Level 3 working draft: <http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional>. The arguments of the function are:

**attr( attribute\_name , attribute\_type , default\_value )**

#### **attribute\_name**

The attribute name. This argument is required.

#### **attribute\_type**

The attribute type. This argument is optional. If it is missing, argument's type is considered string. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor accepts one of the following types:

#### **color**

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value #FFFFFF.

#### **url**

The value is a URL pointing to a media object. Oxygen XML Editor supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

#### **integer**

The value must be interpreted as an integer.

#### **number**

The value must be interpreted as a float number.

#### **length**

The value must be interpreted as an integer.

#### **percentage**

The value must be interpreted relative to another value (length, size) expressed in percents.

#### **em**

The value must be interpreted as a size. 1 em is equal to the font-size of the relevant font.

#### **ex**

The value must be interpreted as a size. 1 ex is equal to the height of the x character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**

The value must be interpreted as a size expressed in centimeters.

**in**

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

**pt**

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

**pc**

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

**default\_value**

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Usage samples for the attr() function**

Consider the following XML instance:

```
<sample>
 <para bg_color="#AAAAFF">Blue paragraph.</para>
 <para bg_color="red">Red paragraph.</para>
 <para bg_color="red" font_size="2">Red paragraph with large font.</para>
 <para bg_color="#00AA00" font_size="0.8" space="4">
 Green paragraph with small font and margin.</para>
</sample>
```

The para elements have bg\_color attributes with RGB color values (such as #AAAAFF). You can use the attr() function to change the elements appearance in the editor based on the value of this attribute:

```
background-color:attr(bg_color, color);
```

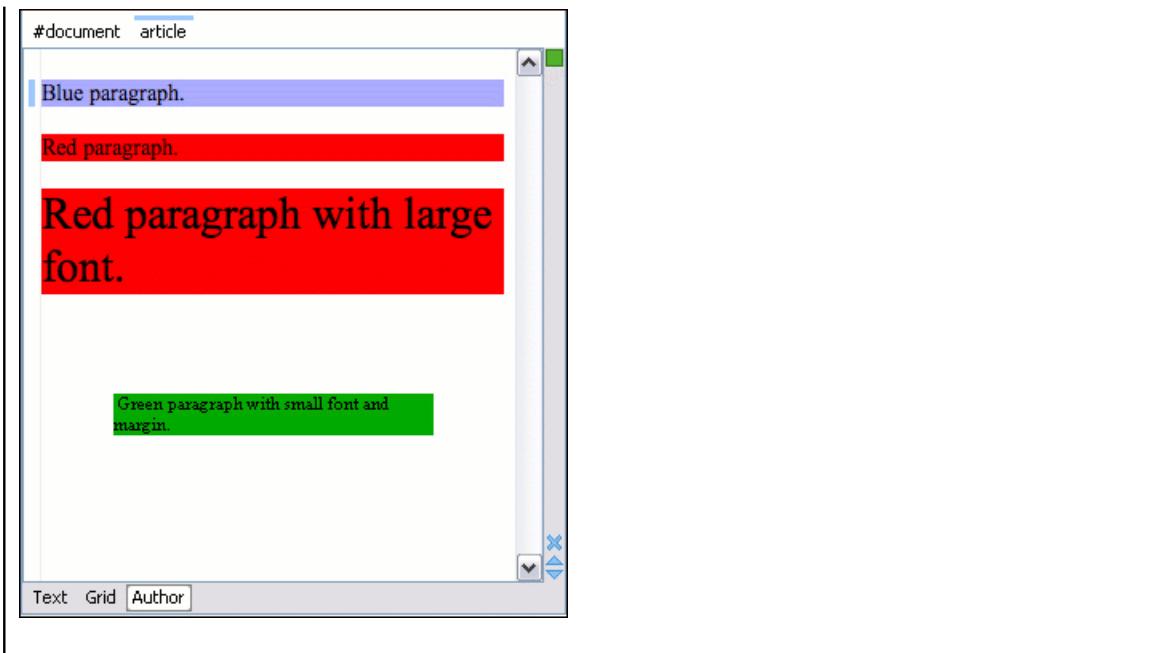

The attribute font\_size represents the font size in em units. You can use this value to change the style of the element:

```
font-size:attr(font_size, em);
```

The complete CSS rule is:

```
para{
 display:block;
 background-color:attr(bg_color, color);
 font-size:attr(font_size, em);
 margin:attr(space, em);
}
```

The document is rendered as:

## Oxygen XML Editor CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.

### Built-in CSS Selectors

When Oxygen XML Editor renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

### List of CSS Selector Contributed by Oxygen XML Editor

```

@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

*[dir='لر'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{
 xi|include:before,

```

```
xi|include:after{
 color:#808080 !important;
}
```

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```
oxy|entity {
 background-color: inherit !important;
}
```

## Additional CSS Selectors

Oxygen XML Editor provides support for selecting additional types of nodes. These custom selectors apply to: *document*, *doctype sections*, *processing-instructions*, *comments*, *CDATA sections*, *reference sections*, and *entities*. *Processing-instructions* are not displayed by default. To display them, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Author**, and select **Show processing instructions**.

**Note:** The custom selectors are presented in the default CSS for **Author** mode and all of their properties are marked with an *!important* flag. For this reason, you have to set the *!important* flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the **Author** mode extensions namespace at the beginning of the stylesheet documents:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- The oxy | document selector matches the entire document:

```
oxy|document {
 display:block !important;
}
```

- The following example changes the rendering of doctype sections:

```
oxy|doctype {
 display:block !important;
 color:blue !important;
 background-color:transparent !important;
}
```

- To match the processing instructions, you can use the oxy | processing-instruction selector:

```
oxy|processing-instruction {
 display:block !important;
 color:purple !important;
 background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the construct:

```
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```
oxy|processing-instruction[target_name][data="b"]
```

- The XML comments display in **Author** mode can be changed using the oxy | comment selector:

```
oxy|comment {
 display:block !important;
 color:green !important;
}
```

```
 background-color:transparent !important;
 }
```

- The oxy|cdata selector matches CDATA sections:

```
oxy|cdata{
 display:block !important;
 color:gray !important;
 background-color:transparent !important;
}
```

- The oxy|entity selector matches the entities content:

```
oxy|entity {
 display:morph !important;
 editable:false !important;
 color:orange !important;
 background-color:transparent !important;
}
```

To match particular entities, use the oxy|entity selector in expressions such as:

```
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
oxy|entity[name='apos'],
oxy|entity[name^='#']{
 -oxy-display-tags: none;
}
```

- The *references to entities*, *XInclude*, and *DITA conrefs* and *conkeyrefs* are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that refers to them.
  - You can use the `reference` property to customize the way these references are rendered in **Author** mode:

```
oxy|reference {
 border:1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains *comments* and changes (if *Track Changes* was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of this comments and changes you can use the oxy|reference[ comments ], oxy|reference[ changeTracking ], and oxy|reference[ changeTracking ][ comments ] selectors.

**Note:** Two artificial attributes (*comments* and *changeTracking*) are set on the reference node, containing information about the number of comments and track changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```
oxy|reference[comments]:before {
 content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain change tracking inside, use the oxy|reference[ changeTracking ] selector.

```
oxy|reference[changeTracking]:before {
 content: "Change tracking: " attr(changeTracking) !important;
}
```

- Here is an example of how you can set a custom color to the reference containing both track changes and comments:

```
oxy|reference[changeTracking][comments]:before {
 content: "Change tracking: " attr(changeTracking)
 " and comments: " attr(comments) !important;
}
```

```

**Figure 579: Example: A Document Rendered Using these Rules**

### Additional CSS Properties

Oxygen XML Editor offers an extension of the standard CSS properties suited for content editing.

#### Folding Elements

Oxygen XML Editor allows you to declare some elements to be *foldable* (collapsible). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the **Folding** submenu of the contextual menu:

##### ▷ Toggle Fold

Toggles the state of the current fold.

##### ▷ Collapse Other Folds (**Ctrl + NumPad/ (Command + NumPad/ on OS X)**)

Folds all the elements except the current element.

##### ▷ Collapse Child Folds (**Ctrl + NumPad. (Command + NumPad. on OS X)**)

Folds the elements indented with one level inside the current element.

##### ▷ Expand Child Folds

Unfolds all child elements of the currently selected element.

##### ⊕ Expand All (**Ctrl + NumPad\* (Command + NumPad\* on OS X)**)

Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: `-oxy-foldable:true;`. To define the elements that are folded by default, use the `-oxy-folded:true` property.

**Note:** The `-oxy-folded` property works in conjunction with the `-oxy-foldable` property. Thus, the `folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property `-oxy-not-foldable-child` is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma separated element names. The first child element from the XML document that appears in the list of element names will be identified as the not foldable child and displayed. If the element is marked as *foldable* (`-oxy-foldable:true;`) but it doesn't have the property `-oxy-not-foldable-child` or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the before pseudo-element.

**Note:** Deprecated properties `foldable`, `not-foldable-child`, and `folded` are also supported.

### Folding DocBook Elements

All the elements below can have a `title` child element and are considered to be logical sections. You mark them as being *foldable* leaving the `title` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
example,
table {
 -oxy-foldable:true;
 -oxy-not-foldable-child: title;
}
```

### Placeholders for Empty Elements

Oxygen XML Editor displays the element name as pseudo-content for empty elements if the [Show placeholders for empty elements option](#) is enabled in the **Author** preferences page and there is no *before* or *after* content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

#### **-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `keyword` element to be displayed as key:

```
keyword{
 -oxy-placeholder-content:"key";
}
```

#### **-oxy-show-placeholder CSS Property**

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:

- `always` - Always display placeholders.
- `default` - Always display placeholders if *before* or *after* content are not set in CSS.
- `inherit` - The placeholders are displayed according to the [Show placeholders for empty elements option](#) (if *before* and *after* content is not declared).

**Note:** Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

#### **Read-only elements: `-oxy-editable` property**

If you want to inhibit editing a certain element content, you can set the `-oxy-editable` (deprecated property `editable` is also supported) CSS property to `false`.

## Display Elements: `-oxy-morph` Value

Oxygen XML Editor allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is inline if all its children are inline.

For example, suppose we have a **wrapper** XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline or block behavior, depending on the behavior of its child elements:

```
wrapper{
 display:-oxy-morph;
}
```

## whitespace Property: `-oxy-trim-when-ws-only` Value

Oxygen XML Editor allows you to set the whitespace property to `-oxy-trim-when-ws-only`, meaning that the leading and trailing whitespaces are removed.

## visibility Property: `-oxy-collapse-text`

Oxygen XML Editor allows you to set the value of the visibility property to `-oxy-collapse-text`, meaning that the text content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

The text value of an XML element will be edited using a text field form control. In this case, we want the text content not to be directly present in the **Author** visual editing mode:

```
title{
 content: oxy_textfield(edit, '#text', columns, 40);
 visibility:-oxy-collapse-text;
}
```

## Cyrillic Counters: `list-style-type` Values (`-oxy-lower-cyrillic`)

Oxygen XML Editor allows you to set the value of the `list-style-type` property to `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

Counting list items with Cyrillic symbols:

```
li{
 display:list-item;
 list-style-type:-oxy-lower-cyrillic-ru;
}
```

## link Property

Oxygen XML Editor allows you to declare some elements to be *links*. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the `link` property on the `before` or `after` pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`

### DocBook Link Elements

The following elements are defined to be links on the `before` pseudo element and their values are defined by the value of an attribute.

```
*[href]:before{
 link:attr(href);
 content: "Click " attr(href) " for opening" ;
}
```

```

ulink[url]:before{
 link:attr(url);
 content: "Click to open: " attr(url);
}

olink[targetdoc]:before{
 -oxy-link: attr(targetdoc);
 content: "Click to open: " attr(targetdoc);
}

```

### Display Tag Markers: `-oxy-display-tags`

Oxygen XML Editor allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- `none` - Tags markers must not be presented regardless of the current [display mode](#).
- `default` - The tag markers will be created depending on the current [display mode](#).
- `inherit` - The value of the property is inherited from an ancestor element.

```

-oxy-display-tags
Value: none | default | inherit
Initial: default
Applies to: all nodes(comments, elements, CDATA, etc.)
Inherited: false
Media: all

```

### DocBook Para elements

In this example, the `para` element from DocBook uses a :before and :after element and its tag markers will not be visible.

```

para:before{
 content: "{}";
}

para:after{
 content: "{}";
}

para{
 -oxy-display-tags: none;
 display:block;
 margin: 0.5em 0;
}

```

### Append Content Properties: `-oxy-append-content` / `-oxy-prepend-content`

#### `-oxy-append-content` Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

#### `-oxy-append-content`

```

element:before{
 content: "Hello";
}
element:before{
 -oxy-append-content: " World!";
}

```

The content shown before the element will be Hello World!.

#### `-oxy-prepend-content` Property

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the -

**-oxy-prepend-content** prepends content to that generated by the lesser specificity rules into a new compound content.

### **-oxy-prepend-content**

```
element:before{
 content: "Hello!";
}
element:before{
 -oxy-prepend-content: "said: ";
}
element:before{
 -oxy-prepend-content: "I ";
}
```

The content shown before the element will be I said: Hello!.

## Custom Colors for Element Tags

By default, Oxygen XML Editor does not display element tags. You can use the  **Partial Tags** button from the **Author** tool bar to control the amount of *displayed markup*.

To configure the default background and foreground colors of the tags, go to **Editor > Edit modes > Author**. The **-oxy-tags-background-color** and **-oxy-tags-color** properties allow you to control the background and foreground colors for any particular XML element.

```
para {
 -oxy-tags-color:white;
 -oxy-tags-background-color:green;
}
title {
 -oxy-tags-color:yellow;
 -oxy-tags-background-color:black;
}
```

## Custom CSS Functions

The visual **Author** editing mode supports also a wide range of custom CSS extension functions.

### **oxy\_local-name()** Function

This function evaluates the local name of the current node.

It does not have any arguments.

To insert as static text content before each element its local name, use this CSS selector:

```
*:before{
 content: oxy_local-name() ":";
}
```

### **oxy\_name()** Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

To insert as static text content before each element its qualified name, use this CSS selector:

```
*:before{
 content: oxy_name() ":";
}
```

### **oxy\_url()** Function

This function extends the standard CSS **url()** function by allowing you to specify additional relative path components (parameters **loc\_1** to **loc\_n**).

Oxygen XML Editor uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (built-in or custom).

**oxy\_url( base\_location , loc\_1 , loc\_2 )**

### **base\_location**

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

### **loc\_1 ... loc\_n (optional)**

Strings representing relative location path components.

The following function receives String objects as input parameters:

```
oxy_url('http://www.oxygenxml.com/css/test.css', '../dir1/',
 'dir2/dir3/', '../../dir4/dir5/test.xml')
```

and returns:

```
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
```

The following function receives the result of the evaluation of two other functions as parameters:

```
image[href]{
 content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
 '.jpeg', 'Thumbnail.jpeg'));
}
```

You can use the above example when you have image references and you want to see thumbnail images stored in the same folder.

The following function uses an editor variable as the first parameter to point to the Oxygen XML Editor installation location:

```
image[href] {
 content: oxy_url('${oxygenHome}', 'logo.png');
}
```

### **Related information**

[Editor Variables](#) on page 164

### **oxy\_base-uri() Function**

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the [XML Base specification](#) for more details.

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
 content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
 '.jpeg', 'Thumbnail.jpeg'));
}
```

### **oxy\_parent-url() Function**

This function evaluates the parent URL of a URL received as string.

**oxy\_parent-url( URL )**

#### **URL**

The URL as string.

### **oxy\_capitalize() Function**

This function capitalizes the first letter of the text received as argument.

```
oxy_capitalize(text)
```

#### text

The text in which the first letter will be capitalized.

To insert as static text content before each element its capitalized qualified name, use this CSS selector:

```
*:before{
 content: oxy_capitalize(oxy_name()) ":";
}
```

### oxy\_uppercase() Function

This function transforms to upper case the text received as argument.

```
oxy_uppercase(text)
```

#### text

The text to be capitalized.

To insert as static text content before each element its upper-cased qualified name, use this CSS selector:

```
*:before{
 content: oxy_uppercase(oxy_name()) ":";
}
```

### oxy\_lowercase() Function

This function transforms to lower case the text received as argument.

```
oxy_lowercase(text)
```

#### text

The text to be lower cased.

To insert as static text content before each element its lower-cased qualified name, use this CSS selector:

```
*:before{
 content: oxy_lowercase(oxy_name()) ":";
}
```

### oxy\_concat() Function

This function concatenates the received string arguments.

```
oxy_concat(str_1 , str_2)
```

#### str\_1 ... str\_n

The string arguments to be concatenated.

If an XML element has an attribute called **padding-left**:

```
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```
*[padding-left]{
 padding-left:oxy_concat(attr(padding-left), "px");
}
```

### oxy\_replace() Function

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

- `oxy_replace( text , target , replacement )`

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

**text**

The text in which the replace will occur.

**target**

The target string to be replaced.

**replacement**

The string replacement.

**EXAMPLE:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
 content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
 '.jpeg', 'Thumbnail.jpeg'));
}
```

- `oxy_replace( text , target , replacement , isRegExp )`

This function replaces each substring of the text that matches the target string with the specified replacement string.

**text**

The text in which the replace will occur.

**target**

The target string to be replaced.

**replacement**

The string replacement.

**isRegExp**

If *true* the target and replacement arguments are considered regular expressions, if *false* they are considered literal strings.

**EXAMPLE:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```
image[title]{
 content:oxy_replace(attr(title), "\s+", "_", true)
}
```

**oxy\_unparsed-entity-uri() Function**

This function returns the URI value of an unparsed entity name.

`oxy_unparsed-entity-uri( unparsedEntityName )`

**unparsedEntityName**

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity**

```
imagedata[entityref]{
 content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

**oxy\_attributes() Function**

This function concatenates the attributes for an element and returns the serialization.

`oxy_attributes( )`

### **oxy\_attributes()**

For the following XML fragment:<element att1="x" xmlns:a="2" x=""/> the CSS selector

```
element{
 content:oxy_attributes();
}
```

will display att1="x" xmlns:a="2" x="" .

### **oxy\_substring() Function**

This function is used to return a string of text.

The **oxy\_substring()** function has two signatures:

- **oxy\_substring( text , startOffset )**

Returns a new string that is a substring of the original **text** string. It begins with the character at the specified **index** and extends to the end of **text** string.

**text**

The original string.

**startOffset**

The beginning index, inclusive

- **substring( text , startOffset , endOffset )**

Returns a new string that is a substring of the original **text** string. The substring begins at the specified **startOffset** and extends to the character at index **endOffset** - 1.

**text**

The original string.

**startOffset**

The beginning index, inclusive

**endOffset**

The ending index, exclusive.

```
oxy_substring('abcd', 1) returns the string 'bcd'.
```

```
oxy_substring('abcd', 4) returns an empty string.
```

```
oxy_substring('abcd', 1, 3) returns the string 'bc'.
```

If we only want to display part of an attribute value, the part that comes before an **Appendix** string:

```
image[longdesc]{
 content: oxy_substring(attr(longdesc), 0,
 oxy_indexof(attr(longdesc), "Appendix"));
}
```

### **oxy\_getSomeText(text, length) Function**

This function allows you to truncate a long string and to set a maximum number of displayed characters.

The following properties are supported:

- **text** - Displays the actual text.
- **length** - Sets the maximum number of characters that are displayed.
- **endsWithPoints** - Specifies if the truncated text ends with ellipsis.

If an attribute value is very large, we can trim its content before it is displayed as static content:

```
*[longdesc]:before{
 content: oxy_getSomeText(attr(longdesc), 200);
```

```
}
```

## **oxy\_indexof() Function**

This function is used to define searches.

The **oxy\_indexof()** function has two signatures:

- **oxy\_indexof( text , toFind )**

Returns the index within **text** string of the first occurrence of the **toFind** substring.

### **text**

Text to search in.

### **toFind**

The searched substring.

- **oxy\_indexof( text , toFind , fromOffset )**

Returns the index within **text** string of the first occurrence of the **toFind** substring. The search starts from **fromOffset** index.

### **text**

Text to search in.

### **toFind**

The searched substring.

### **fromOffset**

The index to start the search from.

```
oxy_indexof('abcd', 'bc') returns 1.
```

```
oxy_indexof('abcdabc', 'bc', 2) returns 4.
```

If we only want to display part of an attribute value, the part that comes before an **Appendix** string:

```
image[longdesc]{
 content: oxy_substring(attr(longdesc), 0,
 oxy_indexof(attr(longdesc), "Appendix"));
}
```

## **oxy\_lastindexof() Function**

This function is used to define last occurrence searches.

The **oxy\_lastindexof()** function has two signatures:

- **oxy\_lastindexof( text , toFind )**

Returns the index within **text** string of the rightmost occurrence of the **toFind** substring.

### **text**

Text to search in.

### **toFind**

The searched substring.

- **oxy\_lastindexof( text , toFind , fromOffset )**

The search starts from **fromOffset** index. Returns the index within **text** string of the last occurrence of the **toFind** substring, searching backwards starting from the **fromOffset** index.

### **text**

Text to search in.

### **toFind**

The searched substring.

## fromOffset

The index to start the search backwards from.

```
oxy_lastindexof('abcdabc', 'bc') returns 4.
oxy_lastindexof('abcdbccdbc', 'bc', 2) returns 1.
```

If we only want to display part of an attribute value, the part that comes before an **Appendix** string:

```
image[longdesc]{
 content: oxy_substring(attr(longdesc), 0,
 oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

## oxy\_xpath() Function

This function is used to evaluate XPath expressions.

The `oxy_xpath()` function has the following signature:

- `oxy_xpath ( XPathExpression [, processChangeMarkers , value ] [, evaluate , value ] )`

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced **xi:include** section or inside artificially referenced content (for example, DITA `conref` or `topicref` references).

The parameters of the function are as follows:

- A required expression parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (`delete` changes are removed and `insert` changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
  - `dynamic` - Evaluates the XPath each time there are changes in the document.
  - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
  - `static` - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

**Note:** When XPath expressions are evaluated, the entities and `xi:include` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```
<article>
 <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```
<section>
 <p>Referenced content</p>
</section>
```

The latter will be the actual content in which the XPath expression is executed.

### An Example of the `oxy_xpath()` Function

The following example counts the number of words from a paragraph (including tracked changes) and displays the result in front of it:

```
para:before{
 content:
```

```

concat(" | Number of words:",
 oxy_xpath(
 "count(tokenize(normalize-space(string-join(text(), '')), ' '))",
 processChangeMarkers,
 true),
 "| ");
}

```

### **oxy\_action() Function**

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from [the `oxy\_button\(\)` function](#).

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- `name` - The name of the action. It will be displayed as the label for the button or menu item.
- `description` (optional) - A short description with details about the result of the action.
- `icon` (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (`oxygen.jar`) by starting its value with / (for example, /images/Remove16.png). It can also be expressed as [editor variables](#).
- `operation` - The name of the Java class implementing the [`ro.sync.ecss.extensions.api.AuthorOperation`](#) interface. There is also a variety of [predefined operations](#) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- `arg-<string>` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- `ID` - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

```

oxy_button(
 action, oxy_action(
 name, 'Insert',
 description, 'Insert an element after the current one',
 icon, url('insert.png'),
 operation,
 'InsertFragmentOperation',
 arg-fragment, '<element>${caret}</element>',
 arg-insertLocation, '.',
 arg-insertPosition, 'After'),
 showIcon, true)

```

You can also create a button form control directly from an `oxy_action` function:

```

oxy_action(
 name, 'Insert',
 description, 'Insert an element after the current one',
 operation, 'InsertFragmentOperation',
 arg-fragment, '<element>${caret}</element>',
 arg-insertLocation, '.',
 arg-insertPosition, 'After')

```

**Tip:** A code template is available to make it easy to add the `oxy_action` function with the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_action` code template.

### **Related information**

[Button Form Control](#) on page 1266

The `oxy_button` built-in form control is used for graphical user interface objects that invoke a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

## **oxy\_action\_list() Function**

This function allows you to define a list of actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action_list()` function is used from [the `oxy\_buttonGroup\(\)` function](#).

The arguments received by the `oxy_action_list()` function are a list of actions that are defined with [the `oxy\_action\(\)` function](#). The following properties are supported in the `oxy_action_list()` function:

- `name` - The name of the action. It will be displayed as the label for the button or menu item.
- `description` (optional) - A short description with details about the result of the action.
- `icon` (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (`oxygen.jar`) by starting its value with / (for example, /images/Remove16.png). It can also be expressed as [editor variables](#).
- `operation` - The name of the Java class implementing the [ro.sync.ecss.extensions.api.AuthorOperation](#) interface. There is also a variety of [predefined operations](#) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- `arg-<string>` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- `ID` - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

```
oxy_action_list(
 oxy_action(
 name, 'Insert',
 description,
 'Insert an element after the current one',
 operation, InsertFragmentOperation,
 arg-fragment, '<element></element>',
 arg-insertLocation, '',
 arg-insertPosition, 'After'
),
 oxy_action(
 name, 'Delete',
 description, 'Deletes the current element',
 operation, DeleteElementOperation
)
)
```

**Tip:** A code template is available to make it easy to add the `oxy_action_list` function with the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_action_list` code template.

## **Related concepts**

[oxy\\_action\(\) Function](#) on page 1256

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

## **Related information**

[Button Group Form Control](#) on page 1267

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

## **oxy\_label() Function**

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are *property name - property value* pairs. The following properties are supported:

- `text` - This property specifies the built-in form control you are using.

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
- **background-color** - Specifies the background color of the form control. If the value of the background-color property is inherit, the form control has the same color as the element in which it is inserted.
- **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  - font-weight, font-size, font-style, font
  - text-align, text-decoration
  - width
  - color, background-color
  - link - For more information about this property see [the link property section](#).

```
element{
 content: oxy_label(text, "Label Text", styles,
 "font-size:2em;color:red;link:attr(href');");
}
```

Instead of using the values of the styles property individually, you can define them in a CSS file as in the following example:

```
* {
 width: 40%;
 text-align:center;
}
```

Then refer that file with an *import* directive, as follows:

```
elem {
 content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")}
```

**CAUTION:** Extensive use of the styles property may lead to performance issues.

If the text from an oxy\_label() function contains new lines, for example oxy\_label(text, 'LINE1\\A LINE2', width, 100px), the text is split in two. Each of the two new lines has the specified width of 100 pixels.

**Note:** The text is split after \\A, which represents a new line character.

You can use the oxy\_label() function together with a [built-in form control](#) function to create a form control based layouts.

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```
person:before {
 content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
 "\A Address:" oxy_textfield(edit, '@address', columns, 20)}
```

Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the oxy\_label() to style each label differently.

```
person:before {
 content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
 oxy_textfield(edit, '@name', columns, 20) "\A "
 oxy_label(text, "Address:", styles, "width:200px")
 oxy_textfield(edit, '@address', columns, 20)}
```

**Tip:** A code template is available to make it easy to add the `oxy_label` function with the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_label` code template..

### **oxy\_link-text() Function**

You can use this function on the CSS content property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks, go to [Configuring an Extensions Bundle](#).

#### **DITA Support**

For DITA, the `oxy_link-text()` function resolves the `xref` element and the elements that have a `keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `topicref` element that has the `navtitle` and `locktitle` attributes set, the function returns the value of the `navtitle` attribute.

#### **DocBook Support**

For DocBook, the `oxy_link-text()` function resolves the `xref` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `xreflabel` attribute.

```
<para><code id="para.id" xreflabel="The reference label">my code</code>
</para>
<para><xref linkend="para.id"/></para>

xref {
 content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `href` is not valid), you can use an optional argument to display fallback text.

```
*[class~="map/topicref"]::before{
 content: oxy_link-text("Cannot find the topic reference");
 link:attr(href);
}
```

### **oxy\_unescapeURLValue(string) Function**

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

```
oxy_unescapeURLValue("http://www.example.com/a%20simple
%20example.html") returns the http://www.example.com/a simple example.html
value.
```

### **Arithmetic Functions**

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the `java.lang.Math` class (<http://download.oracle.com/javase/6/docs/api/java/lang/Math.html>).

In addition to that, the following functions are available:

Syntax	Details
<code>oxy_add (param1, ..., paramN, 'returnType')</code>	Adds the values of all parameters from param1 to paramN.
<code>oxy_subtract (param1, param2, ..., paramN, 'returnType')</code>	Subtracts the values of parameters param2 to paramN from param1.
<code>oxy_multiply (param1, ..., paramN, 'returnType')</code>	Multiples the values of parameters from param1 to paramN.
<code>oxy_divide (param1, param2, 'returnType')</code>	Performs the division of param1 to param2.
<code>oxy_modulo (param1, param2, 'returnType')</code>	Returns the reminder of the division of param1 to param2.

**Note:** The returnType can be 'integer', 'number', or any of the supported CSS measuring types.

If we have an image with **width** and **height** specified on it we can compute the number of pixels on it:

```
image:before{
 content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");}
```

## Form Controls

Oxygen XML Editor provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects.

Oxygen XML Editor provides the following built-in form controls:

- **Text Field** - A graphical user interface box that allows you to enter a single line of text.
- **Combo Box** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Checkbox** - A graphical user interface box that you can click to select or deselect a value.
- **Pop-up** - A contextual menu that provides quick access to various actions.
- **Button** - A graphical user interface object that performs a specific action.
- **Button Group** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Text Area** - A box that allows you to enter multiple lines of text.
- **URL Chooser** - A dialog box that allows you to select the location of local or remote resources.
- **Date Picker** - A form control object that allows you to select a date in a specified format.
- **HTML Content** - A graphical user interface box that is used for rendering HTML content.

For customization purposes, Oxygen XML Editor also supports [custom form controls in Java](#).

To watch our video demonstration in regards to form controls, go to [https://www.oxygenxml.com/demo/Form\\_Controls.html](https://www.oxygenxml.com/demo/Form_Controls.html).

## Related information

[Dynamically Add Form Controls Using a Styles Filter](#) on page 1290

### Text Field Form Control

The `oxy_textfield` built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The `oxy_textfield` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:

- **@attribute\_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.
- Note:** You can set the value of the **visibility** property to **-oxy-collapse-text** to render the text only in the form control that the **oxy\_editor** function specifies.
- **columns** - Controls the width of the form control. The unit size is the width of the **w** character.
  - **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The **width** property takes precedence over the **columns** property (if the two are used together).
  - **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to **true**.
  - **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.
  - **values** - Specifies the values that populate the content completion list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
  - **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the  **\${comma}** variable.
  - **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
  - **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element in which it is inserted.
  - **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

**Note:** If the value is **false**, the **Content Completion Assistant** considers the entire text as the prefix for its proposals. If the value is **true** (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: `value a`, `value b`, and other values. If the **hasMultipleValues** property is set to **true** and the user enters "value " (notice the space character after 'value') in the text field, the **Content Completion Assistant** will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the **hasMultipleValues** property was set to **false** for our example, the **Content Completion Assistant** would only suggest `value a` and `value b` because the space is considered part of the prefix.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

### Text Field Form Control

```
element {
 content: "Label: "
 oxy_textfield(
 edit, "@my_attr",
 values, "value1, value2",
 color, "red",
 columns, 40);
}
```

**Tip:** To insert a sample of the **oxy\_textfield** form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the **oxy\_textfield** code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### Combo Box Form Control

The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.
- `Note`: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `columns` - Controls the width of the form control. The unit size is the width of the `w` character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `editable` - This property accepts the `true` and `false` values. In addition to a drop-down menu, the `true` value also generates an editable text field box that allows you to insert other values than the proposed ones. The `false` value generates a drop-down menu that only accepts the proposed values.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the  `${comma}`  variable.
- `values` - Specifies the values that populate the content completion list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema..
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `labels` - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the  `${i18n()}`  editor variable.

**Note:** This property is only available for read-only combo boxes (the `editable` property is set to `false`).

- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

- `canRemoveValue` - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

#### Combo Box Form Control

```
comboBox:before {
 content: "A combo box that edits an attribute value.
 The possible values are provided from CSS:"
 oxy_combobox(
 edit, "@attribute",
```

```

 editable, false,
 values, "value1, value2, value3",
 labels, "Value no1, Value no2, Value no3");
}

```

**Tip:** To insert a sample of the oxy\_combobox form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the **oxy\_combobox** code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### *Checkbox Form Control*

The **oxy\_checkbox** built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple check-boxes can be used to present and edit the value on an attribute or element.

The **oxy\_checkbox** form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute\_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.
- **Note:** You can set the value of the **visibility** property to **-oxy-collapse-text** to render the text only in the form control that the **oxy\_editor** function specifies.
- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.
- **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the  **\${comma}** variable.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.
- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, **oxy\_combobox(values, '1\\, 2\\, 3, 4, edit, false)** will display a combo box having the first value 1, 2, 3 and the second value 4.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to **true**.
- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.
- **labels** - This property must have the same number of items as the **values** property. Each item provides a literal description of the items listed in the **values** property. These labels can be translated using the  **\${i18n()} editor variable**. If this property is not specified, the **values** property is used as the label.
- **columns** - Controls the width of the form control. The unit size is the width of the **w** character.
- **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element in which it is inserted.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```

p:before {
 content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}

```

## Single Checkbox Form Control

```
checkBox[attribute]:before {
 content: "A check box editor that edits a two valued attribute (On/Off)
 The values are specified in the CSS:"
 oxy_checkbox(
 edit, "@attribute",
 values, "On",
 uncheckedValues, "Off",
 labels, "On/Off");
}
```

## Multiple Check-boxes Form Control

```
multipleCheckBox[attribute]:before {
 content: "Multiple checkboxes editor that edits an attribute value.
 Depending whether the check-box is selected,
 a different value is committed:"
 oxy_checkbox(
 edit, "@attribute",
 values, "true, yes, on",
 uncheckedValues, "false, no, off",
 resultSeparator, " "
 labels, "Present, Working, Started");
}
```

**Tip:** To insert a sample of the oxy\_checkbox form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the **oxy\_checkbox** code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

### Pop-up Form Control

The oxy\_popup built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The oxy\_popup form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute\_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:** You can set the value of the **visibility** property to **-oxy-collapse-text** to render the text only in the form control that the **oxy\_editor** function specifies.

- **rows** - This property specifies the number of rows that the form control presents.

**Note:** If the value of the **rows** property is not specified, the default value of 12 is used.

- **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element in which it is inserted.

**Note:** This property is used for rendering in the **Author** mode.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.
- **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the  **\${comma}** variable.

### Example:

```
link:before{
 content: oxy_popup(
 edit, '@href',
 values, "Spring, Summer, Autumn, Winter",
 tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
 Chrysanthemum${comma}Salvia, Gerbera",
 selectionMode, single);
```

```
}
```

- values - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `oxy_combobox(values, '1\\\", 2\\\", 3, 4, edit, false)` will display a combo box having the first value 1, 2, 3 and the second value 4.

- resultSeparator - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

**Note:** The value of the resultSeparator property cannot exceed one character.

- selectionMode - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.
- labels - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.
- columns - Controls the width of the form control. The unit size is the width of the `w` character. This property is used for the visual representation of the form control.
- width - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- rendererSort - Allows you to sort the values rendered on the form control label. The possible values of this property are `ascending` and `descending`.
- editorSort - Allows you to sort the values rendered on the form control. The possible values of this property are `ascending` and `descending`.
- rendererSeparator - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.
- fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

### Pop-up Form Control

```
popupWithMultipleSelection:before {
 content: " This editor edits an attribute value.
 The possible values are specified
inside the CSS:
 oxy_popup(
 edit, "@attribute",
 values, "value1, value2, value3, value4, value5",
 labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
 resultSeparator, "|",
 columns, 10,
 selectionMode, "multiple",
 color, "blue",
 fontInherit, true);
 font-size:30px;
}
```

**Tip:** To insert a sample of the `oxy_popup` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_popup` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

## Button Form Control

The `oxy_button` built-in form control is used for graphical user interface objects that invoke a custom **Author mode** action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_button` form control supports the following properties:

- `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `actionID` - The ID of the action, specified in the associated [document type framework](#), that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.

- `action` - Defines an action directly, rather than using the `actionID` parameter to reference an action from the associated [document type framework](#). This property is defined using the [`oxy\_action` function](#).

```
oxy_button(action, oxy_action(
 name, 'Insert',
 description, 'Insert an element after the current one',
 icon, url('insert.png'),
 operation, 'InsertFragmentOperation',
 arg-fragment, '<element>${caret}</element>',
 arg-insertLocation, '.',
 arg-insertPosition, 'After'
))
```

**Tip:** You can also create a button form control [`directly from an oxy\_action function`](#).

- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `transparent` - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).
- `showText` - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```
element {
 content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

- `showIcon` - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```
element {
 content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

- `enableInReadOnlyContext` - To enable [button form controls](#) or [groups of buttons form controls](#) this property needs to be set to `true`. This property can be used to specify areas as `read-only` (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_button(hoverPseudoclassName, 'showBorder')
}
:p:showBorder {
 border: 1px solid red;
```

```
}
```

## Button Form Control

```
button:before {
 content: "Label:";
 oxy_button(
 /* This action is declared in the document type
 associated with the XML document. */
 actionID, "insert.popupWithMultipleSelection");
}
```

**Tip:** To insert a sample of the `oxy_button` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.oxy_button` code template. Also, an `.oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an action parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

### Button Group Form Control

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- `actionIDs` - The IDs of the actions that will be presented in the group of buttons.
- `actionID` - The ID of the action, specified in the associated *document type framework*, that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.

- `action_list` - Defines a list of actions directly, rather than using the `actionID` parameter to reference actions from the associated *document type framework*. This property is defined using the `oxy_action_list function`.

```
oxy_buttonGroup(
 label, 'A group of actions',
 icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
 actions,
 oxy_action_list(
 oxy_action(
 name, 'Insert',
 description, 'Insert an element after the current one',
 operation, 'InsertFragmentOperation',
 arg-fragment, '<element></element>',
 arg-insertLocation, '.',
 arg-insertPosition, 'After'
),
 oxy_action(
 name, 'Delete',
 description, 'Deletes the current element',
 operation, 'DeleteElementOperation'
)
)
)
```

**Tip:** A code template is available to make it easy to add the `oxy_action_list` function.

- `label` - Specifies the label to be displayed on the button. This label can be translated using the `$(i18n()) editor variable`.
- `icon` - The path to the icon to be displayed on the button.
- `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **actionStyle** - Specifies what to display for an action in the form control. The values of this property can be **text** (default value), **icon**, or both.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be **true** or **false**.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to **true**.
- **enableInReadOnlyContext** - To enable **button form controls** or **groups of buttons form controls** this property needs to be set to **true**. This property can be used to specify areas as **read-only** (by setting the **-oxy-editable** property to **false**). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
:showBorder {
 border: 1px solid red;
}
```

### Button Group Form Control

```
buttongroup:before {
 content:
 oxy_label(text, "Button Group:", width, 150px, text-align, left)
 oxy_buttonGroup(
 label, 'A group of actions',
 /* The action IDs are declared in the document type
 associated with the XML document. */
 actionIDs,
 "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
 actionStyle, "both");
}
```

**Tip:** To insert a sample of the `oxy_buttonGroup` form control in a CSS file (or LESS file),, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_buttonGroup` code template. Also, an `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

### Text Area Form Control

The `oxy_textArea` built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute\_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
<apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
 content:
 oxy_textArea(
 edit, '#content',
 contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

**Note:** When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
<apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
 content:
 oxy_textArea(
 edit, '#content',
 contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

**Note:** When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- `columns` - Controls the width of the form control. The unit size is the width of the `w` character.
- `width` - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `rows` - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- `contentType` - Specifies the type of content for which the form control offers syntax highlighting. The following values are supported: text/css; text/shell; text/cc; text/xquery; text/xml; text/python; text/xsd; text/c; text>xpath; text/javascript; text/xsl; text/wsdl; text/html; text/xproc; text/properties; text/sql; text/rng; text/sch; text/json; text/perl; text/php; text/java; text/batch; text/rnc; text/dtd; text/nvdl; text/plain.
- `indentOnTab` - Specifies the behavior of the **Tab** key. If the value of this property is set to `true` (default value), the **Tab** key inserts characters. If it is set to `false`, **Tab** is used for navigation, jumping to the next editable position in the document.
- The white-space CSS property influences the value that you edit, as well as the form control size:
  - `pre` - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specified, the form control calculates its size on its own so that all the text is visible.
  - `pre-wrap` - The long lines are wrapped to avoid horizontal scrolling.

**Note:** The rows and columns properties must be specified. If these are not specified, the form control considers the value to be pre.

- normal - The white spaces and new lines are normalized.
- hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

### Text Area Form Control

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```
textArea {
 visibility: -oxy-collapse-text;
 white-space: pre;
}

textArea[language="CSS"]::before {
 content: oxy_textArea(
 edit, '#text',
 contentType, 'text/css');
}

textArea[language="XML"]::before {
 content: oxy_textArea(
 edit, '#text'
 contentType, 'text/xml',
 rows, 10,
 columns, 30);
}
```

**Tip:** To insert a sample of the oxy\_textArea form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  oxy\_textArea code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### URL Chooser Form Control

The oxy\_urlChooser built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.

The oxy\_urlChooser editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute\_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.
- **Note:** You can set the value of the **visibility** property to **-oxy-collapse-text** to render the text only in the form control that the oxy\_editor function specifies.
- **columns** - Controls the width of the form control. The unit size is the width of the w character.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the color property is **inherit**, the form control has the same color as the element in which it is inserted.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "`jpg, png, gif`" is mapped to a single filter that will display all jpg, png, and gif files.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

### URL Chooser Form Control

```
urlChooser[file]:before {
 content: "A URL chooser editor that allows browsing for a URL.

 The selected URL is made relative to the currently edited file:

 oxy_urlChooser(

 edit, "@file",

 columns 25);
}
```

**Tip:** To insert a sample of the `oxy_urlChooser` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_urlChooser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### Date Picker Form Control

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute\_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName` and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- **format** - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If missing, the type of the date is determined from the associated schema.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.

- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_datePicker(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

### Date Picker Form Control

```
date {
 content:
 oxy_label(text, "Date time attribute with
 format defined in CSS: ", width, 300px)
 oxy_datePicker(
 columns, 16,
 edit, "@attribute",
 format, "yyyy-MM-dd");
}
```

**Tip:** To insert a sample of the `oxy_datePicker` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_datePicker` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### HTML Content Form Control

The `oxy_htmlContent` built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The `oxy_htmlContent` form control supports the following properties:

- `href` - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- `id` - The unique identifier of an item. This is a `div` element that has a unique `id` and is a child of the `body` element. The `div` element is the container of the HTML content to be rendered by the form control.
- `content` - An alternative to the `href` and `id` pair of elements. It provides the HTML content that will be displayed in the form control.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
 content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
 border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined in-line. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

In the following example, the form control collects the content from the `p_description` `div` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `intro_id` attribute value.

```
p#intro_id:before {
 content:
 oxy_htmlContent(
```

```

 href, "descriptions.html",
 id, "p_description",
 width, 400px);
}

```

An alternative example, using the `content` property:

```

p#intro_id:before {
 content:
 oxy_htmlContent(
 content, "<div style='font-weight:bold;'>My content</div>",
 width, 400px);
}

```

**Tip:** To insert a sample of the `oxy_htmlContent` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### *Audio File Player Form Control*

The `oxy_audio` built-in form control is used for providing a mechanism to play audio clips.

The `oxy_audio` form control supports the following properties:

- `href` - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3')), width, 400px)
```

- `width` - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

#### **Audio File Player Form Control**

```

object {
 content:
 oxy_audio(
 href, 'resources/audio.mp3',
 width, 200px,
)
}

```

**Tip:** To insert a sample of the `oxy_audio` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  `oxy_audio` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

#### *Video Player Form Control*

The `oxy_video` built-in form control is used for providing a mechanism to play videos.

The `oxy_video` form control supports the following properties:

- `href` - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4')), width, 400px, height, 300px)
```

- `width` - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.
- `height` - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

## Video Player Form Control

```
object {
 content:
 oxy_video(
 href, 'resources/video.mp4',
 width, 400px,
 height, 300px,
)
}
```

**Tip:** To insert a sample of the oxy\_video form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  oxy\_video code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

### Browser Form Control

The oxy\_browser built-in form control is used for providing a mechanism to render HTML frames or interact with SVG documents in **Author** mode.

The oxy\_browser form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg')), width, 50%, height, 50%)
```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.
- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

## Browser Form Control

```
object {
 content:
 oxy_browser(
 href, 'http://example.page',
 width, 600px,
 height, 400px,
)
}
```

**Tip:** To insert a sample of the oxy\_browser form control in a CSS file (or LESS file), invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the  oxy\_browser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: **[OXYGEN\_INSTALL\_DIR]/samples/form-controls**.

### Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

## Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of [ro.sync.ecss.extensions.api.editor.InplaceRenderer](#). The renderer has to be a **SWING** implementation and can be used both in the standalone and Eclipse distributions.
- **swingEditorClassName** - You can use this property for the standalone (**Swing**-based) distribution to specify the name of the class used for editing. It is a **Swing** implementation of [ro.sync.ecss.extensions.api.editor.InplaceEditor](#).

- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a **SWT** implementation of the [\*ro.sync.ecss.extensions.api.editor.InplaceEditor\*](#).

**Note:** If the custom form control is intended to work in the Oxygen XML Editor standalone distribution, the declaration of **swtEditorClassName** is not required. The *renderer* (the class that draws the value) has different properties from the *editor* (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.
- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor will perform the commit logic by itself. You can use the custom value to perform the commit logic yourself.
- **saHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form controls that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas). It is also helpful if you want to use JavaFX, since JavaFX-based form controls are not compatible with the classic form control architecture.

The value of this property is a class name that must implement the [\*ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor\*](#) method. The JAR that contains this implementation can either be added in the [\*Classpath tab in the Document type configuration dialog box\*](#) for your particular framework or specified with the *classpath* property.

### Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```
public class ComboBoxEditor extends AbstractInplaceEditor {
 /**
 * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
 */
 @Override
 public void stopEditing() {
 Runnable customCommit = new Runnable() {
 @Override
 public void run() {
 AuthorDocumentController documentController =
 context.getAuthorAccess().getDocumentController();
 documentController.insertXMLFragment("<custom/>" , offset);
 }
 };
 EditingEvent event = new EditingEvent(customCommit, true);
 fireEditingStopped(event);
 }
}
```

The custom form controls can use any of the predefined properties of the [\*built-in form controls\*](#), as well as specified custom properties.

### Example: CSS

The following is an example of how to specify a custom form control in the CSS:

```
myElement {
 content: oxy_editor(
 rendererClassName, "com.custom.editors.CustomRenderer",
 swingEditorClassName, "com.custom.editors.SwingCustomEditor",
 .swtEditorClassName, "com.custom.editors.SwtCustomEditor",
 edit, "@my_attr",
 customProperty1, "customValue1",
 customProperty2, "customValue2"
)
}
```

## How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor SDK at [https://www.oxygenxml.com/oxygen\\_sdk\\_maven.html](https://www.oxygenxml.com/oxygen_sdk_maven.html).

2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR library.
4. Copy the JAR library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Editor, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, edit the appropriate framework, and add the JAR library in the **Classpath** tab.
6. Specify the custom form control in your CSS, as described above.

**Tip:** To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

#### *Editing Processing Instructions Using Form Controls*

Oxygen XML Editor allows you to edit *processing instructions*, *comments*, and *CDATA* by using the built-in editors.

Oxygen XML Editor allows you to edit *processing instructions*, *comments*, and *CDATA* by using the built-in editors.

**Note:** You can edit both the content and the attribute value from a *processing instruction*.

#### **Editing an Attribute from a Processing Instruction**

##### **PI content**

```
<?pi_target attr="val"?>
```

##### **CSS**

```
oxy|processing-instruction:before {
 display:inline;
 content:
 "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
 visibility:visible;
}
oxy|processing-instruction{
 visibility:-oxy-collapse-text;
}
```

#### **Custom CSS Pseudo-classes**

You can set your custom CSS pseudo-classes on the nodes from the [AuthorDocument](#) model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them the document does not create undo and redo edits - the document is considered unmodified. You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Editor they are used to hide/show the colspec elements from CALS tables. To take a look at the implementation, see:

1. `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/cals_table.css` (Search for `-oxy-visible-colspecs`)
2. The definition of `action table.toggle.colspec` from the DocBook 4 framework makes use of the pre-defined [`TogglePseudoClassOperation`](#) **Author** mode operation.

Here are some examples:

##### **Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```
section {
 display:none;
}

section:access-control-user {
 display:block;
```

```
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

### Coloring the elements at the current cursor location

```
*:caret-visited {
 color:red;
}
```

You could create an `AuthorCaretListener` that sets the caret-visited pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

The API that you can use from the CaretListener:

```
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String,
 ro.sync.ecss.extensions.api.node.AuthorElement)
ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String
 ro.sync.ecss.extensions.api.node.AuthorElement)
```

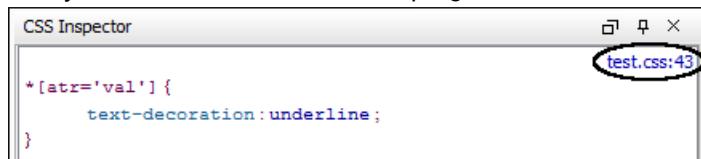

Pre-defined `Author mode operations` can be used directly in your framework to work with custom pseudo-classes:

1. [TogglePseudoClassOperation](#)
2. [SetPseudoClassOperation](#)
3. [RemovePseudoClassOperation](#)

## Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the **Author** mode includes a [CSS Inspector view](#) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

**Figure 580: CSS Inspector View**

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

## Creating and Running Automated Tests

If you have developed complex custom plugins or document types, the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Editor standalone installation includes a main `oxygen.jar` library located in the `[OXYGEN_INSTALL_DIR]`. That JAR library contains a base class for testing developer customizations named: `ro.sync.exml.workspace.api.PluginWorkspaceTCBase`.

To develop JUnit tests for your customizations using the **Eclipse** workbench, follow these steps:

1. Create a new Eclipse Java project and copy to it the entire contents of the [*OXYGEN\_INSTALL\_DIR*].
2. Add all JAR libraries present in the [*OXYGEN\_INSTALL\_DIR*]/lib directory to the **Java Build Path->Libraries** tab. Make sure that the main JAR library oxygen.jar or oxygenAuthor.jar is the first one in the Java classpath by moving it up in the **Order and Export** tab.
3. Click **Add Library** and add the *JUnit* and *JFCUnit* libraries.
4. Create a new Java class that extends *ro.sync.exml.workspace.api.PluginWorkspaceTCBase*.
5. Pass the following parameters on to the constructor of the super class:
  - *File installationFolder* - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.
  - *File frameworksFolder* - The file path to the frameworks directory. It can point to a custom frameworks directory where the custom framework resides.
  - *File pluginsFolder* - The file path to the plugins directory. It can point to a custom plugins directory where the custom plugins resides.
  - *File optionsFolder* - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
  - *String licenseKey* - The license key used to license the test class.
  - *int productID* - The ID of the product and should be one of the following: *PluginWorkspaceTCBase.XML\_AUTHOR\_PRODUCT*, *PluginWorkspaceTCBase.XML\_EDITOR\_PRODUCT*, or *PluginWorkspaceTCBase.XML\_DEVELOPER\_PRODUCT*.
6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```
public class MyTestClass extends PluginWorkspaceTCBase {

 /**
 * Constructor.
 */
 public MyTestClass() throws Exception {
 super(null, new File("frameworks"), new File("plugins"), null,
 "-----START-LICENSE-KEY-----\n" +
 "\n" +
 "Registration_Name=Developer\n" +
 "\n" +
 "Company=\n" +
 "\n" +
 "Category=Enterprise\n" +
 "\n" +
 "Component=XML-Editor, XSLT-Debugger, Saxon-SA\n" +
 "\n" +
 "Version=14\n" +
 "\n" +
 "Number_of_Licenses=1\n" +
 "\n" +
 "Date=09-04-2012\n" +
 "\n" +
 "Trial=31\n" +
 "\n" +
 "SGN=MCwCFGNoEGJSeiC3XCYIyalvjzHhGhhqAhRNRDpEu8RIWb8icCJ07HqfVP4++A\\=\\=\\=\n" +
 "\n" +
 "-----END-LICENSE-KEY-----",
 PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);
 }

 /**
 * <p>Description: TC for opening a file and using a bold operation</p>
 * <p>Bug ID: EXM-20417</p>
 *
 * @author radu_coravu
 *
 * @throws Exception
 */
 public void testOpenFileAndBoldEXM_20417() throws Exception {
 WSEditor ed = open(new File
 ("D:/projects/exml/test/authorExtensions/dita/sampleSmall.xml").toURL());
 //Move caret
 moveCaretRelativeTo("Context", 1, false);

 //Insert
 invokeAuthorExtensionActionForID("bold");
 assertEquals("<?xml version='1.0' encoding='utf-8'?>\n" +
 "<!DOCTYPE task PUBLIC "-//OASIS//DTD DITA Task//EN\"
 "\nhttp://docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd\">\n" +
 "<task id=\"taskId\">\n" +
 " <title>Task </title>\n" +
 " <prolog/>\n" +
 "
```

```

 " <taskbody>\n" +
 " <context>\n" +
 " <p>Context for the current task</p>\n" +
 " </context>\n" +
 " <steps>\n" +
 " <step>\n" +
 " <cmd>Task step.</cmd>\n" +
 " </step>\n" +
 " </steps>\n" +
 " </taskbody>\n" +
 "</task>\n" +
 "", getCurrentEditorXMLContent());
}
}

```

## API Frequently Asked Questions (API FAQ)

---

This section contains answers to common questions regarding the Oxygen XML Editor customizations using the [oXygen SDK](#), [Author Component](#), or [Plugins](#).

For additional questions, [contact us](#). The preferred approach is via email because API questions must be analyzed thoroughly. We also provide code snippets, if they are required.

To stay up-to-date with the latest API changes, discuss issues and ask for solutions from other developers working with the [oXygen SDK](#), register on the [oXygen-SDK mailing list](#).

### Add Custom Actions to the Contextual Menu?

#### Question

How do I add my own custom actions to the contextual menu using an API?

#### Answer

The API methods `WSAuthorEditorPageBase.addPopUpMenuCustomizer` and `WSTextEditorPage.addPopUpMenuCustomizer` allow you to customize the contextual menu shown either in the **Author** or **Text** modes. The API is available both in the standalone application and in the Eclipse plugin.

Here is an elegant way to add actions to the **Author** page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

```

import org.eclipse.jface.action.ContributionManager;
import org.eclipse.ui.PlatformUI;
import org.eclipse.ui.menus.IMenuService;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;
/**
 * This class is used to create the possibility to attach certain
 * menuContributions to the {@link ContributionManager}, which is used for the
 * popup menu in the Author Page of the Oxygen Editor.

 * You just need to use the org.eclipse.ui.menus extension and add a
 * menuContribution with the locationURI: menu:oxygen.authorpage
 */
public class OxygenAuthorPagePopupMenuCustomizer implements
 AuthorPopupMenuCustomizer {

 @Override
 public void customizePopUpMenu(Object menuManagerObj,
 AuthorAccess authoraccess) {
 if (menuManagerObj instanceof ContributionManager) {
 ContributionManager contributionManager = (ContributionManager) menuManagerObj;
 IMenuService menuService = (IMenuService) PlatformUI.getWorkbench()
 .getActiveWorkbenchWindow().getService(IMenuService.class);

 menuService.populateContributionManager(contributionManager,
 "menu:oxygen.authorpage");
 contributionManager.update(true);
 }
 }
}

```

2. Add a workbench listener and add the pop-up customizer when an editor is opened in the **Author** page:

```

Workbench.getInstance().getActiveWorkbenchWindow().getPartService()
 .addPartListener(
 new IPartListener() {
 @Override

```

```

public void partOpened(IWorkbenchPart part) {
 if(part instanceof ro.sync.exml.workspace.api.editor.WSEditor) {
 WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();
 if(currentPage instanceof WSAuthorEditorPage) {
 ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer
(new OxygenAuthorPagePopupMenuCustomizer());
 }
 }
}.....
});

```

### 3. Implement the extension point in your plugin.xml:

```

<extension
 point="org.eclipse.ui.menus">
 <menuContribution
 allPopups="false"
 locationURI="menu:oxygen.authorpage">
 <command
 commandId="eu.doccenter.kgu.client.tagging.removeTaggingFromOxygen"
 style="push">
 </command>
 </menuContribution>
</extension>

```

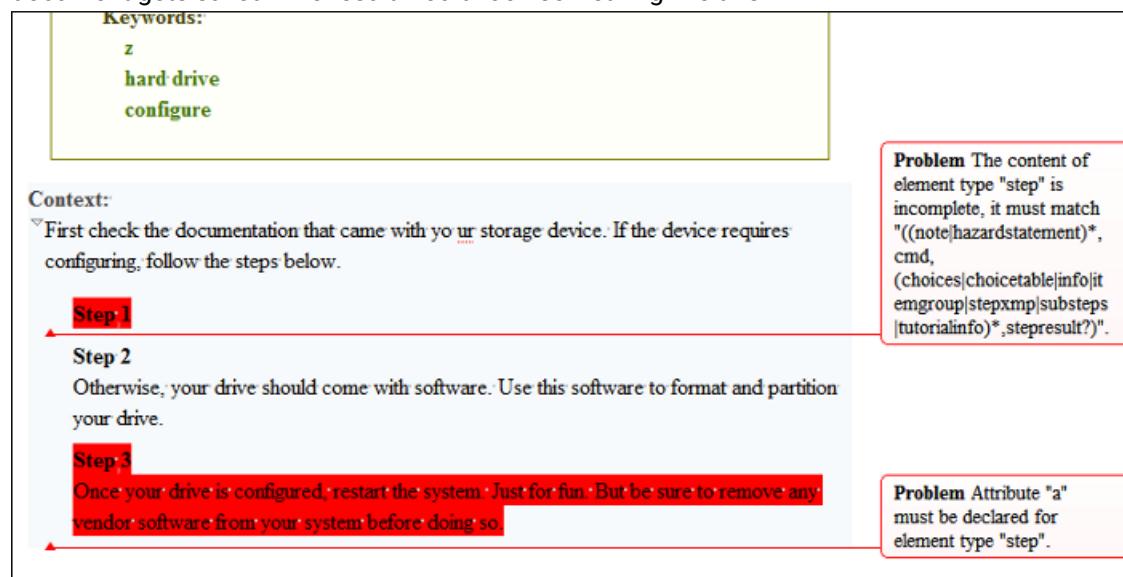

## Add Custom Callouts

### Question

I want to highlight validation errors, instead of underlining them (for example, changing the text background color to light red or yellow). Also, I want to let Oxygen XML Editor write a note about the error type into the **Author** mode directly at the error position (for example, "[value "text" not allowed for attribute "type"]"). Is this possible using the API?

### Answer

The Plugins API allows you to set a `ValidationProblemsFilter` that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the **Author** mode using the API `WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)`. For each of those offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

**Figure 581: Custom Callouts with Persistent Highlights**

Here is a working example:

```

/**
 * Plugin extension - workspace access extension.
 */

```

```

public class CustomWorkspaceAccessPluginExtension
 implements WorkspaceAccessPluginExtension {

 /**
 * @see ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension
 #applicationStarted(
 ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
 */
 public void applicationStarted
 (final StandalonePluginWorkspace pluginWorkspaceAccess) {
 pluginWorkspaceAccess.addEditorChangeListener
 (new WSEditorChangeListener() {
 /**
 * @see WSEditorChangeListener#editorOpened(java.net.URL)
 */
 @Override
 public void editorOpened(URL editorLocation) {
 final WSEditor currentEditor = pluginWorkspaceAccess.getEditorAccess
 (editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
 WSEditorPage currentPage = currentEditor.getCurrentPage();
 if(currentPage instanceof WSAuthorEditorPage) {
 final WSAuthorEditorPage currentAuthorPage =
 (WSAuthorEditorPage)currentPage;
 currentAuthorPage.getPersistentHighlighter().setHighlightRenderer
 (new PersistentHighlightRenderer() {
 @Override
 public String getTooltip(AuthorPersistentHighlight highlight) {
 return highlight.getClonedProperties().get("message");
 }
 @Override
 public HighlightPainter getHighlightPainter
 (AuthorPersistentHighlight highlight) {
 //Depending on severity could have different color.
 ColorHighlightPainter painter = new ColorHighlightPainter
 (Color.COLOR_RED, -1, -1);
 painter.setBgColor(Color.COLOR_RED);
 return painter;
 }
 });
 currentAuthorPage.getReviewController()
 .getAuthorCalloutsController().setCalloutsRenderingInformationProvider(
 new CalloutsRenderingInformationProvider() {
 @Override
 public boolean shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
 //All custom highlights are ours
 return true;
 }
 @Override
 public AuthorCalloutRenderingInformation getCalloutRenderingInformation(
 final AuthorPersistentHighlight highlight) {
 return new AuthorCalloutRenderingInformation() {
 @Override
 public long getTimestamp() {
 //Not interesting
 return -1;
 }
 @Override
 public String getContentFromTarget(int limit) {
 return "";
 }
 @Override
 public String getComment(int limit) {
 return highlight.getClonedProperties().get("message");
 }
 @Override
 public Color getColor() {
 return Color.COLOR_RED;
 }
 @Override
 public String getCalloutType() {
 return "Problem";
 }
 @Override
 public String getAuthor() {
 return "";
 }
 @Override
 public Map<String, String> getAdditionalData() {
 return null;
 }
 };
 }
 });
 currentEditor.addValidationProblemsFilter(new ValidationProblemsFilter() {
 List<int[]> lastStartEndOffsets = new ArrayList<int[]>();
 /**
 * @see ro.sync.exml.workspace.api.editor.validation.ValidationProblemsFilter
 #filterValidationProblems
 (ro.sync.exml.workspace.api.editor.validation.ValidationProblems)
 */
 @Override
 public void filterValidationProblems(ValidationProblems validationProblems) {
 List<int[]> startEndOffsets = new ArrayList<int[]>();
 List<DocumentPositionedInfo> problemsList =
 validationProblems.getProblemsList();

```

```

 if(problemsList != null) {
 for (int i = 0; i < problemsList.size(); i++) {
 try {
 startEndOffsets.add(currentAuthorPage.getStartEndOffsets(problemsList.get(i)));
 } catch (BadLocationException e) {
 e.printStackTrace();
 }
 }
 if(lastStartEndOffsets.size() != startEndOffsets.size()) {
 //Continue
 } else {
 boolean equal = true;
 for (int i = 0; i < startEndOffsets.size(); i++) {
 int[] o1 = startEndOffsets.get(i);
 int[] o2 = lastStartEndOffsets.get(i);
 if(o1 == null && o2 == null) {
 //Continue
 } else if(o1 != null && o2 != null
 && o1[0] == o2[0] && o1[1] == o2[1]){
 //Continue
 } else {
 equal = false;
 break;
 }
 }
 if(equal) {
 //Same list of problems already displayed.
 return;
 }
 }
 //Keep last used offsets.
 lastStartEndOffsets = startEndOffsets;
 } catch (InterruptedException e1) {
 e1.printStackTrace();
 } catch (InvocationTargetException e1) {
 e1.printStackTrace();
 }
 if(problemsList != null) {
 for (int i = 0; i < problemsList.size(); i++) {
 //A reported problem (could be warning, could be error).
 DocumentPositionedInfo dpi = problemsList.get(i);
 try {
 final int[] currentOffsets = startEndOffsets.get(i);
 if(currentOffsets != null) {
 //These are offsets in the Author content.
 final LinkedHashMap<String, String> highlightProps =
new LinkedHashMap<String, String>();
 highlightProps.put("message", dpi.getMessage());
 highlightProps.put("severity", dpi.getSeverityAsString());
 if(! SwingUtilities.isEventDispatchThread()) {
 SwingUtilities.invokeAndWait(new Runnable() {
 @Override
 public void run() {
 currentAuthorPage.getPersistentHighlighter().addHighlight(
 currentOffsets[0], currentOffsets[1] - 1, highlightProps);
 }
 });
 }
 }
 } catch (InterruptedException e) {
 e.printStackTrace();
 } catch (InvocationTargetException e) {
 e.printStackTrace();
 }
 }
 });
 currentEditor.addEditorListener(new WSEditorListener() {
 /**
 * @see WSEditorListener#editorAboutToBeSavedVeto(int)
 */
 @Override
 public boolean editorAboutToBeSavedVeto(int operationType) {
 try {
 if(! SwingUtilities.isEventDispatchThread()) {
 SwingUtilities.invokeAndWait(new Runnable() {
 @Override
 public void run() {
 //Remove all persistent highlights before saving
 currentAuthorPage.getPersistentHighlighter().removeAllHighlights();
 }
 });
 }
 }
 });
 }
}

```

```

 } catch (InterruptedException e) {
 e.printStackTrace();
 } catch (InvocationTargetException e) {
 e.printStackTrace();
 }
 return true;
 });
}
}, StandalonePluginWorkspace.MAIN_EDITING_AREA);
}

/**
 * @see WorkspaceAccessPluginExtension#applicationClosing()
 */
public boolean applicationClosing() {
 return true;
}
}

```

## Add Custom Highlights to Content

### Question

How can we add custom highlights to the document content in **Author** mode?

### Answer

There are two types of highlights you can add:

- 1. Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

You can use the following API method:

```
ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()
```

to obtain an *AuthorHighlighter* that allows you to add a highlight between certain offsets with a specified painter.

For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.

- 2. Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

You can use the following API method:

```
ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHighlighter()
```

to obtain an *AuthorPersistentHighlighter* class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

For example, you can use this support to implement your own way of adding review comments.

## Auto-Generate an ID When a Document is Opened or Created

### Question

Is it possible to configure how the application generates ids? For project compliance we need ids having a certain format for each created topic.

### Answer

This could be done implementing a plugin for Oxygen XML Editor using the Plugins SDK:

[https://www.oxygenxml.com/oxygen\\_sdk.html#Developer\\_Plugins](https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins)

There is a type of plugin called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented plugin would intercept the opened editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
 /**
 * @see WSEditorChangeListener#editorOpened(java.net.URL)
 */
 @Override
 public void editorOpened(URL editorLocation) {
 WSEditor ed = pluginWorkspaceAccess.getEditorAccess
 (editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
 generateID(ed);
 }
 /**
 * @see WSEditorChangeListener#editorPageChanged(java.net.URL)
 */
 @Override
 public void editorPageChanged(URL editorLocation) {
 WSEditor ed = pluginWorkspaceAccess.getEditorAccess
 (editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
 generateID(ed);
 }

 private void generateID(WSEditor ed) {
 if(ed.getCurrentPage() instanceof WSAuthorEditorPage) {
 WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
 AuthorDocumentController ctrl = authorEditPage.getDocumentController();
 AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();
 if(root.getAttribute("id") == null ||
 !root.getAttribute("id").getValue().startsWith("generated_")) {
 ctrl.setAttribute("id", new AttrValue("generated_" + Math.random()), root);
 }
 }
 }
}, PluginWorkspace.MAIN_EDITING_AREA);
```

## Change the Default Track Changes (Review) Author Name

### Question

How can we change the default author name used for Track Changes in the *Author Component*?

### Answer

The Track Changes (Review) author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:

```
ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
```

2. **Options** - If the author name was not imposed from the API, it is determined from the [Author option set in the Review preferences page](#).
3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:

```
System.getProperty("user.name")
```

So, to impose the Track Changes author, use one of the following approaches:

1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method:  
[https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName\(java.lang.String\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName(java.lang.String))
2. Customize the default options and set a specific value for the [Author name option set in the Review preferences page](#).
3. Set the value of user.name system property when the applet is initializing and before any document is loaded.

## Change the DOCTYPE of an Opened XML Document

### Question

How to change the DOCTYPE of a document opened in the **Author** mode?

### Answer

The following API:

```
ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype()
```

allows you to get the DOCTYPE of the current XML file opened in the **Author** mode.

There is also an API method available that would allow you to set the DOCTYPE back to the XML:

```
ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDocumentType)
```

Here is an example of how this solution would work:

```
AuthorDocumentType
dt = new AuthorDocumentType("article", "testSystemID", "testPublicID",
 "<!DOCTYPE article PUBLIC \"testPublicID\" \"testSystemID\">");
docController.setDoctype(dt);
```

Basically, you could take the entire content from the existing DOCTYPE,

```
ro.sync.ecss.extensions.api.AuthorDocumentType.getContent()
```

modify it to your needs, and create another AuthorDocumentType object with the new content and with the same public, system IDs.

For example, you could use this API if you want to add unparsed entities in the XML DOCTYPE.

## Control XML Serialization in the Oxygen XML Author Component

### Question

How can I force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside block-level elements?

### Answer

Usually, in a standalone version of Oxygen XML Editor, the **Editor > Format** and **Editor > Format > XML** preferences pages allow you to control the way the XML is saved on the disk after you edit it in the **Author** mode.

In the editor application (Standalone or Eclipse-based), you can either bundle a [default set of options](#) or use the `PluginWorkspace.setGlobalObjectProperty(String, Object)` API:

```
//For not breaking the line
//Long line
pluginWorkspace.setObjectProperty("editor.line.width", new Integer(100000));
//Do not break before inline elements
pluginWorkspace.setObjectProperty("editor.format.indent.inline.elements", false)
;

//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty("editor.detect.indent.on.open", false);
//Zero indent size
pluginWorkspace.setObjectProperty("editor.indent.size.v9.2", 0);
```

In the Oxygen XML Author Component, you can either bundle a [fixed set of options](#), or use our Java API to set properties that overwrite the default options:

```
//For not breaking the line
//Long line
AuthorComponentFactory.getInstance().setObjectProperty
("editor.line.width", new Integer(100000));
//Do not break before inline elements
AuthorComponentFactory.getInstance().setObjectProperty
("editor.format.indent.inline.elements", false);

//For forcing zero indent
```

```

//Force indent settings to be controlled by us
AuthorComponentFactory.getInstance().setObjectProperty
("editor.detect.indent.on.open", false);
//Zero indent size
AuthorComponentFactory.getInstance().setObjectProperty
("editor.indent.size.v9.2", 0);

```

## Customize the Default Icons for Toolbars/Menus

### Question

How can we change the default icons used for the application built-in actions?

### Answer

If you look inside the main JAR library `[OXYGEN_INSTALL_DIR]\lib\oxygen.jar` or `[OXYGEN_INSTALL_DIR]\lib\author.jar`, it contains an `images` folder that contains all the images that we use for our buttons, menus, and toolbars.

To overwrite them with your own creations, follow these steps:

1. In the `[OXYGEN_INSTALL_DIR]\lib` directory create a folder called `endorsed`.
2. In the `endorsed` folder create another folder called `images`.
3. Add your own images in the `images` folder.

You can use this mechanism to overwrite any kind of resource located in the main oXygen JAR library. The folder structure in the `endorsed` directory and in the main oXygen JAR must be identical.

## Customize the Outline View in Text Mode?

### Question

How do I customize the **Outline** view in **Text** mode?

### Answer

Suppose that you have the following XML document:

```

<doc startnumber="15">
 <sec counter="no">
 <info/>
 <title>Introduction</title>
 </sec>
 <sec>
 <title>Section title</title>
 <para>Content</para>
 <sec>
 <title>Section title</title>
 <para>Content</para>
 </sec>
 </sec>
 <sec>
 <title>Section title</title>
 <para>Content</para>
 </sec>
</doc>

```

and you want to display the XML content in a simplified Outline view like this:

```

doc "15"
sec Introduction
sec 15 Section title
sec 15.1 Section title
sec 16 Section title

```

Usually an Outline should have the following characteristics:

1. Double clicking in the Outline the corresponding XML content would get selected.
2. When the cursor moves in the opened XML document the Outline would select the proper entry.
3. When modifications occur in the document, the Outline would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```
/**
 * Simple Outline for Text mode based on executing XPaths over the text content.
 */
public class CustomWorkspaceAccessPluginExtension implements
WorkspaceAccessPluginExtension {
 /**
 * The custom outline list.
 */
 private JList customOutlineList;

 /**
 * Maps outline nodes to ranges in document
 */
 private WSXMLTextNodeRange[] currentOutlineRanges;

 /**
 * The current text page
 */
 private WSXMLTextEditorPage currentTextPage;

 /**
 * Disable CaretListener when we select from the CaretListener.
 */
 private boolean enableCaretListener = true;

 /**
 * @see WorkspaceAccessPluginExtension#applicationStarted
(ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
 */
 @Override
 public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
 pluginWorkspaceAccess.addViewComponentCustomizer
(new ViewComponentCustomizer() {
 /**
 * @see ViewComponentCustomizer#customizeView
(ro.sync.exml.workspace.api.standalone.ViewInfo)
 */
 @Override
 public void customizeView(ViewInfo viewInfo) {
 if(
 //The view ID defined in the "plugin.xml"
 "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
 customOutlineList = new JList();
 //Render the content in the Outline.
 customOutlineList.setCellRenderer(new DefaultListCellRenderer()) {
 /**
 * @see javax.swing.DefaultListCellRenderer#getListCellRendererComponent
(javax.swing.JList, java.lang.Object, int, boolean, boolean)
 */
 @Override
 public Component getListCellRendererComponent
(JList<?> list, Object value, int index,
 boolean isSelected, boolean cellHasFocus) {
 JLabel label = (JLabel) super.getListCellRendererComponent
(list, value, index, isSelected, cellHasFocus);
 String val = null;
 if(value instanceof Element) {
 Element element = ((Element)value);
 val = element.getNodeName();
 if(!"".equals(element.getAttribute("startnumber"))) {
 val += " " + "" + element.getAttribute("startnumber") + "";
 }
 NodeList titles = element.getElementsByTagName("title");
 if(titles.getLength() > 0) {
 val += " \" " + titles.item(0).getTextContent() + "\"";
 }
 }
 label.setText(val);
 return label;
 }
);
 //When we click a node, select it in the text page.
 customOutlineList.addMouseListener(new MouseAdapter() {
 @Override
 public void mouseClicked(MouseEvent e) {
 if(SwingUtilities.isLeftMouseButton(e) && e.getClickCount() == 2) {
 int sel = customOutlineList.getSelectedIndex();
 enableCaretListener = false;
 try {
 currentTextPage.select(currentTextPage.getOffsetOfLineStart
(currentOutlineRanges[sel].getStartLine()) +
currentOutlineRanges[sel].getStartColumn() - 1,
currentTextPage.getOffsetOfLineStart
(currentOutlineRanges[sel].getEndLine()) +
currentOutlineRanges[sel].getEndColumn());
 } catch (BadLocationException e1) {
 e1.printStackTrace();
 }
 enableCaretListener = true;
 }
 }
);
 }
 }
 });
 }
}
```

```

 });
 viewInfo.setComponent(new JScrollPane(customOutlineList));
 viewInfo.setTitle("Custom Outline");
 }
});

pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
 /**
 * @see WSEditorChangeListener#editorOpened(java.net.URL)
 */
 @Override
 public void editorOpened(URL editorLocation) {
 //An editor was opened
 WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
(editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
 if(editorAccess != null) {
 WSEditorPage currentPage = editorAccess.getCurrentPage();
 if(currentPage instanceof WSXMLTextEditorPage) {
 //User editing in Text mode an opened XML document.
 final WSXMLTextEditorPage xmlTP = (WSXMLTextEditorPage) currentPage;
 //Reconfigure outline on each change.
 xmlTP.getDocument().addDocumentListener(new DocumentListener() {
 @Override
 public void removeUpdate(DocumentEvent e) {
 reconfigureOutline(xmlTP);
 }
 @Override
 public void insertUpdate(DocumentEvent e) {
 reconfigureOutline(xmlTP);
 }
 @Override
 public void changedUpdate(DocumentEvent e) {
 reconfigureOutline(xmlTP);
 }
 });
 JTextArea textComponent = (JTextArea) xmlTP.getTextComponent();
 textComponent.addCaretListener(new CaretListener() {
 @Override
 public void caretUpdate(CaretEvent e) {
 if(currentOutlineRanges != null & currentTextPage != null &&
enableCaretListener) {
 enableCaretListener = false;
 //Find the node to select in the outline.
 try {
 int line = xmlTP.getLineOfOffset(e.getDot());
 for (int i = currentOutlineRanges.length - 1; i >= 0; i--) {
 if(line > currentOutlineRanges[i].getStartLine() &&
line < currentOutlineRanges[i].getEndLine()) {
 customOutlineList.setSelectedIndex(i);
 break;
 }
 }
 } catch (BadLocationException e1) {
 e1.printStackTrace();
 }
 enableCaretListener = true;
 }
 }
 });
 }
 }
 }
 /**
 * @see WSEditorChangeListener#editorActivated(java.net.URL)
 */
 @Override
 public void editorActivated(URL editorLocation) {
 //An editor was selected, reconfigure the common outline
 WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
(editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
 if(editorAccess != null) {
 WSEditorPage currentPage = editorAccess.getCurrentPage();
 if(currentPage instanceof WSXMLTextEditorPage) {
 //User editing in Text mode an opened XML document.
 WSXMLTextEditorPage xmlTP = (WSXMLTextEditorPage) currentPage;
 reconfigureOutline(xmlTP);
 }
 }
 }
}, StandalonePluginWorkspace.MAIN_EDITING_AREA);

/**
 * Reconfigure the outline
 *
 * @param xmlTP The XML Text page.
 */
protected void reconfigureOutline(final WSXMLTextEditorPage xmlTP) {
 try {
 //These are DOM nodes.
 Object[] evaluateXPath = xmlTP.evaluateXPath("//doc | //sec");
 //These are the ranges each node takes in the document.
 currentOutlineRanges = xmlTP.findElementsByXPath("//doc | //sec");
 currentTextPage = xmlTP;
 }
}

```

```

 DefaultListModel listModel = new DefaultListModel();
 if(evaluateXPath != null) {
 for (int i = 0; i < evaluateXPath.length; i++) {
 listModel.addElement(evaluateXPath[i]);
 }
 }
 customOutlineList.setModel(listModel);
 } catch(XPathException ex) {
 ex.printStackTrace();
 }
}

/***
 * @see WorkspaceAccessPluginExtension#applicationClosing()
 */
@Override
public boolean applicationClosing() {
 return true;
}
}

```

## Difference Between a Document Type (Framework) and a Plugin Extension

### Question

What is the difference between a Document Type (Framework) and a Plugin Extension?

### Answer

Two ways of customizing the application are possible:

1. Implement a plugin.

A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Editor.

For the Oxygen XML EditorPlugins API, Javadoc, samples, and documentation, go to [https://www.oxygenxml.com/oxygen\\_sdk.html#Developer\\_Plugins](https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins)

2. *Create or modify the document type* that is associated to your specific XML vocabulary.

This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

For example, if the end users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA Document Type. If you look in the [Document Type Association preferences page](#) there is a DITA document type. If you edit that document type you will see that it has an **Author** tab in the [Document Type configuration dialog box](#). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

For information about developing your own document types (frameworks), see [Author Mode Customization Guide](#) on page 1132.

If you look on disk in the `[OXYGEN_INSTALL_DIR]\frameworks\dita` folder, there is a file called `dita.framework`. That file gets updated when you edit a document type from the [Document Type Association preferences page](#). Then you can share that updated file with all users.

The same folder contains some JAR libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

We have an oXygen SDK that contains the Java sources from all the DITA Java customizations:

[https://www.oxygenxml.com/oxygen\\_sdk.html#XML\\_Editor\\_Authoring\\_SDK](https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK)

**Important:** It is possible for a plugin to share the same classes with a framework. For further details, go to [How to Share the Classloader Between a Framework and a Plugin](#).

### Related tasks

[Add a Custom Operation to an Existing Framework](#) on page 1157

## Disable Context-Sensitive Menu Items for Custom Author Actions

### Question

Is there a way to disable menu items for custom **Author** mode actions depending on the cursor context?

### Answer

By default, Oxygen XML Editor does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain **Author** mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own `ro.sync.ecss.extensions.api.ExtensionsBundle` implementation you can overwrite the method:

`ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()` and when the extension state listener gets activated, you can use the API like this:

```
/**
 * @see ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated
(ro.sync.ecss.extensions.api.AuthorAccess)
 */
public void activated(final AuthorAccess authorAccess) {

 //Add a caret listener to enable/disable extension actions:
authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener()
{
 @Override
 public void caretMoved(AuthorCaretEvent caretEvent) {
 try {
 Map<String, Object> authorExtensionActions =
authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();
 //Get the action used to insert a paragraph. It's ID is "paragraph"
 AbstractAction insertParagraph = (
AbstractAction) authorExtensionActions.get("paragraph");
 //Evaluate an XPath expression in context of the current node
 Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath
(".[ancestor-or-self::p]", false, false, false, false);
 if(evaluateXPath != null && evaluateXPath.length > 0 &&
evaluateXPath[0] != null) {
 //We are inside a paragraph, disable the action.
 insertParagraph.setEnabled(false);
 } else {
 //Enable the action
 insertParagraph.setEnabled(true);
 }
 } catch (AuthorOperationException e) {
 e.printStackTrace();
 }
 }
});
```

When the extension is deactivated, you should remove the `CaretListener` to avoid adding multiple listeners that perform the same functionality.

## Dynamically Add Form Controls Using a Styles Filter

### Question

How do I add form controls using an API?

### Answer

Usually, a form control is added from the CSS using one of the [built-in form controls](#). However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically `ro.sync.ecss.extensions.api.StylesFilter`.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```
public class SDFStylesFilter implements StylesFilter {

 public Styles filter(Styles styles, AuthorNode authorNode) {
 if(authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
 && "before".equals(authorNode.getName())) {
```

```

authorNode = authorNode.getParent();
if ("country".equals(authorNode.getName())) {
 // This is the BEFORE pseudo element of the "country" element.
 // Read the supported countries from the configuration file.
 Map<String, Object> formControlArgs = new HashMap<String, Object>();
 formControlArgs.put(InlineEditorArgumentKeys.PROPERTY_EDIT, "#text");
 formControlArgs.put(InlineEditorArgumentKeys.PROPERTY_TYPE,
 InlineEditorArgumentKeys.TYPE_COMBOBOX);
 // This will be a comma separated enumeration: France, Spain, Great Britain
 String countries = readCountriesFromFile();
 formControlArgs.put(InlineEditorArgumentKeys.PROPERTY_VALUES, countries);
 formControlArgs.put(InlineEditorArgumentKeys.PROPERTY_EDITABLE, "false");

 // We also add a label in form of the form control.
 Map<String, Object> labelProps = new HashMap<String, Object>();
 labelProps.put("text", "Country:");
 labelProps.put("styles", "* {width: 100px; color: gray;}");
 StaticContent[] mixedContent = new StaticContent[]
 {new LabelContent(labelProps), new EditorContent(formControlArgs)};
 styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
}
}

// The added form control is the only way the element can be edited.
if ("country".equals(authorNode.getName())) {
 styles.setProperty(Styles.KEY_VISIBILITY, "-oxy-collapse-text");
}

return styles;
}
}

```

If the execution of the `formControlArgs.put(InlineEditorArgumentKeys.PROPERTY_VALUES, countries);` line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called *lazy evaluation* and can be implemented as follows:

```

formControlArgs.put(InlineEditorArgumentKeys.PROPERTY_VALUES,
 new LazyValue<List<CIValue>>() {
 public java.util.List<CIValue> get() {
 // We avoid reading the possible values until they are actually requested.
 // This will be a List with CIValues created over countries:
 // France, Spain, Great Britain
 return readCountriesFromFile();
 }
 });

```

The lazy evaluation approach can be used for the following form controls properties:

- `InlineEditorArgumentKeys.PROPERTY_VALUES`
- `InlineEditorArgumentKeys.PROPERTY_LABELS`
- `InlineEditorArgumentKeys.PROPERTY_TOOLTIPS`

The full source code for this example is available inside the [oXygen SDK](#).

## Dynamically Modify the Content Inserted by the Author

### Question

Is there a way to insert typographic quotation marks instead of double quotes?

### Answer

By using the API you can set a document filter to change the text that is inserted in the document in **Author** mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```

authorAccess.getDocumentController().setDocumentFilter
(new AuthorDocumentFilter() {
 /**
 * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText
 */
 @Override
 public void insertText(AuthorDocumentFilterBypass filterBypass,
 int offset, String toInsert) {
 if(toInsert.length() == 1 && "\"".equals(toInsert)) {
 //User typed a quote but he actually needs a smart quote.
 //So we either have to add \u201E (start smart quote)
 }
 }
});

```

```

//Or we add \u201C (end smart quote)
//Depending on whether there's already a start smart quote inserted
in the current paragraph.

try {
 AuthorNode currentNode =
authorAccess.getDocumentController().getNodeAtOffset(offset);
 int startofTextInCurrentNode = currentNode.getStartOffset();
 if(offset > startofTextInCurrentNode) {
 Segment seg = new Segment();
 authorAccess.getDocumentController().getChars(startofTextInCurrentNode,
offset - startofTextInCurrentNode, seg);
 String previosTextInNode = seg.toString();
 boolean insertStartQuote = true;
 for (int i = previosTextInNode.length() - 1; i >= 0; i--) {
 char ch = previosTextInNode.charAt(i);
 if('\u201C' == ch) {
 //Found end of smart quote, so yes, we should insert a start one
 break;
 } else if('\u201E' == ch) {
 //Found start quote, so we should insert an end one.
 insertStartQuote = false;
 break;
 }
 }
 if(insertStartQuote) {
 toInsert = "\u201E";
 } else {
 toInsert = "\u201C";
 }
 } catch (BadLocationException e) {
 e.printStackTrace();
 }
}
System.err.println("INSERT TEXT |" + toInsert + "|");
super.insertText(filterBypass, offset, toInsert);
});
}

```

You can find the online Javadoc for `AuthorDocumentFilter` API here: <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro.sync/ecss/extensions/api/AuthorDocumentFilter.html>

An alternative to using a document filtering is the use of a `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter`, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

## Dynamically Open File in Oxygen XML Editor Distributed via JavaWebStart

### Question

How can we dynamically open a file in an Oxygen XML Editor distributed via JWS?

### Answer

The JWS packager Ant build file that is included with Oxygen XML Editor signs by default the JNLP file (this means that a copy of it is included in the main JAR library) in this step:

```
<copy file="${outputDir}/${packageName}/${productName}.jnlp" tofile="${home}/JNLP-INF/APPLICATION.JNLP"/>
```

Sigining the JNLP file is required by newer Java versions and means that it is impossible to automatically generate a JNLP file containing some dynamic arguments. The solution is to use the signed JNLP template feature of Java 7, bundle inside the JAR library a signed APPLICATION\_TEMPLATE.JNLP instead of an APPLICATION.JNLP with a wildcard command line argument:

```
<application-desc main-class="ro.sync.jws.JwsDeployer">
<argument>*</argument>
</application-desc>
```

Then you can replace the wildcard in the external placed JNLP to the actual, dynamic command line arguments value.

A different, more complicated approach would be to have the JNLP file signed and always referenced as a URL argument a location like this:

```
http://path/to/server/redirectEditedURL.php
```

When the URL gets clicked on the client side you would also call a PHP script on the server side that would update the redirect location for `redirectEditedURL.php` to point to the clicked XML resource. Then the opened Oxygen XML Editor would try to connect to the redirect PHP and be redirected to open the XML.

## Extend the Java Functionality of an Existing Framework (Document Type)

### Question

How can I change the way a DocBook 4 `xref` displays in **Author** mode based on what element is at the `linkend`?

### Answer

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Editor classes:

```
<dependency>
 <groupId>com.oxygenxml</groupId>
 <artifactId>oxygen-sdk</artifactId>
 <version>${oxygen.version}</version>
</dependency>
```

where `oxygen.version` is the version of Oxygen XML Editor.

Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the `[OXYGEN_INSTALL_DIR]\frameworks\docbook\docbook.jar` to the class path of the project.
3. Create a class that extends `ro.sync.ecss.extensions.docbook.DocBook4ExtensionsBundle` and overwrites the method:  
`ro.sync.ecss.extensions.api.ExtensionsBundle#createLinkTextResolver()`
4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the *Oxygen SDK*).
5. Pack your extension classes in a JAR file. Copy the JAR to: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\custom.jar`.
6. Start Oxygen XML Editor.
7. *Open the Preferences dialog box (Options > Preferences)* and go to **Document Type Association**. Edit the DocBook 4 document type. In the **Classpath** list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.
8. You can rename the document type and the docbook framework folder to something else (such as `custom_docbook`) and share it with others. A document type can also be installed using our [add-on support](#).

## Impose Custom Options for Authors

### Question

How to enable **Track Changes** at startup?

### Answer

There are two ways to enable **Track Changes** for every document that you open:

1. You could *customize the default options* that are used by your authors and set the **Track Changes - Initial State option** to **Always On**.

## 2. Use an API to toggle the **Track Changes** state after a document is opened in **Author** mode:

```
// Check the current state of Track Changes
boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
if (!trackChangesOn) {
 // Set Track Changes state to On
 authorAccess.getReviewController().toggleTrackChanges();
}
```

## Insert an Element with all the Required Content

### Question

I am inserting a DITA *image* XML element using the API that points to a certain resource and has required content. Can the required content be automatically inserted by the application?

### Answer

The API [ro.sync.ecss.extensions.api.AuthorSchemaManager](#) can propose valid elements that can be inserted at the specific offset. Using the method `AuthorSchemaManager.createAuthorDocumentFragment(CIElement)`, you can convert the proposed elements to document fragments (which have all the required content filled in) that can then be inserted in the document.

```
AuthorSchemaManager schemaManager =
this.authorAccess.getDocumentController().getAuthorSchemaManager();

WhatElementsCanGoHereContext context =
schemaManager.createWhatElementsCanGoHereContext
(this.authorAccess.getEditorAccess().getCaretnOffset());

List<CIElement> possibleElementsAtCaretPosition =
schemaManager.whatElementsCanGoHere(context);
loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
 CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
 List<CIAttribute> attrs = possibleElement.getAttributes();
 if(attrs != null) {
 for (int j = 0; j < attrs.size(); j++) {
 CIAttribute ciAttribute = attrs.get(j);
 if (ciAttribute.getName().equals("class")) {
 if (ciAttribute.getDefaultValue() != null
 && ciAttribute.getDefaultValue().contains(" topic/image ")) {
 //Found a CIElement for image
 //Create a fragment that contains all required child elements already built.
 AuthorDocumentFragment frag =
schemaManager.createAuthorDocumentFragment(possibleElement);
 //Now set the @href to it.
 //Ask the user and obtain a value for the @href
 //Then:
 String href = "test.png";
 List<AuthorNode> nodes = frag.getContentNodes();
 if(!nodes.isEmpty()) {
 AuthorElement imageEl = (AuthorElement) nodes.get(0);
 imageEl.setAttribute("href", new AttrValue(href));
 }
 //And insert the fragment.
 this.authorAccess.getDocumentController().insertFragment
(this.authorAccess.getEditorAccess().getCaretnOffset(), frag);
 break loop;
 }
 }
 }
 }
}
```

## Modify the XML Content on Open

### Question

I have a bunch of DITA documents that have a fixed path the image `src` attributes. These paths are not valid and I am trying to move away from this practice by converting it in to relative paths. When an XML document is opened, can I trigger the Java API to change the fixed path to a relative path?

## Answer

The Plugins SDK: [https://www.oxygenxml.com/oxygen\\_sdk.html#Developer\\_Plugins](https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins) contains a sample Plugin Type called `WorkspaceAccess`. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:

1. Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use our *Author API* to change attributes:

```
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
 /**
 * @see WSEditorChangeListener#editorOpened(java.net.URL)
 */
 @Override
 public void editorOpened(URL editorLocation) {
 WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess
 (StandalonePluginWorkspace.MAIN_EDITING_AREA);
 if(openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
 WSAuthorEditorPage authPage = (WSAuthorEditorPage)
 openedEditor.getCurrentPage();
 AuthorDocumentController docController =
 authPage.getDocumentController();
 try {
 //All changes will be undone by pressing Undo once.
 docController.beginCompoundEdit();
 fixupImageRefs(docController,
 docController.getAuthorDocumentNode());
 } finally {
 docController.endCompoundEdit();
 }
 }
 }

 private void fixupImageRefs
 (AuthorDocumentController docController, AuthorNode authorNode) {
 if(authorNode instanceof AuthorParentNode) {
 //Recurse
 List<AuthorNode> contentNodes =
 ((AuthorParentNode)authorNode).getContentNodes();
 if(contentNodes != null) {
 for (int i = 0; i < contentNodes.size(); i++) {
 fixupImageRefs(docController, contentNodes.get(i));
 }
 }
 }
 if(authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
 AuthorElement elem = (AuthorElement) authorNode;
 if("image".equals(elem.getLocalName())) {
 if(elem.getAttribute("href") != null) {
 String originalHref = elem.getAttribute("href").getValue();
 URL currentLocation = docController.getAuthorDocumentNode().getXMLBaseURL();
 //TODO here you compute the new href.
 String newHref = null;
 docController.setAttribute("href", new AttrValue(newHref), elem);
 }
 }
 }
 }
}, StandalonePluginWorkspace.MAIN_EDITING_AREA);
```

2. An API to open XML documents in the application:

```
ro.sync.exml.workspace.api.Workspace.open(URL)
```

So you can create up a plugin that automatically opens one by one XML documents from a certain folder in the application, makes modifications to them, saves the content by calling:

```
ro.sync.exml.workspace.api.editor.WSEditorBase.save()
```

and then closes the editor:

```
ro.sync.exml.workspace.api.Workspace.close(URL)
```

## Modify the XML Content on Save

### Question

Is it possible to get Oxygen XML Editor to update the revised date on a DITA document when it's saved?

## Answer

The Plugins SDK: [https://www.oxygenxml.com/oxygen\\_sdk.html#Developer\\_Plugins](https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins) contains a sample Plugin Type called **WorkspaceAccess**. Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use our *Author API* to change attributes before the save takes place:

```
@Override
public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
 pluginWorkspaceAccess.addEditorChangeListener
(new WSEditorChangeListener(){
 //An editor was opened
 @Override
 public void editorOpened(URL editorLocation) {
 final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
 if(editorAccess != null){
 editorAccess.addEditorListener
(new ro.sync.exml.workspace.api.listeners.WSEditorListener(){
 //Editor is about to be saved
 @Override
 public boolean editorAboutToBeSavedVeto(int operationType) {
 if(EditorPageConstants.PAGE_AUTHOR.equals
(editorAccess.getCurrentPageID())){
 WSAuthorEditorPage authorPage =
(WSAuthorEditorPage) editorAccess.getCurrentPage();
 AuthorDocumentController controller =
authorPage.getDocumentController();
 try {
 //Find the revised element
 AuthorNode[] nodes = controller.findNodesByXPath
("//revised", true, true, true);
 if(nodes != null && nodes.length > 0){
 AuthorElement revised = (AuthorElement) nodes[0];
 //Set the modified attribute to it...
 controller.setAttribute("modified",
new AttrValue(new Date().toString()), revised);
 }
 } catch (AuthorOperationException e) {
 e.printStackTrace();
 }
 }
 //And let the save continue..
 return true;
 }
}, PluginWorkspace.MAIN_EDITING_AREA);
}
}, PluginWorkspace.MAIN_EDITING_AREA);
```

## Multiple Rendering Modes for the Same Document in Author Mode

### Question

How can we add multiple buttons, each showing a different visualization mode of the same document in **Author** mode?

### Answer

In the toolbar of the **Author** mode there is a **Styles** drop-down menu that contains alternative CSS styles for the same document. To add an alternative CSS stylesheet, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, select the document type associated with your documents and press **Edit**. In the [Document Type configuration dialog box](#) that appears, go to the **Author** tab, and in the **CSS** subtab add references to alternate CSS stylesheets.

For example, one of the alternate CSS stylesheets that we offer for the DITA document type is located here:

```
[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideClospec.css
```

If you open it, you will see that it imports the main CSS and then adds selectors of its own.

## Obtain a DOM Element from AuthorNode or AuthorElement

### Question

Can a DOM Element be obtained from an AuthorNode or an AuthorElement?

### Answer

No, a DOM Element cannot be obtained from an AuthorNode or an AuthorElement. The AuthorNode structure is also hierarchical but the difference is that all the text content is kept in a single text buffer instead of having individual text nodes.

We have an image in the Javadoc documentation that explains this situation: <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html>

## Obtain the Currently Selected Element Using the Author API

### Question

In **Author** mode, if an element is fully selected, I want to perform an action on it. If not, I want to perform an action on the node that is located at the cursor position. Is this possible via the API?

### Answer

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using `AuthorDocumentController.getNodeAtOffset` will actually return the parent of the selected node. We have some special API that makes it easier for you to determine this situation: `WSAuthorEditorPageBase.getFullySelectedNode()`.

```
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretnOffset();

AuthorElement nodeAtCaret =
(AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();
if (nodeAtCaret == null) {
 //We have no fully selected node. We can look at the cursor offset.
 nodeAtCaret = (AuthorElement)
authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
 //Or we could look at the selection start and end, see which node is
 the parent of each offset and get the closest common ancestor.
}
```

## Run XSLT or XQuery Transformations

### Question

Can I run XSL 2.0 / 3.0 transformation with Saxon EE using the oXygen SDK?

### Answer

The API class `ro.sync.xml.workspace.api.util.XMLUtilAccess` allows you to create an XSLT Transformer that implements the JAXP interface `javax.xml.transform.Transformer`. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an `AuthorAccess` API available:

```
InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xsl")).toString());
xslSrc = new SAXSource(is);
javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer
(xslSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);
transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));
```

If you want to create the transformer from the plugins side, you can use this method instead:  
`ro.sync.xml.workspace.api.PluginWorkspace.getXMLUtilAccess()`.

## Save a New Document with a Predefined File Name Pattern

### Question

Is it possible to get Oxygen XML Editor to automatically generate a file name comprising a UUID plus file extension using the SDK?

### Answer

This could be done implementing a plugin for Oxygen XML Editor using the Plugins SDK:

[https://www.oxygenxml.com/oxygen\\_sdk.html#Developer\\_Plugins](https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins)

There is a type of plugin called *Workspace Access* that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```
private static class CustomEdListener extends WSEditorListener{
 private final WSEditor editor;
 private final StandalonePluginWorkspace
 pluginWorkspaceAccess;
 private boolean saving = false;
 public CustomEdListener
(StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
 this.pluginWorkspaceAccess = pluginWorkspaceAccess;
 this.editor = editor;
 }
 @Override
 public boolean editorAboutToBeSavedVeto(int operationType) {
 if(! saving &&
 editor.getEditorLocation().toString().contains("Untitled")) {
 File chosenDir = pluginWorkspaceAccess.chooseDirectory();
 if(chosenDir != null) {
 final File chosenFile =
new File(chosenDir, UUID.randomUUID().toString() + ".dita");
 SwingUtilities.invokeLater(new Runnable() {
 @Override
 public void run() {
 try {
 saving = true;
 editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
 } catch (MalformedURLException e) {
 e.printStackTrace();
 } finally {
 saving = false;
 }
 }
 });
 }
 }
 //Reject the original save request.
 return false;
 }
 return true;
}

@Override
public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
 pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
 @Override
 public void editorOpened(URL editorLocation) {
 final WSEditor editor = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
 if(editor !=
null && editor.getEditorLocation().toString().contains("Untitled")) {
 //Untitled editor
 editor.addListener(new CustomEdListener(pluginWorkspaceAccess, editor));
 }
 }
 },
 PluginWorkspace.MAIN_EDITING_AREA);
....
```

## Split Paragraph on Enter (Instead of Showing Content Completion List)

### Question

How to split the paragraph on Enter instead of showing the content completion list?

### Answer

To obtain this behavior, edit your document type and in the [Document Type configuration dialog box](#) go to the **Author** tab, then **Actions** subtab, and add your own split action. This action must have the **Enter** shortcut key associated and must trigger your own custom operation that handles the split.

So, when you press **Enter**, your Java operation is invoked and it will be your responsibility to split the paragraph using the current API (probably creating a document fragment from the cursor offset to the end of the paragraph, removing the content and then inserting the created fragment after the paragraph).

This solution has as a drawback. Oxygen XML Editor hides the *Content Completion Assistant* when you press **Enter**. If you want to show allowed child elements at that certain offset, implement your own content proposals window using the `ro.sync.ecss.extensions.api.AuthorSchemaManager` API to use information from the associated schema.

## Use Custom Rendering Styles for Entity References, Comments, or PIs

### Problem

Is there a way to display entity references in the **Author** mode without the distinct gray background and tag markers?

### Solution

There is a built-in CSS stylesheet in the Oxygen XML Editor libraries that is used when styling content in the **Author** mode, no matter what CSS you use. This CSS has the following content:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
 display:block !important;
}

oxy|cdata {
 display:morph !important;
 white-space:pre-wrap !important;
 border-width:0px !important;
 margin:0px !important;
 padding: 0px !important;
}

oxy|processing-instruction {
 display:block !important;
 color: rgb(139, 38, 201) !important;
 white-space:pre-wrap !important;
 border-width:0px !important;
 margin:0px !important;
 padding: 0px !important;
}

oxy|comment {
 display:morph !important;
 color: rgb(0, 100, 0) !important;
 background-color:rgb(255, 255, 210) !important;
 white-space:pre-wrap !important;
 border-width:0px !important;
 margin:0px !important;
 padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
 link: attr(href) !important;
 text-decoration: underline !important;
 color: navy !important;

 margin: 2px !important;
}
```

```

 padding: 0px !important;
}

oxy|reference:before {
 display: morph !important;
 content: url(..../images/editContent.gif) !important;
}

oxy|entity[href]:before{
 display: morph !important;
 content: url(..../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
 editable:false !important;
 background-color: rgb(240, 240, 240) !important;
 margin:0px !important;
 padding: 0px !important;
}

oxy|reference {
 display:morph !important;
}

oxy|entity {
 display:morph !important;
}

oxy|entity[href] {
 border: 1px solid rgb(175, 175, 175) !important;
 padding: 0.2em !important;
}

xi|include {
 display:block !important;
 margin-bottom: 0.5em !important;
 padding: 2px !important;
}
xi|include:before,
xi|include:after{
 display:inline !important;
 background-color:inherit !important;
 color:#444444 !important;
 font-weight:bold !important;
}
xi|include:before {
 content:url(..../images/link.gif) attr(href) !important;
 link: attr(href) !important;
}
xi|include[xpointer]:before {
 content:url(..../images/link.gif) attr(href) " " attr(xpointer) !important;
 link: oxy_concat(attr(href), "#", attr(xpointer)) !important;
}
xi|fallback {
 display:morph !important;
 margin: 2px !important;
 border: 1px solid #CB0039 !important;
}
xi|fallback:before {
 display:morph !important;
 content:"XInclude fallback: " !important;
 color:#CB0039 !important;
}

oxy|doctype {
 display:block !important;
 background-color: transparent !important;
 color:blue !important;
 border-width:0px !important;
 margin:0px !important;
 padding: 2px !important;
}

oxy|error {
 display:morph !important;
 editable:false !important;
 white-space:pre !important;
 color: rgb(178, 0, 0) !important;
 font-weight:bold !important;
}

*[xlink|href]:before {
 content:url(..../images/link.gif);
 link: attr(xlink|href) !important;
}

/*No direct display of the MathML and SVG images.*/
svg|svg{
 display:inline !important;
 white-space: trim-when-ws-only;
}

```

```
}

svg|svg svg|*{
 display:none !important;
 white-space: normal;
}

mml|math{
 display:inline !important;
 white-space: trim-when-ws-only;
}
mml|math mml|*{
 display:none !important;
 white-space: normal;
}
```

In the CSS used for rendering the XML in **Author** mode, do the following:

1. Import the special **Author** mode namespace.
2. Use a special selector to customize the entity node.

**Example:**

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
oxy|entity {
 background-color: inherit !important;
 margin:0px !important;
 padding: 0px !important;
 -oxy-display-tags:none;
}
```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and *CData* sections. You can also customize the way *xi:include* elements are rendered.

## Topics:

- [Extending Oxygen XML Editor with Plugins](#)
- [Oxygen XML Author Component](#)
- [Oxygen XML Web Author Component](#)

Oxygen XML Editor has an SDK that can be used as a base to develop frameworks and plugins. It can be also used to create projects that use the Oxygen XML Author Component. The SDK is available on our website at [https://www.oxygenxml.com/oxygen\\_sdk.html](https://www.oxygenxml.com/oxygen_sdk.html).

## Extending Oxygen XML Editor with Plugins

A plugin is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a plugin for the standalone version of Oxygen XML Editor. The [Plugins Development Kit](#) contains sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

If you want to customize the Oxygen XML Editor Eclipse Plugin you can look at the [Eclipse IDE Integration Sample Project](#) to see how an Eclipse plugin can interact with the Oxygen XML Editor APIs.

### Introduction to Plugins

A plugin can have multiple plugin extensions. The following plugin extensions are available (in the order of importance).

Plugins that are used in the entire workspace:

- [Workspace Access Plugin Extension](#) on page 1308
- [Workspace Access Plugin Extension \(JavaScript-Based\)](#) on page 1310
- [Components Validation Plugin Extension](#) on page 1305
- [Custom Protocol Plugin Extension](#) on page 1305
- [Resource Locking Custom Protocol Plugin Extension](#) on page 1307
- [Open Redirect Plugin Extension](#) on page 1306

Plugins that work only in the **Text** editing mode:

- [General Plugin Extension](#) on page 1312
- [Selection Plugin Extension](#) on page 1312
- [Document Plugin Extension](#) on page 1313

### General Configuration of an Oxygen XML Editor Plugin

The Oxygen XML Editor functionality can be extended with plugins that implement a clearly specified API.

On the Oxygen XML Editor website there is an [SDK](#) with sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

The minimal implementation of a plugin must provide:

- A Java class that extends the `ro.sync.exml.plugin.Plugin` class.
- A Java class that implements the `ro.sync.exml.plugin.PluginExtension` interface.

- A plugin descriptor file called `plugin.xml`.

A `ro.sync.exml.plugin.PluginDescriptor` object is passed to the constructor of the subclass of the `ro.sync.exml.plugin.Plugin` class. It contains the following data items about the plugin:

- `basedir` (*File* object) - The base directory of the plugin.
- `description` (*String* object) - The description of the plugin.
- `name` (*String* object) - The name of the plugin.
- `vendor` (*String* object) - The vendor name of the plugin.
- `version` (*String* object) - The plugin version.
- `id` (*String* object) - A unique identifier.
- `classLoaderType` - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that are referenced in the Oxygen XML Editor lib directory will have precedence over those referenced in the `plugin.xml` configuration file, if they have the same package names. When choosing `preferReferencedResources`, the libraries that are referenced in the `plugin.xml` configuration file will have precedence over those found in the Oxygen XML Editor lib directory, if they have the same package names.

The plugin descriptor is an XML file that defines how the plugin is integrated in Oxygen XML Editor and what libraries are loaded. The structure of the plugin descriptor file is fully described in a DTD grammar located in `[OXYGEN_INSTALL_DIR]/plugins/plugin.dtd`. Here is a sample plugin descriptor used by the *Capitalize Lines* sample plugin:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
 name="Capitalize Lines"
 description="Capitalize the first character on each line"
 version="1.0.0"
 vendor="SyncRO"
 class="ro.sync.sample.plugin.caplines.CapLinesPlugin">
 <runtime>
 <library name="lib/caplines.jar"/>
 </runtime>
 <extension type="selectionProcessor"
 class="ro.sync.sample.plugin.caplines.CapLinesPluginExtension"
 keyboardShortcut="ctrl shift EQUALS"/>
</plugin>
```

If your plugin is of type *Selection*, *Document* or *General*, and thus contributes an action either to the contextual menu or to the main menu of the **Text** editing mode, then you can assign a keyboard shortcut for it. You can use the `keyboardShortcut` attribute for each extension element to specify the desired shortcut.

**Tip:** To compose string representations of the desired shortcut keys you can go to the Oxygen XML Editor **Menu Shortcut Keys** preferences page, press **Edit** on any action, press the desired key sequence and use the representation that appears in the **Edit** dialog box.

## Referencing libraries

To reference libraries, use either of the following elements:

- `<library name="libraryName" scope="global"/>` - To point to specific libraries.
- **Note:** You can use the  `${oxygenInstallDir}` editor variable as part of the value of the `name` attribute. You can also use a system variable ( `${system(var.name)}`) or environment variable ( `${env(VAR_NAME)}`).
- `<librariesFolder name="libraryFolderPath" scope="global"/>` - To point to multiple libraries located in the specified folder.

Both elements support the `scope` attribute that defines the loading priority. It can have one of the following three values:

- `local` - The library is loaded in the plugin's own class loader. This is the default behavior.
- `global` - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application lib directory).
- `globalHighPriority` - The library is loaded in the main application class loader as the first library in the list (useful to patch certain resources located in other JARs of the application).

## Installation

Choose one of the following methods to install a plugin in Oxygen XML Editor:

### Automatic Method

To install a new add-on, follow these steps:

1. Go to **Help > Install new add-ons**.
  2. In the displayed dialog box, fill-in the **Show add-ons from** with the *update site* that hosts add-ons. If you want to see all Oxygen XML Editor default add-ons, choose the **ALL AVAILABLE SITES** option from the **Show add-ons from** drop down. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.
- Note:** To see all the add-ons from the remote update site, disable **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site. You cannot install an incompatible add-on.
3. By default, only the latest versions of the add-ons that are compatible with the current version of Oxygen XML Editor are displayed.
  4. Choose the add-ons you want to install, press the **Next** button, then follow the on-screen instructions.

**Note:** Accepting the license agreement of the add-on is a mandatory step in the installation process.

**Note:** All add-ons are installed in the extensions directory inside the Oxygen XML Editor *preferences directory*.

### Manual Method

To install a plugin in Oxygen XML Editor, follow these steps:

1. Go to the Oxygen XML Editor installation directory and locate the **plugins** directory.  
**Note:** The **plugins** directory contains all the plugins available to Oxygen XML Editor.
2. In the **plugins** directory, create a subfolder to store the plugin files.
3. In the new folder, place the plugin descriptor file (**plugin.xml**), the Java classes of the plugin, and the other files that are referenced in the descriptor file.
4. Restart Oxygen XML Editor.

## Types of Plugin Extensions

A plugin can have one or more defined plugin extensions that provide functionality to the application.

### Author Stylesheet Plugin Extension

This plugin type allows the developer to add a stylesheet that renders elements in **Author** mode.

This plugin type allows the developer to add a stylesheet (CSS or LESS) that renders elements in **Author** mode.

To specify additional stylesheets, edit the plugin descriptor and add extension elements that point to them, as in the following example:

```
<extension type="AuthorStylesheet" href="showTables.css"/>
<extension type="AuthorStylesheet" href="hideButtons.css"/>
```

Using this mechanism, you can add one or more CSS stylesheets to merge with the existing ones. Whenever you add a new stylesheet using this plugin, it will have priority over all other stylesheets applied on the file edited in **Author** mode.

If your implementation requires more flexibility (such as a dynamic change of the stylesheet), you should consider using the *StylesFilter plugin extension*.

## Components Validation Plugin Extension

This plugin type allows the developer to customize the editor menus, toolbars, and other components by allowing or filtering them from the user interface.

This plugin provides the following API:

- The interface ComponentsValidatorPluginExtension - There is one method that must be implemented:
  - `getComponentsValidator()` - Returns a `ro.sync.xml.ComponentsValidator` implementation class used for validating the menus, toolbars, and their actions.
- The ComponentsValidator interface provides methods to filter various features from being added to the GUI of Oxygen XML Editor:
  - `validateMenuOrTaggedAction(String[] menuOrActionPath)` - Checks if a menu or a tag action from a menu is allowed and returns a boolean value. A tag is used to uniquely identifying an action. The `String[]` argument is the tag of the menu / action and the tags of its parent menus if any.
  - `validateToolbarTaggedAction(String[] toolbarOrAction)` - Checks if an action from a toolbar is allowed and returns a boolean value. The `String[]` argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.
  - `validateComponent(String key)` - Checks if the given component is allowed and returns a boolean value. The `String` argument is the tag identifying the component. You can remove toolbars entirely using this callback.
  - `validateAccelAction(String category, String tag)` - Checks if the given accelerator action is allowed to appear in the GUI and returns a boolean value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.
  - `validateContentType(String contentType)` - Checks if the given content type is allowed and returns a boolean value. The `String` argument represents the content type. You can instruct Oxygen XML Editor to ignore content types such as `text / xsl` or `text / xquery`.
  - `validateOptionPane(String optionPaneKey)` - Checks if the given options page can be added in the preferences option tree and returns a boolean value. The `String` argument is the option pane key.
  - `validateOption(String optionKey)` - Checks if the given option can be added in the option page and returns a boolean value. The `String` argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.
  - `validateLibrary(String library)` - Checks if the given library is allowed to appear listed in the **About** dialog box and returns a boolean value. The `String` argument is the library. This method is mostly for internal use.
  - `validateNewEditorTemplate(EditorTemplate editorTemplate)` - Checks if the given template for a new editor is allowed and returns a boolean value. The `EditorTemplate` argument is the editor template. An `EditorTemplate` is used to create an editor for a given extension. You can thus filter what appears in the list of the **New** dialog box.
  - `isDebuggerperspectiveAllowed()` - Check if the debugger perspective is allowed and returns a boolean value.
  - `validateSHMarker(String marker)` - Checks if the given marker is allowed and returns a boolean value. The `String` argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.
  - `validateToolbarComposite(String toolbarCompositeTag)` - Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

**Tip:** The best way to decide what to filter is to observe the values that Oxygen XML Editor passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.

## Custom Protocol Plugin Extension

This type of plugin allows the developer to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

- The interface URLStreamHandlerPluginExtension - There is one method that must be implemented:

- `getURLStreamHandler(String protocol)` - It takes as an argument the name of the protocol and returns a `URLStreamHandler` object, or null if there is no URL handler for the specified protocol.

This type of plugin extension can be usually combined with a [Workspace Access plugin extension](#) that can add a custom toolbar with custom actions for opening documents from a certain source.

As an alternative, two older plugin extensions can also be used to add a toolbar action for showing a custom URL chooser:

- With the help of the `URLChooserPluginExtension2` interface, it is possible to create your own dialog box that works with the custom protocol. This interface provides two methods:
  - `chooseURLs(StandalonePluginWorkspace workspaceAccess)` - Returns a `URL[]` object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser dialog box here and then return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Editor.
  - `getMenuItemName()` - Returns a `String` object that is the name of the entry added in the **File** menu.
- With the help of the `URLChooserToolbarExtension` interface, it is possible to provide a toolbar entry that is used for launching the custom URLs chooser from the `URLChooserPluginExtension` implementation. This interface provides two methods:
  - `getToolbarIcon()` - Returns the `javax.swing.Icon` image used on the toolbar.
  - `getToolbarTooltip()` - Returns a `String` that is the tooltip used on the toolbar button.

### **Lock Handler Plugin Extension**

This type of extension is used for locking resources from a specific protocol.

It provides the following API:

- The interface `LockHandlerFactoryPluginExtension`.

You need to implement the following two methods:

- `LockHandler getLockHandler()`  
Gets the lock handler for the current handled protocol. Might be null if not supported.
- `boolean isLockingSupported(String protocol)`  
Checks if a lock handler can be provided for a specific protocol.

To use this type of extension in your plugin, create an extension of `LockHandlerFactory` type in your `plugin.xml` and specify the class implementing `LockHandlerFactoryPluginExtension`:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomLockHandler">
 <runtime>

 </runtime>
 <extension type="LockHandlerFactory"
 class="LockHandlerFactoryPluginExtensionImpl"/>

</plugin>
```

### **Open Redirect Plugin Extension**

This type of plugin is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the **Archive Browser** view a plugin of this type can decide to open a file also from the archive in an XML editor panel. This file can be the `document.xml` main file from an OOXML file archive or a specific XML file from a zip archive.

The plugin must implement the interface `OpenRedirectExtension`. It only has one callback: `redirect(URL)` that receives the URL of the file opened by the Oxygen XML Editor user. If the plugin decides to open also other files it must return an array of information objects (`OpenRedirectInformation[]`) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, `text/xml`). The content type is used for determining the type of editor panel. A null content type allows auto-detection of the file type.

## Option Page Plugin Extension

This extension type allows developers to add custom preference pages to the application **Preferences** dialog box.

The extension must implement the `ro.sync.exml.plugin.option.OptionPagePluginExtension` interface. The provided callbacks allow the developer to create the custom *Swing* component that will be added to the page and to react to various calls to persistently save the page settings using the OptionsStorage API.

All preferences pages that are contributed by a plugin appear listed in the **Preferences** dialog box in the **Plugins** category. The `plugin.xml` configuration file can specify one or more such extensions using constructs like this:

```
<extension type="OptionPage" class="my.pack.CustomOptionPagePluginExtension"/>
```

## Resource Locking Custom Protocol Plugin Extension

This plugin type allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource on opening it in Oxygen XML Editor.

This resource locking plugin extension allows you to work with a custom designed protocol for retrieving and storing files. It can lock a resource on opening it in Oxygen XML Editor. This type of plugin extends the custom protocol plugin type with resource locking support.

Such a plugin provides the following API:

- The interface `URLStreamHandlerWithLockPluginExtension` - The plugin receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Editor.

There are two additional methods that must be implemented:

- `getLockHandler()` - Returns a `LockHandler` implementation class with the implementation of the lock specific methods from the plugin.
- `isLockingSupported(String protocol)` - Returns a boolean that is `true` if the plugin accepts to manage locking for a certain URL protocol scheme (such as `ftp`, `http`, `https`, or `customName`).

## Styles Filter Plugin Extension

This plugin type allows the developer to dynamically modify the CSS styles used to render elements in the **Author** mode.

The plugin must extend the

`ro.sync.exml.plugin.author.css.filter.GeneralStylesFilterExtension` class. This class has a callback on which you can alter the styles for an **Author** mode element.

This extension point is similar with the Styles Filter that you set at the *Document Type* level. The only difference is that the plugin filters styles are used for any opened XML document, regardless of the document type. The changes made by this plugin are prioritised over the changes made by the Document Type level filter.

**Note:** Alternatively, you can use the [AuthorStylesheet plugin extension](#), which does not require any additional Java development and is compatible with Oxygen XML Web Author Component.

## Related information

[Configuring CSS Styles Filter](#) on page 1195

## Targeted URL Stream Handler Plugin Extension

This type of plugin can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This plugin extension can handle the following protocols: `http`, `https`, `ftp` or `sftp`, for which Oxygen XML Editor usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension will be asked to provide the URL stream handler for each opened connection of a URL having that protocol.

To use this type of plugin, you have to implement the `ro.sync.exml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension` interface, that provides the following methods:

- `boolean canHandleProtocol(String protocol)`

This method checks if the plugin can handle a specific protocol. If this method returns `true` for a specific protocol, the `getURLStreamHandler(URL)` method will be called for each opened connection of a URL having this protocol.

- URLStreamHandler getURLStreamHandler(URL url)

This method provides the URL handler for the specified URL and it is called for each opened connection of a URL with a protocol for which the `canHandleProtocol(String)` method returns `true`.

If this method returns null, the default Oxygen XML Editor URLStreamHandler is used.

To use this type of extension in your plugin, create an extension of TargetedURLHandler type in your plugin.xml and specify the class that implements TargetedURLStreamHandlerPluginExtension:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomTargetedURLStreamHandlerPlugin">
 <runtime>

 </runtime>

 <extension type="TargetedURLHandler"
 class="CustomTargetedURLStreamHandlerPluginExtension"/>

</plugin>
```

This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Editor `HTTP URLStreamHandler` may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Editor) to use the default SUN `URLStreamHandler`, since it is more compatible with sending and receiving SOAP requests.

```
public class CustomTargetedURLStreamHandlerPluginExtension
 implements TargetedURLStreamHandlerPluginExtension {

 @Override
 public boolean canHandleProtocol(String protocol) {
 boolean handleProtocol = false;
 if ("http".equals(protocol) || "https".equals(protocol)) {
 // This extension handles both HTTP and HTTPS protocols
 handleProtocol = true;
 }
 return handleProtocol;
 }

 @Override
 public URLStreamHandler getURLStreamHandler(URL url) {
 // This method is called only for the URLs with a protocol
 // where canHandleProtocol(String) method returns true (HTTP and HTTPS)

 URLStreamHandler handler = null;

 String host = url.getHost();
 String protocol = url.getProtocol();
 if ("some_host".equals(host)) {
 // When there are connections opened from some_host, the SUN HTTP(S)
 // handlers are used
 if ("http".equals(protocol)) {
 handler = new sun.net.www.protocol.http.Handler();
 } else {
 handler = new sun.net.www.protocol.https.Handler();
 }
 }
 return handler;
 }
}
```

## Workspace Access Plugin Extension

This plugin type allows you to contribute actions to the main menu and toolbars, create custom views and interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually require access to some workspace resources such as toolbars, menus, views, and editors. This type of plugin is also useful because it allows you to make modifications to the XML content of an opened editor.

The plugin must implement the `ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension` interface. The callback method `applicationStarted` of this interface allows access to a parameter of the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` type (allows for API access to the application workspace).

The `StandalonePluginWorkspace` interface has three methods that can be called to customize toolbars, menus, and views:

- `addToolbarComponentsCustomizer` - Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated `plugin.xml` descriptor using the following construct:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess">
 <runtime>

 </runtime>
 <extension type="WorkspaceAccess">

 <toolbar id="SampleID" initialSide="NORTH" initialRow="1"/>
 </extension>
</plugin>
```

The `toolbar` element adds a toolbar in the Oxygen XML Editor interface and allows you to contribute your own plugin-specific actions. The following attributes are supported:

- `id` - Unique identifier for the plugin toolbar.
- `initialSide` - Specifies the place where the toolbar is initially displayed. The allowed values are `NORTH` and `SOUTH`.
- `initialRow` - Specifies the initial row on the specified side where the toolbar is displayed. For example, the first toolbar has an initial row of `0` and the next toolbar has an initial row of `1`.

The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified `id` will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

- `addViewComponentCustomizer` - Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated `plugin.xml` descriptor using the following construct:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess">
 <runtime>

 </runtime>
 <extension type="WorkspaceAccess">

 <view id="SampleID" initialSide="WEST" initialRow="0"/>
 </extension>
</plugin>
```

The `view` element adds a view in the Oxygen XML Editor interface and allows you to contribute your own plugin-specific UI components. The following attributes are supported:

- `id` - Unique identifier of the view component.
- `initialSide` - Specifies the place where the view is initially displayed. The allowed values are: `NORTH`, `SOUTH`, `EAST`, and `WEST`.
- `initialRow` - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Editor, the **Project** view has an initial row of `0` and the **Outline** view has an initial row of `1`. Both views are in the `WEST` part of the workbench.
- `initialState` - Specifies the initial state of the view. The allowed values are: `hidden`, `docked`, `autohide`, and `floating`. By default, the view is visible and docked.

The `ro.sync.exml.workspace.api.standalone.ViewInfo` view component information with the specified `id` will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

- `addMenuBarCustomizer` - Contributes to or modifies existing menu components.

Access to the opened editors can be done by first getting access to all URLs opened in the workspace using the `StandalonePluginWorkspace.getAllEditorLocations(int editingArea)`

API method. There are two available editing areas: the **DITA Maps Manager** editing area and the main editing area. Using the URL of an opened resource, you can gain access to it using the `StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)` API method. A `ro.sync.exml.workspace.api.editor.WSEditor` then allows access to the current editing page.

A special editing API is supported for the **Text** mode (`ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage`) and the **Author** mode (`ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPage`).

To be notified when editors are opened, selected, and closed, you can use the `StandalonePluginWorkspace.addEditorChangeListener` API method to add a listener.

### Workspace Access Plugin Extension (JavaScript-Based)

This is a JavaScript-based plugin extension that allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

This extension can use the same API as the [Workspace Access plugin extension](#), but the implementation is JavaScript-based and uses the bundled [Rhino](#) library to create and work with Java API from the JavaScript code.

The plugin descriptor file `plugin.xml` needs to point to a JavaScript file, as in the following example:

```
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
 id="unique.id.value"
 name="Add Action To DITA Maps Manager_popup-menu"
 description="Plugin adds action to DITA Maps Manager contextual menu."
 version="1.0"
 vendor="Syncro Soft"
 class="ro.sync.exml.plugin.Plugin"
 classLoaderType="preferReferencedResources">
 <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>
```

In the example above, the JavaScript file `wsAccess.js`, located in the plugin folder, will be called. This JavaScript file needs to have two JavaScript methods defined inside. Methods that will be called when the application starts and when it ends:

```
function applicationStarted(pluginWorkspaceAccess) {
.....
}

function applicationClosing(pluginWorkspaceAccess) {
.....
}
```

In regards to the `applicationStarted` callback, besides using the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` API with the `pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the **DITA Maps Manager** view. The action starts the `notepad.exe` application and passes the reference to the currently selected `topicref` to it.

```
function applicationStarted(pluginWorkspaceAccess) {
 Packages.java.lang.System.out.println("Application started "
 + pluginWorkspaceAccess);
 edChangedListener = {
 /*Called when a DITA Map is opened*/
 editorOpened: function(editorLocation) {
 Packages.java.lang.System.out.println("\nrunning " + editorLocation);
 }
 /*Get the opened DITA Map*/
 editor = pluginWorkspaceAccess.getEditorAccess(editorLocation,
 Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
 ditaMapPage = editor.getCurrentPage();
 /*Add listener called when right-click is done in the DITA Maps manager*/
 customizeObj = {
 customizePopUpMenu: function(popUp, ditaMapDocumentController) {
 Packages.java.lang.System.out.println("RIGHT CLICK " + popUp);
 tree = ditaMapPage.getDITAMapTreeComponent();
 /*Selected tree path*/
 sel = tree.getSelectionPath();
 if (sel != null) {
 selectedElement = sel.getLastPathComponent();
 /*Reference attribute*/
 href = selectedElement.getAttribute("href");
 }
 }
 }
 }
}
```

```

 if (href != null) {
 try {
 /*Create absolute reference*/
 absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(),
 href.getValue());
 Packages.java.lang.System.out.println("Computed absolute reference "
 + absoluteRef);
 mi = new Packages.javax.swing.JMenuItem("Run notepad");
 popUp.add(mi);
 actionPerfObj = {
 actionPerformed: function (e) {
 try {
 Packages.java.lang.Runtime.getRuntime().exec("notepad.exe "
 + pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
 }
 }
 };
 mi.addActionListener(new JavaAdapter(Packages.java.awt.event.ActionListener,
 actionPerfObj));
 }
 catch (e1) {
 e1.printStackTrace();
 }
 }
 }
 mi.addActionListener(new JavaAdapter(Packages.java.awt.event.ActionListener,
 actionPerfObj));
}
catch (e1) {
 Packages.java.lang.System.out.println(e1);
}
}
}
}

ditaMapPage.setPopUpMenuCustomizer(new Packages.ro.sync.exml.workspace.api.
editor.page.ditamap.DITAMapPopupMenuCustomizer(customizerObj));
}
}
edChangedListener = new JavaAdapter(Packages.ro.sync.exml.workspace.api.
listeners.WSEditorChangeListener, edChangedListener);
pluginWorkspaceAccess.addEditorChangeListener(
edChangedListener,
Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
}

function applicationClosing(pluginWorkspaceAccess) {
 Packages.java.lang.System.out.println("Application closing "
 + pluginWorkspaceAccess);
}
}

```

For more information and some samples, see [GitHub Project with Multiple Workspace Access JavaScript-Based Plugin Samples](#).

### XML Refactoring Operations Plugin Extension

This plugin type allows the developer to specify one or more directories from which the XML Refactoring operation resources are loaded.

The RefactoringOperationsProvider extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Editor will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

#### Sample XML Refactoring Operations Plugin Extension

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">

<plugin
 id="refactoring.operations"
 name="Refactoring operations plugin"
 description="Contains operation descriptors and related scripts"
 version="1.0">
 <extension type="RefactoringOperationsProvider">
 <folder path="customDir"/>
 <folder path="customDir2"/>
 </extension>
</plugin>

```

### Plugin Extensions Designed to Work only in the Text Editing Mode

These plugin extensions operate only when editing documents in the **Text** mode. They are mounted automatically by the application on the contextual menu in the **Plugins** submenu.

## General Plugin Extension

This type of plugin allows you to invoke custom code to interact with the workspace in **Text** mode.

The *general* plugin type allows you to invoke custom code and to interact with the workspace of Oxygen XML Editor.

This plugin is the most general plugin type and provides a limited API:

- The interface `GeneralPluginExtension` - Intended for general-purpose plugins, kind of external tools but triggered from the **Plugins** menu. The implementing classes must provide the method `process(GeneralPluginContext)`, which must provide the plugin processing. This method takes as a parameter a `GeneralPluginContext` object.
- The class `GeneralPluginContext` - Represents the context in which the general plugin extension does its processing. The `getPluginWorkspace()` method allows you access to the workspace of Oxygen XML Editor.

## Selection Plugin Extension

This type of plugin allows you to manage selections of text.

A *selection* plugin can be applied to both XML and non-XML documents. The plugin is started by making a selection in the editor, then selecting the corresponding menu item from the **Plugins** submenu in the contextual menu of **Text** mode.

This plugin type provides the following API:

- The interface `SelectionPluginExtension` - The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The `process(GeneralPluginContext)` method must return a `SelectionPluginResult` object that contains the result of the processing. The `String` value returned by the `SelectionPluginResult` object can include editor variables such as  `${caret}` and  `${selection}`.
- The `SelectionPluginContext` object represents the context. It provides four methods:
  - `getSelection()` - Returns a `String` that is the current selection of text.
  - `getFrame()` - Returns a `Frame` that is the editing frame.
  - `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Editor.
  - `getDocumentURL()` - Returns the URL of the current edited document.

## Related information

[Editor Variables](#) on page 164

### Example - Uppercase Plugin

The following plugin is called `UppercasePlugin` and is an example of a *Selection plugin*. It is used in Oxygen XML Editor for capitalizing the characters in the current selection. This example consists of two Java classes and the plugin descriptor:

- `UppercasePlugin.java`:

```
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.Plugin;
import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {
 /**
 * Plugin instance.
 */
 private static UppercasePlugin instance = null;

 /**
 * UppercasePlugin constructor.
 *
 * @param descriptor Plugin descriptor object.
 */
 public UppercasePlugin(PluginDescriptor descriptor) {
 super(descriptor);

 if (instance != null) {
 throw new IllegalStateException("Already instantiated !");
 }
 instance = this;
 }
}
```

```

 /**
 * Get the plugin instance.
 *
 * @return the shared plugin instance.
 */
 public static UppercasePlugin getInstance() {
 return instance;
 }
}

```

- `UppercasePluginExtension.java`:

```

package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension {
 /**
 * Convert the text to uppercase.
 *
 * @param context Selection context.
 * @return Uppercase plugin result.
 */
 public SelectionPluginResult process(SelectionPluginContext context) {
 return new SelectionPluginResultImpl(
 context.getSelection().toUpperCase());
 }
}

```

- `plugin.xml`:

```

<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
 name="UpperCase"
 description="Convert the selection to uppercase"
 version="1.0.0"
 vendor="SyncRO"
 class="ro.sync.sample.plugin.uppercase.UppercasePlugin">
 <runtime>
 <library name="lib/uppercase.jar"/>
 </runtime>
 <extension type="selectionProcessor"
 class="ro.sync.sample.plugin.uppercase.UppercasePluginExtension"/>
</plugin>

```

## Document Plugin Extension

This type of plugin allows you to manage the current document.

The *document* plugin type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The plugin is started by selecting the corresponding menu item from the **Plugins** submenu in the contextual menu of **Text** mode. It provides the following API:

- **Interface DocumentPluginExtension** - Receives the context object containing the current document. The `process(GeneralPluginContext)` method can return a `DocumentPluginResult` object containing a new document.
- **DocumentPluginContext object** - Represents the context and provides three methods:
  - `getDocument()` - Returns a `javax.swing.text.Document` object that represents the current document.
  - `getFrame()` - Returns a `java.awt.Frame` object that represents the editing frame.
  - `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Editor.

## Oxygen XML Editor Plugin How to...

This section includes information about how to implement complex plugins.

### How to Write a CMS Integration Plugin

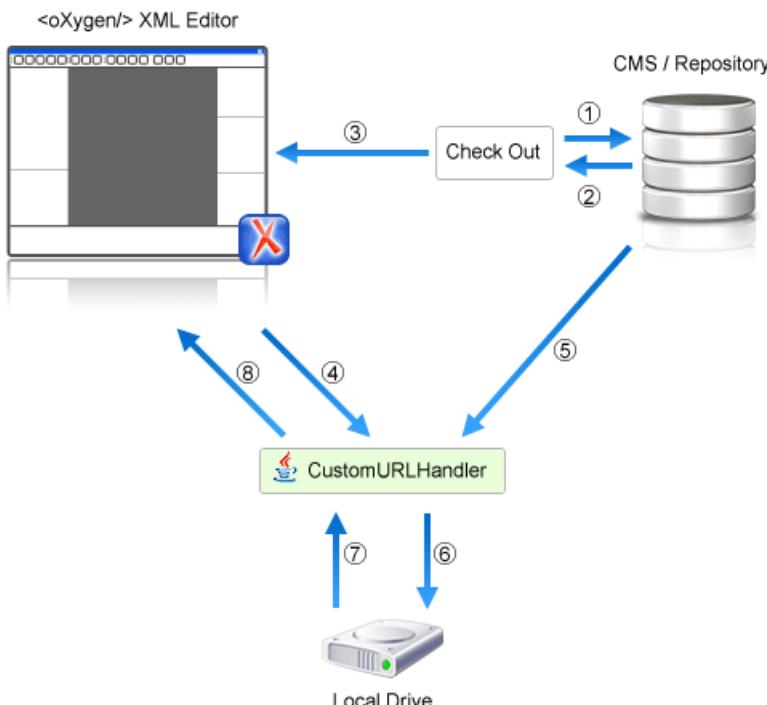

To have a complete integration between Oxygen XML Editor and a CMS, you usually have to write a plugin that combines the following two available plugin extensions:

- [Workspace Access](#)
- [Custom protocol](#)

The usual set of requirements for an integration between Oxygen XML Editor and the CMS are as follows:

- Contribute to the Oxygen XML Editor toolbars and main menu with your custom **Check Out** and **Check In** actions:
  - **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
  - **Check In** allows you to send the modified content back to the server.
- You can use the **Workspace Access** plugin extension (and provided sample Java code) for all these operations.
- When **Check Out** is called, use the Oxygen XML Editor API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a **Custom Protocol** extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Editor. Your custom `java.net.URLStreamHandler` implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```
/**
 * Sample implementation for the "Check Out" method.
 *
 * @param pluginWorkspaceAccess (Workspace Access plugin).
 * @throws MalformedURLException
 */
private void checkOut(StandalonePluginWorkspace pluginWorkspaceAccess)
throws MalformedURLException {
 //TODO Show the user a custom dialog box for browsing the CMS
 //TODO after user selected the resource create a URL with a custom protocol
 //which will uniquely map to the resource on the CMS using the URLHandler
 //something like:
 URL customURL = new URL("mycms://host/path/to/file.xml");
 //Ask Oxygen to open the URL
 pluginWorkspaceAccess.open(customURL);
 //Oxygen will then your custom protocol handler to provide the contents for
 //the resource "mycms://host/path/to/file.xml"
 //Your custom protocol handler will check out the file in a temporary
 //directory, for example, and provide the content from it.
 //Oxygen will also pass through your URLHandler if you have any relative
 //references which need to be opened/obtained.
}
```

**Figure 582: Check Out Process Diagram**

Each phase is described below:

1. Browse CMS repository
  2. User chooses a resource
  3. Use API to open custom URL: mycms://path/to/file.xml
  4. Get content of URL: mycms://path/to/file.xml
  5. Get content of resource
  6. Store on disk for faster access
  7. Retrieve content from disk if already checked out
  8. Retrieved content
- Contribute a special **Browse CMS** action to every dialog box in Oxygen XML Editor where a URL can be chosen to perform a special action (such as the **Reuse Content** or **Insert Image** action). Sample code:

```
//Add an additional browse action to all dialog boxes/places
//where Oxygen allows selecting a URL.
pluginWorkspaceAccess.addInputURLChooserCustomizer
(new InputURLChooserCustomizer() {
 public void customizeBrowseActions
(List<Action> existingBrowseActions, final InputURLChooser chooser) {
 //IMPORTANT, you also need to set a custom icon on the action
 //for situations when its text is not used for display.
 Action browseCMS = new AbstractAction("CMS") {
 public void actionPerformed(ActionEvent e) {
 URL chosenResource = browseCMSAndChooseResource();
 if (chosenResource != null) {
 try {
 //Set the chosen resource in the combo box chooser.
 chooser.urlChosen(chosenResource);
 } catch (MalformedURLException e1) {
 //
 }
 }
 }
 };
 existingBrowseActions.add(browseCMS);
});
});
```

When inserting references to other resources using the actions already implemented in Oxygen XML Editor, the reference to the resource is made by default relative to the absolute location of the edited XML file. You can gain control over the way in which the reference is made relative for a specific protocol like this:

```
//Add a custom relative reference resolver for your custom protocol.
//Usually when inserting references from one URL to another Oxygen
//makes the inserted path relative.
//If your custom protocol needs special relativization techniques then
//it should set up a custom relative
//references resolver to be notified when resolving needs to be done.
pluginWorkspaceAccess.addRelativeReferencesResolver(
 //Your custom URL protocol for which you already have a
 //custom URLStreamHandlerPluginExtension set up.
 "mycms",
 //The relative references resolver
 new RelativeReferenceResolver() {
 public String makeRelative(URL baseURL, URL childURL) {
 //Return the referenced path as absolute for example.
 //return childURL.toString();
 //Or return null for the default behavior.
 return null;
 }
});
```

- Write the plugin.xml descriptor. Your plugin combines the two extensions using a single set of libraries. The descriptor would look like this:

```
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
 name="CustomCMSAccess"
 description="Test"
 version="1.0.0"
 vendor="ACME"
 class="custom.cms.CMSAccessPlugin">
 <runtime>
 <library name="lib/cmsaccess.jar"/>
 </runtime>
 <!--Access to add actions to the main menu and toolbars or to add custom views.-->
 <!--See the "ro.sync.sample.plugin.workspace.CustomWorkspaceAccessPluginExtension" Java sample for more details-->
 <extension type="WorkspaceAccess"
 class="custom.cms.CustomWorkspaceAccessPluginExtension"/>
 <!--The custom URL handler that will communicate with the CMS implementation-->
```

- ```
<!--See the "ro.sync.sample.plugin.workspace.customprotocol.CustomProtocolURLHandlerExtension" Java sample for more
details-->
<extension type="URLHandler"
  class="custom.cms.CustomProtocolURLHandlerExtension"/>
</plugin>
• Create a cmsaccess.jar JAR archive containing your implementation classes.
• Copy your new plugin directory in the plugins subfolder of the Oxygen XML Editor install folder and start
Oxygen XML Editor.
```

Class Loading Issues

It is possible that the Java libraries you have specified in the plugin libraries list conflict with the ones already loaded by Oxygen XML Editor. To instruct the plugin to prefer its libraries over the ones used by Oxygen XML Editor, you can add the following attribute on the <plugin> root element: `classLoaderType="preferReferencedResources"` from the `plugin.xml` descriptor.

A **Late Delegation Class Loader** (the main class loader in Oxygen XML Editor) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Editor Class Loader uses as libraries all jars specified in the `[OXYGEN_INSTALL_DIR]\lib` directory. Its parent class loader is the default JVM Class loader. For each plugin instance, a separate class loader is created having as parent the Oxygen XML Editor Class Loader.

The plugin class loader can be either a standard `java.net.URLClassLoader` or a `LateDelegationClassLoader` (depending on the attribute `classLoaderType` in the `plugin.xml`). Its parent class loader is always the Oxygen XML Editor `LateDelegationClassLoader`.

If you experience additional problems, such as:

```
java.lang.LinkageError: ClassCastException:
attempting to cast
jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar!/
javax/xml/ws/spi/Provider.class
to jar:file:/D:/Program
  Files/Oxygen XML Editor
  12/plugins/wspcaccess/../../xdocs/lib/jaxws/
jaxws-api.jar!/:javax/xml/ws/spi/Provider.class
  at javax.xml.ws.spi.Provider.provider(
  Provider.java:94) at
  javax.xml.ws.Service.<init>(Service.java:56)
  ....
```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a `try/finally` statement:

```
ClassLoader oldClassLoader =
  Thread.currentThread().getContextClassLoader();
try {
  //This is the implementation of the
  //WorkspaceAccessPluginExtension plugin interface.
  Thread.currentThread().setContextClassLoader(
    CustomWorkspaceAccessPluginExtension.
      this.getClass().getClassLoader());
  //WRITE YOUR CODE HERE
} finally {
  Thread.currentThread().
    setContextClassLoader(oldClassLoader);
}
```

How to Write A Custom Protocol Plugin

To create a custom protocol plugin, follow these steps:

1. Write the handler class for your protocol that implements the `java.net.URLStreamHandler` interface.
Be careful to provide ways to encode and decode the URLs of your files.
2. Write the plugin class by extending `ro.sync.xml.plugin.Plugin`.
3. Write the plugin extension class that implements the `ro.sync.xml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface.

It is necessary that the plugin extension for the custom protocol implements the `URLStreamHandlerPluginExtension` interface. Without it, you cannot use your plugin, because Oxygen XML Editor is not able to find the protocol handler.

You can choose also to implement the *URLChooserPluginExtension* interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

An implementation of the extension *URLHandlerReadOnlyCheckerExtension* allows you to:

- Mark a resource as read-only when it is opened.
- Switch between marking the resource as read-only and read-write while it is edited.

It is useful when opening and editing CMS resources.

4. Write the plugin.xml descriptor.

Remember to set the name of the plugin class to the one from the second step and the plugin extension class name with the one you have chosen at step 3.

5. Create a .jar archive with all these files.

6. Install your new plugin in the plugins subfolder of the Oxygen XML Editor install folder.

Packing and Deploying Plugins or Frameworks as Add-ons

Packing a Plugin or Framework as an Add-on

This procedure is suitable for developers who want a better control over the add-on package or those who want to automate some of the steps:

1. Pack the plugin or framework as a ZIP file or a . Note that you should pack the entire root directory not just its contents.
2. Digitally sign the package. Note that you can perform this step only if you have created a at the previous step. You will need a certificate signed by a trusted authority. To sign the jar you can either use the jarsigner command line tool inside Oracle's Java Development Kit. ([JDK_DIR]/bin/jarsigner.exe) or, if you are working with , you can use the signjar task (a front for the jarsigner command line tool).

Note: The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the keytool command line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Editor provides. To use this template, go to **File > New** and select the **Oxygen add-ons update site** template. Once deployed, this descriptor file is referenced as *update site*.

Alternatively, you can use the **Add-ons Packager** plugin by following this procedure:

1. Install the **Add-ons Packager** plugin from <https://www.oxygenxml.com/InstData/Addons/optional/updateSite.xml> as described in the *Installing Add-ons* procedure.
2. Restart Oxygen XML Editor. If the add-on is correctly installed, the **Add-ons packager** toolbar action is available.
3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.
4. Press **OK** to complete the packaging process.

Deploying an Add-on

To deploy an add-on, copy the ZIP/ file and the descriptor file to an HTTP server. The URL to this location serves as the *Update Site URL*.

How to Share a Class Loader Between a Framework and Plugin

In some cases you may need to extend the functionality of Oxygen XML Editor both through a framework and through a plugin. Normally, a framework and a plugin both run in their own private classloader. If the framework and the plugin use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one *Class Loader* and they will both use the same static objects and have the ability to cast objects between one another.

To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, select the document type, go to the **Classpath** tab, and in the **Use parent classloader from plugin with ID** fields introduce the ID of the plugin. This ID is declared in the [configuration file of the plugin](#).

Important: The shared classes must be specified only in the configuration files of the plugin, and not in the configuration file and the document type class path at the same time.

Creating and Running Automated Tests

If you have developed complex custom plugins or document types, the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Editor standalone installation includes a main oxygen.jar library located in the [OXYGEN_INSTALL_DIR]. That JAR library contains a base class for testing developer customizations named: ro.sync.exml.workspace.api.PluginWorkspaceTCBase.

To develop JUnit tests for your customizations using the **Eclipse** workbench, follow these steps:

1. Create a new Eclipse Java project and copy to it the entire contents of the [OXYGEN_INSTALL_DIR].
2. Add all JAR libraries present in the [OXYGEN_INSTALL_DIR]/lib directory to the **Java Build Path->Libraries** tab. Make sure that the main JAR library oxygen.jar or oxygenAuthor.jar is the first one in the Java classpath by moving it up in the **Order and Export** tab.
3. Click **Add Library** and add the **JUnit** and **JFCUnit** libraries.
4. Create a new Java class that extends ro.sync.exml.workspace.api.PluginWorkspaceTCBase.
5. Pass the following parameters on to the constructor of the super class:
 - File installationFolder - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.
 - File frameworksFolder - The file path to the frameworks directory. It can point to a custom frameworks directory where the custom framework resides.
 - File pluginsFolder - The file path to the plugins directory. It can point to a custom plugins directory where the custom plugins resides.
 - File optionsFolder - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
 - String licenseKey - The license key used to license the test class.
 - int productId - The ID of the product and should be one of the following: PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT, PluginWorkspaceTCBase.XML_EDITOR_PRODUCT, or PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT.
6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```
public class MyTestClass extends PluginWorkspaceTCBase {  
  
    /**  
     * Constructor.  
     */  
    public MyTestClass() throws Exception {  
        super(null, new File("frameworks"), new File("plugins"), null,  
        "-----START-LICENSE-KEY-----\n" +  
        "\n" +  
        "Registration_Name=Developer\n" +  
        "\n" +  
        "Company=\n" +  
        "\n" +  
        "Category=Enterprise\n" +  
        "\n" +  
        "Component=XML-Editor, XSLT-Debugger, Saxon-SA\n" +  
        "\n" +  
        "Version=14\n" +  
        "\n" +  
        "Number_of_Licenses=1\n" +  
        "\n" +  
        "Date=09-04-2012\n" +  
        "\n" +  
        "Trial=31\n" +  
        "\n" +  
        "SGN=MCwCFGNoEGJSeiC3XCYIyalvzHhGhhqAhRNRDpEu8RIWb8icCJ07HqfVP4++A\\=\\=\n" +  
        "\n" +  
        "-----END-LICENSE-KEY-----",  
        PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);  
  
        /**  
         * <p><b>Description:</b> TC for opening a file and using a bold operation</p>  
         * <p><b>Bug ID:</b> EXM-20417</p>  
        */  
    }  
}
```

```

/*
 * @author radu_coravu
 *
 * @throws Exception
 */
public void testOpenFileAndBoldEXM_20417() throws Exception {
    WSEditor ed = open(new File
        ("D:/projects/eXML/test/authorExtensions/dita/sampleSmall.xml").toURL());
    //Move caret
    moveCaretRelativeTo("Context", 1, false);

    //Insert <b>
    invokeAuthorExtensionActionForID("bold");
    assertEquals("<?xml version=\"1.0\" encoding=\"utf-8\"?>\n" +
        "<!DOCTYPE task PUBLIC \"-//OASIS//DTD DITA Task//EN\""
        + "\n\"http://docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd\">\n" +
        "<task id=\"taskId\">\n" +
        "    <title>Task <b>title</b></title>\n" +
        "    <prolog/>\n" +
        "    <taskbody>\n" +
        "        <context>\n" +
        "            <p>Context for the current task</p>\n" +
        "        </context>\n" +
        "        <steps>\n" +
        "            <step>\n" +
        "                <cmd>Task step.</cmd>\n" +
        "            </step>\n" +
        "        </steps>\n" +
        "    </taskbody>\n" +
        "</task>\n" +
        "", getCurrentEditorXMLContent());
}
}

```

Debugging a Plugin Using the Eclipse Workbench

To debug problems in the code of the plugin without having to re-bundle the Java classes of the plugin in a JAR library, follow these steps:

1. [Download](#) and install Oxygen XML Editor.
2. Set up the oXygen SDK following [this set of instructions](#).
3. Create an Eclipse Java Project (for example, MyPluginProject) from one of the sample plugins (the Workspace Access plugin, for example).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder copy the plugin.xml from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the **Project** view), and go to **Build Path > Configure Build Path**. Then inspect the value of the **Default output folder** text box.

Example: If the compiled output folder is classes, then you need to add in the plugin.xml the following library reference:

```
<library name="...classes"/>
```

5. Copy the plugin.dtd from the [*OXYGEN_INSTALL_DIR*]/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject build path add external JAR references to all the JAR libraries in the [*OXYGEN_INSTALL_DIR*]/lib folder. Now your MyPluginProject should compile successfully.
7. In the Eclipse IDE, create a new Java Application configuration for debugging. Set the **Main class** box to ro.sync.exml.Oxygen. Click the **Arguments** tab and add the following code snippet in the **VM arguments** input box, making sure that the path to the plugins directory is the correct one:

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
-XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects
\MyPluginProject
```

Note: If you need to configure the plugin for , set the com.oxygenxml.app.descriptor to ro.sync.exml.AuthorFrameDescriptor or ro.sync.exml.DeveloperFrameDescriptor, respectively.

8. Add a break point in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your breakpoint, the debug perspective should take over.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

To debug problems in the extension code without having to bundle the extension's Java classes in a JAR library, perform the following steps:

1. [Download](#) and install Oxygen XML Editor.
2. Create an Eclipse Java Project (for example, MySDKProject) with the corresponding Java sources (for example, a custom implementation of the `ro.sync.ecss.extensions.api.StylesFilter` interface).
3. In the Project build path add external JAR references to all the JAR libraries in the `[OXYGEN_INSTALL_DIR]/lib` folder. Now your Project should compile successfully.
4. Start the standalone version of Oxygen XML Editor from the `[OXYGEN_INSTALL_DIR]` and in the [Document Type Association preferences page](#), edit the document type (for example, **DITA**) to open the [Document Type configuration dialog box](#). In the **Classpath** tab, add a reference to your Project's classes directory and in the **Extensions** tab, select your custom `StylesFilter` extension as a value for the **CSS styles filter** property. Close the application to save the changes to the framework file.
5. Create a new Java Application configuration for debugging. The Main Class should be `ro.sync.exml.Oxygen`. The given VM Arguments should be

```
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m -  
XX:MaxPermSize=384m
```

6. Add a break point in one of the source Java classes.
7. Debug the created configuration. When the code reaches your breakpoint, the debug perspective should take over.

Disabling a Plugin

To disable a plugin, use one of the following two methods:

- [Open the Preferences dialog box \(Options > Preferences\)](#), go to **Plugins**, and deselect the plugin that you want to disable.
- Create an empty file called `plugin.disable` next to the plugin configuration file (`plugin.xml`). The plugin will be disabled and will no longer be loaded by the application on startup.

Note: This is useful if you want to temporarily stop work on a plugin and use the application without it.

Oxygen XML Author Component

The Oxygen XML Author Component was designed as a subset of Oxygen XML Editor that can be integrated into another application under the terms of the Oxygen XML Editor SDK agreement to provide functionality for editing and authoring XML documents. The component can be embedded in a third-party standalone Java application or customized as a Java Web Applet to provide WYSIWYG-like XML editing directly in your web browser.

The Oxygen XML Author Component startup project for Java Swing integrations is available online as a Maven archetype on the Oxygen XML Editor website. More information about the setup can be found on the [oxygen SDK page](#).

Licensing

The licensing terms and conditions for the Oxygen XML Author Component are defined in the [oxygen SDK License Agreement](#). To obtain the licensing terms and conditions and other licensing information as well, you can also contact our support team at support@oxygenxml.com. You may also obtain a free of charge evaluation license key for development purposes, subject to registration. Any deployment of an application developed using the Oxygen XML Author Component is also subject to the terms of the SDK agreement.

There are two main categories of Oxygen XML Author Component integrations:

1. Integration for internal use.

You develop an application that embeds the *Author Component* to be used internally (in your company or by you). You can buy and use previously purchased Oxygen XML Editor floating licenses to enable the runtime usage of the Oxygen XML Author Component as it was integrated into the application.

2. Integration for external use.

Using the Oxygen XML Author Component, you create an application that you distribute to other users outside your company (with a CMS for example). In this case you need to contact us to apply for a Value Added Reseller (VAR) partnership.

From a technical point of view, the Oxygen XML Author Component provides the Java API to:

- Inject floating license server details in the Java code. The following link provides details about how to configure an HTTP floating license server: https://www.oxygenxml.com/license_server.html#floating_license_servlet.

```
AuthorComponentFactory.getInstance().init(frameworkZips,  
    optionsZipURL, codeBase, appletID,  
    //The servlet URL  
    "http://www.host.com/servlet",  
    //The HTTP credentials user name  
    "userName",  
    //The HTTP credentials password  
    "password");
```

- Inject the licensing information key (for example, the evaluation license key) directly in the component's Java code.

```
AuthorComponentFactory.getInstance().init(  
    frameworkZips, optionsZipURL, codeBase, appletID,  
    //The license key if it is a fixed license.  
    licenseKey);
```

- Display the license registration dialog box. This is the default behavior if a null license key is set using the API, this transfers the licensing responsibility to the end-user. The user can license an Oxygen XML Author Component using standard Oxygen XML Editor license keys. The license key will be saved to the local user's disk and on subsequent runs the user will not be asked anymore.

```
AuthorComponentFactory.getInstance().init(  
    frameworkZips, optionsZipURL, codeBase, appletID,  
    //Null license key, will ask the user.  
    null);
```

Related information

Installation Requirements

Running the Oxygen XML Author Component as a Java applet requires:

- Oracle (Sun) Java JRE version 1.6 update 10 or newer.
- At least 100 MB disk space and 100MB free memory.
- The applet needs to be signed with a valid certificate and will request full access to the user machine to store customization data (such as options and framework files).
- A table of supported browsers can be found in [Supported Browsers and Operating Systems](#) on page 1325.

Running the Oxygen XML Author Component embedded in a third-party Java/Swing application requires:

- Oracle (Sun) Java JRE version 1.6 or newer.
- At least 100 MB disk space and 100MB free memory.

Customization

For a special type of XML, you can create a custom framework (which also works in a standalone version of Oxygen XML Editor). Oxygen XML Editor already has frameworks for editing DocBook, DITA, TEI, and so on. Their sources are available in [the Oxygen SDK](#). This custom framework is then packed in a zip archive and used to deploy the component.

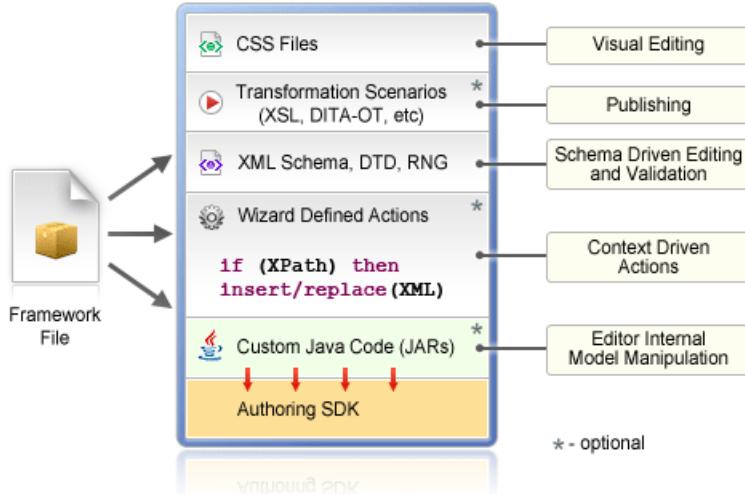

Figure 583: Components of a Custom Framework

Multiple frameworks can coexist in the same component and can be used at the same time for editing XML documents.

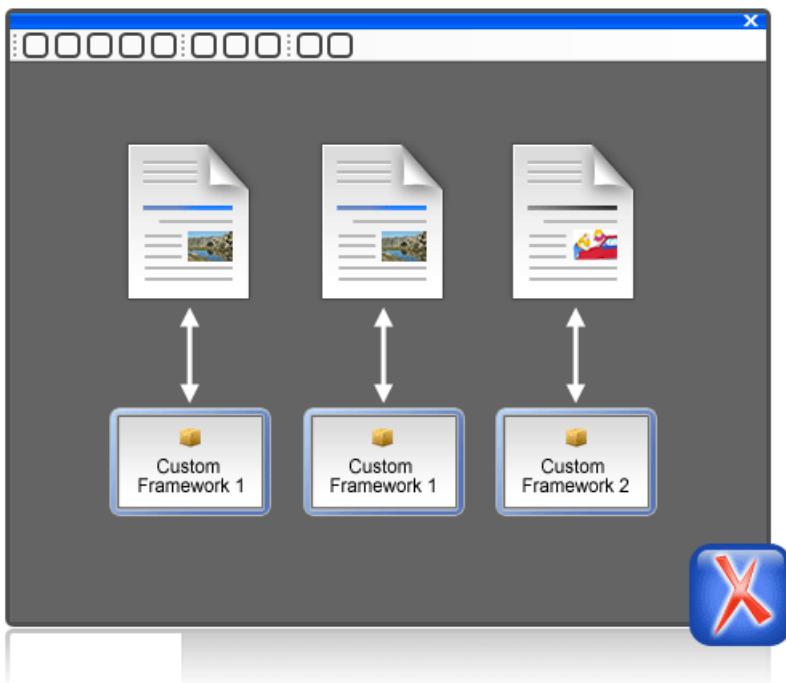

Figure 584: Multiple Frameworks

You can add on your custom toolbar all actions available in the standalone Oxygen XML Editor application for editing in the **Author** mode. You can also add custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component can also provide the **Outline**, **Model**, **Elements**, and **Attributes** views, which can be added to your own developed containers.

The main entry point for the Oxygen XML Author Component Java API is the [AuthorComponentFactory](#) class.

Related information

- [Author Mode Customization Guide](#) on page 1132
- [Oxygen XML Author Component](#) on page 1320
- [AuthorComponentFactory API](#)

Example - Customizing the DITA Framework

If you look inside the `bundle-frameworks\oxygen-frameworks` folder distributed with the [Oxygen XML Author Component sample project](#), it contains a document type framework folder. Customizations that affect the framework/document type configuration for the component should first be done in a standalone installation of Oxygen XML Editor.

An Oxygen XML Editor standalone installation includes a `frameworks` folder that contains the `dita` framework located in `[OXYGEN_INSTALL_DIR]\frameworks\dita`. The `dita` framework contains a bundled **DITA-OT** distribution which contains the DTDs used for DITA editing. If your DTD specialization is a DITA OT plugin, it [should be installed](#) in the `DITA_OT_DIR\plugins` folder.

To make changes to the DITA document type configuration, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. These changes will affect the `[OXYGEN_INSTALL_DIR]\frameworks\dita\dita.framework` configuration file.

After you do this you can re-pack the Oxygen XML Author Component following the instructions from the `README.html` file located in the `oxygen-sample-applet` project. The *Author Component* sample project and the Oxygen XML Editor standalone installation should be of the same version.

Related information

- [Document Type Association Advanced Customization](#) on page 1138

Packing a Fixed Set of Options

The Oxygen XML Author Component shares a common internal architecture with the standalone application, although it does not have **Preferences** dialog boxes. However, the *Author Component Applet* can be configured to use a fixed set of user options on startup.

The sample project contains a module called `bundle-options`. The module contains a file called `options.xml` in the `oxygen-options` folder. Such an XML file can be obtained by exporting the options to an XML format from an installation of Oxygen XML Editor.

To create an `options` file in the Oxygen XML Editor:

- Make sure the options that you want to set are not [stored at project level](#).
- Set the values you want to impose as defaults in the [Preferences pages](#).
- Select **Options > Export Global Options**.

Deployment

The Oxygen XML Author Component Java API allows you to use it in your Java application or as a Java applet. The JavaDoc for the API can be found [here](#). The sample project found in the `oxygen-sample-applet` module includes Java sources (`ro.sync.ecss.samples/AuthorComponentSample.java`) demonstrating how the component is created, licensed and used in a Java application.

Important: You must obtain the appropriate deployment license (upon payment of a required deployment license fee) to deploy the Oxygen XML Author Component along with your application developed with the SDK.

Web Deployment

The Oxygen XML Author Component can be deployed as a Java Applet using the new Applet with JNLP Java technology, available in Oracle (Sun) Java JRE version 1.6 update 10 or newer.

The [sample project](#) demonstrates how the Oxygen XML Author Component can be distributed as an applet.

To deploy the Oxygen XML Author Component as a Java Applet, consider the following notes:

- Follow the instructions [here](#) to setup the sample project and look for Java sources of the sample Applet implementation in the sample project module (**oxygen-sample-applet**). They can be customized to fit your requirements.
- The `default.properties` configuration file must first be edited to specify your custom certificate information used to sign the applet libraries. You also have to specify the code base from where the applet will be downloaded.
- You can look inside the `web-resources/author-component-dita.html` and `web-resources/author-component-dita.js` sample Web resources to see how the applet is embedded in the page and how it can be controlled using JavaScript (to set and get XML content from it).
- The sample Applet target/jnlp/author-component-dita.jnlp file contains the list of used libraries. This list is automatically generated from the Maven dependencies of the project.
- The sample frameworks and options JAR archives can be found in the `bundle-frameworks` and `bundle-options` modules of the sample project.
- Use the Maven command `mvn package` to pack the component. More information are available [here](#). The resulting applet distribution is copied in the `target/jnlp/` directory. From this on, you can copy the applet files on your web server.

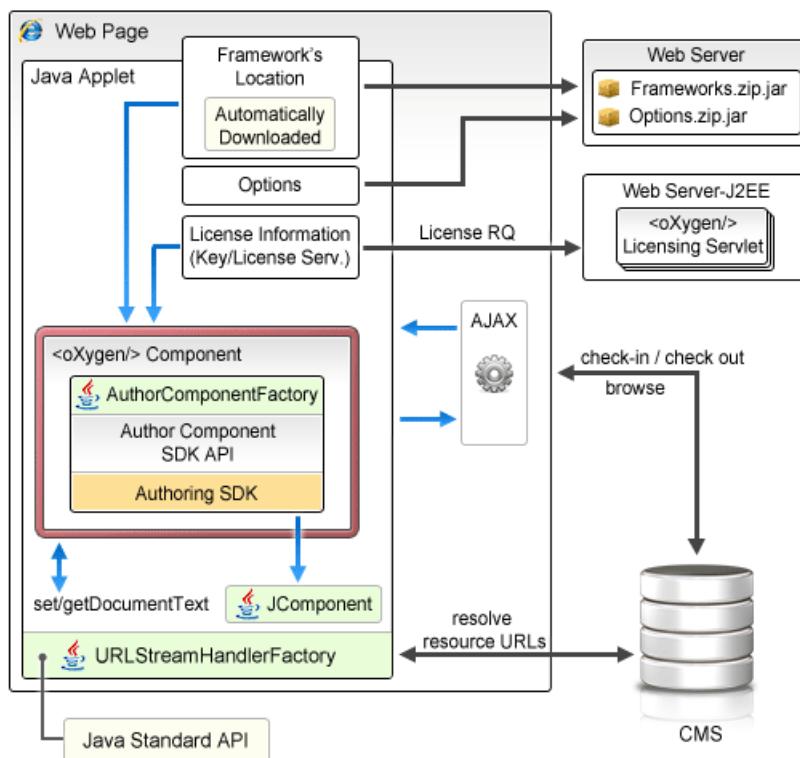

Figure 585: Oxygen XML Author Component Deployed as a Java Applet

Generate a Testing Certificate for Signing an Applet

All jar files of an applet deployed on a remote Web server must be signed with the same certificate before the applet is deployed. The following steps describe how to generate a test certificate for signing the jar files. We will use the tool called `keytool`, which is included in the Oracle Java Development Kit.

- Create a keystore with an RSA encryption key.

Invoke the following in a command-line terminal:

```
keytool -genkey -alias myAlias -keystore keystore.pkcs -storetype PKCS12 -  
keyalg RSA -keysize 2048 -dname "cn=your name here, ou=organization unit name,  
o=organization name, c=US"
```

This command creates a keystore file called `keystore.pkcs`. The certificate attributes are specified in the `dname` parameter: common name of the certificate, organization unit name (for example, *Purchasing* or *Sales Department*), organization name, country.

2. Generate a self-signed certificate.

Invoke the following in a command-line terminal:

```
keytool -selfcert -alias myAlias -keystore keystore.pkcs -storetype PKCS12
```

3. Optionally display the certificate details in a human readable form.

First, the certificate must be exported to a separate file with the following command:

```
keytool -export -alias myAlias -keystore keystore.pkcs -storetype PKCS12 -file certfile.cer
```

The certificate details are displayed with the command:

```
keytool -printcert -file certfile.cer
```

4. Edit the `default.properties` file and fill-in the parameters that hold the path to `keystore.pkcs` file (keystore parameter), keystore type (storetype parameter, with JSK or PKCS12 as possible values), alias (alias parameter) and password (password parameter).

5. The jar files are automatically signed during the `package` phase of the Maven build.

Supported Browsers and Operating Systems

The applet was tested for compatibility with the following browsers:

	IE 7	IE 8	IE 9	IE 10	IE 11	Edge	Firefox	Safari	Chrome	Opera
Vista	-	Passed	Passed	Passed	Passed		Passed	-	Passed	Passed
Windows 7	-	-	Passed	Passed	Passed		Passed	-	Passed	Passed
Windows 8	-	-	-	Passed	Passed		Passed	-	Passed	Passed
Windows 10	-	-	-	-	-	Passed	Passed	-	Passed	Passed
OS X (10.6 - 10.9)	-	-	-	-	-		Passed	Passed	Failed	Passed
Linux Ubuntu 10	-	-	-	-	-		Passed	-	Failed	Passed

Communication Between the Web Page and Java Applet

Applets can communicate with JavaScript code that runs in the Web Page. JavaScript code can call an applet Java methods and from the Java code you can invoke JavaScript code from the web page.

You are not limited to displaying only *Swing* dialog boxes from the applet. From the operations of an applet, you can invoke a JavaScript API that displays a web page and then obtains the data that has been filled in by the user.

Troubleshooting the Applet

When the applet fails to start:

1. Make sure that your web browser really runs the next generation Java plugin and not the legacy Java plugin.

For Windows and OS X the procedure is straight forward. Some steps are given below for installing the Java plugin on Linux.

Manual Installation and Registration of Java Plugin for Linux: <http://www.oracle.com/technetwork/java/javase/manual-plugin-install-linux-136395.html>

2. Refresh the web page.
3. Remove the Java Webstart cache from the local drive and try again.
 - On Windows this folder is located in: %APPDATA%\LocalLow\Sun\Java\Deployment\cache.
 - On OS X this folder is located in: /Users/user_name/Library/Caches/Java/cache.
 - On Linux this folder is located in: /home/user/.java/deployment/cache.
4. Remove the Oxygen XML Author Component framework cache from the local drive and try again:
 - On Windows Vista/7/8/10 this folder is located in: %APPDATA%\Roaming\com.oxygenxml.author.component.
 - On Windows XP this folder is located in: %APPDATA%\com.oxygenxml.author.component.
 - On OS X this folder is located in: /Users/user_name/Library/Preferences/com.oxygenxml.author.component.
 - On Linux this folder is located in: /home/user/.com.oxygenxml.author.component.
5. Problems sometimes occur after upgrading the web browser and/or the JavaTM runtime. Redeploy the applet on the server by running Ant in your Oxygen XML Author Component project. However, doing this does not always fix the problem, which often lies in the web browser and/or in the Java plugin itself.
6. Sometimes when the HTTP connection is slow on first time uses the JVM would simply shut down while the jars were being pushed to the local cache (for example, first time uses). This shut down typically occurs while handling oxygen.jar. One of the reasons could be that some browsers (Firefox, for example) implement some form of "Plugin hang detector" See https://developer.mozilla.org/en/Plugins/Out_of_process_plugins/The_plugin_hang_detector.
7. If you are running the Applet using Safari on OS X and it has problems writing to disk or fails to start, do the following:
 - In Safari, go to **Safari->Preferences->Security**.
 - Select **Manage Website Settings**.
 - Then select Java and for the oxygenxml.com entry, choose the **Run in Unsafe mode** option.

Enable JavaWebstart logging on your computer to get additional debug information:

1. Open a console and run javaws -viewer.
2. In the **Advanced** tab, expand the **Debugging** category and select all boxes.
3. Expand the **Java console** category and choose **Show console**.
4. Save settings.
5. After running the applet, you will find the log files in:
 - On Windows this folder is located in: %APPDATA%\LocalLow\Sun\Java\Deployment\log.
 - On OS X this folder is located in: /Users/user_name/Library/Caches/Java/log.
 - On Linux this folder is located in: /home/user/.java/deployment/log.

Avoiding Resource Caching

A Java plugin installed in a web browser caches access to all HTTP resources that the applet uses. This is useful to avoid downloading all the libraries each time the applet is run. However, this may have undesired side-effects when the applet presents resources loaded via HTTP. If such a resource is modified on the server and the browser window is refreshed, you might end-up with the old content of the resource presented in the applet.

To avoid such a behavior, you need to edit the `ro.sync.ecss.samples.AuthorComponentSampleApplet` class and set a custom `URLStreamHandlerFactory` implementation. A sample usage is already available in the class, but it is commented-out for increased flexibility:

```
//THIS IS HOW YOU CAN REGISTER YOUR OWN PROTOCOL HANDLER TO THE JVM.  
//THEN YOU CAN OPEN YOUR CUSTOM URLs IN THE APPLET AND IT WILL USE YOUR HANDLER  
URL.setURLStreamHandlerFactory(new URLStreamHandlerFactory() {  
    public URLStreamHandler createURLStreamHandler(String protocol) {  
        if("http".equals(protocol) || "https".equals(protocol)) {  
            return new URLStreamHandler();  
        }  
    }  
});
```

```

@Override
protected URLConnection openConnection(URL u) throws IOException {
    URLConnection connection = new HttpURLConnection(u, null);
    if(!u.toString().endsWith(".jar")) {
        //Do not cache HTTP resources other than JARS
        //By default the Java HTTP connection caches content for
        //all URLs so if one URL is modified and then re-loaded in the
        //applet the applet will show the old content.
        connection.setDefaultUseCaches(false);
    }
    return connection;
}
};

return null;
}
);

```

Adding MathML support in the Oxygen XML Author Component Web Applet

By default, the Oxygen XML Author Component Web Applet project does not come with the libraries necessary for viewing and editing MathML equations in the **Author** mode. You can view and edit MathML equations either by adding support for [JEuclid](#) or by adding support for [MathFlow](#).

Adding MathML Support Using JEuclid

By default, the JEuclid library is excluded from the oXygen SDK artifact dependencies. To enable it, comment the following lines in the pom.xml file:

```

<exclusion>
    <artifactId>jeuclid-core</artifactId>
    <groupId>net.sourceforge.jeuclid</groupId>
</exclusion>

```

To edit specialized DITA Composite with MathML content, include the entire MathML2 framework directory (*[OXYGEN_INSTALL_DIR]/frameworks/mathml2*) in the frameworks bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

Adding MathML support using MathFlow

In the pom.xml file add dependencies to the additional libraries used by the MathFlow library to parse MathML equations:

1. MFComposer.jar
2. MFEExtraSymFonts.jar
3. MFSimpleEditor.jar
4. MFStructureEditor.jar
5. MFStyleEditor.jar

Note: For MathFlow 2.1, all of these JAR files are packaged into one file called MathFlow.jar.

You can reference these additional libraries from the MathFlow SDK as in the example below:

```

<dependency>
    <groupId>com.dessci</groupId>
    <artifactId>MFComposer</artifactId>
    <version>1.0.0</version>
    <scope>system</scope>
    <systemPath>${MathFlowSDKDir}/lib/MFComposer.jar</systemPath>
</dependency>

```

In addition, you must obtain fixed MathFlow license keys for editing and composing MathML equations and register them using these API methods:

`AuthorComponentFactory.setMathFlowFixedLicenseKeyForEditor` and
`AuthorComponentFactory.setMathFlowFixedLicenseKeyForComposer`.

To edit specialized DITA Composite with MathML content, include the entire *[OXYGEN_INSTALL_DIR]/frameworks/mathml2* MathML2 framework directory in the frameworks bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

More documentation is available on the [Design Science MathFlow](#) website.

Adding Support to Insert References from a WebDAV Connection

Predefined actions that insert references, such as the **Insert Image** action, display a URL chooser that allows you to select the **Browse Data Source Explorer** action. To use an already configured WebDAV connection in the Oxygen XML Author Component, follow these steps:

1. Open a standalone Oxygen XML Editor 18.1 and configure a WebDAV connection.
2. Pack the *fixed set of options* from the standalone to use them with the Oxygen XML Author Component project.
3. In the Oxygen XML Author Component, the defined connection still does not work when expanded because the additional JAR libraries used to browse the WebDAV repository are missing. By default, the *httpclient* dependency of the oXygen SDK artifact is excluded. You can enable it by commenting the following lines:

```
<exclusion>
    <artifactId>httpclient</artifactId>
    <groupId>org.apache.httpcomponents</groupId>
</exclusion>
```

If you want to have multiple WebDAV connection URLs, user names, and passwords (depending on the user who started the component), you can use a more flexible approach by using the following API:

```
//DBConnectionInfo(String id, String driverName, String url, String user,
String passwd, String host, String port)
DBConnectionInfo info = new DBConnectionInfo("WEBDAV", "WebDAV FTP",
"http://host/webdav-user-root", "userName", "password", null, null);
AuthorComponentFactory.getInstance().setObjectProperty
("database.stored.sessions1", new DBConnectionInfo[] {info});
```

Using Plugins with the Oxygen XML Author Component

To bundle Workspace Access plugins, that are developed for standalone application with the Oxygen XML Author Component, follow these steps:

- The `bundle-plugins` module must contain the additional plugin directories in the `dropins` subdirectory. The content must also contain a `plugin.dtd` file. Copy the `plugin.dtd` file from an `[OXYGEN_INSTALL_DIR]\plugins` folder.
- In the class that instantiates the `AuthorComponentFactory`, for example the `ro.sync.ecss.samples.AuthorComponentSample` class, call the methods `AuthorComponentFactory.getPluginToolbarCustomizers()`, `AuthorComponentFactory.getPluginViewCustomizers()` and `AuthorComponentFactory.getMenubarCustomizers()`, obtain the customizers that have been added by the plugins and call them to obtain the custom swing components that they contribute. There is a commented-out example for this in the `AuthorComponentSample.reconfigureActionsToolbar()` method for adding the toolbar from the **Acrolinx** plugin.

Important: As the Oxygen XML Author Component is just a subset of the entire application, there is no guarantee that all the functionality of the plugin works.

Sample SharePoint Integration of the Oxygen XML Author Component

This section presents the procedure to integrate the Oxygen XML Author Component as a Java applet on a SharePoint site.

Microsoft SharePoint®

Microsoft SharePoint® is a Web application platform developed by Microsoft®.

SharePoint comprises a multipurpose set of Web technologies backed by a common technical infrastructure. It provides the benefit of a central location for storing and collaborating on documents, which can significantly reduce emails and duplicated work in an organization. It is also capable of keeping track of the multiple versions created by multiple users.

Why Integrate the Oxygen XML Author Component with SharePoint

The Oxygen XML Author Component can be embedded in a SharePoint site as a Java applet. This is a simple and convenient way for you to retrieve, open, and save XML and XML related documents stored on your company's SharePoint server, directly from your web browser.

For example, suppose that you are working on a team project that uses the DITA framework for writing product documentation. You have the DITA maps and topics stored on a SharePoint repository. By using a custom defined action from the contextual menu of a document, you can easily open it in the Oxygen XML Author Component applet that is embedded in your SharePoint Documents page.

You can embed the applet either on a site that is located on a standalone SharePoint server, or on your company Microsoft Office 365 account.

This example can be used as a starting point for other CMS integrations.

Deploying Resources

You can embed the Oxygen XML Author Component in a SharePoint site as a Java Applet, using the new Applet with JNLP Java technology. Sign with a valid certificate the JNLP file and the associated JAR files that the applet needs.

Deploy these resources on a third party server (other than the SharePoint server). The Java applet downloads the resources as needed. If you deploy the JNLP and JAR files on the SharePoint server, the Java Runtime Environment will not be able to access the applet resources because it is not aware of the current authentication tokens from your browser. This causes the Java Class Loader to fail loading classes, making the applet unable to start.

Accessing Documents

One of the main challenges when integrating the Oxygen XML Author Component applet in your SharePoint site is to avoid authenticating twice when opening a document resource stored in your SharePoint repository.

You have already signed in when you started the SharePoint session, but the applet is not aware of your current session. In this case every time the applet is accessing a document it will ask you to input your credentials again.

As a possible solution, do not execute HTTP requests directly from the Java code, but forward them to the web browser that hosts the applet, because it is aware of the current user session (authentication cookies).

To open documents stored on your SharePoint repository, register your own protocol handler to the JVM. We implemented a handler for both *http* and *https* protocols that forwards the HTTP requests to a JavaScript XMLHttpRequest object. This way, the browser that executes the JavaScript code is responsible for handling the authentication to the SharePoint site.

To install this handler, add the following line to your Java Applet code (in our case, in the `ro.sync.ecss.samples.AuthorComponentSampleApplet` class):

```
URL.setURLStreamHandlerFactory(new  
    ro.sync.net.protocol.http.handlers.CustomURLStreamHandlerFactory(this));
```

To enable JavaScript calls from your Java applet code, set the MAYSCRIPT attribute to `true` in the `<applet>` element embedded in you HTML page:

```
<applet width="100%" height="600"  
    code="ro.sync.ecss.samples.AuthorComponentSampleApplet"  
    name="authorComponentAppName" id="authorComponentApplet"  
    MAYSCRIPT="true">  
    ....  
</applet>
```

Tip: If the applet is not working, or you cannot open documents from your SharePoint repository, enable the debugging tools that come bundled with your Web Browser or the Java Console from your operating system to try to identify the cause of the problem.

Integrating the Oxygen XML Author Component

To integrate the Oxygen XML Author Component as a Java applet with your SharePoint site, you need the Oxygen XML Author Component start-up project.

The project is available as a Maven archetype online. For more information about the setup, go to the [Oxygen XML SDK Website](#).

An online demo applet is deployed at <https://www.oxygenxml.com/demo/AuthorDemoApplet/author-component-dita-requirements.html>.

Customize Your Applet

Follow these steps to customize the Oxygen XML Author Component Java applet:

1. Follow [this set of instructions](#) to setup the sample project and look for the Java sources (these can be customized to fit your requirements) of the sample applet implementation;
Note: The Java source files are located in the `src` folder of the `oxygen-sample-applet` module.
2. Look inside `web-resources/sharepoint/author-component-dita.aspx` and the associated `*.js` resources, to see how the applet is embedded in the page and how it can be controlled using JavaScript (to set and get XML content from it).
3. Edit the `default.properties` configuration to specify your custom certificate information, used to sign the applet libraries. Also, specify the code base from where the applet resources will be downloaded.
4. The sample Applet target/jnlp/author-component-dita.jnlp file contains the list of used libraries. This list is automatically generated from the Maven dependencies of the project. The sample frameworks and options JAR archives are located in the `bundle-frameworks` and `bundle-options` modules of the sample project.
Note: The JNLP file and the associated resources and libraries must be deployed on a non-SharePoint web server. Otherwise, the applet will not be loaded.
5. Use the Maven command `mvn package` to pack the component. More information are available [here](#). The resulting applet distribution is copied in the `target/jnlp/` directory. From now on, you can copy the applet files on your web server.

Add Resources to Your SharePoint Site

Copy the following resources to a sub-folder (in our example named `author-component`) of the `SitePages` folder from your SharePoint site, where you want to embed the applet:

1. **author-component-dita.aspx** - an HTML document containing the Java applet.

Note: It has an `.aspx` extension instead of `.html`. If you use the latter extension, the browser will download the HTML document instead of displaying it.

Note: Edit the `.aspx` file and change the value of the applet parameter `jnlp_href` to the URL of the deployed `author-component-dita.jnlp`. Keep in mind that the JNLP file should be deployed on a third party server. For example:

```
<applet>
  <param name="jnlp_href"
        value="http://www.oxygenxml.com/DemoApplet/author-component-dita.jnlp"/>
  .....
</applet>
```

2. **author-component-dita.css** - contains custom styling rules for the HTML document.
3. **author-component-dita.js** - contains JavaScript code, giving access to the Oxygen XML Author Component contained by the Java applet.
4. **connectionUtil.js** - contains JavaScript utility methods.

Note: Replace the value of the `SPRootSiteURL` property with the URL of your SharePoint root site, without trailing `'/'`. This is used by the `openListItemInAuthor(itemUrl)` method, to compute the absolute URL of the list item that is to be opened in the applet.

Copy Resources Using Oxygen XML Editor

You can use Oxygen XML Editor to copy your resources to the SharePoint server:

1. Configure a new connection to your SharePoint site in the **Data Source Explorer** View.

Note: To watch our video demonstration about connecting to repository located on a SharePoint server, go to https://www.oxygenxml.com/demo/SharePoint_Support.html.

2. Browse your new SharePoint connection site and select the **SitePages** folder.
3. Create a folder named `author-component` using the **New Folder** contextual menu action.
4. Upload your resources to this folder using the **Import Files** contextual menu action.

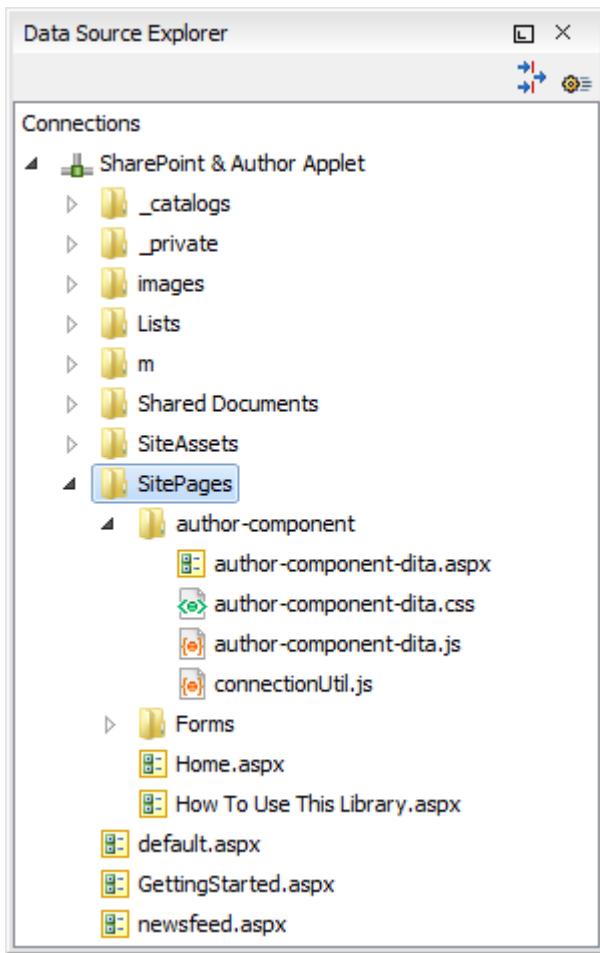

Figure 586: Data Explorer View

Embed the Java Applet in Your SharePoint Site

To embed the Java Applet in your SharePoint site, edit the page that contains the applet and add a new Script Editor Web Part next to an existing Documents web part.

Note: It is recommended that you deselect the **Enable Java content in the browser** option from the **Java Control Panel** until you finish editing the page. Otherwise, the browser will load the applet for every change that you will make.

Edit the page directly in your browser, following these steps:

1. Go to the home page of your SharePoint site where you want to add the *Author Component* Java applet.
2. Select the **Page** tab from the ribbon located at top of the page and click the **Edit** button.
3. Select the **Insert** tab and click **Web Part**.
4. In the **Categories** panel, select **Media and Content**.
5. In the **Parts** panel, select the **Script Editor** Web Part.
6. Click the **Add** button to insert the selected Web Part to your page content.
7. Select the newly added Web Part.
8. Select the **Web Part** tab and click the **Web Part Properties** button.
9. Click the **Edit Snippet** link under your Web Part.
10. Insert the following HTML snippet to your newly created Web Part:

```
<div>
  <iframe
    id="appletIFrame"
    src="/applet/SitePages/author-component/author-component-dita.aspx"
    width="800px" height="850px">
  </iframe>
  <script type="text/JavaScript">
    function openInAuthor(itemUrl) {
```

```

        var appletFrame = document.getElementById("appletIFrame");
        var appletWin = appletFrame.contentWindow;
        appletWin.openListItemInAuthor(itemUrl);
    }
</script>
</div>

```

The above HTML fragment contains an IFrame that points to the page where the Java applet resides. Replace the value of the src attribute with the path of the author-component-dita.aspx HTML page that you added earlier to the SitePages folder;

Note: Use the iframe element from the HTML fragment with the expanded form (<iframe></iframe>). Otherwise, the Web Part will not display the target page of the frame.

11. Save the changes you made to the page.

Note: Do not forget to select the **Enable Java content in the browser**, to allow the browser to load the Java applet.

Create a SharePoint Custom Action

To open a document from your SharePoint repository in the Oxygen XML Author Component applet, add a new custom action to the contextual menu of your Documents Library:

1. Open your SharePoint site in **Microsoft SharePoint Designer®**.
2. Click **Lists and Libraries** in the **Navigation** pane.
3. Open the **Documents** library.
4. Go to the **Custom Actions** panel.
5. Click the **New** button to add a new custom action.
6. Give a name to the action (for example, **Open In Oxygen XML Author**).
7. In the **Select the type of action** section, select the **Navigate to URL** option and enter the following text:

```
javascript:openInAuthor("{ItemUrl}")
```

Note: This translates to a call to the openInAuthor(itemUrl) JavaScript function defined in the HTML fragment that was embedded in the Script Editor Web Part. The {ItemUrl} parameter will be expanded to the URL of the list item that the action is invoked on.

8. Click the **OK** button to save the action.

Integration Result

Frequently Asked Questions

Installation and Licensing

1. What hosting options are available for applet delivery and licensing services (for example, Apache, IIS, etc.)?

For applet delivery any web server. We currently use Apache to deploy the sample on our site. For the floating license server you would need a J2EE server (such as Tomcat) if you want to restrict the access to the licenses.

If you do not need the access restrictions that are possible with a J2EE server you can simplify the deployment of the floating license server by using the TCP version of this server. The TCP license server is a simple Java application that communicates with the Oxygen XML Author Component by TCP/IP connections.

2. Are there any client requirements beyond the Java VM and (browser) Java PlugIn Technology?

Oracle (formerly Sun) Java JRE version 1.6 update 10 or newer. At least 200 MB disk space and 200MB free memory would be necessary for the Oxygen XML Author Component applet.

3. Are there any other client requirements or concerns that could make deployment troublesome (for example, browser security settings, client-side firewalls, and AV engines)?

The applet is signed and will request access to the user machine to store customization data (frameworks). The applet needs to be signed with a valid certificate.

4. How sensitive is the applet for the automatic Java VM updates that are typically on by default (for example, could automatic updates potentially "break" the run-time)?

The component should work well with newer Java versions but we cannot guarantee this.

5. How and when are "project" related files deployed to the client (for example, applet code, DTD, styling files, customizations, etc.)?

Framework files are downloaded on the first load of the applet. Subsequent loads will re-use the cached customization files and will be much faster.

6. For on-line demo (<http://www.oxygenxml.com/demo/AuthorDemoApplet/author-component-dita.html>), noted a significant wait during initial startup. Any other mechanisms to enhance startup time?

- See the explanation above.
7. Does the Oxygen XML Author Component support multiple documents being open simultaneously? What are the licensing ramifications?
- A single `AuthorComponentFactory` instance can create multiple `EditorComponentProvider` editors that can then be added and managed by the developer who is customizing the component in a Swing `JTabbedPane`. A single license (floating or user-based) is enough for this.
- If you need to run multiple Java Applets or distinct Java processes using the Oxygen XML Author Component, the current floating license model allows for now only two concurrent components from the same computer when using the HTTP floating license server. An additional started component will take an extra license seat.
8. Is there any internet traffic during an editing session (user actively working on the content, on the client side, in the Oxygen XML Author Component)?

No.

Functionality

1. How and when are saves performed back to the hosting server?

What you can see on our web site is just an example of the Oxygen XML Author Component (which is a Java Swing component) used in an Applet.

This applet is just for demonstration purposes. Its source can be at most a starting point for a customization. You should implement, sign and deploy your custom applet implementation.

The save operation could be implemented either in JavaScript by requesting the XML content from the Applet or in Java directly working with the Oxygen XML Author Component. You would be responsible to send the content back to the CMS.

2. Is there a particular XML document size (or range) when the applet would start to exhibit performance problems?

The applet has a total amount of used memory specified in the JNLP JavaWebstart configuration file, which can be increased if necessary. By default, it is 156 Mb. It should work comfortably with documents of 1-3 megabytes.

3. What graphic formats can be directly rendered in the Oxygen XML Author Component?

GIF, JPEG, PNG, BMP and SVG.

4. Can links be embedded to retrieve (from the server) and "play" other types of digital assets, such as audio or video files?

You could add listeners to intercept clicks and open the clicked links. This would require a good knowledge of the *oxygen SDK*. The Oxygen XML Author Component can only render static images (no GIF animations).

5. Does the Oxygen XML Author Component provide methods for uploading ancillary files (new graphics, for instance) to the hosting server?

No.

6. Does the Oxygen XML Author Component provide any type of autosave functionality?

By default no but you could customize the applet that contains the Oxygen XML Author Component to save its content periodically to a file on disk.

7. Assuming multiple documents can be edited simultaneously, can content be copied, cut and pasted from one Oxygen XML Author Component "instance" to another?

Yes.

8. Does the Oxygen XML Author Component support pasting content from external sources (such as a web page or a Microsoft Word document and, if so, to what extent?)

If no customizations are available the content is pasted as simple text. We provide customizations for the major frameworks (DITA, DocBook, TEI, etc.) that use a conversion XSLT stylesheet to convert HTML content from clipboard to the target XML.

9. Can UTF-8 characters (such as Greeks, mathematical symbols, etc.) be inserted and rendered?

Any UTF-8 character can be inserted and rendered, provided that the font used for editing supports rendering the characters. The font can be changed by developers but not by the users. When using a logical font (by default, *Serif* for the Oxygen XML Author Component), the JVM will know how to map all characters to glyphs. There is no character map available but you could implement one.

Customization

1. Please describe, in general terms, the menus, toolbars, contextual menu options, helper panes, and so on, that are available for the Oxygen XML Author Component out-of-the box.

You can mount on your custom toolbar all actions available in the standalone Oxygen XML Editor application for editing in the **Author** mode. This includes custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component also can provide the **Outline**, **Model**, **Elements**, and **Attributes** views that can be added to your own panels (see sample applet).

2. Please describe, in general terms, the actions, project resources (for example, DTD/Schema for validation purposes, CSS/XSL for styling, etc.) and typical level of effort that would be required to deploy a Oxygen XML Author Component solution for a customer with a proprietary DTD.

The **Author** mode internal engine uses CSS to render XML.

For a special type of XML, you can create a custom framework (which also works in an Oxygen XML Editor standalone version) that would also contain default schemas and custom actions. A simple framework would probably need 2-3 weeks development time. For a complex framework with many custom actions it could take a couple of months. Oxygen XML Editor already has frameworks for editing (DocBook, DITA, TEI, etc.) Sources for them are available in [the Oxygen SDK](#).

Multiple frameworks can co-exist in the same Oxygen XML Editor instance (the desktop standalone version or the applet version) and can be used at the same time for editing XML documents.

3. Many customers desire a very simplistic interface for contributors (with little or no XML expertise) but a more robust XML editing environment for editors (or other users with more advanced XML expertise). How well does the Oxygen XML Author Component support varying degrees of user interface complexity and capability?

- *Showing/hiding menus, toolbars, helpers, etc.*

You assemble all the UI parts from the Oxygen XML Author Component. For example, you could provide two applet implementations: one for advanced users and one for content authors.

- *Forcing behaviors (for example, ensuring change tracking is on and preventing it from being shut down).*

You could avoid placing the change tracking toolbar actions in the custom applet. You could also use API to turn change tracking ON when the content has been loaded.

- *Preventing access to "privileged" editor processes (for example, accept/reject changes).*

You can remove the change tracking actions completely in a custom applet implementation. Including the ones from the contextual menu.

- *Presenting and/or describing XML constructs (for example, tags) in "plain-English".*

Using our API, you can customize what the Outline or Breadcrumb presents for each XML tag. You can also customize the in-place content completion list.

- *Presenting a small subset of the overall XML tag set (rather than the full tag set) for use by contributors (for example, allowing an author to only insert Heading, Para and inline emphasis).*

The API allows for a content completion filter that also affects the *Elements* view.

4. Does the Oxygen XML Author Component API provide access to the XML document, for manipulation purposes, using common XML syntax (such as DOM, XPath, etc.)?

Yes, using the Oxygen XML Author Component API.

5. Can custom dialog boxes be developed and launched to collect information in a "form" (with scripting behind to push tag the collection information and embed it in the XML document)?

Yes.

6. Can project resources and customizations be readily shared between the desktop and component versions of your Oxygen XML Author Component product line?

A framework developed for the desktop version of the Oxygen XML Editor application can then be bundled with the Oxygen XML Author Component in a custom applet. For example, the demo applet from our web site is DITA-aware using the same framework as the Oxygen XML Editor standalone distribution.

A custom version of the applet that includes one or more customized frameworks and user options can be built and deployed for non-technical authors by a technical savvy user using a built-in tool of Oxygen XML Editor. All the authors that load the deployed applet from the same server location will share the same frameworks and options.

A custom editing solution can deploy one or more frameworks that can be used at the same time.

Print Document Within the Oxygen XML Author Component

Question

Can a document be printed within the Oxygen XML Author Component?

Answer

You can use the following API method to either print the document content to the printer or to show the Print Preview dialog box, depending on the preview parameter value:

```
AuthorComponentProvider.print(boolean preview)
```

Here is the online Javadoc for this method: [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print\(boolean\)](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean))

Feature Matrix

The Oxygen XML Author Component was designed to provide the functionality of the standard **Author** mode and can be embedded either in a third-party standalone Java application or customized as a Java Web Applet to provide WYSIWYG-like XML editing directly in your choice of web browsers.

The Oxygen XML Web Author and Oxygen XML Web Author Component are re-implementations of the Oxygen XML Editor **Author** mode user interface, based on JavaScript and HTML5. Its purpose is to enable XML editing and reviewing on your mobile devices and desktops, directly in a web browser environment. Since the interface was thinned down as much as possible, the core XML processing was moved into a Java-enabled server.

Table 45: Feature Matrix Showing Differences Between Web Author, Web Author Component, and Author Component

Feature	Oxygen XML Web Author	Oxygen XML Web Author Component	Oxygen XML Author Component
Intended audience	Reviewers and occasional contributors.	Reviewers and occasional contributors.	Content authors, technical writers.
Mobile device support	Specifically designed for mobile devices.	Specifically designed for mobile devices.	No
Compatibility with the standard version of Oxygen XML Editor	Covers only editing and reviewing features.	Covers only editing and reviewing features.	100%
Text Mode	Yes	Yes	Yes
Grid Mode	No	No	Yes
Client-side setup	Yes, with an <i>Administration</i> page.	Yes, with an <i>Administration</i> page.	Requires Java to be installed, and Java Applets to be allowed to run.

Feature	Oxygen XML Web Author	Oxygen XML Web Author Component	Oxygen XML Author Component
Server-side setup	Simply requires running an installer.	Requires a servlet container and performing a Maven build.	Requires a web server.
Ability to configure installation bundles	No	Yes	Yes

Oxygen XML Web Author Component

The [oXygen SDK](#) includes a sample project that you can use to integrate the Oxygen XML Web Author Component.

This section describes the various ways that you can customize the Oxygen XML Web Author Component, and how to deploy it.

Oxygen XML Web Author Component Customization Overview

The core of Oxygen XML Editor can be deployed on a server, allowing a variety of HTML5-enabled client devices to edit and review XML content.

Oxygen XML Web Author Component is a highly versatile application that can be customized to work with any XML vocabulary and any file repository system. It uses the same extension points as the standalone version of Oxygen XML Editor (frameworks, options, and plugins).

Note: The frameworks, options and plugins used by the Oxygen XML Web Author Component are similar with those used in the Oxygen XML Editor product suite. This means that you can use them with a high degree of compatibility across oXygen products.

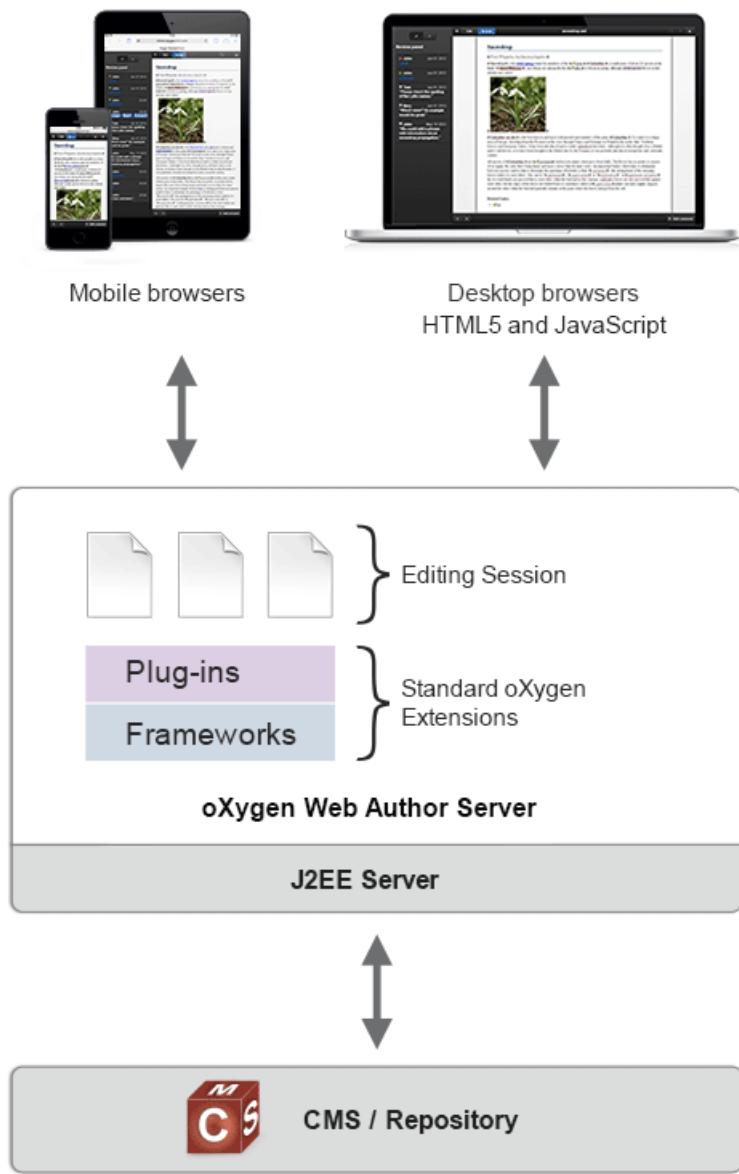

Figure 588: Graphical Description of the Oxygen XML Web Author Component System

Customizing Options

The Oxygen XML Web Author Component functionality that is common with the standalone distribution of Oxygen XML Editor share the same options. This allows you to configure a consistent editing experience for all users.

Author Mode Options

Oxygen XML Web Author Component stores its options in an `options.xml` file.

If you are using the [oXygen XML SDK project](#), the file is located in the `bundle-options/oxygen-options/` folder and will be bundled with the web application. If you are using one of the installation kits, it is located in the `options` folder of the [Oxygen Data Directory](#).

There are multiple ways to configure these options:

- Some of the options can be changed using the [Administration Page](#) in your web browser.

- Use an options file exported from Oxygen XML Editor standalone application. To export the file, use the [Options > Export Global Options menu action](#).
- Manually edit the options file. To learn more about the supported options and the file format, see [Oxygen XML Author Options Supported by Oxygen XML Web Author Component](#) on page 1358.

Oxygen XML Web Author Component specific options

A small number of options are specific only to the Oxygen XML Web Author Component and they can be configured in the WEB-INF/web.xml file. Each option is specified as a context-param element.

The following is a list of options and their accepted values:

Option name	Value	Description
com.oxygenxml.loadBuiltinProtocolHandlers	false	Controls whether or not the built-in handlers for HTTP/HTTPS and FTP/SFTP protocols are installed. Default value is true.
com.oxygenxml.webapp.datastore.sessions	An integer number	Specifies the number of editing sessions stored in memory.
com.oxygenxml.webapp.datastore.duration	Duration (*)	Specifies the delay after which inactive sessions are stored on disk.
com.oxygenxml.webapp.datastore.diskSessions	An integer number	Specifies the number of inactive editing sessions that can be stored on disk.
com.oxygenxml.webapp.datastore.diskTime	Duration (*)	Specifies the delay after which inactive sessions are discarded.
com.oxygenxml.validation.threads	An integer number	Configures the number of validation threads.

(*) - Duration is represented by an integer, followed by one of "d", "h", "m", or "s", representing days, hours, minutes, or seconds, respectively.

Here is an example of how to configure a context parameter:

```
<context-param>
  <param-name>com.oxygenxml.loadBuiltinProtocolHandlers</param-name>
  <param-value>false</param-value>
</context-param>
```

[How to Set a System Property](#) on page 1339

How to Set a System Property

A variety of Java system properties can be set to influence the behavior of Oxygen XML Web Author Component. For example, you can change the location of the [Oxygen Data Directory](#) (oxygen.data.dir).

To set a system property, follow the procedure below for the type of installer you used:

Windows Installer

To set a system property for a Windows installation, follow these steps:

1. Go to the installation directory of Oxygen XML Web Author Component.
2. Launch **Manage Web Author**.
3. Go to the **Java** tab.
4. In the **Java Options** section, add the system property using the following pattern: –
D[option_name]=[option_value]
5. Restart the application.

Linux Installer or All Platforms Kit

To set a system property for a for a Linux or All Platforms installation, follow these steps:

1. Go to the installation directory of Oxygen XML Web Author Component.
2. Edit the `oxygenxmlwebauthor.vmoptions` file.
3. Add the system property on a new line, using the following pattern: `-D[option_name]=[option_value]`
4. Restart the application.

Customizing Oxygen XML Web Author Component Frameworks

The custom *frameworks* that are designed for documentation purposes (such as DITA, DocBook, or TEI) can be reused interchangeably between the Oxygen XML Editor standalone distribution and the Oxygen XML Web Author Component. However, some fine-tuning might be necessary to maximize the editing experience for your content authors. The advantages of using a common framework include:

- Easier development and testing, since you can test most of the functionality in the standalone version of Oxygen XML Editor using advanced tools such as the **CSS Inspector**, **CSS Editor**, or the **Document Type Association** customization dialog box.
- Uniform experience across multiple Oxygen XML Editor distributions.
- Ability to reuse previously developed frameworks.

Developing and Testing a Framework Using the Oxygen XML Web Author Test Server Add-on

The following procedures assumes that you have access to an Oxygen XML Editor standalone installation. This is not a mandatory requirement, but rather a way to speed up the development process.

1. Use the standalone installation of Oxygen XML Editor to customize a specific framework for whatever type of documentation that you require. Modifications made to the framework are instantly visible in the standalone version of Oxygen XML Editor, but if you want to preview them in the Oxygen XML Web Author Component, proceed to the next step.
2. *Run the Oxygen XML Web Author Component using the add-on distribution and test the framework.*

Note: The changes that you make to your framework will not automatically be reflected in the Oxygen XML Web Author Component if it was already running. To see the results of changes, close the server using the **Close and stop server** button and start it again.

Deploying a Framework

1. Copy your customized framework into the `bundle-frameworks/oxygen-frameworks/` folder of the [Oxygen XML SDK project](#).
2. *Build the SDK project and deploy it.*

Customization Tips

- If you want to use CSS rules that only apply when the framework is used in the Oxygen XML Web Author Component, use the following media query:

```
@media oxygen AND (platform:webapp) {  
    ...  
}
```

- In the `web` folder of each framework, you can add a `framework.js` file that calls the [JavaScript API](#) to implement custom editing actions. The possible use cases include the following:
 - Create custom actions and add them to the toolbar or contextual menu. For more details, see the [JS custom action tutorial](#).
 - Create custom form controls. For more details, see the [JS form control tutorial](#).
 - Add more views. For more details, see the [JS custom view tutorial](#).
- If the framework contains **Author** mode operations (Java implementations of the `ro.sync.ecss.extensions.api.AuthorOperation` interface), they can be enabled to be used by the Oxygen XML Web Author Component using the `ro.sync.ecss.extensions.api.WebappCompatible` annotation.

- Note:** Author mode operations that use Java Swing components to display a graphical interface are not compatible with the Oxygen XML Web Author Component and they should not be annotated.
- The Oxygen XML Web Author Component continuously validates the XML documents using the default validation scenarios defined at framework level. Only the validation units that have the **Automatic Validation option selected in the Edit Scenario dialog box** that is accessed by editing a scenario in the **Validation** subtab when editing a document type.

Oxygen XML Web Author Component CSS Limitations

The Oxygen XML Web Author Component CSS support is compatible with that offered by the standalone distribution of Oxygen XML Editor, with the following exceptions:

- The + (*direct adjacent*) and > (*child selector*) structural selectors cannot be used to match table-related elements.
- Oxygen XML Editor CSS extensions are ignored on print media. If an Oxygen XML Editor CSS extension is used on the screen media, it will also be used on the print media.
- Oxygen XML Editor CSS extension *properties* and *functions* cannot be used in a rule that has a :hover pseudo-class in the selector. The attr function is also not supported in such a rule due to a lack of browser support.
- The :hover pseudo-class is only available for mouse-enabled platforms.
- Oxygen XML Editor CSS extensions used in property values that express lengths may not behave as expected. Nevertheless, it is a good approximation.
- Oxygen XML Editor synthetic DOM nodes comment, reference, cdata, pi, and error interfere with the + (*direct adjacent*) structural selector. For example:

```
b + b {
color: red;
}
```

will not match the following XML structure:

```
<root>
<b/>
<!--comment-->
<b/>
</root>
```

- The Oxygen XML Web Author Component does not render non-table-row children elements of tables and non-table-cell elements of table-row elements.
- A width or height property set on any element other than the root XML element may cause some resize handles (that cannot be disabled) to be displayed in IE 11. This is also true for elements that have a position property with a value of absolute or fixed. For more information about this issue, see [this Microsoft Connect article](#).
- The Oxygen XML Web Author Component does not support the following:
 - :nth-last-of-type, :first-of-type, :last-of-type, :nth-last-of-type pseudo-classes.
 - oxy-tags-color, -oxy-tags-background-color, and -oxy-foldable properties.
 - Subject selectors, since they are not supported by web browsers.
 - Specifying widths for inline elements.
 - Attribute selectors that use wildcard for the attribute name.
 - Oxygen XML Editor CSS extensions to style :before and :after pseudo-elements, except in the content property.
 - CSS property values that contain the oxy_xpath function are not refreshed correctly.

To overcome these differences you can use media queries described in [Customization Tips](#).

Oxygen XML Web Author Component Editor Variable Limitations

The Oxygen XML Web Author Component processes Oxygen XML Editor editor variables. However, the following categories of editor variables are not supported:

- Editor variables related with functionality that is not available in the Oxygen XML Web Author Component, such as \${dbgXML} or \${dbgXSL}.
- Editor variables related with Oxygen XML Editor project location, such as \${pdu}, \${pd}, or \${pn}.

- Any editor variable that displays Java Swing-based components, such as \${ask}.
- Editor variables related with the Oxygen XML Editor standalone installation directory, such as \${oxygenHome} or \${oxygenInstallDir}.

Related information

[Editor Variables](#) on page 164

Customizing Oxygen XML Web Author Component Plugins

The Oxygen XML Web Author Component server side can be customized with a variety of plugin types. We currently provide support for the following extension types:

- **URLStreamHandler** - This extensions can be used to integrate the Oxygen XML Web Author Component with XML databases or CMS. There is an example URLStreamHandler provided in [oxygen XML SDK project](#) in the oxygen-sample-plugins/oxygen-sample-plugin-custom-protocol folder. The extension uses the **cproto** protocol to access the file system of the server and can be used as a starting point.

Note: For more details about implementing an authentication mechanism, see [Implementing a CMS Authentication Mechanism](#) on page 1346.

- **WorkspaceAccess** - Most of the methods used to configure the Oxygen XML Editor GUI are unavailable in these extensions, but they can still be used, for example, to configure a javax.xml.transform.URIResolver.

Note: The `ro.sync.xml.workspace.api.PluginWorkspace` instance passed to the extension also implements the `ro.sync.ecss.extensions.api.webapp.access.WebappPluginWorkspace` interface and provides access to some Oxygen XML Web Author Component-specific functionality.

- **WebappServlet** - This extension allows you to provide an implementation of a servlet-like interface (`ro.sync.ecss.extensions.api.webapp.plugin.WebappServletPluginExtension`) that will be dynamically loaded by the Oxygen XML Web Author Component. Your implementation will also provide the path to the location where the servlet will be exposed.
- **AuthorStylesheet** - Allows you to add a stylesheet (CSS or LESS) used for rendering all XML documents.
- **WebappStaticResourcesFolder** - This extension allows you to access a static resource folder. It should provide a path attribute (the static resources folder path relative to the plugin directory) and an href attribute that declares the plugin. An example of a use-case is you can use it to have the Oxygen XML Web Author Component provide icons for plugin-specific actions.

In the following example, the static resources will be available at `[OXYGEN_WEBAUTHOR_INSTALL_DIR]/plugin-resources/relative-href/path-to-file`, with the path-to-file being relative to the static resources folder:

```
<extension type="WebappStaticResourcesFolder" path="path-to-resorce-folder"
           href="relative-href"/>
```

Loading plugin-related custom JavaScript code

If your plugin needs accompanying JavaScript code to be loaded and executed on the client-side you can bundle it together with your plugin code. The Oxygen XML Web Author Component loads all files with the .js extension located in the web folder of the plugin.

Adding the Plugins in the Oxygen XML Web Author Component

If you have already developed such Oxygen XML Editor plugins, they can be added in the bundle-plugin/dropins folder in the Maven project.

If you are developing a new Oxygen XML Editor plugin you are encouraged to use as a starting point any of the existing plugins. Then you should add the resulting Maven project as a dependency (or even a sub-module) in the oxygen-sample-plugins module.

Public Plugin Integration Projects

Some public projects are available on [github.com](#) that can be used to help you integrate Oxygen XML Web Author Component. The following plugin projects are available:

- **Oxygen XML Web Author Component GitHub Connector** (<https://github.com/oxygenxml/webapp-github-plugin>)
 - This plugin enables Oxygen XML Web Author Component to open and commit files on GitHub.
- **WebDAV Server Plugin for Oxygen XML Web Author Component** (<https://github.com/oxygenxml/webapp-webdav-server>) - This project is a simple Oxygen XML Web Author Component plugin that provides a WebDAV-enabled workspace by registering the Tomcat built-in WebDAV servlet to manage a folder.
- **WebDAV Support for oXygen XML Web Author** (<https://github.com/oxygenxml/webapp-webdav-integration>)
 - This project is a very simple integration of Oxygen XML Web Author Component with a WebDAV-enabled server, which can be extended with more features or can be adapted to work with any CMS.

Related tasks

[Setting Up a Development Environment for Oxygen XML Web Author Component Plugins](#) on page 1348

Related information

[Adding and Configuring Plugins](#) on page 1353

Customizing Oxygen XML Web Author Component Client Side

Client side customization is available through a JavaScript API. Unlike the server side customization, it can be used to modify the application's GUI.

The Oxygen XML Web Author Component is an editing platform, but it is the job of the integrator to provide a way for the user to select which file is going to be edited. Afterwards, the user should be redirected to the Oxygen XML Web Author Component editing page, and the following three URL parameters specified:

- **url** - An absolute URL of the edited file.
- **ditamap** - (Optional parameter) An absolute URL taken into account only when editing a DITA file. Provides the DITA map context of the edited DITA file.
- **author** - The author name.

Suppose that the Oxygen XML Web Author Component is deployed at the following URL:

```
http://www.example.com/oxygen-sdk-sample-webapp/
```

The user (John Doe) wants to edit a file (located at `http://www.test.com/topics/topic.xml`) in the context of a DITA map (located at `http://www.test.com/map.xml`). In this case, the editing URL should be:

```
http://www.example.com/oxygen-sdk-sample-webapp/app/oxygen.html
?url=http%3A%2Fwww.test.com%2Ftopics%2Ftopic.xml
&ditamap=http%3A%2Fwww.test.com%2Fmap.xml
&author=John%20Doe
```

Note: The parameter values are percent encoded before being added to the editing URL.

Customize Oxygen XML Web Author Component Using JavaScript Code

To extend the client-side functionality provided by Oxygen XML Web Author Component you can use the [JavaScript API](#). To load the your JavaScript customization code, use one of the following methods:

- Create a file called `plugin.js` and copy it in the `app` folder of the Oxygen XML Web Author Component deployment.
- [Bundle JavaScript code with a Java Plugin](#).
- Bundle the JavaScript code with a framework. Save your code in the `framework.js` file (located in the `web` folder inside the particular framework folder).

Related information

[Customizing Oxygen XML Web Author Component Frameworks](#) on page 1340

[Oxygen XML Web Author Component JavaScript API](#)

Oxygen XML Web Author Component How to ...

This section includes information on how to accomplish a variety of common use cases.

Adding Custom Dictionaries for the Spell Checker

Oxygen XML Web Author Component includes an automatic spell checking feature and you can customize the words that are detected by adding custom dictionaries.

To add a custom dictionary, follow these steps:

1. Download the files needed for your custom dictionary (or create your own). You will need a *dictionary* file (.dic file extension) and an *affix* file (.aff file extension). If the dictionary did not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly.

Tip: An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

2. Copy both files (.dic and .aff) to the dicts folder that is located inside your *Oxygen Data Directory* (oxygen.data.dir).

Important: The name of the dictionary file should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen (for example, en_medical.dic for a medical dictionary in the English language). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

3. Restart the server for the spell checker to start using the new dictionary.

Configuring Minimal File Access Permissions

The Oxygen XML Web Author Component requires access to the following file resources:

- *READ* access to the directory where the Oxygen XML Web Author Component is deployed.
- *READ* and *WRITE* access to the application's working directory.
- *READ* and *WRITE* access to JVM's temporary directory.

It is a good security practice to allow a component to access only the information and resources that are necessary for its purpose. In an environment that uses Apache Tomcat, you can enforce these rules following these steps:

- Start the Apache Tomcat server using the -security flag.
- Edit the catalina.policy file and add the following snippet:

```
grant codeBase "file:${catalina.base}/webapps/oxygen-webapp/-" {  
    // Oxygen uses System properties for various configuration purposes.  
    permission java.util.PropertyPermission "*", "read,write";  
    // Oxygen custom protocols need access to network.  
    permission java.net.NetPermission "*";  
    permission java.net.SocketPermission "*", "accept,connect,listen,resolve";  
    // The web framework used by Oxygen Webapp uses reflection and classloaders.  
    permission java.lang.reflect.ReflectPermission "suppressAccessChecks";  
    permission java.security.SecurityPermission "*";  
    permission java.util.logging.LoggingPermission "control";  
    permission java.lang.RuntimePermission "*";  
  
    // Oxygen requires these permissions to connect to a URL.  
    permission java.net.URLPermission "http:*", "*";  
    permission java.net.URLPermission "https:*", "*";  
    permission java.net.URLPermission "file:*", "*";  
  
    // Oxygen should be allowed to read JVM jars  
    permission java.io.FilePermission "${java.home}/-", "read";  
  
    // Oxygen uses the JVM's java.io.tmpdir for various file handling tasks.  
    permission java.io.FilePermission "${java.io.tmpdir}/-", "read,write,delete";  
    permission java.io.FilePermission "${java.io.tmpdir}", "read,write,delete";  
  
    // Folder used by Oxygen to deploy the plugins to.  
    permission java.io.FilePermission "${oxygen.data.dir}/-", "read,write,delete";  
    permission java.io.FilePermission "${oxygen.data.dir}", "read,write,delete";  
};  
// The jar that contains sandboxing code.  
grant codeBase  
    "jar:file:${catalina.base}/oxygen-webapp/WEB-INF/lib/oxygen-sandbox.jar!/-" {  
    permission java.security.AllPermission;  
};  
// Give all permissions to plugins code unless otherwise instructed by vendor.  
grant codeBase "file:${oxygen.data.dir}/plugins-v18.1/-" {  
    permission java.security.AllPermission;  
};  
// Give all permissions to frameworks code unless otherwise instructed by vendor  
grant codeBase "file:${oxygen.data.dir}/frameworks-v18.1/-" {  
    permission java.security.AllPermission;  
};
```

Note: In the previous example, in the first line, replace oxygen-webapp with the name of your deployment of the Oxygen XML Web Author Component.

Configuring File Permissions to Custom Locations

There are cases when the Oxygen XML Web Author Component needs to access files system resources, but due to security reasons, you want to prevent your users from opening them directly in the Oxygen XML Web Author Component editing page using the file:// protocol.

You can do this by following these steps:

- Edit the catalina.policy file and add a line such as:

```
permission java.io.FilePermission "path/to/yourSecretDir/-", "read,write,delete";  
permission java.io.FilePermission "path/to/yourSecretDir", "read,write,delete";
```

- Use the following system property when starting the Tomcat server:

```
-Dfile.protocol.blacklist=/path/to/yourSecretDir
```

Note: Use the value of path.separator system property to separate more directories. For example, under Linux, the value of path.separator property is a colon punctuation character :.

Embedding Oxygen XML Web Author Component in a CMS Page

Oxygen XML Web Author Component can be embedded in a CMS to offer editing functionality for documents stored in the CMS.

To embed Oxygen XML Web Author Component, load the main page (app/oxygen.html) in an iframe.

Security Restrictions

Oxygen XML Web Author Component uses cookies to enforce its licensing and to maintain the editing state of the opened documents. Some browsers block third-party cookies for security reasons. To avoid having the cookies blocked, Oxygen XML Web Author Component should be served from the same origin as the CMS host page.

Passing Parameters to the Editor

To control the editor, you can use URL parameters described in the [options section](#). To pass custom parameters, you can implement a [plugin for Oxygen XML Web Author Component](#) that contains JavaScript code to interpret those parameters.

Communicating with the Editor

To communicate with the editor, you can send messages between the host CMS page and the Oxygen XML Web Author Component page.

Browsers offer the window.postMessage JavaScript API that allows messages to be sent between pages. To receive the message, create a [plugin for Oxygen XML Web Author Component](#) that contains JavaScript code that listens for the messages sent by the CMS host page and uses the [Oxygen XML Web Author Component JavaScript API](#) to implement the required functionality.

Other problems

- We experienced problems if the *iframe* is hidden while loading using display: none. You can use visibility: hidden for the same purpose.
- Some XML vocabularies (for example, DITA) support cross-document links. By default, clicking on a cross-document link will open that document in the Oxygen XML Web Author Component in another browser tab. If the editor is embedded, you may want to change this behavior using the sync.api.Editor.EventTypes.LINK_OPENED event that is triggered on the [sync.api.Editor](#) instance.

Enabling File Browsing for a Custom Protocol Handler

To allow users to insert images more easily, the Oxygen XML Web Author Component provides a file browsing JavaScript widget that can be used for any custom protocol plugin. To enable this widget, follow these steps:

1. Develop a plugin that implements the `ro.sync.eml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface. The `getURLStreamHandler` method should return an instance of `java.net.URLStreamHandler` (for example, `myHandler`).
2. `myHandler.openConnection()` should open an instance of the `ro.sync.net.protocol.FileBrowsingConnection` interface.
3. On the client-side, register the `sync.api.FileBrowsingDialog` widget as a `UrlChooser` using the following code snippet:

```
workspace.setUrlChooser(new sync.api.FileBrowsingDialog());
```

Implementing a CMS Authentication Mechanism

Suppose you want to impose an authentication step to all users who want to edit documents in the Oxygen XML Web Author Component. This is usually required when the CMS needs authentication before granting access to a file. The Oxygen XML Web Author Component provides both a server-side and client-side API that allows you to implement such a mechanism.

Implement CMS Authentication Mechanism

The following is a list of the basic building blocks of the authentication mechanism:

- Develop a plugin that implements the `ro.sync.eml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension` interface. Considering the multiple user context of the Oxygen XML Web Author Component, the `getURLStreamHandler` method should return an instance of the `ro.sync.ecss.extensions.api.webapp.plugin.URLStreamHandlerWithContext` class. This class tracks the user, based on the URL connection that will be made.
- If the CMS rejects the connection attempt with a message that the user is not authenticated, you should throw a `ro.sync.ecss.extensions.api.webapp.plugin.UserActionRequiredException` exception. This exception is automatically relayed to the client-side as a `sync.api.WebappMessage` JavaScript object.
- On the client side, follow these steps:
 1. Use the `sync.api.Editor.EventTypes.CUSTOM_MESSAGE RECEIVED` event to intercept the messages sent from the server-side.
 2. Display a dialog box to collect more authentication information from the user.
 3. Send the credentials to the server, more specifically to the `ro.sync.ecss.extensions.api.webapp.plugin.URLStreamHandlerWithContext` instance defined at step 1. For this part, you will need to implement a secure way to transmit the credentials. This can range from a simple servlet that runs in the Oxygen XML Web Author Component to an `OAuth` implementation.
 4. Retry the operation that triggered the authentication procedure.

Locating and Configuring Logs

How to Locate Log Files in the Windows, Linux, and All Platforms Versions

To locate the **Log file** or **Config file** that Oxygen XML Web Author Component uses for logging purposes, go to the [Administration Page](#) and in the [General tab](#) you can view the location of the logging files.

How to Locate the Logs of the WAR Version

By default, the WAR version of Oxygen XML Web Author Component sends its logs to standard output. To configure it to send logs to a file, edit the **Config file** and replace the first line with:

```
log4j.rootCategory= warn, R2
```

Also replace the value of the `log4j.appenders.R2.File` property with the path of the file where you want the logs to be saved.

Enabling HTTP Request Logging

To enable a detailed logging of the HTTP requests sent by Oxygen XML Web Author Component, edit the **Config file** and add the following lines:

```
log4j.category.org.apache.http.impl.conn=debug  
log4j.category.org.apache.http.impl.client=debug  
log4j.category.org.apache.http.client=debug  
log4j.category.org.apache.http.wire=debug  
log4j.category.org.apache.http=debug
```

Opening a File as Read-Only in Oxygen XML Web Author Component

Note: This topic assumes that you are using a [URL Stream Handler](#) plugin to open the files in your repository.

When a file is opened, your plugin is asked to provide a `URLConnection` object that Oxygen XML Editor uses to read the contents of the file.

By opening the file as read-only, the Oxygen XML Web Author Component is instructed to visually warn users that the content of the document cannot be edited. This is an alternative to having them edit the content and then receive an error when trying to check it in.

You can instruct the Oxygen XML Web Author Component to open a file as read-only by using one of the following methods:

- Implement the `java.net.URLConnection.getHeaderField(String)` method to return a value of `true` for the `oxygen_read_only` header name.
- Use a JavaScript extension that invokes an **Author** mode operation that changes the document status to read-only:

```
editor.getActionsManager().invokeOperation(  
    'SetReadOnlyStatusOperation',  
    {'read-only': true}  
)
```

Registering Actions to Create or Open Documents for Configured Plugins

The Oxygen XML Web Author Component has a user-friendly **Dashboard** and if a particular plugin registers a create or open action, then it will include sections for creating and opening documents for plugin integrations.

Register Create and Open actions for the Oxygen XML Web Author Component Dashboard

To register *Create* and *Open* actions, follow these steps:

1. [Create a plugin](#) that has a `plugin.js` file in its web folder.
2. In the `plugin.js` file, add code similar to the following example:

```
// The base url to browse.  
var initialUrl = 'file:///[PATH_TO_RESOURCE_FOLDER]';  
  
var createAction = new sync.api.CreateDocumentAction(  
    new sync.api.FileBrowsingDialog({initialUrl : initialUrl}));  
createAction.setActionName('New Document');  
  
var openAction =new sync.actions.OpenAction(  
    new sync.api.FileBrowsingDialog({initialUrl : initialUrl}));  
openAction.setActionName('Open Document');  
  
var actionsManager = workspace.getActionsManager();  
actionsManager.registerCreateAction(createAction);  
actionsManager.registerOpenAction(openAction);
```

Note: This example will provide browsing capabilities on your local file system. More complex connectors can be implemented using our Java and [JavaScript API](#). Also, to see information for a more complex example, you can also look at our [Oxygen XML Web Author Component storage services integration project that is hosted on GitHub](#).

3. [Deploy the plugin](#) in the Oxygen XML Web Author Component.

Result: The registered *create* action will appear in the **New** section on your **Dashboard**, while a registered *open* action will appear in the **Open** section.

Setting Up a Development Environment for Oxygen XML Web Author Component Plugins

You will need a recent Eclipse EE.

This procedure describes a development environment that can be used to increase your productivity in writing plugins for Oxygen XML Web Author Component.

Developing a plugin for Oxygen XML Web Author Component might require repetitive coding-testing cycles. Since the *process of building a whole SDK project* requires a full Maven build, the whole process might prove to be time consuming. The following procedure provide a faster alternate way of testing the plugin:

1. Go to the following repository and follow the instructions: <https://github.com/oxygenxml/web-author-plugin-archetype>.
2. Run Oxygen XML Web Author Component in a Tomcat server. You can either use one of the *installation kits*, or build it using the *oxygen XML SDK*.
3. Look in the Tomcat logs (or in the console) for a line like "Loading plugins from: \${path}" and note the path of the plugins folder.
4. In the plugins folder, create a sub-folder with a name of your choice (for example, `myplugin`).
5. In that folder (`myplugin`), create a `plugin.redirect` file that contains the path to your plugin project (created in step 2) on a single line.
6. Import your plugin project in Eclipse.
 - a) Click **File > Import**.
 - b) Choose **Existing Maven Project**.
 - c) Browse for the location of your plugin.

7. Modify the `plugin.xml` file to add a library reference to the directory where Eclipse places the compiled output.

With the default setup of a Maven project, this step requires that you add the following element:

```
<library name="target/classes/" />
```

8. You can now open a document in the Oxygen XML Web Author Component and it will automatically load your plugin.

Every time you make changes to the plugin sources, you will need to restart Oxygen XML Web Author Component.

Once you are happy with the result, you need to add the plugin back in your SDK project and follow [these instructions](#) to perform a final testing of the project.

Related information

[Adding and Configuring Plugins](#) on page 1353

Sharing a Tomcat Instance

If you want to share a Tomcat instance between Oxygen XML Web Author Component and another web application, the following issues need to be considered:

- Oxygen XML Web Author Component reads and sets system properties, and while we try to namespace those that are specific to Oxygen XML Web Author Component, there is no guarantee that there will not be any clashes with those set by other applications.
- You have to adapt the JVM's memory configuration to the scenario where there will be more applications competing for the same pool of memory.
- The Oxygen XML Web Author Component currently does not restart (or *reload* in Apache Tomcat terminology) correctly unless the Servlet Container is also restarted.

Troubleshooting Oxygen XML Web Author Component Errors

This topic is intended for system administrators and integration developers that want to troubleshoot deployment or programming errors. If you are not in either of those categories, you should contact your system administrator.

Oxygen XML Web Author Component intentionally does not provide explanatory messages for errors caused by deployment or programming mistakes. If you are trying to troubleshoot such a problem, you can find more information in the browser logs or in the server logs.

Browser logs

To see the browser logs, open the **Developer Tools** in your browser. This can usually be achieved by pressing **F12**.

Server logs

To see the server logs, follow the instructions detailed in the [Locating and Configuring Logs](#) on page 1346 topic.

[Locating and Configuring Logs](#) on page 1346

[How to Set a System Property](#) on page 1339

Using an IIS Reverse Proxy

If you want to use Oxygen XML Web Author Component with IIS as a reverse proxy, follow this procedure:

1. Configure IIS to allow double escaping in URLs. See the following examples:

- For Microsoft Azure, the applicationHost.xdt file should contain the following:

```
<?xml version="1.0" encoding="utf-8"?>
<configuration xmlns:xdt="http://schemas.microsoft.com/XML-Document-Transform">
  <system.webServer>
    <security>
      <requestFiltering allowDoubleEscaping="true"
        xdt:Transform="SetAttributes(allowDoubleEscaping)" />
    </security>
  </system.webServer>
</configuration>
```

- For other types, insert the following fragment inside the applicationHost.config file:

```
<security>
  <requestFiltering allowDoubleEscaping="true" />
</security>
```

2. Configure Tomcat to allow escaped slashes. Append the following line in the tomcat\conf\catalina.properties file:

```
org.apache.tomcat.util.buf.UDecoder.ALLOW_ENCODED_SLASH=true
```

3. Set an environment variable to instruct Oxygen XML Web Author Component that the URL path is already decoded. Insert the following line in the [OXYGEN_WEBAUTHOR_INSTALL_DIR]\tomcat\bin\catalina.bat file:

```
set "URL_DECODING_PROXY=true"
```

Deploying Oxygen XML Web Author Component

Server Requirements

Even though the requirements are not very strict, you should consider the following metrics when provisioning the server for running the Oxygen XML Web Author Component:

- A processor core can handle 50 to 100 active users.
- Editing an average DITA file consumes about 10MB of RAM. However, the Oxygen XML Web Author Component includes a [configurable caching mechanism](#) that stores the oldest files to disk when memory resources become low.

Software Requirements

On the server side, the following applications are supported:

- Servlet container:

- Apache Tomcat 7 or 8
- WildFly 10.0.0.Final
- IBM WebSphere Liberty 8.5.5.8
- Java Virtual Machine 1.7 or newer (if started in security mode, Java 1.8 is required).

Oxygen Data Directory and Other Important Deployment Notes

- All Oxygen XML Web Author Component configuration files are stored in a single folder that can be shared amongst multiple servers in a distributed deployment. It can also be reused when you update the server to a new version or when stored on a shared file system to be used by multiple server instances.

The default location of this folder depends on the distribution, as follows:

Windows, Linux, and All Platforms Distributions

`[OXYGEN_WEBAUTHOR_INSTALL_DIR]/tomcat/work/Catalina/localhost/oxygen-xml-web-author`

Web Archive Distribution

Depends on the servlet container. For example, in Tomcat it is located in `work/Catalina/localhost/oxygen-xml-web-author`.

However, the default location can be overridden by the [`oxygen.data.dir` system property](#).

 **Attention:** If the Oxygen XML Web Author Component is started in security mode, you must [`set the oxygen.data.dir system property`](#).

Note: WildFly and WebSphere will erase the folder with configuration files upon restart. For these servers, you must [`set the oxygen.data.dir system property`](#) to a folder that persists across restarts.

- It is recommended that you install the Oxygen XML Web Author Component in its own instance of Tomcat, without sharing it with other applications.
- If you want to reload the application, you have to restart the server.

Related information

[Setting up an HTTP Floating License Server](#) on page 35

Licensing

The Oxygen XML Web Author Component uses a floating license model, where the license key is stored on a server and individual users consume license seats from a common pool.

How it works

The license key contains the maximum number of users that can simultaneously access the Oxygen XML Web Author Component at any given moment. After a period of inactivity, the license allocated to that user becomes available.

While no personal information is sent to the server, a cookie that identifies the user is auto-generated. Note that the use of two different browsers (for example, Firefox and Chrome) by a single user, will consume two floating licenses. However, using two or more windows or tabs of the same browser, consumes a single floating license.

Licensing

Follow these steps to license a deployment of the Oxygen XML Web Author Component:

1. [*Install a floating license server*](#). You can deploy the HTTP license server in the same Tomcat server, alongside with Oxygen XML Web Author Component.
2. Configure the license server connection.

Note: Information about your license will be displayed in the **About** section of the Oxygen XML Web Author Component **Dashboard**.

Configuring the License Server Connection

For information on configuring the license server connection with a simple GUI, see [Configuring the License Server Connection](#) on page 1353.

Bundling a default License Server Configuration in the Oxygen XML Web Author Component

If you need to build the Oxygen XML Web Author Component with a default license configuration bundled inside, use this method.

The connection to the server should be configured in a properties file located in WEB-INF / license.properties. This file might look like this:

```
licensing.server.type=http
licensing.server.url=http://example.com:8080/oxygenLicenseServlet/license-servlet
licensing.server.user=<USER>
licensing.server.password=<CHANGE-ME>
```

The following keys are supported:

licensing.server.type

Type of licensing server. Set it to http.

licensing.server.url

The URL of the license server.

licensing.server.user

The name of the user with role user used to connect to the license server.

licensing.server.password

The password used for the license server.

licensing.server.encryptedPassword

This is an alternative to **licensing.server.password**. The value should be the encrypted password.

To encrypt the password, setup the [SDK project](#) and run the following command in the oxygen-sample-webapp module:

```
mvn exec:java -Dexec.mainClass="com.oxygenxml.webapp.EncryptionTool" -
Dexec.args="encryptionKey passwd"
```

where passwd is the password and encryptionKey is the encryption key used to encrypt the password.

backup.licensing.server.url

(optional) For some of the licensing packages we offer a backup license key that can be deployed on a second license server in order to provide higher availability in presence of machine and network failures. This key contains the URL of this backup license server.

backup.licensing.server.user

(optional) The name of the user with role user used to connect to the backup license server.

backup.licensing.server.password

(optional) The password to use for the backup license server.

backup.licensing.server.encryptedPassword

(optional) This is an alternative to **backup.licensing.server.password**. In order to generate its value, see the instructions for **licensing.server.encryptedPassword**.

Upgrading

Every new version of Oxygen XML Web Author Component comes with a lot of new features, improvements, bug fixes, and security upgrades. Therefore, you should always use the latest version. However, you may want to perform some internal tests before allowing the users to use the new features. For example, you may want to disable some of the new features to keep the UI simple or to tweak some of the settings.

It is recommended that you make a separate deployment of the new version on a different VM, perform some acceptance tests, and then switch all of your users to the new deployment.

To upgrade Oxygen XML Web Author Component, follow these steps:

1. Deploy the new version of Oxygen XML Web Author Component on a separate virtual machine and connect it to your existing license server. The two deployments will work in parallel, both using the same license pool.
2. It might be necessary to update your license key. If you receive an error message in regards to the license key version, follow [this procedure](#). Your existing Oxygen XML Web Author Component deployment will continue to work with a license for the newer version.
3. Tweak the settings for the new version to suit your needs.
4. Switch all of the users to the new version. This can be achieved either by changing the DNS entry or configuring the [Load Balancer](#) to use the new deployment.

Administration Page

Oxygen XML Web Author Component includes a user-friendly **Administration Page** that helps you to configure your instance of the Oxygen XML Web Author Component. You can use this page to configure a variety of settings. You need to enable the **Administration Page** before you can access it, but once you do, you can access it from a link on the top-right corner of the **Dashboard** page.

Enabling the Administration Page

If you used the [Linux, Windows, or All Platforms installation kits](#), the administration page is already enabled.

If you used the **Web Application Archive** version, you need to manually enable the **Administration Page** by following these steps:

1. Configure Tomcat to use a security Realm element. Refer to the [Tomcat Documentation](#) for more information.
2. Edit the `tomcat-users.xml` file from your Tomcat installation and configure a user for the `admin` role, as in the following example:

```
<tomcat-users>
  <role rolename="admin"/>
  <user username="USERNAME" password="PASSWORD" roles="admin"/>
</tomcat-users>
```

3. Your Administration Page is now enabled. To access it, go to the following URL:

```
http://example.com:8080/oxygen-webapp/app/admin.html
```

where `http://example.com:8080/oxygen-webapp` is the URL of your instance of the Oxygen XML Web Author Component.

4. You will be prompted for authentication credentials and you will enter those configured in the steps above.

Accessing the Administration Page

You can easily access the **Administration** page from a link on the **Dashboard** page.

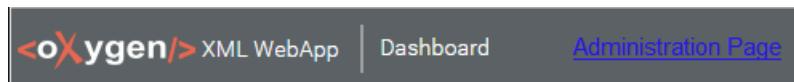

Figure 589: Administration Page Link

How to Hide the Administration Page Link

You can hide the **Administration Page** link from regular users by disabling the **Show a link to the Administration Page** option that is available in the **Settings** section of the **Administration Page**.

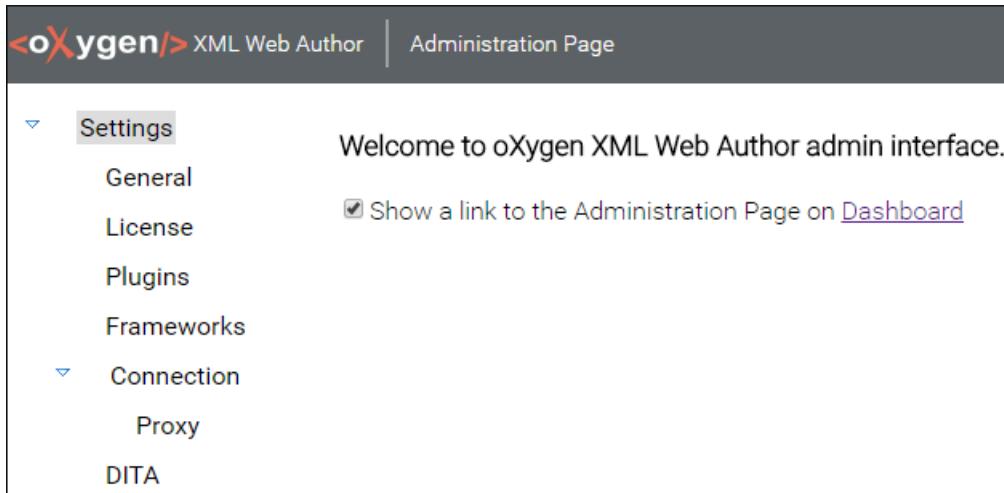

Figure 590: Show Administration Page Link Option

Types of Settings in the Administration Page

You can click on any of the listed types of settings to access configurable options for each type. The **Administration Page** allows you to configure settings for the following:

- **General** - Allows you to choose the initial state of the Change Tracking feature. You can choose between **Stored in document**, **Always On**, and **Always Off**. This tab also displays the location of logging files.
- **License** - Allows you to configure a license server connection.
- **Plugins** - Allows you to add and configure plugins for your Oxygen XML Web Author Component.
- **Frameworks** - Allows you to add or remove frameworks for your Oxygen XML Web Author Component.
- **Connection** - Includes an option for automatically accepting invalid security certificates.
- **Connection > Proxy** - Allows you to configure the proxy settings for your Oxygen XML Web Author Component.

Configuring the License Server Connection

To configure the license server connection for your Oxygen XML Web Author Component, follow these steps:

Note: This method only applies to *the oXygen HTTP Floating License Server*.

1. Go to your [Administration Page](#).
2. Select **License**.
3. Enter the server URL and your authentication credentials for the license server.
4. Click **Submit**.

You should see a message that informs you that the license configuration was successfully applied. After it is configured, you can change or manage your server connection by using the **Change Server** or **Manage Server** buttons.

Adding and Configuring Plugins

Oxygen XML Web Author Component includes a user-friendly **Administration Page** that helps you to configure your instance of the Oxygen XML Web Author Component.

Add a New Plugin

To add a new plugin to the Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Plugins**.
3. Click **Upload Plugin** and choose a plugin file to upload.
4. Click **OK** to upload the file. The plugin should appear in the list on this page.
5. Once you are finished with all of your changes, restart the server.

Enable or Disable a Plugin

To enable or disable a plugin, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Plugins**.
3. Click the **disabled** button to enable the plugin, or the **enabled** button to disable it.
4. Once you are finished with all of your changes, restart the server.

Configure a Plugin

If the plugin can be configured, a  **Configure** icon is displayed next to its name in the [Administration Page](#). To configure the plugin, click the icon and follow the instructions.

Delete a Plugin

To delete a plugin from your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Plugins**.
3. Find the plugin you want to delete and click the  **Delete the plugin** button on the right side of its name.
4. Restart the server to apply the changes.

Creating a Plugin Configuration Page

To create a configuration page for a plugin that does not already have the  **Configure** icon displayed in the **Administration** page, follow these steps:

1. Register a **WebappServlet** extension type with a **role** attribute set to **config** in your `plugin.xml` file, as in the following example:

```
<extension type="WebappServlet" role="config" class="com.ex.MyPluginConfigExt"/>
```

The `class` attribute value should point to an extension of the [PluginConfigExtension](#) class.

2. When extending the [PluginConfigExtension](#) class, consider the following notes:

- Implement the `getOptionsForm` method to return an HTML form and make sure that contains inputs with the `name` attribute the same as the option you want to configure.
- Implement the `getOptionsJson` method to return a JSON string that contains the options that you want to make available to the JavaScript code. They will be accessible in your plugin JavaScript code using the `sync.options.PluginsOptions.getClientOption(optionName)` method.

Note: The JSON should only contain key values, where values are of the type `string | number | boolean` with no arrays or other objects.

Tip: You should not include any sensitive information (e.g. OAuth secrets) in the options returned by this method.

- Implement the `getPath` method to return a non-empty string that represents the path for which this extension will be served.

For example:

```
{webapp-context}/plugins-dispatcher/RESULT_OF_GETPATH
```

- If you need to override the `init` method, make sure you call `super.init()`. Otherwise, options will not be saved to disk and will be lost when you restart the application.
- If you need to override any of the `doPut`/`doDelete` methods, make sure you call the `saveOptions` method at the end to save the options to disk.
- If you need to override the `doGet` method, make sure it responds with the result of `getOptionsForm` for header `Accept=text/html`, and with the result of `getOptionsJson` when called with header `Accept=application/json`. Use the `getOption` or `getDefaultOptions` methods to access the current or default options.

Tip: For an implementation example, you can look at com.oxygenxml.sdksamples.github.GithubPluginConfigExtension in the [webapp-github-plugin project](#).

Result: A  **Configure** icon is now displayed next to its name in the **Administration** page.

Related information

[Adding and Configuring Plugins](#) on page 1353

Adding or Removing a Framework

Add a New Framework

To add a new framework to your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Frameworks**.
3. Click **Upload Framework** and choose a framework file to upload.
4. Click **OK** to upload the file. The framework should appear in the list on this page.
5. Once you are finished with all of your changes, restart the server.

Delete a Framework

To delete a framework from your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Frameworks**.
3. Find the framework you want to delete and click the  **Schedule for deletion** button on the right side of its name.
4. Restart the server to apply the changes.

Configuring Proxy Settings

Configure Proxy Settings for Oxygen XML Web Author Component

To configure the proxy setting for your Oxygen XML Web Author Component, follow these steps:

1. Go to your [Administration Page](#).
2. Select **Connection > Proxy**.
3. Specify how HTTP(S) connections go through the proxy server. You can choose between the following:
 - **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
 - **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.
 - **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

Depending on the option you choose, you can configure the following additional options:

Web Proxy (HTTP/HTTPS) section

Address

The address of the proxy server used for manual configurations.

Port

The port of the proxy server used for manual configurations.

No proxy for

Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, myhost.example.com) or as a domain name (for example, example.com). Use a comma to separate multiple hosts.

User

The user name for authentication with the proxy server.

Password

The password for authentication with the proxy server.

SOCKS Proxy section**Address**

The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

Port

The port of a SOCKS proxy that all connections will pass through.

4. Click **Apply** to accept your changes.

Setting up a Load-Balanced Server

To scale a deployment to a larger number of users and to increase the availability, Oxygen XML Web Author Component can be deployed on a set of *load-balanced* servers. This topic describes the required setup for such a scenario.

Configure Session Stickyness

Every Oxygen XML Web Author Component server keeps the state of the edited documents in memory for performance reasons. This implies that every user should connect to the same back-end server for the duration of an editing session. To achieve this result in a *load-balanced* setting, you should enable **session stickyness**.

Configure Server Health Checks

To detect unhealthy servers, Oxygen XML Web Author Component offers a health check REST API. The endpoint has the following interface:

URL

`rest-public/status`

Response status code

200 for a healthy server and 503 for an unhealthy server.

Response body

For an unhealthy server, the response body contains a text description of the problem.

Configure the License Server

All Oxygen XML Web Author Component servers can use the same pool of floating licenses. To this end, they all need to be [configured to use the same license server](#).

Share Options Between All Instances

The configuration options are stored in the file system in a directory that can be changed using the [`oxygen.data.dir` system property](#). In order for all instances to use the same options, `oxygen.data.dir` should point to the same directory on a shared file system.

Oxygen XML Web Author Component Form Controls

Table 46: Properties supported in the Oxygen XML Web Author Component

Form control	Description	Supported properties
The Text Field form control	This form control provides a text field box that is used for entering a single line of text.	type columns fontInherit (always true) tooltip color
The Date Picker form control Note: Some browsers interpret the HTML5 datePicker as a text-field.	This form control offers a text field that allows the user to choose a date in a specified format. Some browsers include a calendar browsing mechanism along with the text field.	columns color format
The URL Chooser form control	This form control provides a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.	columns color fontInherit (always true)
The Combo Box form control	This form control provides a graphical object that is a drop-down menu of proposed values. It can also be used for a combination of a drop-down menu and an editable single-line text field.	columns editable tooltips values fontInherit (always true) labels color
The Checkbox form control	This form control offers a single checkbox or multiple check-boxes that can be used to enable or disable an option.	resultSeparator tooltips values uncheckedValues labels color
The Button form control	This form control provides a button object that is used to invoke a specific action.	color actionID transparent
The Button Group form control	This form control provides a group of button objects that are used to invoke specific actions.	label icon actionDisplayStyle tooltips transparent

Form control	Description	Supported properties
The Pop-up form control	This form control offers a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.	color tooltips values resultSeparator selectionMode labels columns rendererSort (has to be identical to editorSort)
The Text Area form control	This form control provides a text box that can be used to enter multiple lines of text.	type columns (in average character width) rows fontInherit tooltip color
The HTML Content form control	This form control is used for rendering HTML content. It is displayed as a graphical element shaped as a box. The shape of the box is determined by a specified width and the height is computed based upon the length of the text.	href ID width
The oxy_label() function	This function can be used as a value for the CSS content property to change the style of generated text.	text width color background-color inherit styles

Oxygen XML Author Options Supported by Oxygen XML Web Author Component

Oxygen XML Web Author Component supports some of the options used by the oXygen XML Author desktop application. The supported options are applied for all Web Author users. The options are stored in an XML file with the following format:

```
<?xml version="1.0" encoding="UTF-8"?>
<serialized version="18.1" xml:space="preserve">
  <map>
    <entry>
      <String>author.show.comments</String>
      <Boolean>true</Boolean>
    </entry>
  </map>
</serialized>
```

For each option, an additional entry should be added in this file.

Table 47: Oxygen XML Author Options Supported in Oxygen XML Web Author Component

Key	Type	Description
dita.ot.directory	String	The directory path to the default DITA OT installation.

Key	Type	Description
track.changes.initial.state	Integer	Option for track changes initial state. <ul style="list-style-type: none">• 0 - Initial state stored in document.• 1 - Track changes always on.• 2 - Track changes always off.
automatically.accept.certificates	boolean	Option that controls if oXygen will accept all HTTPS certificates.
additional.frameworks.directories	See example entry below	An array of java.lang.String objects representing paths to the additional frameworks folders (may also contain editor variables).
WEBAPP_SHOW_ADMIN_PAGE_LINK	boolean	"True" to display the admin page link on the dashboard.
author.convert.external.content.on.paste	boolean	Option that controls whether or not the content pasted in Author mode should be converted to match the destination styles.
author.convert.external.content.space.preserve	boolean	Option that controls whether or not the content pasted in Author mode should be converted to match the destination styles in space preserve elements.
http.read.timeout.seconds	Integer	An integer number that configures the timeout used when waiting for an HTTP request.
http.proxy.system	boolean	"True" to detect HTTP proxy from system.
http.proxy.set	boolean	HTTP proxy uses manual configuration.
http.proxy.port	Integer	Proxy port.
http.proxy.host	String	Proxy hostname or IP address.
http.proxy.user	String	Proxy user.
http.proxy.password	String	Proxy password.
http.proxy.direct	String	Comma separated list of hosts for which the proxy is bypassed.
http.max.simultaneous.connections.per.host	boolean	Limits the number of connections the HTTP client can open to the same server host.
author.show.comments	boolean	Show the comment nodes in the author page.
author.show.processing.instructions	boolean	Show the pi nodes in the author page.

Example entry for additional.frameworks.directories option:

```
<entry>
  <String>
    additional.frameworks.directories
  </String>
  <String-array>
    <String>
      /path/to/frameworks
    </String>
  </String-array>
</entry>
```

Feature Matrix

The Oxygen XML Author Component was designed to provide the functionality of the standard **Author** mode and can be embedded either in a third-party standalone Java application or customized as a Java Web Applet to provide WYSIWYG-like XML editing directly in your choice of web browsers.

The Oxygen XML Web Author and Oxygen XML Web Author Component are re-implementations of the Oxygen XML Editor **Author** mode user interface, based on JavaScript and HTML5. Its purpose is to enable XML editing and reviewing on your mobile devices and desktops, directly in a web browser environment. Since the interface was thinned down as much as possible, the core XML processing was moved into a Java-enabled server.

Table 48: Feature Matrix Showing Differences Between Web Author, Web Author Component, and Author Component

Feature	Oxygen XML Web Author	Oxygen XML Web Author Component	Oxygen XML Author Component
Intended audience	Reviewers and occasional contributors.	Reviewers and occasional contributors.	Content authors, technical writers.
Mobile device support	Specifically designed for mobile devices.	Specifically designed for mobile devices.	No
Compatibility with the standard version of Oxygen XML Editor	Covers only editing and reviewing features.	Covers only editing and reviewing features.	100%
Text Mode	Yes	Yes	Yes
Grid Mode	No	No	Yes
Client-side setup	Yes, with an <i>Administration</i> page.	Yes, with an <i>Administration</i> page.	Requires Java to be installed, and Java Applets to be allowed to run.
Server-side setup	Simply requires running an installer.	Requires a servlet container and performing a Maven build.	Requires a web server.
Ability to configure installation bundles	No	Yes	Yes

Oxygen XML Editor includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the **Tools** menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project** view.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view.

Note: The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that are used also appear in the **Refactoring** submenu of the contextual menu in the **Project** view and the **DITA Maps Manager**.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

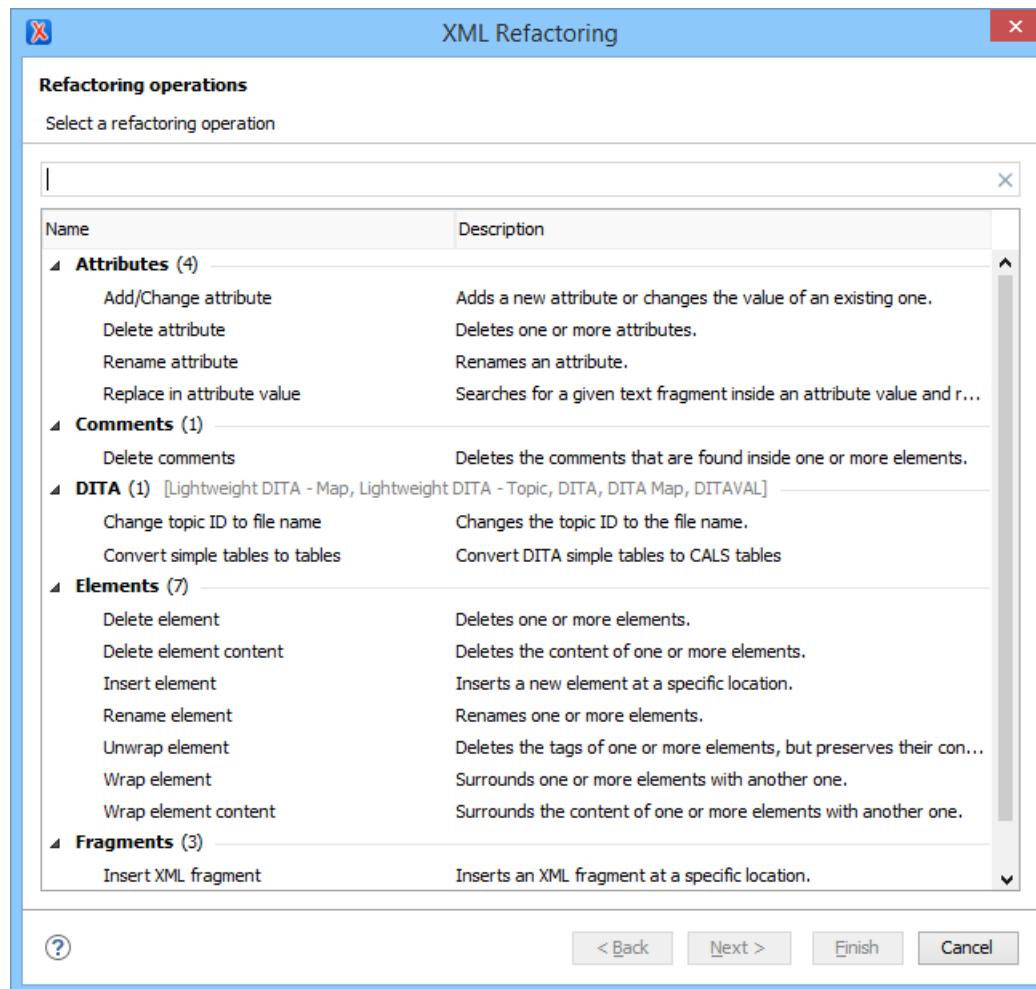

Figure 591: XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

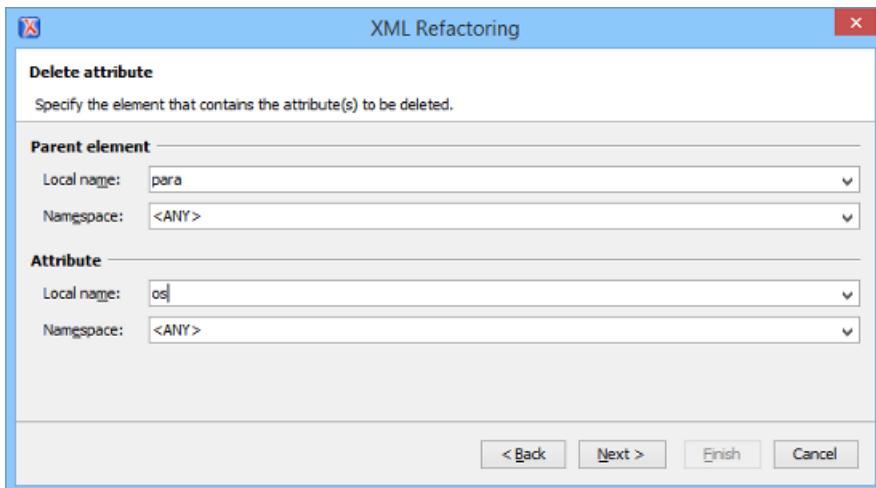

Figure 592: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map hierarchy, etc.) or you can define your own set of resources by creating a working set.

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When enabled, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When enabled, the resources inside archives will also be affected.

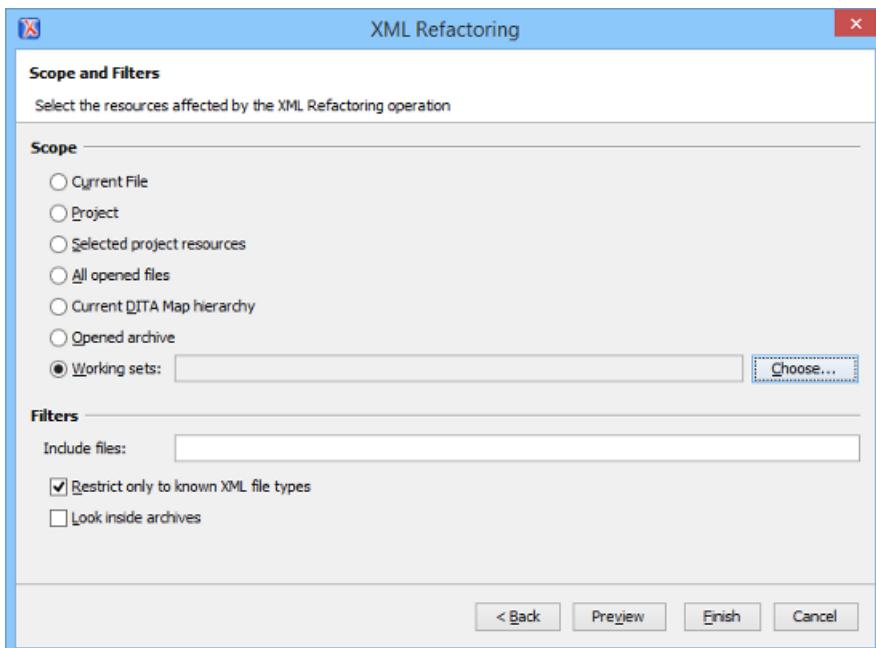

Figure 593: XML Refactoring - Scope and Filters Wizard Page

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

Note: It is recommended that you use the **Preview** button to review all the changes that will be made by the refactoring operation before applying the changes.

 **Warning:** After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Predefined Refactoring Operations

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip: Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:

Refactoring Operations for Attributes

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
 - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
 - **Local name** - The local name of the affected attribute.
 - **Namespace** - The namespace of the affected attribute.
 - **Value** - The value for the affected attribute.
- **Options** section
 - You can choose between one of the following options for the **Operation mode**:
 - **Add the attribute in the parent elements where it is missing**
 - **Change the value in the parent elements where the attribute already exists**
 - **Both**

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section

- **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
 - **Find** - The text fragments to find. You can use Perl-like regular expressions.
 - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note: Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA*

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
 - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
 - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
 - **Local name** - The local name of the element to be inserted.
 - **Namespace** - The namespace of the element to be inserted.
- **Location** section
 - **XPath** - An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
 - **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
 - **Local name** - The local name of the *Wrapper element*.
 - **Namespace** - The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
 - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
 - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.

- **Location** section
 - **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
 - **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

Refactoring Operations for JATSKit

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
 - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
 - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
 - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

Additional Notes

Note: There are some operations that allow <ANY> for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-FO-XQUERY > XPath](#) page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

Custom Refactoring Operations

While Oxygen XML Editor includes a variety of predefined XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

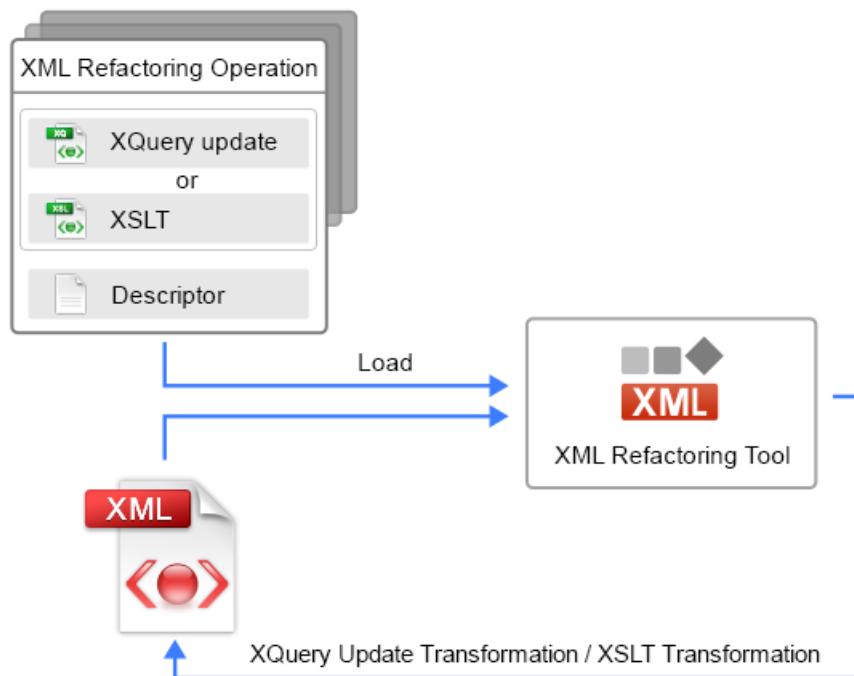

Figure 594: Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the *XML Refactoring Tool* and presented in [the Refactoring Operations wizard page](#), along with the predefined built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a *safe mode*, which implies the following:

- When loading the document:
 - The *XInclude* mechanism is disabled. This means that the resources included by using *XInclude* will not be visible in the transformation.
 - The DTD entities will be processed without being expanded.
 - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
 - The DOCTYPE will be preserved.
 - The DTD entities will be preserved as they are in the original document when the document is saved.
 - The attribute values will be kept in their original form without being normalized.
 - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note: To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction: *Comments or processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments or processing instructions* that are inside the root element.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. [Create an XQuery Update script or XSLT file](#).
2. [Create an XML Refactoring Operation Descriptor file](#).
3. Store both files in [one of the locations that Oxygen XML Editor](#) scans when loading the custom operations.

Result: Once you run the **XML Refactoring** tool again, the custom operation appears in [the Refactoring Operations wizard page](#).

Related information

[Storing and Sharing Refactoring Operations](#) on page 498

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an *XQuery Update script* or *XSLT stylesheet* that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use [our examples](#) to help you with the content.

There are cases when it is necessary to add parameters in the *XQuery script* or *XSLT stylesheet*. For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in [the refactoring operation descriptor file](#) that is associated with this operation.

Note: The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this facility by creating an [XQuery transformation scenario](#) and choose **Saxon EE** as the transformation engine. Also, you need to make sure the [Enable XQuery update option is enabled in the Saxon processor advanced options](#).

Note: If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the [XML /XSLT-FO-XQuery / XPath preferences page](#).

The next step in creating a custom refactoring operation is to [create a custom operation descriptor file](#).

[Example of an XML Refactoring Operation](#) on page 495

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessary when loading an XML Refactoring operation . It also contains the path to the XQuery Update script or XSLT stylesheet that is associated with the particular operation through the `script` element.

You can specify a category for your custom operations to logically group certain operations. The `category` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the [Configure Operation Parameters wizard page](#) for that particular operation.

The value of the first `description` element in the **parameters** section will be displayed at the top of [the Configure Operation Parameters wizard page](#).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
 - TEXT - Generic type used to specify a simple text fragment.
 - XPATH - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.

Note: The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

Note: A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

Note: When writing XPath expressions, you can only use prefixes declared in the [Options > Preferences > XML > XSLT-FO-XQUERY > XPath](#) options page.

- NAMESPACE - Used for editing namespace values.
- REG_EXP_FIND - Used when you want to match a certain text by using Perl-like regular expressions.
- REG_EXP_REPLACE - Used along with REG_EXP_FIND to specify the replacement string.
- XML_FRAGMENT - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.

- NC_NAME - The parameter for NC_NAME values. It is useful when you want to specify the local part of a QName for an element or attribute.
- BOOLEAN - Used to edit boolean parameters.
- TEXT_CHOICE - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
    <value name="before">Before</value>
    <value name="after" default="true">After</value>
    <value name="firstChild">First child</value>
    <value name="lastChild">Last child</value>
</possibleValues>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `label` attribute is displayed in the application as the label of the text field. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `elementLocation`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
    <element label="Element location">
        <description>Element location description.</description>
    </element>
</ ElementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `label` attributes is displayed in the application as the label of the associated text fields. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `attributeLocation`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
    <element label="Element path">
        <description>Element path description.</description>
    </element>
    <attribute label="Attribute" >
        <description>Attribute path description.</description>
    </attribute>
</ AttributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `label` attribute is displayed in the application as label of the

associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the **Name** and **Namespace** combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```
<elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true"
useCurrentContext="true">
        <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
    </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as the label of the associated combo box. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note: An attributeParameter is dependant upon an elementParameter. The list of attributes and namespaces are computed based on the selection in the elementParameter combo boxes.

Example of an attributeParameter:

```
<attributeParameter dependsOn="elemID">
    <localName label="Name" name="attribute_localName" useCurrentContext="true">
        <description>The name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
    </namespace>
</attributeParameter>
```

Note: All predefined operations are loaded from the `[OXYGEN_INSTALL_DIR]/refactoring` folder.

[Example of an XML Refactoring Operation](#) on page 495

Example of an XML Refactoring Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `image` elements where a deprecated `alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `image` element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the `image` element.

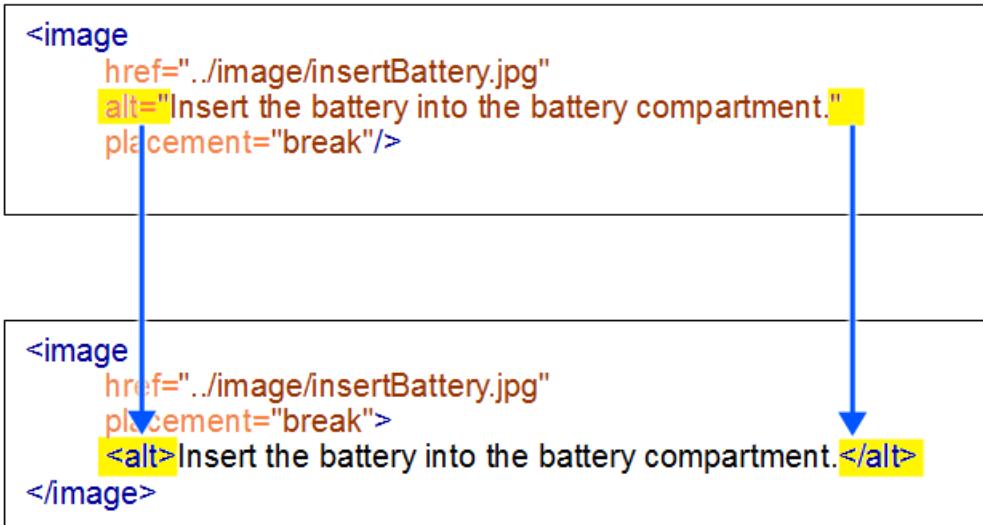

Figure 595: Example: Custom XML Refactoring Operation

A new custom XML refactoring operation requires:

- An [XQuery Update script](#) or [XSLT stylesheet](#).
- An [XML Refactoring operation descriptor file](#) that contains the path to the XQuery Update script or XSLT stylesheet.

Example of an XQuery Update Script for Creating a Custom Operation to Convert an Attribute to an Element

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the QName of the new element to be inserted and inserts it as the first child of the parent element.

```

(: XQuery document used to implement 'Convert attribute to element'
   operation from XML Refactoring tool.
:)

declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";
declare option output:method    "xml";
declare option output:indent    "no";

(: Local name of the attribute's parent element. :)
declare variable $element_localName as xs:string external;

(: Namespace of the attribute's parent element. :)
declare variable $element_namespace as xs:string external;

(: The local name of the attribute to be converted :)
declare variable $attribute_localName as xs:string external;

(: The namespace of the attribute to be converted :)
declare variable $attribute_namespace as xs:string external;

(: Local name of the new element. :)
declare variable $new_element_localName as xs:string external;

(: Namespace of the new element. :)
declare variable $new_element_namespace as xs:string external;

(: Convert attribute to element:)
for $node in /**
(: Find the attribute to convert :)
let $attribute :=
  $node/@*[local-name() = $attribute_localName and
            ($attribute_namespace = '<ANY>' or $attribute_namespace = namespace-uri())]

(: Compute the prefix for the new element to insert :)
let $prefix :=
  for $p in in-scope-prefixes($node)
    where $new_element_namespace = namespace-uri-for-prefix($p, $node)
  return $p

```

```
(: Compute the qname for the new element to insert :)
let $new_element_qName :=
    if (empty($prefix) or $prefix[1] = '') then $new_element_localName
    else $prefix[1] || ':' || $new_element_localName

where ('<ANY>' = $element_localName or local-name($node) = $element_localName)
and
($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))

return
if (exists($attribute)) then
    (insert node element {QName($new_element_namespace, $new_element_qName)}
    {string($attribute)} as first into $node,
    delete node $attribute)
else ()
```

Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
    version="2.0">

                        <xsl:copy-of select=". "/>
                    </xsl:for-each>
                    <!-- The new element namespace -->
                    <xsl:variable name="nsURI" as="xs:string">
                        <xsl:choose>
                            <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
                                <xsl:value-of select="''"/>
                            </xsl:when>
                            <xsl:otherwise>
                                <xsl:value-of select="$new_element_namespace"/>
                            </xsl:otherwise>
                        </xsl:choose>
                    </xsl:variable>
                    <xsl:element name="{{$new_element_localName}}" namespace="{{$nsURI}}>
                        <xsl:value-of select="$attributeToConvert"/>
                    </xsl:element>
                    <xsl:apply-templates select="node()"/>
                </xsl:copy>
            </xsl:otherwise>
        </xsl:choose>
    </xsl:template>
</xsl:stylesheet>
```

Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML catalog set in the *XML Refactoring* framework.

Example of an Operation Descriptor File for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XQuery script or XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element.
    The new element will be inserted as first child of the attribute's
    parent element.</description>
  <!-- For the XSLT stylesheet option uncomment the following line and comment
      the line referring the XQuery Update script -->
  <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
  <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID">
        <localName label="Name" name="element_localName" allowsAny="true">
          <description>Local name of the parent element.</description>
        </localName>
        <namespace label="Namespace" name="element_namespace" allowsAny="true">
          <description>Local name of the parent element</description>
        </namespace>
      </elementParameter>
    </section>
    <section label="Attribute">
      <attributeParameter dependsOn="elemID">
        <localName label="Name" name="attribute_localName">
          <description>Name of the attribute to be converted.</description>
        </localName>
        <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
          <description>Namespace of the attribute to be converted.</description>
        </namespace>
      </attributeParameter>
    </section>
    <section label="New element">
      <elementParameter>
        <localName label="Name" name="new_element_localName">
          <description>The name of the new element.</description>
        </localName>
        <namespace label="Namespace" name="new_element_namespace">
          <description>The namespace of the new element.</description>
        </namespace>
      </elementParameter>
    </section>
  </parameters>
</refactoringOperationDescriptor>
```

Note: If you are using an XSLT file, the line with the `script` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder [scanned by Oxygen XML Editor when it loads the custom operation](#). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

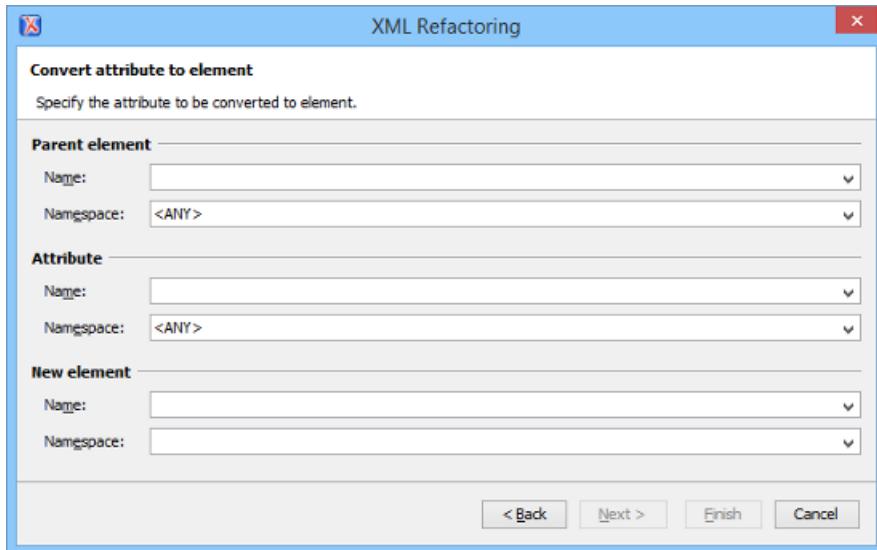

Figure 596: Example: XML Refactoring Wizard for a Custom Operation

Storing and Sharing Refactoring Operations

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a framework you are customizing.
- Any folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Refactoring**, and specify the same folder in the **Load additional refactoring operations from text box**.

Note: If you share a project with your team, you can also share the custom operation by doing the following:
Then by doing the following:

1. Save the custom operation in a folder that is part of your project.
 2. Switch the **XML Refactoring** option page to project level:
 - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**.
 - b. Select **Project Options** at the bottom of the dialog box.
 3. In the **Load additional refactoring operations from text box**, use the \${pd} editor variable so that the folder path is declared relative to the project.
- A folder specified by the [XML Refactoring Operations Plugin Extension](#).
 - The refactoring folder from the Oxygen XML Editor installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as frameworks or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.

- The description of the `parameters` element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- An `i18n` folder located in directories specified through the [XML Refactoring Operations Plugin Extension](#).
- The `refactoring/i18n` folder from the Oxygen XML Editor installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/i18n`).

Example of a Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
    name="${i18n(Remove_text_content)}">
    <description>${i18n(Remove_text_content_description)}</description>
    <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
    <parameters>
        <description>${i18n(parameters_description)}</description>
        <parameter label="${i18n(Element_name)}" name="element_localName"
            type="NC_NAME">
            <description>${i18n(Element_name_descriptor)}</description>
            <possibleValues>
                <value default="true" name="value1">${i18n(value_1)}</value>
                <value name="value2">${i18n(value_2)}</value>
            </possibleValues>
        </parameter>
    </parameters>
</refactoringOperationDescriptor>
```

Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in [XML Schema preferences page](#).

To generate sample XML files from an XML Schema, use the  **Generate Sample XML Files** action from the **Tools** menu. This action is also available in the contextual menu of the schema [Design mode](#). The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

For more information about this tool, watch our video demonstration about generating sample XML files at https://www.oxygenxml.com/demo/Generate_Sample_XML_Files.html.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the [Sample XML Files Generator preferences page](#). You can also run the tool from the command line using exported options.

Schema Tab (Generate Sample XML Files Tool)

The  **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the **Schema** tab.

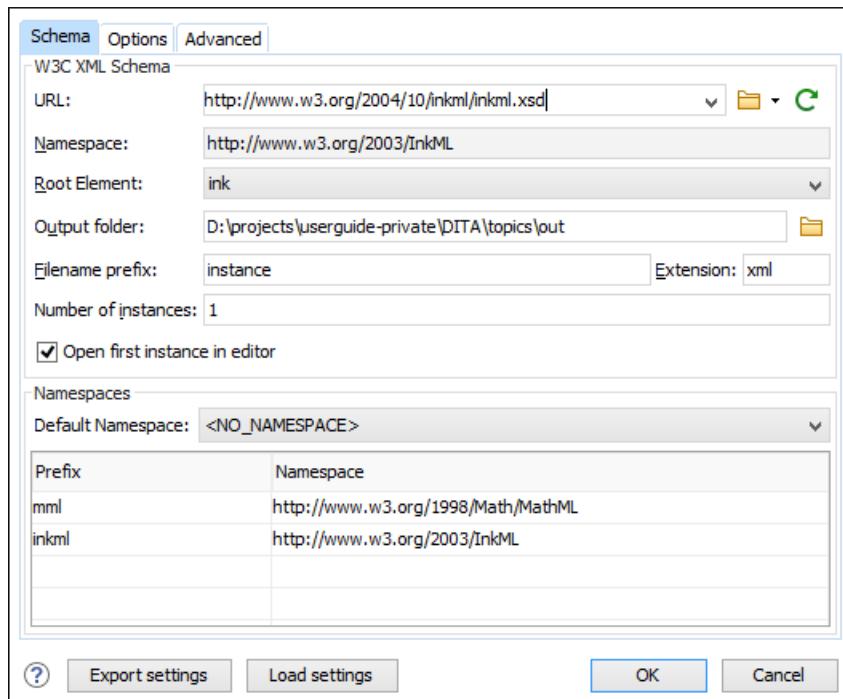

Figure 597: Generate Sample XML Files Dialog Box (Schema Tab)

This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing tools in the **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: prefixN.extension, where N represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When checked, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Load settings

Use this button to load previously exported settings.

Export settings

Use this button to save the current settings for future use.

You can click **OK** at any point to generate the sample XML files.

Options Tab (Generate Sample XML Files Tool)

The  **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Options** tab allows you to set specific options for namespaces and elements.

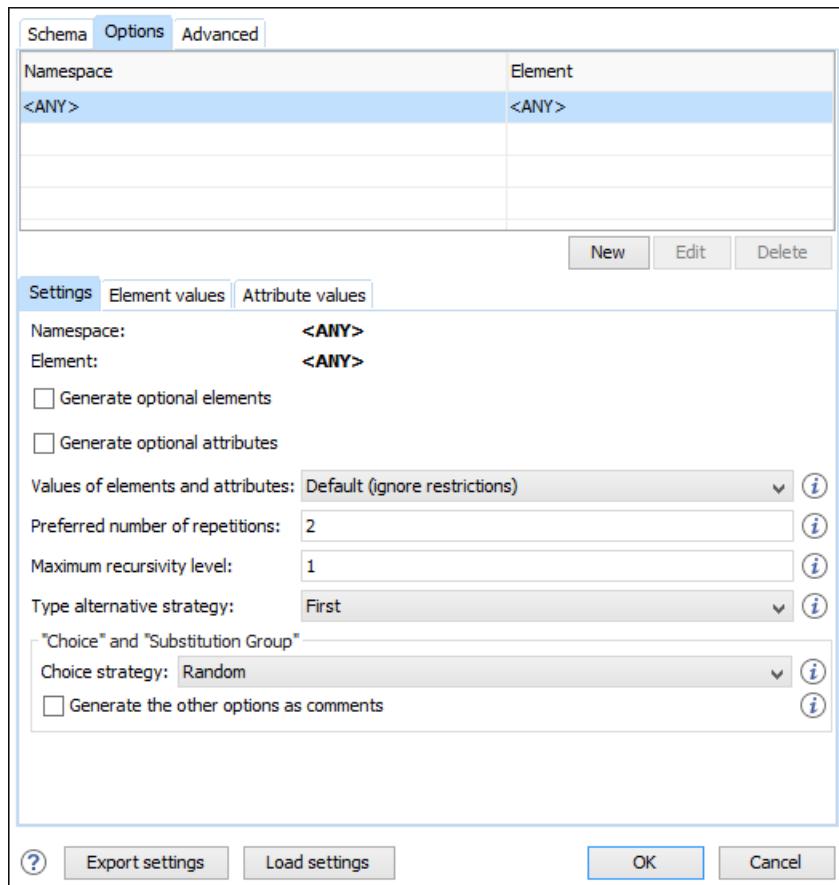

Figure 598: Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When checked, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When checked, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **XML Instances Generator** preferences page). Note that type restrictions are ignored when this option is enabled. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.

Important: If all of the following are true, the **XML Instances Generator** outputs invalid values:

- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to **minOccurs** and **maxOccurs** facets defined in the XML Schema.

- If the value set here is between **minOccurs** and **maxOccurs**, then that value is used.
- If the value set here is less than **minOccurs**, then the **minOccurs** value is used.
- If the value set here is greater than **maxOccurs**, then **maxOccurs** is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the **xs:alternative** element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for **xs:choice** or **substitutionGroup** elements. The possible strategies are:

- **First** - The first branch of **xs:choice** or the head element of **substitutionGroup** is always used.
- **Random** - A random branch of **xs:choice** or a substitute element or the head element of a **substitutionGroup** is used.

Generate the other options as comments

If enabled, generates the other possible choices or substitutions (for **xs:choice** and **substitutionGroup**). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Load settings

Use this button to load previously exported settings.

Export settings

Use this button to save the current settings for future use.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab (Generate Sample XML Files Tool)

The  **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Advanced** tab allows you to set some options in regards to output values and performance.

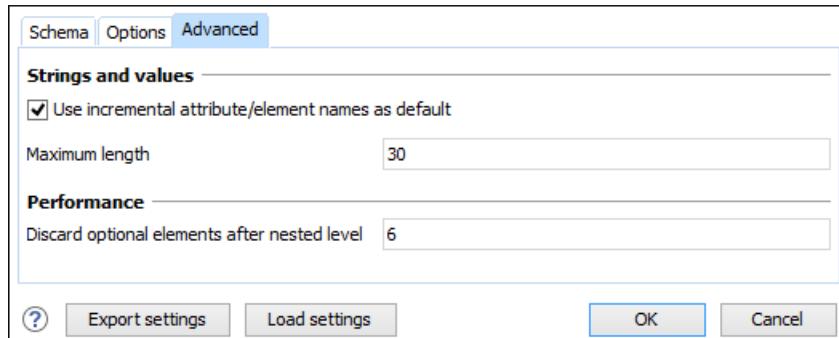

Figure 599: Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

Use incremental attribute / element names as default

If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an element the generated values are: a1, a2, a3, and so on. If not checked, the value is the name of the type of that element / attribute (for example: string, decimal, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Running the Generate Sample XML Files Tool from the Command Line

The **Generate Sample XML Files** tool can be also used from command line by running the script called `xmlGenerator.bat` (on Windows) / `xmlGenerator.sh` (on Mac OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The parameters can be set in the dialog box, exported to an XML file on disk with the **Export settings** button, and then reused from command line. With the exported settings file, you can generate the same XML instances from the command line as from the dialog box. For example:

```
xmlGenerator.bat path_of_CFG_file
```

The script can be integrated in an external batch process launched from the command line. The command line parameter of the script is the relative path to the exported XML settings file. The files specified with relative paths in the exported XML settings will be made absolute relative to the folder where the script is run.

The following example shows such an XML configuration file:

```
XML Configuration File

<settings>
  <schemaSystemId>http://www.w3.org/2001/XMLSchema.xsd</schemaSystemId>
  <documentRoot>schema</documentRoot>
  <outputFolder>D:\projects\output</outputFolder>
  <filenamePrefix>instance</filenamePrefix>
  <filenameExtension>xml</filenameExtension>
  <noOfInstances>1</noOfInstances>
  <openFirstInstance>true</openFirstInstance>
  <defaultNamespace>&lt;NO_NAMESPACE&gt;</defaultNamespace>
  <element namespace=&lt;ANY&gt; name=&lt;ANY&gt;>
    <generateOptionalElements>false</generateOptionalElements>
    <generateOptionalAttributes>false</generateOptionalAttributes>
    <valuesForContentType>DEFAULT</valuesForContentType>
    <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
    <maximumRecursivityLevel>1</maximumRecursivityLevel>
    <choicesAndSubstitutions strategy="RANDOM">
      <generateOthersAsComments>false</generateOthersAsComments>
    </choicesAndSubstitutions>
  </element>
</settings>
```

```

<attribute namespace="&lt;ANY>" name="&lt;ANY;>">
    <attributeValue>attrValue1</attributeValue>
    <attributeValue>attrValue2</attributeValue>
</attribute>
</element>
<element namespace="&lt;NO_NAMESPACE>" name="&lt;ANY;>">
    <generateOptionalElements>true</generateOptionalElements>
    <generateOptionalAttributes>true</generateOptionalAttributes>
    <valuesForContentType>DEFAULT</valuesForContentType>
    <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
    <maximumRecursivityLevel>1</maximumRecursivityLevel>
    <choicesAndSubstitutions strategy="RANDOM"
        generateOthersAsComments="true"/>
    <elementValue>value1</elementValue>
    <elementValue>value2</elementValue>
    <attribute namespace="&lt;ANY;>" name="&lt;ANY;>">
        <attributeValue>attrValue1</attributeValue>
        <attributeValue>attrValue2</attributeValue>
    </attribute>
</element>
</settings>

```

Converting Schema to Another Schema Language

The  **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses [Trang multiple format converter](#) to perform the actual schema conversions.

To use this tool, select the  **Generate/Convert Schema (Alt + Shift + C (Command + Alt + C on OS X))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project** view. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

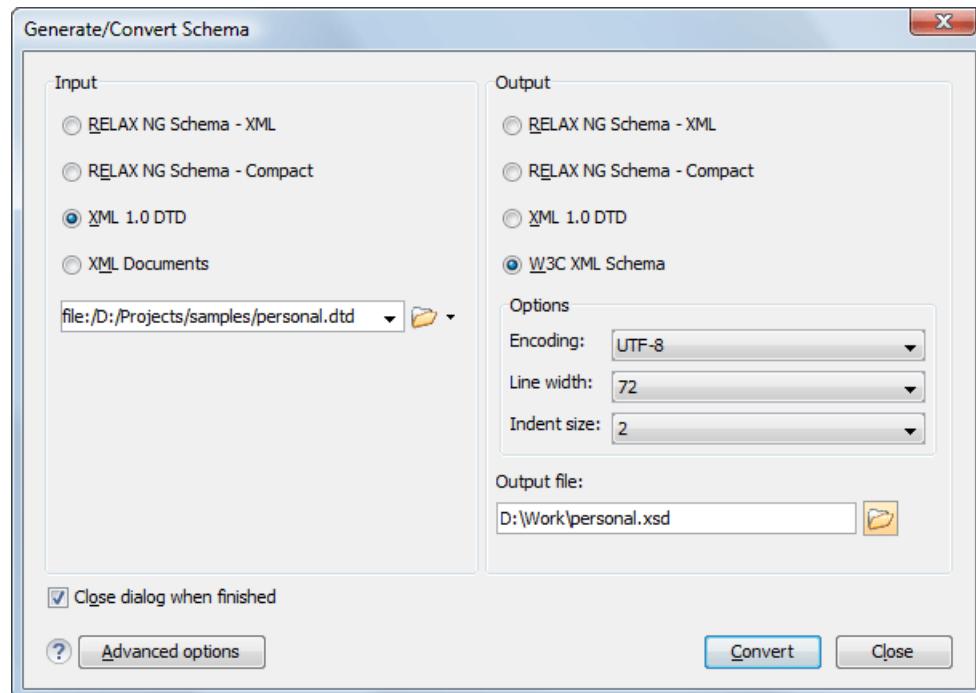

Figure 600: Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using an annotation attribute `prefix:defaultValue` where prefix is the specified value and is bound to <http://relaxng.org/ns/compatibility/annotations/1.0> as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the processContents attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the processContents attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the [Data Sources preferences page](#) where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:

- **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
 - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.
4. Click **Connect**.
 - Result:** The database structure is listed in the **Select database tables** section according to the format you chose.
 5. Select the database tables that you want to be included in the XML Schema.
 6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
 - a. Select the database column you want to configure.
 - b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
 - c. You can also change the name of the selected database column by changing it in the **Name** text field.
 7. Click **Generate XML Schema**.

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by `xs:include` and `xs:import` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `xs:include` and `xs:import` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. The action opens the **Flatten Schema** dialog box that allows you to configure the operation.

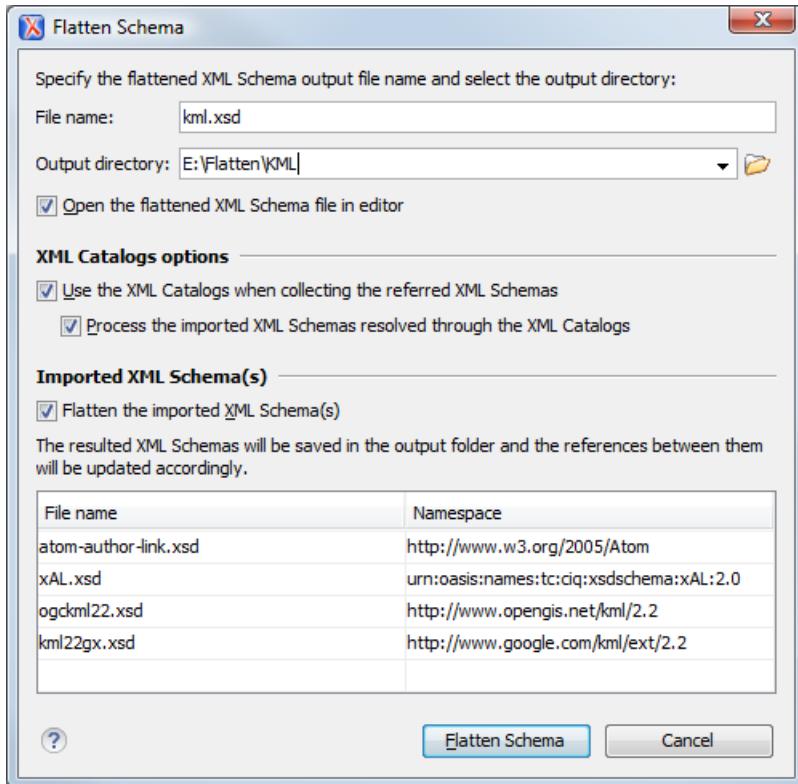

Figure 601: Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note: If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `xs:include`, `xs:redefine`, and `xs:override` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor

Opens the main flattened schema in the editing area after the operation completes.

Use the XML Catalogs when collecting the referenced XML Schemas

Enables the imported and included schemas to be resolved through the available XML Catalogs.

Note: Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs

Specifies whether or not the imported schemas that were resolved through an XML Catalog are also processed.

Flatten the imported XML Schema(s)

Specifies whether or not the imported schemas are flattened.

Note: For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

Flatten Schema from the Command Line

The **Flatten Schema** tool can be also ran from command line by using the following command:

- flattenSchema.bat on Windows
- sh flattenSchemaMac.sh on OS X
- sh flattenSchema.sh on Unix/Linux

The command line accepts the following parameters:

- -in:inputSchemaURL - The input schema URL.
- -outDir:outputDirectory - The directory where the flattened schemas should be saved.
- -flattenImports:<boolean_value> - Controls whether or not the imported XML Schemas should be flattened. The default value true.
- -useCatalogs:<boolean_value> - Controls if the references to other XML Schemas should be resolved through the available XML Catalogs. The default value false.
- -flattenCatalogResolvedImports:<boolean_value> - Controls whether or not the imported schemas that were resolved through the XML Catalogs should be flattened. The default value is true.
Note: This option is used only when -useCatalogs is set to true.
- -verbose - Provides information about the current flatten XML Schema operation.
- --help | -help | --h | -h - Prints the available parameters for the operation.

Command Line Example for Windows

```
flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd  
-outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true  
-flattenCatalogResolvedImports:true -verbose
```

Command Line Example for OS X

```
sh flattenSchemaMac.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd  
-outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true  
-flattenCatalogResolvedImports:true -verbose
```

Command Line Example for Unix/Linux

```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd  
-outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true  
-flattenCatalogResolvedImports:true -verbose
```

XML to JSON Converter

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. It can be found in the **Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools** menu.

The **XML to JSON** dialog box is displayed:

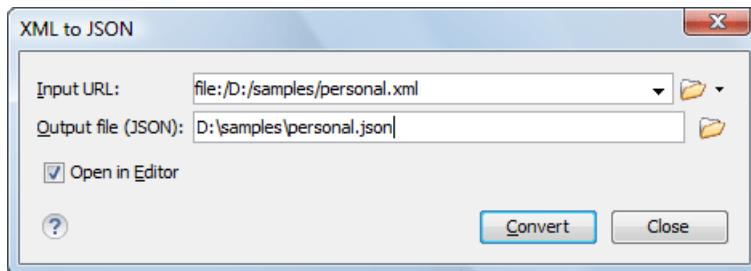

Figure 602: XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the conversion JSON result.
4. Check the **Open in Editor** option to open the JSON result of the conversion in the Oxygen XML Editor JSON Editor.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.

```

1  <?xml version="1.0" encoding="UTF-8"?>
2  <!DOCTYPE personnel SYSTEM "personnel.dtd">
3  <?xml-stylesheet type="text/css" href="personnel.css"?
4  <personnel>
5    <person id="Big.Boss">
6      <name>
7        <family>Boss</family>
8        <given>Big</given>
9      </name>
10     <email>chief@oxygenxml.com</email>
11     <link subordinates="one.worker" manager="Big.Boss"/>
12   </person>
13   <person id="one.worker">
14     <name>
15       <family>Worker</family>
16       <given>One</given>
17     </name>
18     <email>one@oxygenxml.com</email>
19     <link manager="Big.Boss"/>
20   </person>
21   <person id="two.worker">

Figure 603: Example: XML to JSON Operation Result

Format and Indent (Pretty Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (*pretty printing*) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project** view or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

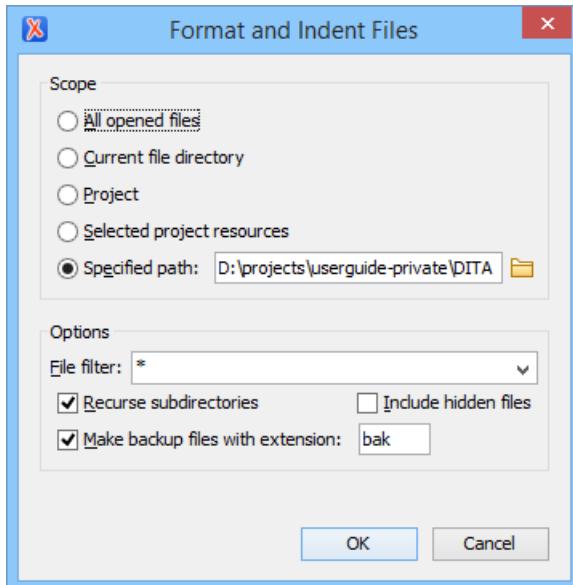

Figure 604: Format and Indent Files Dialog Box

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty print* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - *Pretty prints* the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the *pretty print* is also performed in the hidden files.
- **Make backup files with extension** - When enabled, Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

Generate Documentation

Oxygen XML Editor includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.

Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note: You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

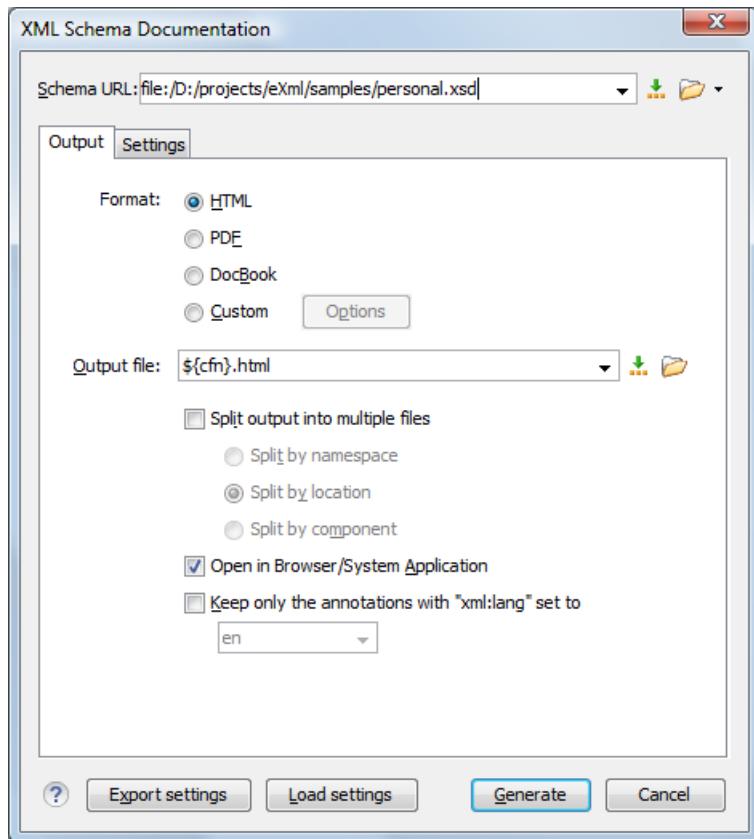

Figure 605: XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format](#).
 - **PDF** - The documentation is generated in [PDF output format](#).
 - **DocBook** - The documentation is generated in [DocBook output format](#).
 - **Custom** - The documentation is generated in a [custom output format](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

- Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.
- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

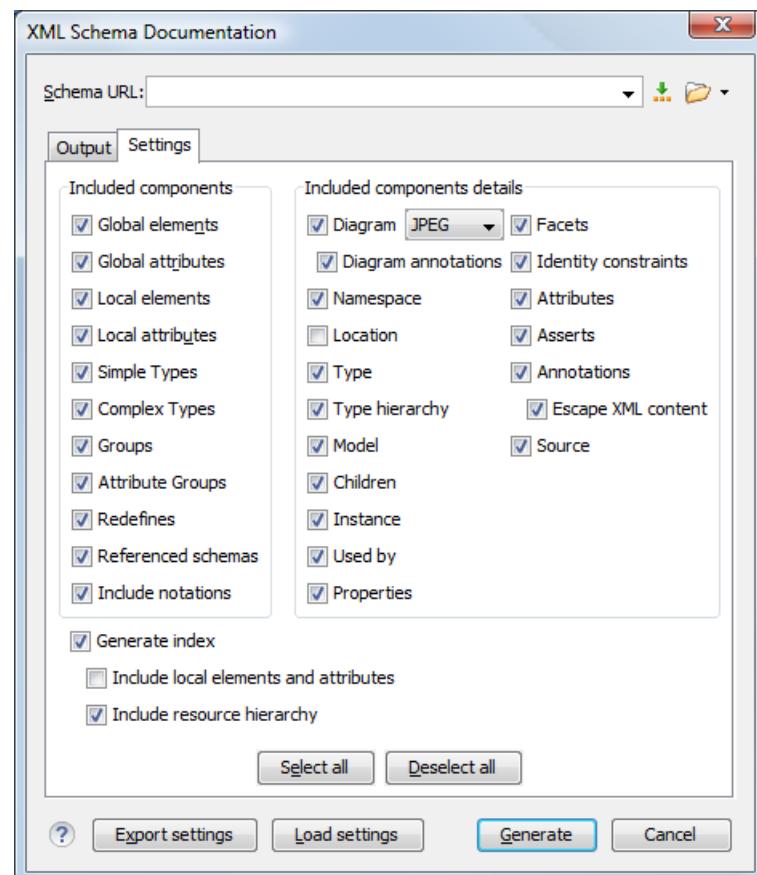

Figure 606: Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties](#) page.
 - **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.

- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
 - xs :all - Its children will be separated by space characters.
 - xs :sequence - Its children will be separated by comma characters.
 - xs :choice - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If checked, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is disabled by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same [documentation from the command line interface](#).)

Load settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a [custom output format](#), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

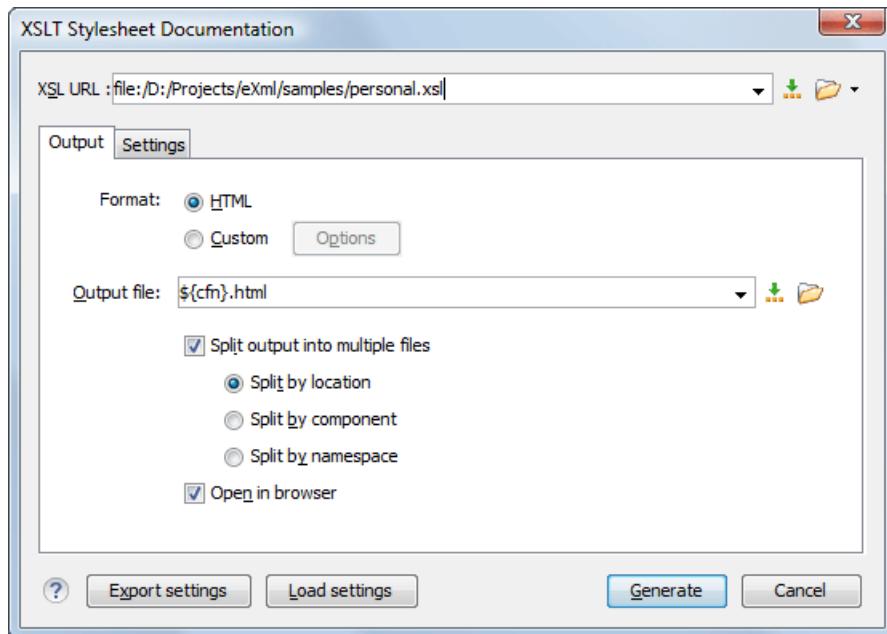

Figure 607: XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format](#).
 - **Custom** - The documentation is generated in a [custom output format](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

Note: To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

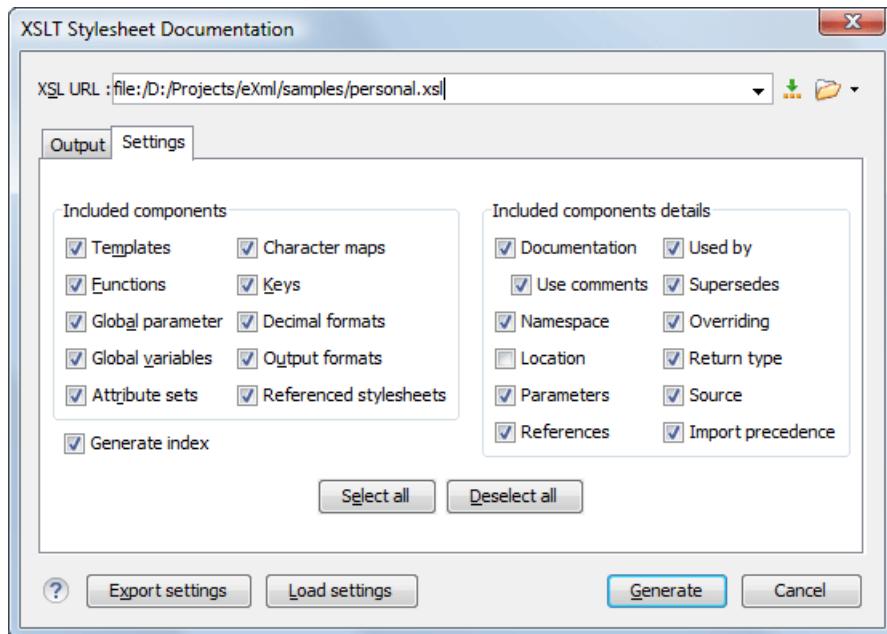

Figure 608: Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
 - Oxygen XML Editor built-in XSLT documentation schema.
 - A subset of DocBook 5 elements. The recognized elements are: section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist.
 - A subset of DITA elements. The recognized elements are: concept, topic, task, codeblock, p, b, i, ul, ol, pre, s1, sli, step, steps, li, title, xref.
 - Full XHTML 1.0 support.
 - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
 - Doxsl documentation framework. Supported elements are : codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listItem, module, parameter, template, attribute-set;
- Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a [custom format](#) instead of the built-in [HTML format](#) and providing your own XSLT stylesheets.
- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
 - **Namespace** - Shows the namespace for named XSLT elements.
 - **Location** - Shows the stylesheet location for each XSLT element.
 - **Parameters** - Shows parameters of templates and functions.
 - **References** - Shows the named XSLT elements that are referenced from within an element.
 - **Used by** - Shows the list of all the XSLT elements that reference the current named element.
 - **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same *documentation from the command-line interface*.)

Load settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

[XSLT Stylesheet Component Documentation Support](#) on page 517

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

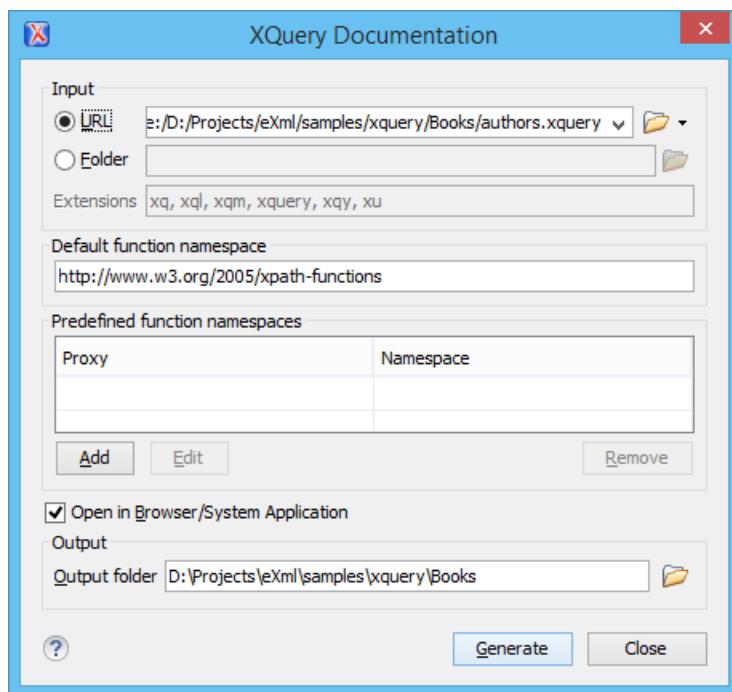

Figure 609: XQuery Documentation Dialog Box

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
 - **URLFile** - The URL of the file in which you want to generate the documentation.
 - **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation

- component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.
- Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.
- **Output** - Allows you to specify where the generated documentation is saved on disk.

Generating Documentation for WSDL Documents

You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a [custom output format](#) by using a custom stylesheet.

Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

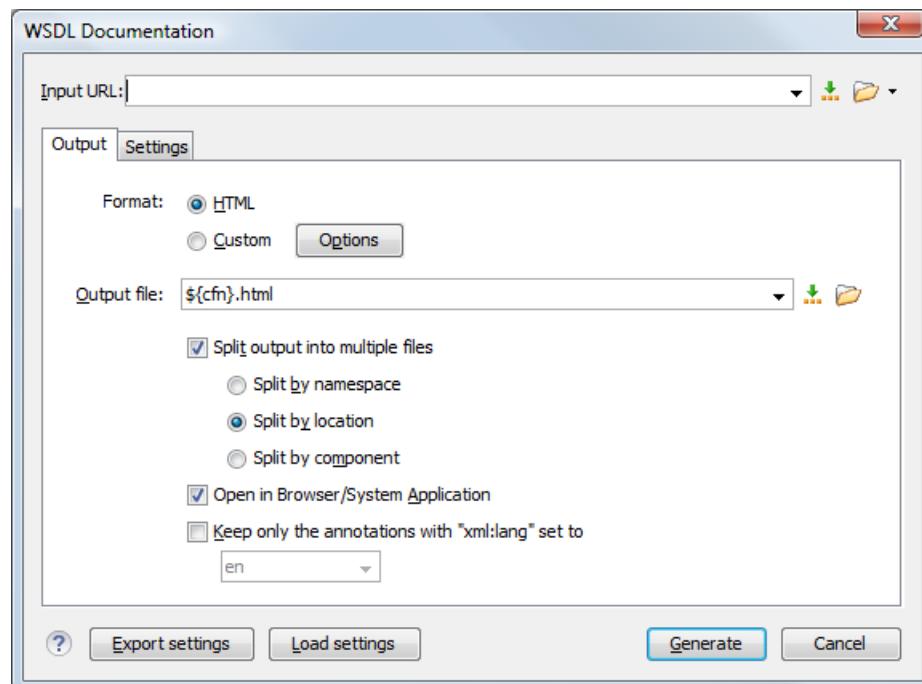

Figure 610: WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format](#).
 - **Custom** - The documentation is generated in a [custom output format](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom

stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

Note: To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

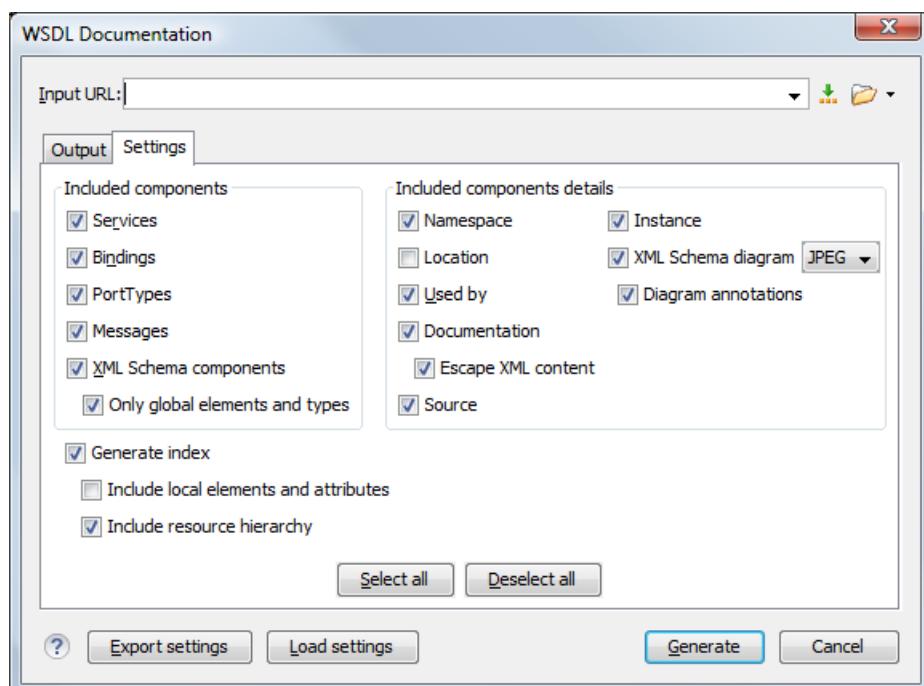

Figure 611: Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
 - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
 - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
 - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
 - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
 - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.

- **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
- **Component Details**
 - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
 - **Location** - Presents the location information for each WSDL or XML Schema component.
 - **Used by** - Presents the list of components that reference the current one.
 - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
 - **Source** - Presents the XML fragment that defines the current component.
 - **Instance** - Generates a sample XML instance for the current component.

Note: This option applies to the XML Schema components only.
- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
 - **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If checked, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is disabled by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same *documentation from the command-line interface*.)

Load settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Canonicalizing Files

You can select the canonicalization algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

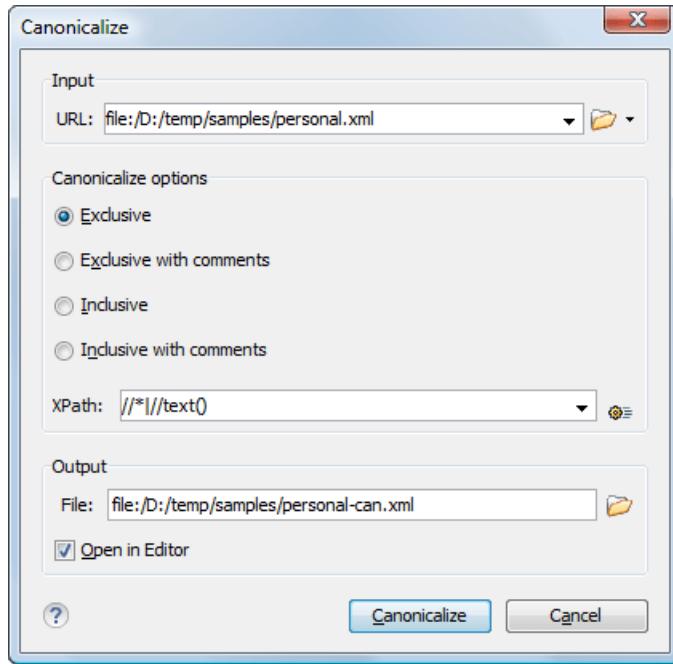

Figure 612: Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in the editor.

[Digital Signatures Overview](#) on page 708

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

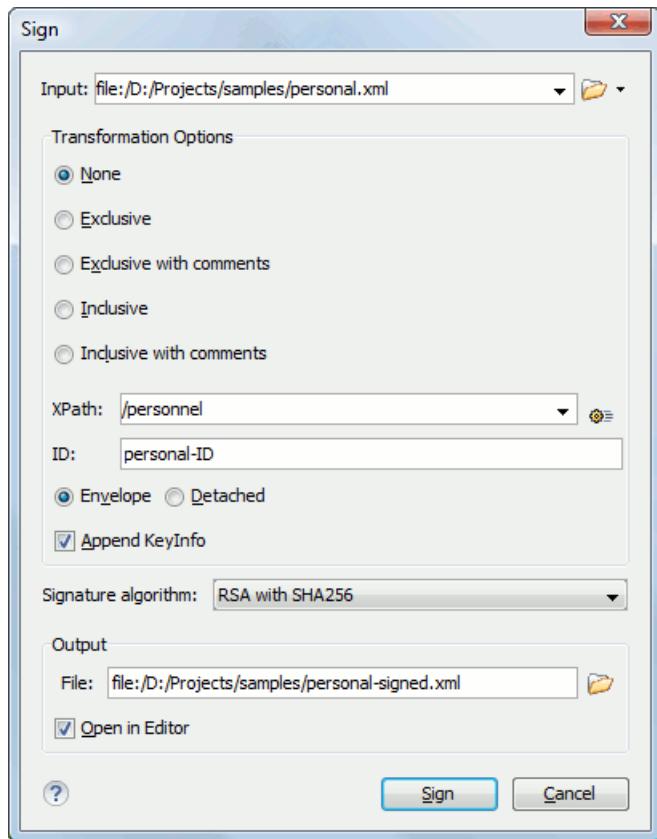

Figure 613: Signature Settings Dialog Box

The following options are available:

Note: If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page](#) where you can configure a valid certificate.

! Could not obtain a valid certificate. You must configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview](#) section for more information about these options.
 - **None** - If selected, no canonicalization algorithm is used.
 - **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.

- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) for more information.
- **Append KeyInfo** - If this option is checked, the ds :KeyInfo element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in Oxygen XML Editor.

WSDL SOAP Analyzer

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **Tools** menu).

Composing a SOAP Request

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the  **WSDL SOAP Analyzer** toolbar button.
- Use the  **WSDL SOAP Analyzer** action from the **Tools** menu.
- Go to **Open with > WSDL SOAP Analyzer** in the contextual menu of the **Project** view.

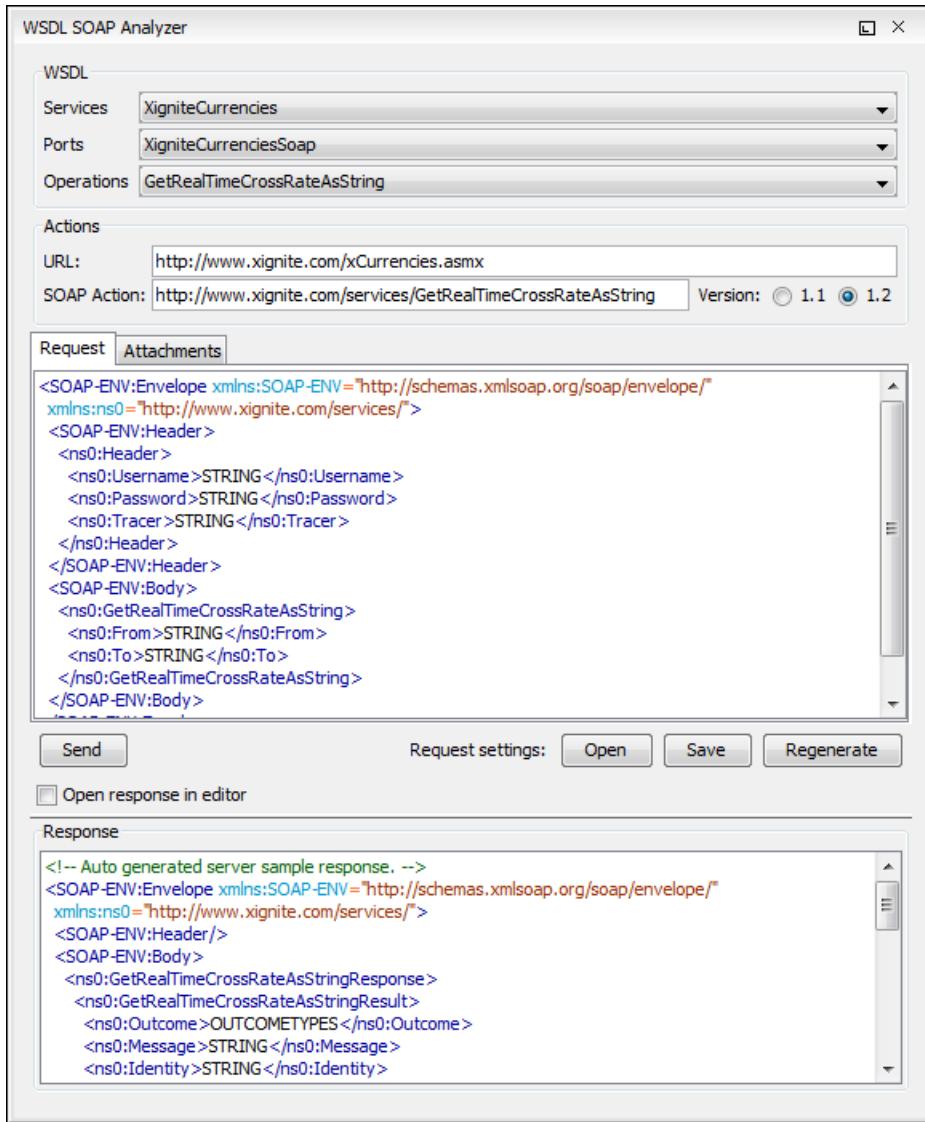

Figure 614: WSDL SOAP Analyzer Dialog Box

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is <http://schemas.xmlsoap.org/soap/envelope/> for SOAP 1.1 or <http://www.w3.org/2003/05/soap-envelope> for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.

- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the [Testing Remote WSDL Files](#) section.

Note: SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools > WSDL SOAP Analyzer**.
2. On the **WSDL File** tab enter the URL of the remote WSDL file.
You enter the URL:
 - by typing
 - by browsing the local file system
 - by browsing a remote file system
 - by browsing a [UDDI Registry](#)
3. Press the **OK** button.

This will open the **WSDL SOAP Analyzer** tool. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

UDDI Registry Browser

Pressing the  button in the **WSDL File Opener** dialog box (menu **Tools > WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.

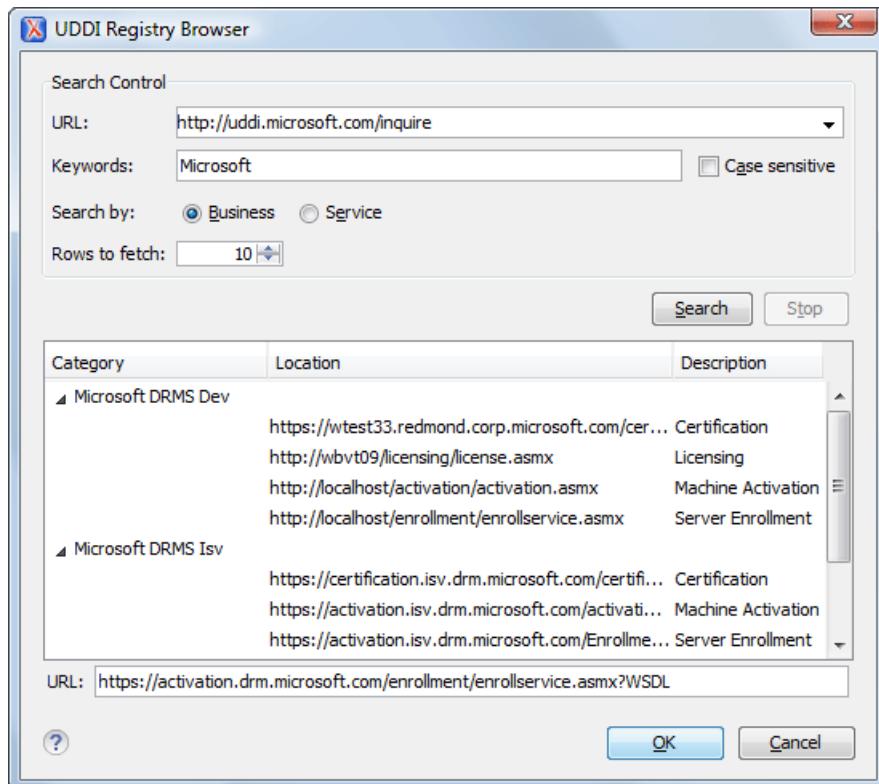

Figure 615: UDDI Registry Browser Dialog Box

The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When checked, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

XML Schema Regular Expressions Builder

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

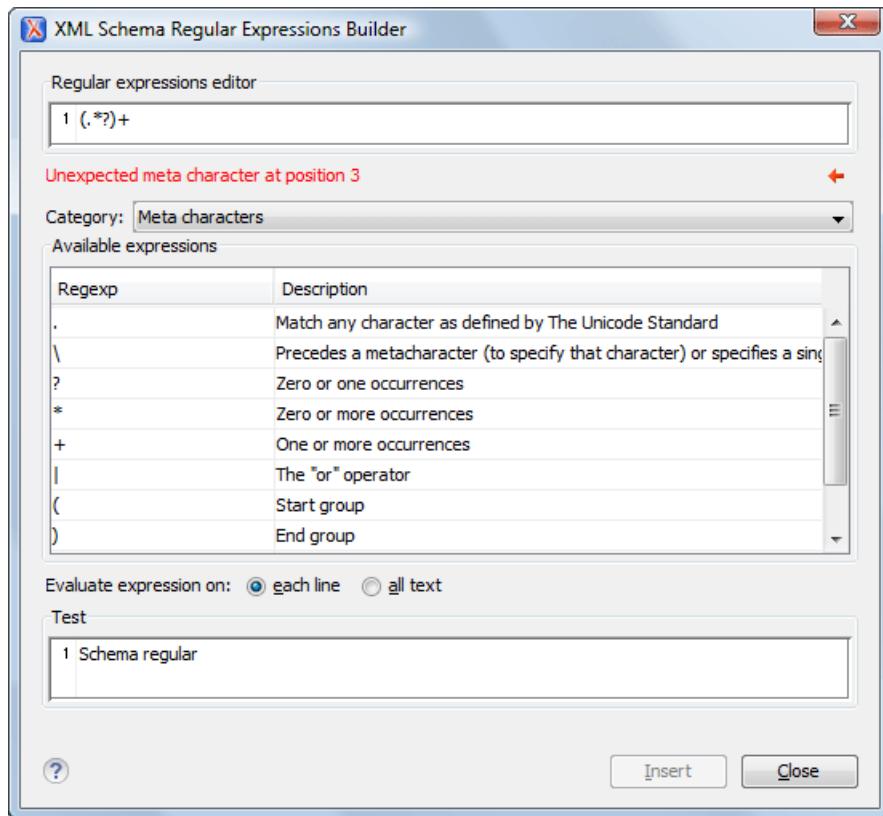

Figure 616: XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space (Command + Space on OS X)**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** or **schema Design mode**. Accordingly, the **Insert** button will be disabled if the current document is edited in these modes.

Note: Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

Large File Viewer

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an *out of memory* error (**OutOfMemoryError**) that would require either increasing the Java heap memory with the -Xmx startup parameter or decreasing the total number of lines in the file.

The powerful **Large File Viewer** is available from the **Tools** menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing the opened document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the opened file is XML, the encoding used to display the text is detected from the XML prolog of the file. For other file types, the encoding is taken from the Oxygen XML Editor options. See [Encoding for non XML files](#).

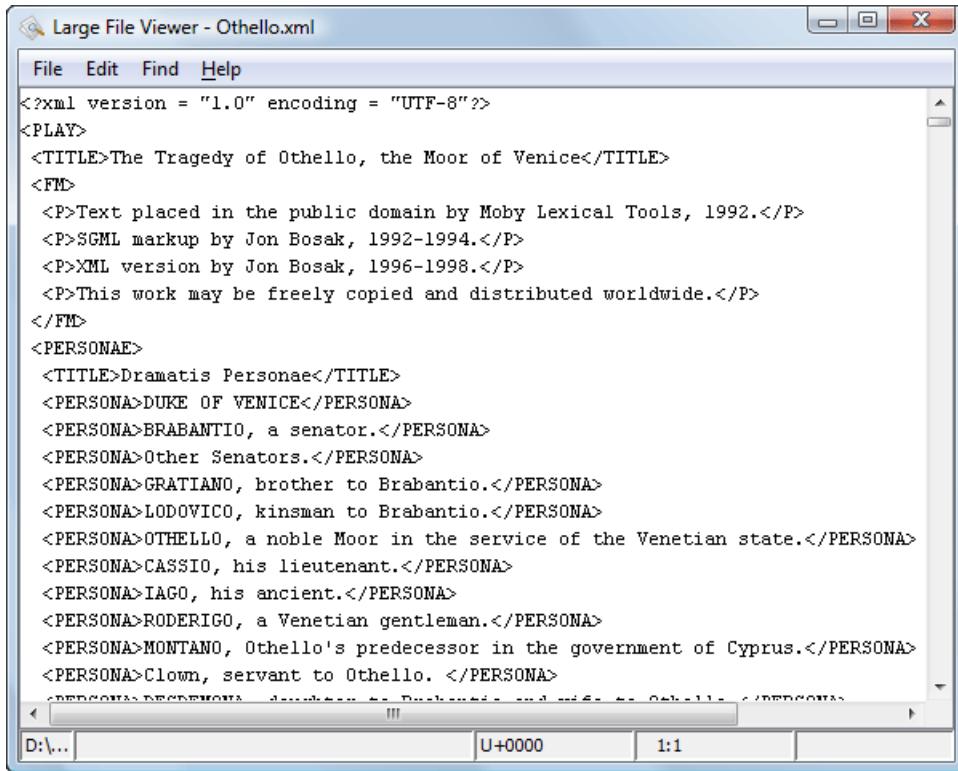

Figure 617: Large File Viewer

Large File Viewer components:

- The menu bar provides menu driven access to all the features and functions that are available in **Large File Viewer**:

File > Open

Opens files in the viewer (also available in the contextual menu).

File > Exit

Closes the viewer.

Edit > Copy

Copies the selected text to clipboard (also available in the contextual menu).

Find > Find

Opens a reduced **Find** dialog box that provides some basic search options, such as:

- **Case sensitive** - When checked, operations are case-sensitive.
 - **Regular Expression** - When checked, allows you to use any regular expression in *Perl-like syntax*.
 - **Wrap around** - Continues the find operation from the start/end of the document after reaching the end/, depending on whether the search is in forward or backward direction.

Help > Help

Provides access to the User Manual.

- The status bar provides information about the current opened file path, the Unicode representation of the character at cursor position and the line and column in the opened document where the cursor is located.

 **Attention:** For faster computation the **Large File Viewer** uses a fixed font (plain, monospace font of size 12) to display characters. The font is *not* configurable from the [Preferences page](#).

Tip: The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

Hex Viewer

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the **Hex Viewer** that is available on the **Tools** menu. It has two panels: the characters are rendered in the right panel and the bytes of each character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

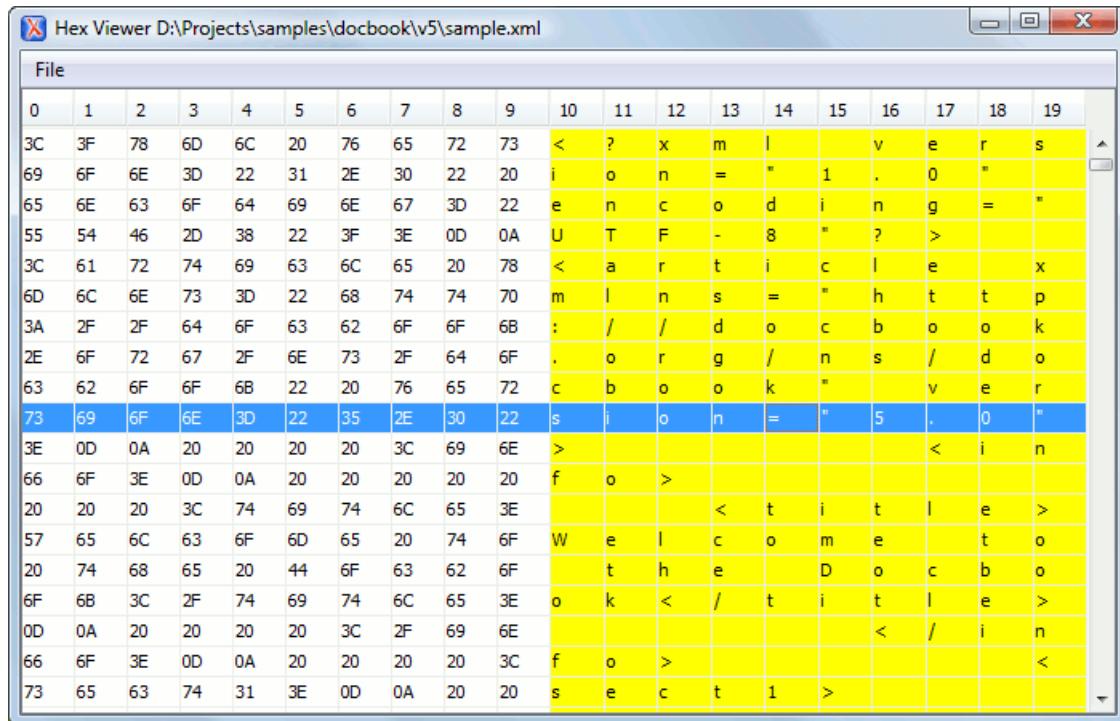

Figure 618: Hex Viewer

To open a file in **Hex Viewer** use the **File > Open** action. Alternatively, you can drag a file and drop it in the **Hex Viewer** panel.

Standalone SVG Viewer

Oxygen XML Editor includes a simple SVG Viewer that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

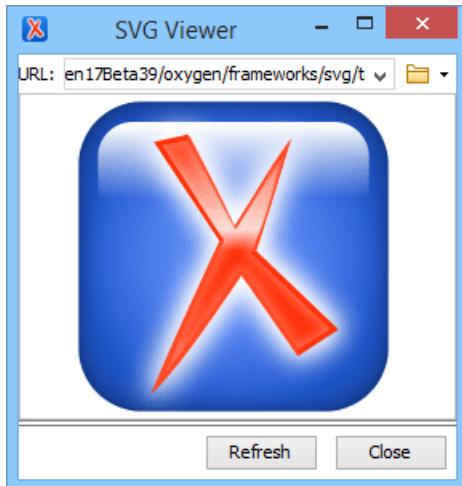

Figure 619: SVG Viewer

You can browse for and open any SVG file that has the .svg or .svgz extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project** view and selecting **Open with > SVG Viewer**.

Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

Zoom out

To zoom out on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** keyboard shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

Pan

To pan an image, **click and drag** the image with your mouse.

Related information

[SVG 1.2 Rendering Issues](#) on page 1535

Tree Editor

The **Tree Editor** (**Tools > Tree Editor**) is used for editing the content of a document displayed as an XML tree. The workspace offers the following functional areas:

- Main menu - Provides access to all the features and functions available in Oxygen XML Editor Tree Editor perspective.
- Toolbar - Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function.
- Editor panel - Easy editing of structured mark-up documents. Each token has an associated icon for easier visual identification.
- Message panel - Displays messages returned from user operations.
- Model view - Shows the detailed information about the attribute or element that you are working on.
- All Elements panel - Presents a list of all defined elements that can be inserted within your document.

The tree editor does not offer entity support. Entities are not presented with a special type of node in the tree and new entity nodes cannot be inserted in the document.

Compare Files

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffFiles.exe`).

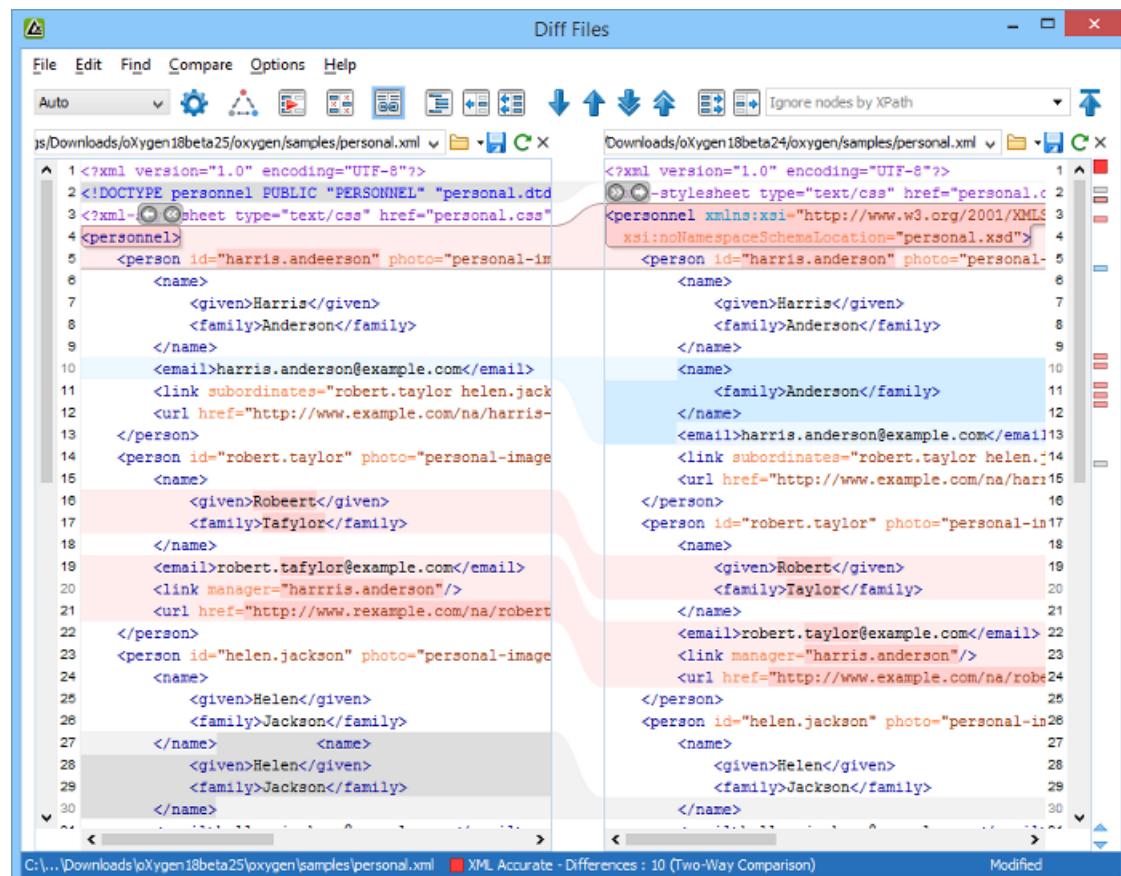

Figure 620: Compare Files Tool

Starting the Tool from a Command Line

The file comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on Unix/Linux, `diffFilesMac.sh` on OS X). To specify the files to compare, you can pass command-line arguments using the following construct: `diffFiles.bat/diffFiles.sh/diffFilesMac.sh [path to left file] [path to right file] [path to 3-way base file]`.

If three files are specified, the tool will start in the [3-way comparison mode](#). If only two files are specified, the tool will start in the [2-way comparison mode](#). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

You can also start the file comparison tool from an external application by using the `[-ext]` argument and there are some additional arguments that are allowed. To see all the details for the command line construct, type `diffFiles.bat --help` in the command line.

For example, to do a 3-way comparison on Windows, the command line might look like this:

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

Tip: If there are spaces in the path names, surround the paths with quotes.

Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the [algorithm](#) for the operation.
4. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

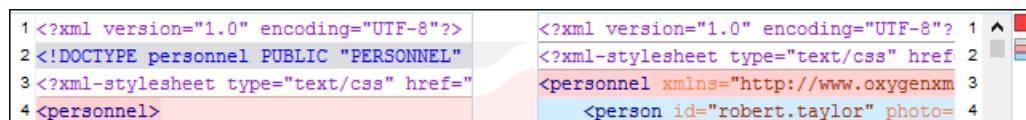

Figure 621: Two-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.

- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Compare Fragments

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the **Close (Ctrl + W (Command + W on OS X))** button, before pasting the fragments. If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the **toolbar** and in the **various menus** (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and Append right change to left

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and Copy change from right to left

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
 - The name of an XML tag
 - The < character
 - The /> sequence of characters
 - The name of an attribute inside an XML tag
 - The = sign
 - The " character
 - An attribute value
 - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Three-Way Comparisons

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

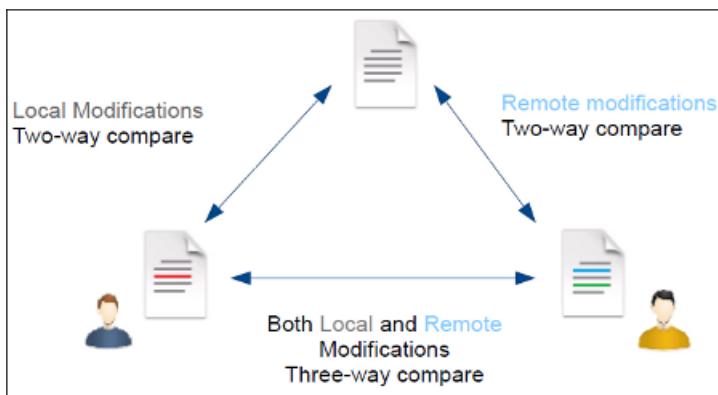

Figure 622: Three-Way Comparison

Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

Step Result: The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.

2. Click the  **Three-Way Comparison** button on the toolbar and select the base file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the  **Browse** drop-down menu.
3. To highlight the differences, click the  **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
5. You can also use the  **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

```

Figure 623: Three-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append left change to right and **Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

Copy change from left to right and Copy change from right to left

Replaces the content of a change from one side with the content of the corresponding change from the other side.

Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms

Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second level comparison is processed using a *syntax-aware comparison*, meaning that it looks for identical tokens. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

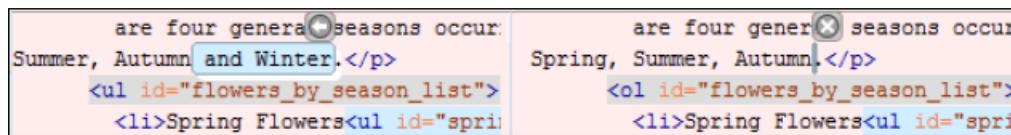

Figure 624: Second Level Diff Comparison

Note: If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second level comparison will not automatically be performed. In this case you can manually select a second level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

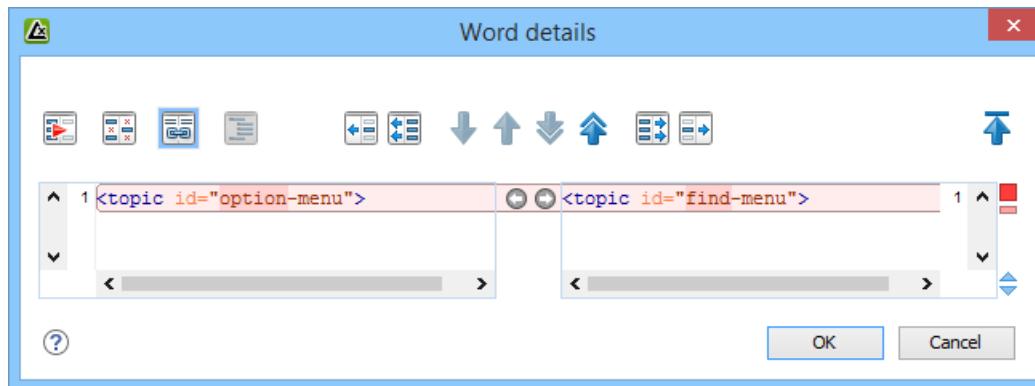

Figure 625: Word Level Comparison

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

Figure 626: Character Level Comparison

[Compare Directories](#) on page 726

Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

Figure 627: Compare Toolbar

The following actions are available:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Enables or disables synchronized scrolling so that a selected difference can be seen on both sides of the application window. This option is enabled by default.

Format and Indent Both Files (**Ctrl + Shift + P (Command + Shift + P on OS X)**)

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (**Ctrl + Period (Command + Period on OS X)**)

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (**Ctrl + Comma (Command + Comma on OS X)**)

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (**Ctrl + Shift + Period (Command + Shift + Period on OS X)**)

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Previous Change (**Ctrl + Shift + Comma (Command + Shift + M on OS X)**)

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an [XPath expression](#) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

Note: If an XPath expression is specified in the [Ignore nodes by XPath option](#) in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an

expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Base

Available for *three-way comparisons*. It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

Save

Saves the changes made in the source (left-side) file.

Reload

Reloads the source (left-side) file.

Close

Closes the source (left-side) file.

Right-Side (Target) File

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

Save

Saves the target (right-side) file.

Reload

Reloads the target (right-side) file.

Close

Closes the target (right-side) file.

Compare Files Tool Menus

The menus in the **Compare Files** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Source > Open

Browses for a file that will be displayed in the left panel.

Source > Open URL

Browses for a remote file that will be displayed in the left panel.

Source > Open File from Archive

Browses an archive for a file that will be displayed in the left panel.

Source > Reload

Reloads the file in the left panel.

Source > Save

Saves the changes made to the file in the left panel.

Source > Save As

Allows you to choose a destination to save the file in the left panel.

Source > ✖ Close

Closes the file in the left panel.

Target > 📁 Open

Browses for a file that will be displayed in the right panel.

Target > 🌐 Open URL

Browses for a remote file that will be displayed in the right panel.

Target > 📁 Open File from Archive

Browses an archive for a file that will be displayed in the right panel.

Target > ⚡ Reload

Reloads the file in the right panel.

Target > 💾 Save

Saves the changes made to the file in the right panel.

Target > Save As

Allows you to choose a destination to save the file in the right panel.

Target > ✖ Close

Closes the file in the right panel.

Base > 📁 Open

Browses for a file that will be compared with both files in a *three-way comparison*.

Base > 🌐 Open URL

Browses for a remote file that will be compared with both files in a *three-way comparison*.

Base > 📁 Open File from Archive

Browses an archive for a file that will be compared with both files in a *three-way comparison*.

Close (Ctrl + W (Command + W on OS X))

Closes the application.

Edit Menu**✂ Cut**

Cut the selection from the currently focused editor panel to the clipboard.

_COPY

Copy the selection from the currently focused editor panel to the clipboard.

📋 Paste

Paste content from the clipboard into the currently focused editor panel.

Select all

Selects all content in the currently focused editor panel.

↶ Undo

Undo changes in the currently focused editor panel.

↷ Redo

Redo changes in the currently focused editor panel.

Find Menu

Find/Replace

Perform *find/replace* operations in the currently focused editor panel.

Find Next

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

Find Previous

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on OS X))

Jumps to the last change.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Directories

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffDirs.exe`).

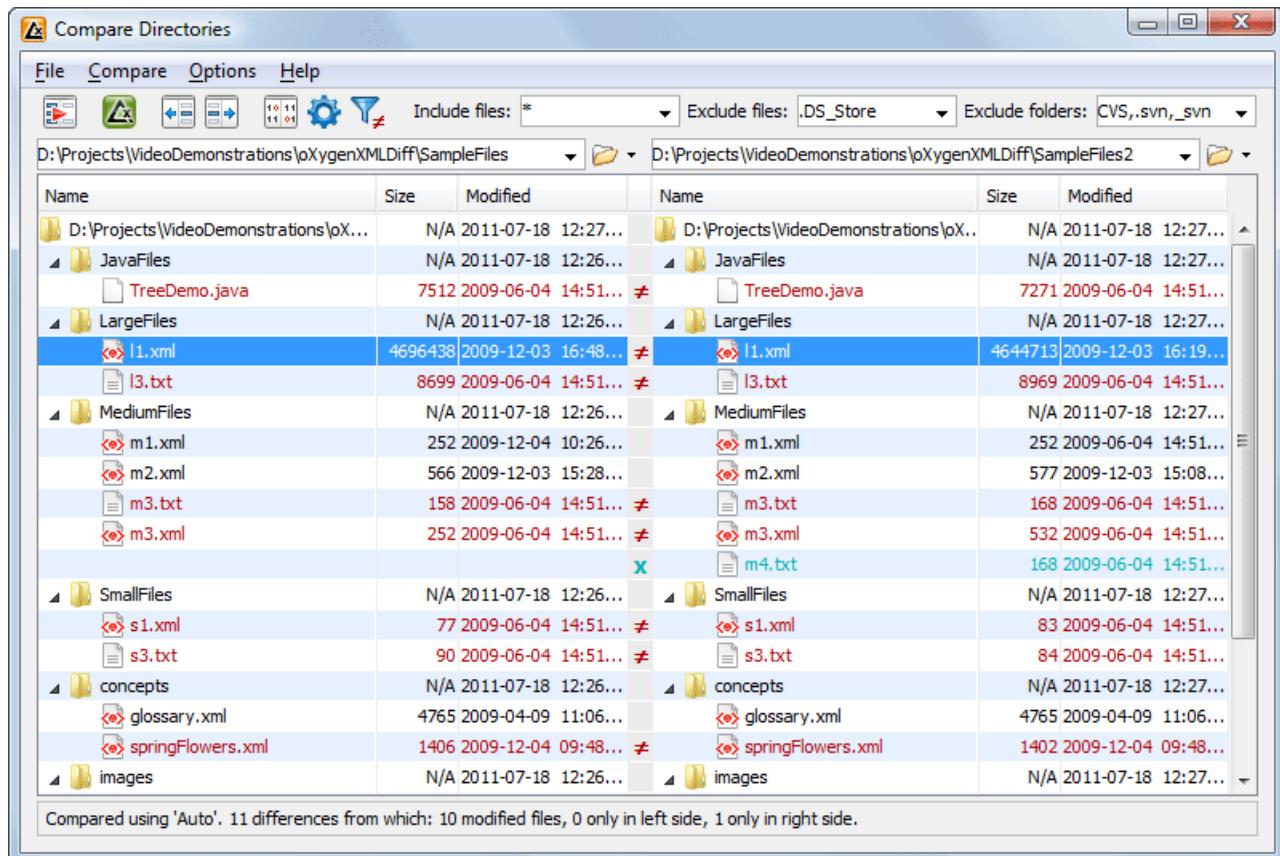

Figure 628: Compare Directories Tool

Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (diffDirs.bat on Windows, diffDirs.sh on Unix/Linux, diffDirsMac.sh on OS X). To specify the directories to compare, you can pass command-line arguments using the following construct: diffDirs.bat/diffDirs.sh/diffDirsMac.sh [directory path 1] [directory path 2].

If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

Tip: If there are spaces in the path names, surround the paths with quotes.

Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

- Step Result:** The selected directory structures are opened in the two side-by-side panels.
2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.
 3. You can also use the **Diff Options** button to access the **Directories Comparison preferences page** where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, enable the [Look in archives option](#) in the **Directories Comparison** preferences page.
3. To highlight the differences, click the **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
- A **#** symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the [Directories Comparison / Appearance preferences page](#). You can double-click lines marked with the **#** symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Editor starts a [file comparison](#) between the two files, using the **Compare Files** tool.

Related information

[Compare Files](#) on page 714

Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the **Compare Directories** tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 629: Compare toolbar

Toolbar Actions

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Binary Compare

Performs a byte-level comparison on the selected files.

Diff Options

Opens the [Directory Comparison preferences page](#) where you can configure various options.

Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the **Exclude files** filter box to read *.jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.

Contextual Menu Actions

Perform Files Differencing

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

Binary Compare

Performs a byte-level comparison on the selected files.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Open

If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

Open in System Application

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the **Compare Directories** tool from the **Tools** menu in Oxygen XML Editor.

Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the **Compare Directories** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Close (**Ctrl + W (Command + W on OS X)**)

Closes the application.

Compare Menu

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Options Menu

Preferences

Opens the preferences dialog box that includes numerous pages of options that can be configured.

Menu Shortcut Keys

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

Reset Global Options

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

Import Global Options

Allows you to import an options set that you have previously exported.

Export Global Options

Allows you to export the current options set to a file.

Help Menu

Help (F1)

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

Use Online Help

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

Support Center

Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Images

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF, JPG, JPEG, PNG, and BMP*.

Compare Directories Against a Base (3-Way)

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

How to Perform 3-Way Directory Comparisons

To perform a 3-way directories comparison, follow these steps:

1. Select **3 Compare Directories Against a Base (3-way)** from the **Tools** menu.

Step Result: This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

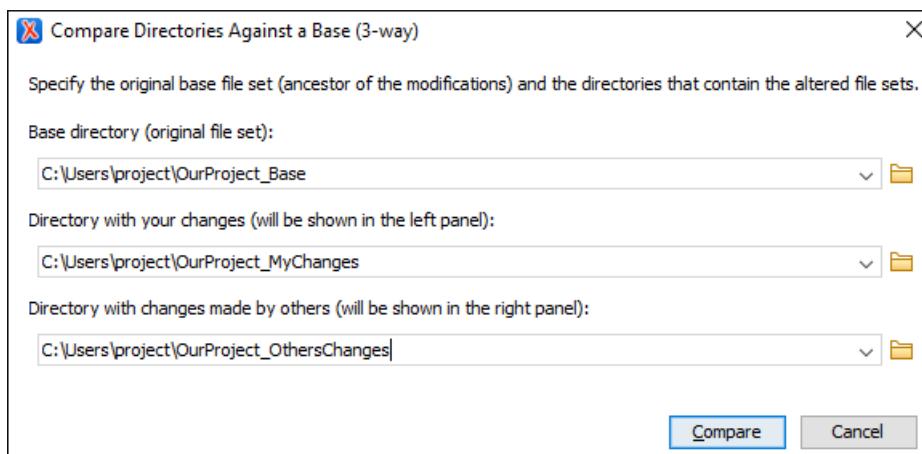

Figure 630: Compare Directories Against a Base File Set Chooser

2. Select the file sets to be compared:

- **Base directory** - This is the original (base) file set before any modifications were made by you or others.
- **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
- **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison tool.

4. Use the features and actions described in the next section to identify and merge the changes.

3-Way Directory Comparison Tool: Features and Actions

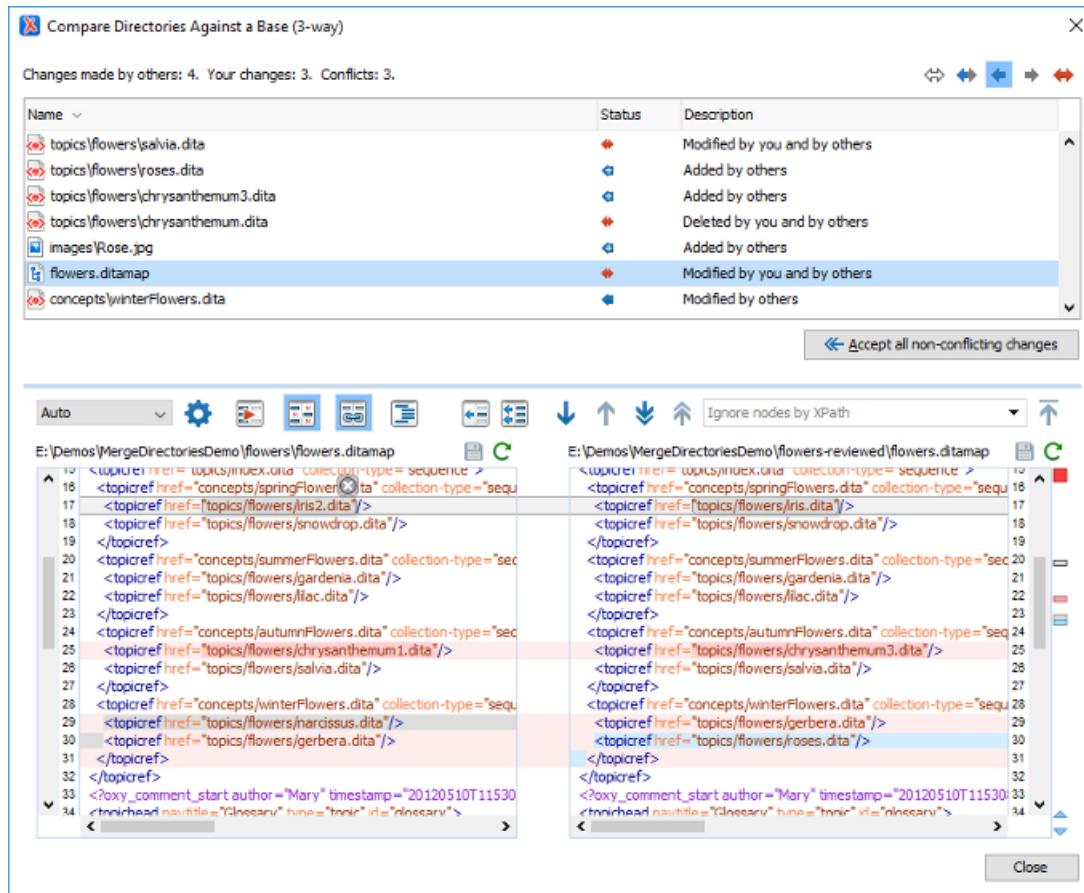

Figure 631: Compare Directories Against a Base (3-way) Tool

The 3-way directory comparison tool includes the following features and actions:

Number of Changes and Conflicts

The first thing you see in the tool is grand total of all the changes made by others, changes made by you, and the number of conflicts.

Filter Buttons

You can filter the list of modifications with the following toggle buttons:

>Show all files

Use this button to show all modified and unmodified files, as well as conflicts.

Show only files modified by you and others

Filters the list to show all files that have been modified, including conflicts.

Show only files modified by others

Filters the list to only show the files that were modified by others.

Show only files modified by you

Filters the list to only show the files that were modified by you.

Show only conflicting files

Filters the list to only show files that contain conflicts.

List of files

This panel shows the list of files in the compared file sets based upon the filter button that is selected. You can see the file path and its status. You can double-click any file to open it in the file comparison panels (the

file from your file set is shown in the left panel while the file from the other file set is shown in the right panel). If you right-click a file in the list, you have access to the following contextual menu actions:

Show modifications (Double-Click)

Opens the file in the comparison panels. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel. If the file only exists in one of the file sets, then the panel for the other file set is blank.

← Accept non-conflicting changes

Merges all non-conflicting changes made by others (in the selected files) with your changes. For the files that were modified by both you and others, the tool will try to merge the changes automatically.

Overwrite your changes

Overwrites the changes you made to the selected files with the changes made by others.

Ignore changes made by others

Ignores the changes made by others to the selected files and keeps your changes.

« Accept all non-conflicting changes

Click this button to accept all non-conflicting changes (in all files) made by others and merge them with your own changes. For the files that were modified by both you and others, the tool will try to merge the changes automatically.

File Comparison Panels

If you double-click a file in the list (or select **Show modifications** from the contextual menu), the files are opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel. The toolbar includes the following actions and options:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespace

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When enabled, a selected difference can be seen in both panels.

Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

↓Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

↑Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

↓Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

↑Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Ignore Nodes by XPath

You can use this text field to enter an *XPath expression* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

Note: If an XPath expression is specified in the *Ignore nodes by XPath option* in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

↑First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Left-Side File (your changes)

Above the panel you can see the file path and the following two buttons:

Save

Saves changes made to the file.

Reload

Reloads the file.

Right-Side File (changes made by others)

Above the panel you can see the file path and the following two buttons:

Reload

Reloads the file.

Displaying Changes in the File Comparison Panels

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

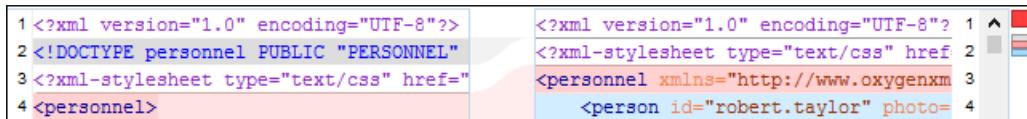

Figure 632: File Comparison Panels

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Direct Editing Actions in the File Comparison Panels

You can edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

Append right change to left

Copies the content of the selected change from the right side and appends it on the left side.

Copy change from right to left

Replaces the content of a change in the left side with the content of the change in the right side.

Remove change

Removes the change from the left side.

[Compare Files](#) on page 714

Syncro SVN Client

The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to **Tools > SVN Client**.

Main Window

This section explains the main window of Syncro SVN Client.

Views

The main window consists of the following views:

- **Repositories view** - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view** - Allows you to manage with ease the content of the working copy.

- **History view** - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view** - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view** - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view** - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel** - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view** - Displays two images side by side.
- **Properties view** - Displays the SVN properties of a resource under version control.
- **Console view** - Displays information about the currently running operation, similar with the output of the Subversion command line client.
- **Dynamic Help view** - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

SVN Main Menu

The main menu of the Syncro SVN Client is composed of the following menus:

File Menu

New submenu:

New File

This operation creates a new file as a child of the selected folder from the **Repositories view** tree or the **Working Copy view** tree, depending on the view that was last used. Note that for the **Working Copy view**, the file is added to *version control* only if the selected folder is under *version control*.

New Folder(**Ctrl (Command on OS X) + Shift + F**)

This operation creates a new folder as a child of the selected folder from the **Repositories view** tree or the **Working Copy view** tree, depending on the view that was last used. Note that for the **Working Copy view**, the file is added to *version control* only if the selected folder is under *version control*.

New External Folder (**Ctrl (Command on OS X) + Shift + W**)

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a **URL of a versioned directory**, and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

Tip: You can specify a particular revision of the external item by using a **peg revision** at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `..` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^` - Relative to the root of the repository in which the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `/` - Relative to the root URL of the server in which the `svn:externals` property is versioned.

Important: To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

Note: Syncro SVN Client does not support definitions of local relative external items.

Open (Ctrl (Command on OS X) + O)

This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal editor or the external application associated with that file type. This action works on any file selection from the [Repositories view](#), [Working Copy view](#), [History view](#), or [Directory Change Set view](#), depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on OS X, etc). Note that opening folders is available only for folders selected in the [Working Copy view](#).

Open with(Ctrl (Command on OS X) + Shift + O)

Displays the **Open with** dialog box for specifying the editor in which the selected file is opened. If multiple files are selected only external applications can be used to open the files. This action works on any file selection from [Repositories view](#), [Working Copy view](#), [History view](#), or [Directory Change Set view](#), depending on the view that was last used to invoke it.

Show in Explorer/Show in Finder

Opens the parent directory of the selected working copy file and selects the file.

Save (Ctrl (Command on OS X) + S)

Saves the local file currently opened in the editor or the **Compare** view.

Save as

Saves any file selected in the **Repositories**, **History**, or **Directory Change Set** view.

Copy URL Location (Ctrl (Command on OS X) + Alt + U)

Copies the URL location of the resource currently selected in the **Repositories** view to clipboard.

Copy to

Copies the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

Note: This action can also be used from **History** and **Directory Change Set** views to recover older versions of a repository item.

Move to(Ctrl (Command on OS X) + M)

Moves the currently selected resource, either in **Repositories** or **Working copy** view, to a specified location.

Rename(F2)

Renames the resource currently selected, either in **Repositories** or **Working copy** view.

Delete (Delete)

Deletes the resource currently selected either, in **Repositories** or **Working copy** view.

Locking:

-  **Scan for locks (Ctrl (Command on OS X) + L)** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under *version control*. For more details see [Scanning for locks](#).
-  **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (*steal*) the lock. This action is active only on files under *version control*. For more details on the use of this action see [Locking a file](#).
-  **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

Show SVN Properties (Ctrl (Command on OS X) + P)

Opens the [Properties view](#) and displays the SVN properties for a selected resource from [Repositories view](#) or [Working Copy view](#), depending on the view that was last used to invoke it.

Show SVN Information (Ctrl (Command on OS X) + I)

Provides additional information for a selected resource. For more details, go to [Obtain information for a resource](#).

Exit (Ctrl (Command on OS X) + Q)

Closes the application.

Edit Menu

Undo (Ctrl (Command on OS X) + Z)

Undo edit changes in the local file that is currently opened in the editor or the **Compare** view.

Redo (Ctrl (Command on OS X) + Y)

Redo edit changes in the local file that is currently opened in the editor or the **Compare** view.

Cut (Ctrl (Command on OS X) + X)

Cut selection from the local file that is currently opened in the editor view or the **Compare** view to clipboard.

Copy (Ctrl (Command on OS X) + C)

Copy selection from the local file that is currently opened in the editor or the **Compare** view to clipboard.

Paste (Ctrl (Command on OS X) + V)

Paste selection from clipboard into the local file that is currently opened in editor or the **Compare** view.

Find/Replace (Ctrl (Command on OS X) + F)

Perform find and replace operations in the local file that is currently opened in the editor or the **Compare** view.

Find Next (F3)

Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

Find Previous (Shift + F3)

Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the **Console** view).

Repository Menu

New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))

Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

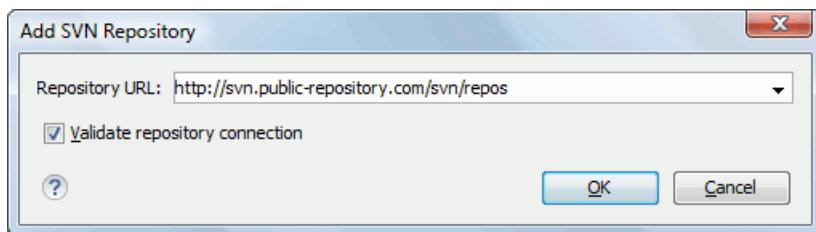

Figure 633: Add SVN Repository Dialog Box

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

Remove Repository Location (**Ctrl + Alt + R (Command + Alt + R on OS X)**)

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

Refresh (F5)

Refreshes the resource selected in the **Repositories** view.

Check out (**Ctrl + Alt + O (Command + Alt + O on OS X)**)

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section [Check out a working copy](#).

Export

Opens the [Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

Import:

Import folder (**Ctrl + Shift + L (Command + Shift + L on OS X)**)

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section [Importing resources into a repository](#).

Note: The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

Import Files (**Ctrl + Shift + I (Command + Shift + I on OS X)**)

Imports the files selected from the files system into the selected folder in the repository.

Working Copy Menu

Working Copies Manager

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

Switch to

Selects one of the following view modes:  All Files,  Modified,  Incoming,  Outgoing, or  Conflicts.

Refresh (F5)

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

Synchronize (**Ctrl (Command on OS X) + Shift + S**)

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the [Always switch to 'Modified' mode option](#) is selected.

Update (**Ctrl (Command on OS X) + U**)

Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the [sparse checkouts](#) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

Update all(**Ctrl (Command on OS X) + Shift + U**)

Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

Commit all

Commits all the resources with outgoing changes. It is disabled when **Incoming** mode is selected or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.

Revert (Ctrl (Command on OS X) + Shift + V)

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is enabled only for modified resources. See [Revert your changes](#) for more information.

Edit conflict (Ctrl (Command on OS X) + E)

Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see [Edit conflicts](#).

Mark Resolved (Ctrl (Command on OS X) + Shift + R)

Instructs the Subversion system that you resolved a conflicting resource. For more information, see [Merge conflicts](#).

Mark as Merged (Ctrl (Command on OS X) + Shift + M)

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts](#) section for more information about how you can solve the pseudo-conflicts.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the [Revert your changes](#) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see [Drop incoming modifications](#).

Mark as copied

You can use this action to mark an item from the working copy as a copy of an other item under *version control*, when the copy operation was performed outside of an SVN client. The **Mark as copied** action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The **Mark as moved** action is available when you select two items from different locations (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)

Allows you to add files that should not participate in the *version control* operations inside your working copy . This action can only be performed on resources not under *version control*. It actually modifies the value of the svn:ignore property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control](#) section.

Add to version control (Ctrl (Command on OS X) + Alt + V)

Allows you to add resources that are not under *version control*. For further details, see [Add Resources to Version Control](#) section.

Remove from version control

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

Clean up (Ctrl (Command on OS X) + Shift + C)

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

Expand All (Ctrl (Command on OS X) + Alt + X)

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

Collapse all (Ctrl (Command on OS X) + Alt + Z)

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking a expanded folder.

Compare Menu

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on OS X))

Jumps to the last change.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

History Menu

Show History(Ctrl (Command on OS X) + H)

Displays the history for a SVN resource at a given revision. The resource can be one selected from the **Repositories** view, **Working Copy** view, or from the **Affected Paths** table from the **History** view, depending on which view was last focused when this action was invoked.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the **Show Annotation** dialog box that computes *the annotations for a file and displays them in the Annotations view*, along with the history of the file in the **History** view.

Repositories

This operation is available for any resource selected from view, **Working Copy** view, **History** view or **Directory Change Sets** view, depending on which view was last focused when this action was invoked.

Revision Graph (Ctrl (Command on OS X) + G)

This action allows you to see the graphical representation of a resource's history. For more details about a resource's revision graph see the section [Revision Graph](#). This operation is enabled for any resource selected into the **Repositories** view or **Working Copy** view.

Tools Menu

Share project

Allows you to [share a new project](#) using an SVN repository. The local project is automatically converted into an SVN working copy.

Branch / Tag

Allows you to copy the selected resource from the **Repositories** view or **Working Copy** view to a branch or tag into the repository. To read more about this operation, see the section [Creating a Branch / Tag](#).

Merge (Ctrl (Command on OS X) + J)

Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section [Merging](#).

Switch (Ctrl (Command on OS X) + Alt + W)

Allows you to change the repository location of a working copy, or only of a versioned item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for *external* items. To read more about this action, see the [Switching the Repository Location](#) section.

Relocate

Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the [Relocate a Working Copy](#) section.

Create patch (Ctrl (Command on OS X) + Alt + P)

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see [the section about patches](#).

Working copy format

This submenu contains the following two operations:

Upgrade

Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

Downgrade

Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

Note: SVN 1.7 working copies cannot be downgraded to older formats.

See the section [Working Copy Format](#) to read more about this subject.

Options Menu

Preferences

Opens the **Preferences** dialog box.

Menu Shortcut Keys

Opens the [Menu Shortcut Keys preferences page](#), where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

Global Run-Time Configuration

Allows you to configure SVN general options, that should be used by all the SVN clients you may use:

- **Edit 'config' file** - In this file you can configure various SVN client-side behaviors.
- **Edit 'servers' file** - In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.

Export Options

Allows you to export the current options to an XML file.

Import Options

Allows you to import options you have previously exported.

Reset Options

Resets all your options to the default ones.

Reset Authentication

Resets the Subversion authentication information.

Window Menu

Show View

Allows you to select the view you want to bring to front.

Show Toolbar

Allows you to select the toolbar you want to be visible.

Enable flexible layout

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Reset Layout

Resets all the views to their default position.

Help Menu

Help (F1)

Opens the **Help** dialog box.

Use online help (Enabled by default)

If this option is enabled, when you select **Help** or press **F1** while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

Show Dynamic Help view

Displays the **Dynamic Help** view.

Report Problem

Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.

Support Center

Opens the Support Center web page in a browser.

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Editor. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the Oxygen XML Editor support team.

About

Opens the **About** dialog box.

SVN Main Toolbar

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

Check out

Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

Synchronize

Synchronizes the current working copy with the repository.

Update All

Updates all resources of the working copy that have an older revision than the repository.

Commit All

Commits all resources of working copy that have a newer version compared to that of the repository.

Refresh

Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to repository yet, are displayed in the **Working Copy** view.

Compare

The selected resource is compared with:

- The **BASE** revision, when the selected resource is:
 - Locally modified and the **All Files** view mode is currently selected (no matter if there are incoming changes).
 - Locally modified and there are no incoming changes when any other view mode is selected.
- The remote version of the same resource, when remote information is available after a **Synchronize** operation (only when one of **Modified**, **Incoming**, **Outgoing** and **Conflicts** view modes is selected).

- The working copy revision, when the selected resource is from the **History** view.

Show History

Displays the history of the selected resource (from the **Working Copy** or **Repository** views) in the **History** view.

Show Annotation

Displays the annotations of the selected resource. The selected resource can be in the **Working Copy** or the **History** views.

Revision Graph

Displays the revision graph of the selected resource. The selected resource can be in the **Working Copy** or the **Repositories** views.

Enable/Disable flexible layout

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Status Bar

The status bar of the Syncro SVN Client window displays important details of the current status of the application. This information is available only in the **Working Copy** view.

Figure 634: Status bar

The status bar is composed of the following areas:

- The path of the currently processed file from the current working copy (during an operation such as **Check out** or **Synchronize**) or the result of the last operation.
- The current status of the following working copy options:
 - Show ignored files (■).
 - Show deleted files (□).
 - Process svn:externals definitions (☒).

The options for ignored and deleted files are switched on and off from *the Settings menu* of the **Working Copy** panel:

- The format of the currently loaded working copy.
- The current numbers of incoming changes (⬅), outgoing changes (➡) and conflicting changes (↔).
- A progress bar for the currently running SVN operation and a button (■) that allows you to stop it.

Getting Started

This section explains the basic operations that can be done in Syncro SVN Client.

SVN Repository Location

This section explains how to add and edit the repository locations in Syncro SVN Client.

Add / Edit / Remove Repository Locations

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Editor supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the **Repositories view**.

To create a repository location, use the  **New Repository Location** action that is available in the **Repository** menu, the **Repositories** view toolbar, and in the contextual menu. This action opens the **New Repository Location** dialog box, which prompts you for the [URL of the repository](#) you want to connect to. You can also [use peg revisions at the end of the URLs](#) (for example, URL@rev1234) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Editor tries to contact the server to get the content of the repository for displaying it in the [Repositories view](#). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the  **Stop** button from the toolbar of the view.

To edit a repository location, use the  **Edit Repository Location** action that is available in the **Repository** menu and in the contextual menu. This action opens the **Edit Repository Location** dialog box, which prompts you for the [URL of the repository](#) you want to connect to. You can also [use peg revisions at the end of the URLs](#) (for example, URL@rev1234) to browse only that specific revision.

To remove a repository location, use the  **Remove Repository Location** action that is available in the **Repository** menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.

The order of the repositories can be changed in the **Repositories** view at any time with the  **Up** arrow and  **Down** arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the **Change the Revision to Browse** action that is available in the **Repository** menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the [Repositories view](#). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository tree. Also, this revision number is used for all the operations executed directly from the [Repositories view](#).

Authentication

Five protocols are supported: *HTTP*, *HTTPS*, *SVN*, *SVN + SSH* and *FILE*. If the repository that you are trying to access is password protected, the **Enter authentication data** dialog box requests a user name and a password. If the **Store authentication data** checkbox is checked, the credentials are stored in Apache Subversion™ default directory:

- Windows - %HOME%\Application Data\Subversion\auth. Example: C:\Documents and Settings\John\Application Data\Subversion\auth
- Linux and OS X - \$HOME/.subversion/auth. Example: /home/John/.subversion/auth

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the **Reset authentication** command from the **Options** menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Editor for the change to take effect.

Tip: The *FILE* protocol is recommended if the SVN repository and Oxygen XML Editor are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a **Certificate Information** dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.

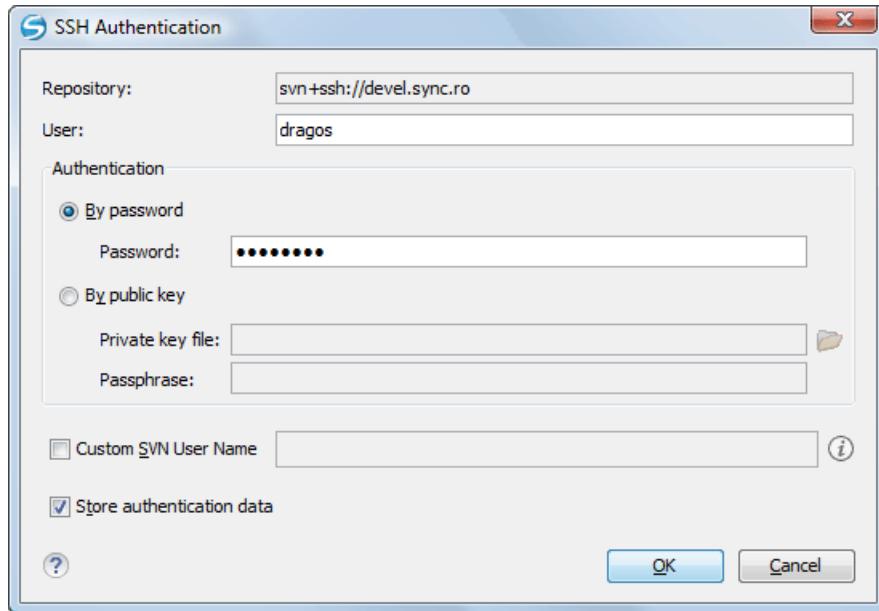

Figure 635: SSH Authentication Dialog Box

After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the *committer* in SVN operations.

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.

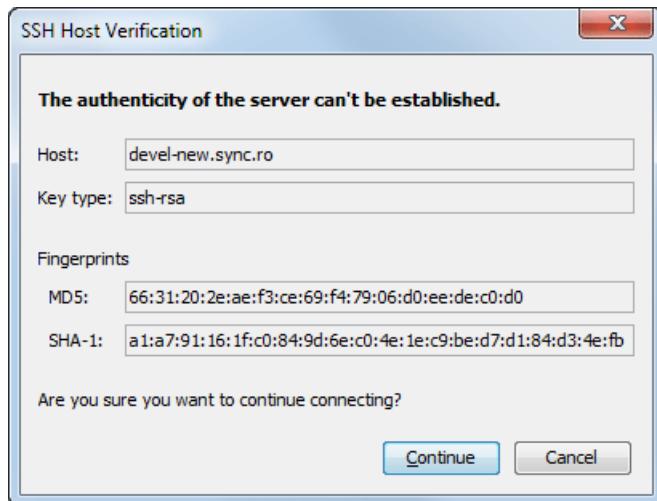

Figure 636: SSH server name and key fingerprint

Share a Project

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is automatically converted to a working copy and added under Syncro SVN Client management. The **Share project** action is available in the **Tools** menu and the contextual menu of the **Repositories** view.

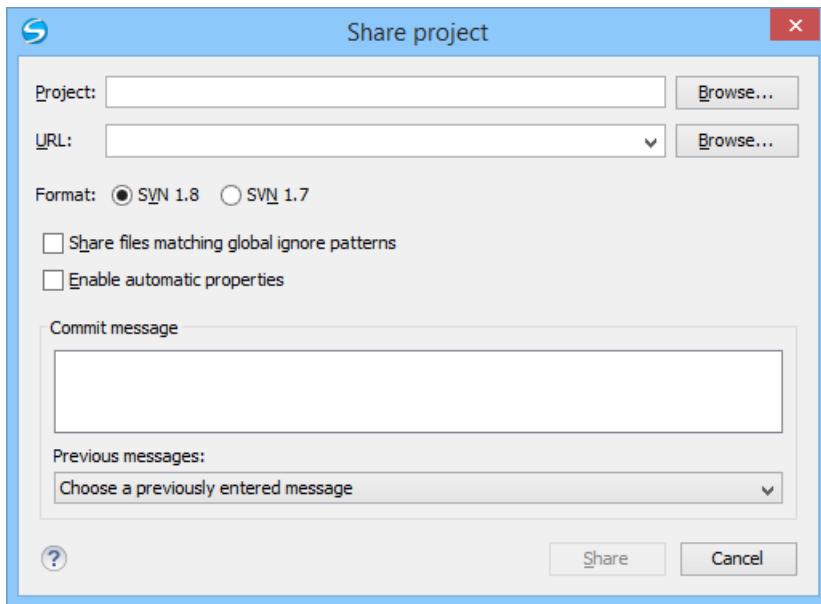

Figure 637: Share Project Dialog Box

The following options can be configured in the **Share project** dialog box:

Project

The location of the project folder on the local disk by using the text box or the **Browse** button. This folder should not be empty or already under version control.

Important: By default, the SVN system only imports the content of the specified folder, and not the root folder itself. Therefore, it is recommended to use the **Browse** button to select the project folder so that the client will automatically append the name of it to the specified URL.

URL

The new location of the project (inside the repository) that will be used to access it.

Note: Peg revisions have no effect for this operation since it is used to send information to the repository.

 **Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

Format

The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

Share files matching global ignore patterns

When enabled, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in *the SVN configuration file*.
- The `File name ignore patterns` option in the **SVN > Working Copy preferences page**.

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in *the SVN configuration file*.

Note: This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

Defining a Working Copy

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your

own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.

Figure 638: Working Copy View

A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named `.svn`, also known as the working copy *administrative directory*. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the *pristine copy* or the *BASE revision* of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others' work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository's file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

Check Out a Working Copy

Check out means to make a copy of a project from a repository to your local file system. This copy is called a *working copy*. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional `.svn` directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the **Repositories** view and select the **Check out** action from the contextual menu, the toolbar, or the **Repository** menu.

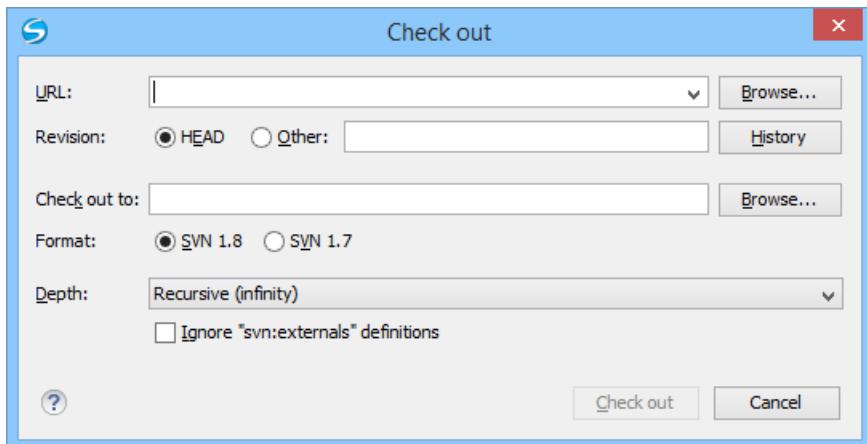

Figure 639: Check Out Dialog Box

The following options can be configured in the **Check out** dialog box:

URL

The location of the repository directory to be checked out.

Note: To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a [peg revision](#) at the end (for example, URL@rev1234).

Revision

You can choose between the **HEAD** or **Other** revision. If you need to *check out* a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from [the History dialog box](#).

Check out to

Specify *the location where you want to check out* the new working copy by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

Important: By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the *check out* location so that the client will automatically append the name of the remote directory to the path of the selected directory.

 **Warning:** The destination directory should be empty. If files exist, they are skipped (left unchanged) by the *check out* operation and [displayed as modified](#) after the operation has finished. Also, the destination directory must not already be under version control.

Format

The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

Depth

The depth is useful if you want to *check out* only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the [sparse checkouts](#) section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

Ignore "svn:externals" definitions

When enabled, external items are ignored in the *check out* operation. This option is only available if you choose the **Recursive (infinity)** depth.

After a check out, the new working copy is added to the list in the [Working Copy view](#) and loaded automatically.

History Dialog Box

The **History** dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as [the Check Out dialog box](#) or [the Branch / Tag dialog box](#). It presents information about revision, commit date, author, and commit comment.

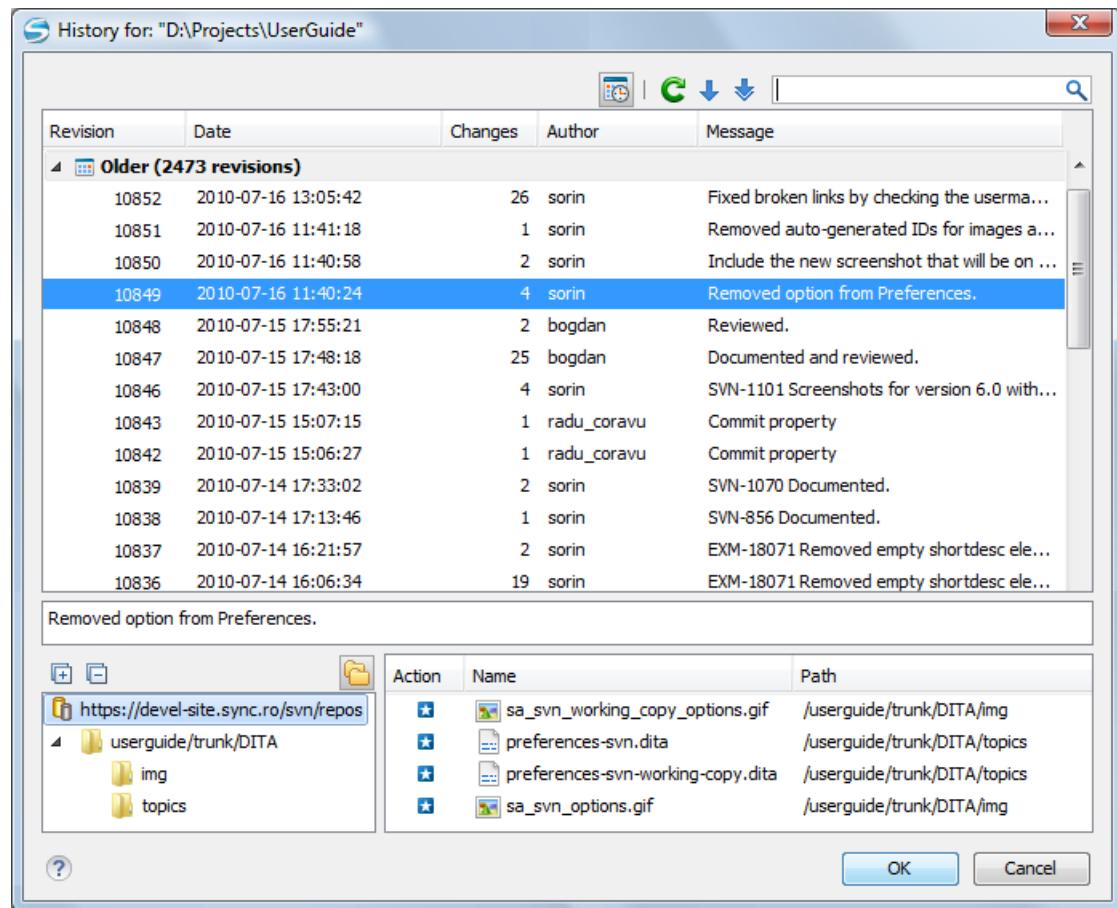

Figure 640: History Dialog Box

The initial number of entries in the list is 50. Additional revisions can be added to the list using the **Get next 50** and **Get all** buttons. The list of revisions can be refreshed at any time with the **Refresh** button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

The **Affected Paths** area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the **Compare with previous version** action, available in the contextual menu.

Use an Existing Working Copy

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section [Import resources into the repository](#). The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the **Working Copies Manager** toolbar button (on Mac OS X) in the **Working Copy** view.
This action opens the **Working copies list** dialog box.
2. Press the **Add** button.
3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

Note: For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Press the **OK** button.

The selected working copy is loaded and presented in the **Working Copy view**.

Notice: You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

Manage Working Copy Resources

This section explains how to work with the resources that are displayed in the **Working Copy** view.

Edit Files

You can edit files from the **Working Copy view** by double clicking them or by right clicking them and choosing **Open** from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (*) - will be added to the file's icon in the **Working Copy view**. The asterisk marks the files that have local modifications that were not committed to the repository.

Add Resources to Version Control

To share new files and folders (created in your working copy), add them to version control using the **Add to version control** option from the **Working Copy view**.

You can easily spot resources not under version control by the  (unversioned) icon displayed in the  **Local file status** column. Resources scheduled for addition (added) are displayed with this icon  in the **Working Copy** view and are added in the repository after you commit them.

Note: Do not make a confusion between  and  icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are *scheduled for addition with history*.

When you use the **Add to version control** option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.

Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you **commit your changes**, the resource is presented in the commit dialog box, but not selected. When you commit an unversioned resource, it is automatically added under version control before starting the commit operation.

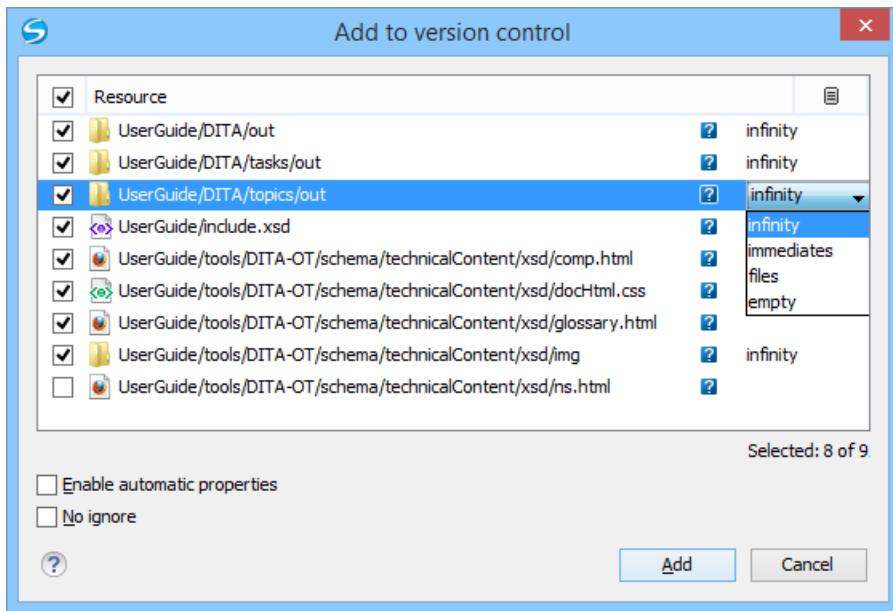

Figure 641: Add to Version Control Dialog Box

Note: Ignored (ⓘ) items can also be added under version control.

The **Depth** column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

Note: The initial value of the **Depth** field can have the following values, depending on the [listing mode of the items in the working copy view](#):

- *infinity* - When the working copy items are presented as a tree.
- *files* - When the working copy items are presented compressed.
- *empty* - When the working copy items are presented flat.

When you add unversioned or ignored directories, the initial value of the **Depth** field also depends on the state of the **Show unversioned directories content** and **Show ignored directories content** options. If these options are enabled, the value is based on the listing mode of the items in the working copy view. When they are disabled, the value is *empty*.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the config file of the Subversion configuration directory.

Note: This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the config file of the Subversion configuration directory, in the auto-props section. Based on the value of the enable-auto-props runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

- **No ignore** - when you enable this option, file-name patterns defined to ignore *unversioned* resources do not apply. Resources that are located inside an *unversioned* directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

Note: This option is available only when directories are also presented in the dialog box.

You can define file-name patterns to ignore *unversioned* resources in one of the following locations:

- In the config file of the Subversion configuration directory (the global-ignores option from the miscellany section).
- In the Oxygen XML Editor options ([open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN > Working copy > Application global ignores**).

Each of the above two options is activated only when you select an item for which the option can be applied.

Ignore Resources Not Under Version Control

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, *.obj, *.class, *.lst, or output folders used to store temporary files.

Whenever you [commit changes](#), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the **Add to svn:ignore** action in the contextual menu of the [Working Copy view](#).

In the **Add to svn:ignore** dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- * - Matches any string of characters of any size, including the empty string.
- ? - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: *.txt.

The action **Add to svn:ignore** adds a predefined Subversion property called `svn : ignore` to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the [Working Copy](#) view. The ignored resources are represented with gray icons.

Delete Resources

The  **Delete** action is available in the contextual menu of the [Working Copy view](#). When you delete an item from the working copy, it is marked as *deleted* (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as *missing* () in your working copy. You can decide what you want to do with a *missing* item:

- In the case of a commit, any *missing* item is first automatically deleted and then committed.
Note: Not any *missing* item can be committed as *deleted*, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition () previously, since this item does not exist in the repository, but you can use the **Delete** action instead.
- If you want to recover *missing* items, either [update](#) the items themselves or one of their parent directories. This fetches their latest version from the repository.

You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

Note: It is recommended that you resolve conflicts manually to avoid loosing any important remote modifications.

Finally, you can change your mind and [revert](#) the deleted items to their initial, pristine, state.

Copy Resources

You can copy resources from various locations of the working copy. You select them in the [Working Copy view](#) and then use **Copy to** from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the **Copy to** action is enabled only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Editor performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

Note:

- If you copy an item to a directory that is *not under version control* (*unversioned* or *ignored*), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
- If you copy a directory that contains *external* items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the *external* items, use the **Update** operation on the copied directory.

In the **Copy to** dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource's name. For *versioned* items, you can select **Ignore resource history** to copy them without their history (similar to a simple file system copy).

Note: The **Copy to** dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the *working copy settings* are taken into account.

In the **Commit** dialog box, only the directory in question will appear without its children.

Move Resources

As in the case of the copy command, you can move several resources at once. Select the resources in the **Working Copy view** and choose the **Move to** action from the contextual menu. The move command actually behaves as if a copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as *deleted*.

Note: *External* items cannot be moved using the **Move to** action, because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item and use the **Update** operation on the item's parent folder for the change to take effect.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Rename Resources

The **Rename** action is available in the contextual menu of the **Working Copy view** and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as *deleted*.

Note: *External* items cannot be renamed using the **Rename** action because they cannot be deleted. Instead, you should edit the `svn:externals` property defining the *external* item, then use the **Update** operation on the item's parent folder for the change to take effect.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Lock / Unlock Resources

The idea of version control is based on the *copy-modify-merge* model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.

The *copy-modify-merge* model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a *lock-modify-unlock* model. Without this, one or more users could end up wasting time on changes that cannot be merged.

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner

- Software authorization - the user's working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.

Scanning for Locks

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the [Working Copy view](#) by selecting one or more resources, then right-clicking them and choosing the **Scan for Locks** action from the contextual menu.

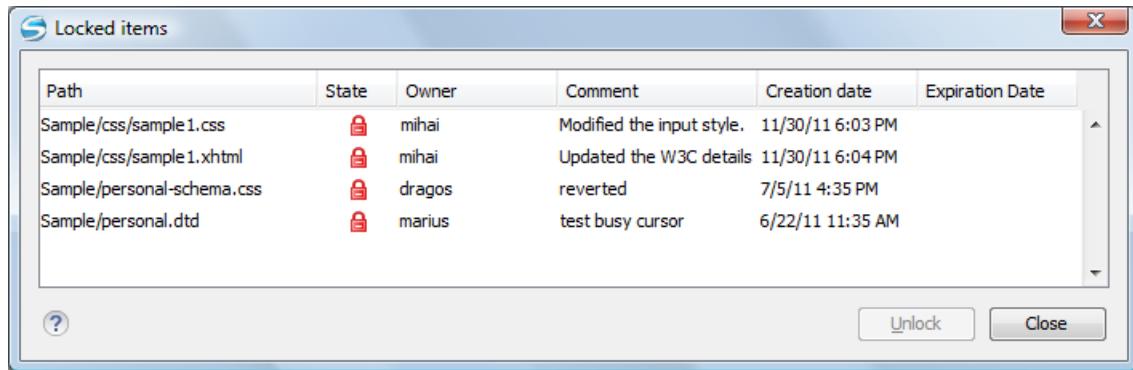

Figure 642: Locked Items Dialog Box

The **Locked items** dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:

- Appears when one of the following conditions apply:
 - Another user has locked the file in the repository.
 - The file was locked by the same user from another working copy.
 - The file was locked from the **Repositories** view.
- Displayed after you have locked a file from the current working copy.
- A file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).
- A file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the **Unlock** button.

Related information

[Working Copy Locks](#) on page 1497

[Repository Locks](#) on page 1490

Locking a File

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the **Repositories** view.

Note: You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The **Lock** dialog box allows you to write a comment when you set a lock or when you *steal* an existing one. Note that you should *steal* a lock only after you made sure that the previous owner no longer needs it. Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the lock expires after a period of time specified in the Subversion server policy.

Unlocking a File

A file can be unlocked from the contextual menu of the [Working Copy view](#). A dialog box will prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

Synchronize with Repository

In the work cycle you will need to incorporate other people's changes (update) and to make your own work available to others (commit). This is what the **Incoming** and **Outgoing** modes of the [Working Copy view](#) was designed for, to help you send and receive modifications from the repository.

The **Incoming** and **Outgoing** modes of this view focus on incoming and outgoing changes. The incoming changes are the changes that other users have committed in the repository since you last updated your working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.

The view presents the status of the working copy resources against the BASE revision after a **Refresh** operation. You can view the state of the resources versus a repository HEAD revision by using the **Synchronize** action from the [Working Copy view](#).

View Differences

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the **Open in compare editor** action from the contextual menu.

The text files are compared using a built-in [Compare view](#) that uses a line differencing algorithm or a specified external diff application (if such an application is set in the [SVN Diff preferences page](#)). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a *diff pseudo-conflict*. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the [SVN](#) preferences page and enable the [Allow unversioned obstructions option](#).

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the [Compare](#) view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the [Working Copy view](#).

Figure 643: Compare View

At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- Incoming changes - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- Outgoing changes - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- Conflicting changes - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the **Compare View toolbar** or in the **Compare** menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called **Perform files differencing**. After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions **Go to first**, **Go to previous**, **Go to next** and **Go to last modification**. If you decide that some incoming change needs to be present in your working file you can use the action **Copy change from right to left**. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The **Copy all non-conflicting changes from right to left** action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the **Word Details** and **Character Details** dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files disregarding the changes in the number of white spaces between words or lines there is available an option in the [SVN Preferences](#) which allows you to enable or disable the white space ignoring feature of the compare algorithm.

Conflicts

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

Real Conflicts vs Mergeable Conflicts

There are two types of conflicts:

- *real conflict* ( icon in *Name* column) - Syncro SVN Client considers the following resource states to be real conflicts:
 - *conflicted state* - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict ( icon in *Local file status* column) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict ( icon in *Local properties status* column) is reported when a property's value was modified both locally and remotely.
 - *tree conflicted state* ( icon in *Local file status* column) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
 - *obstructed state* ( icon in *Local file status* column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.
- *pseudo-conflict* ( icon in *Name* column) - A file is considered to be in *pseudo-conflict* when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation may automatically merge the incoming file content into the existing locally one. In this case, the *pseudo-conflict* marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.

Note:

- A conflicting resource cannot be committed to repository. You have to resolve it first, by using **Mark Resolved** action (after manually editing/merging file contents) or by using **Mark as Merged** action (for pseudo-conflicts).
-  and  icons are presented only when one of the following view modes is selected: **Modified, Incoming, Outgoing, Conflicts**.
- The  icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

Content Conflicts vs Property Conflicts

A *Content conflict* appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, Apache Subversion™ cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<< filename  
your changes  
=====  
code merged from repository  
>>>>> revision
```

Also, for every conflicted file Subversion places three additional temporary files in your directory:

- `filename.ext.mine` - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.
- `filename.ext.rOLDREV` - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.
- `filename.ext.rNEWREV` - This is the file that Subversion client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

OLDREV and NEWREV are revision numbers. If you have conflicts with binary files, Subversion does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get `filename.ext.r*` files also.

A *Property conflict* is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named `filename.ext.prej` is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the **Mark resolved** action to commit the file. Note that the **Mark resolved** action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.

Edit Real Content Conflicts

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the **Compare** view (the built-in file comparison tool) or with an [external diff application](#). Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The **Compare** view (or the external diff application [set in Preferences](#)) is opened with the **Edit Conflict** action, which is available on the contextual menus of [the Working Copy view](#) and is enabled only for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If [the option Show warning dialog when edit conflicts is enabled](#) you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<, =====, >>>>>) with the original local version of the file that preceded the update operation. If you press the OK button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension `.sync.bak` to the file as stored on the SVN server. If you press the **Cancel** button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:

Save

Saves the modifications of the local version of the file displayed in the left side of the view.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When enabled, a selected difference can be seen in both panels.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

↓Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

↑Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

↓Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

↑Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

↑First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<, =====, >>>>>) with the original local version of the file before running the update action that created the conflict. After that the differences between this original local version and the repository version are displayed in the **Compare** view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the **Compare** view you should work on the local working copy file after the update operation without running the action **Edit Conflict**. If you decide that you want to edit the conflict version directly after running the action **Edit Conflict** you have to work on the .sync.bak file.

If you did not finish editing the conflicts in a file at the first run of the action **Edit Conflict** you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:

- The **Mark Resolved** action on the file so that the result of the conflict editing process can be committed to the SVN repository.
- The **Revert** action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

Revert Your Changes

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select **Revert**. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you want to revert and click the **OK** button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

Note: By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in **Compare view** and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action **Copy change from right to left** from the **Compare view toolbar**. After editing the conflicting file you have to run the action **Mark as merged** before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the **Override and update** action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.

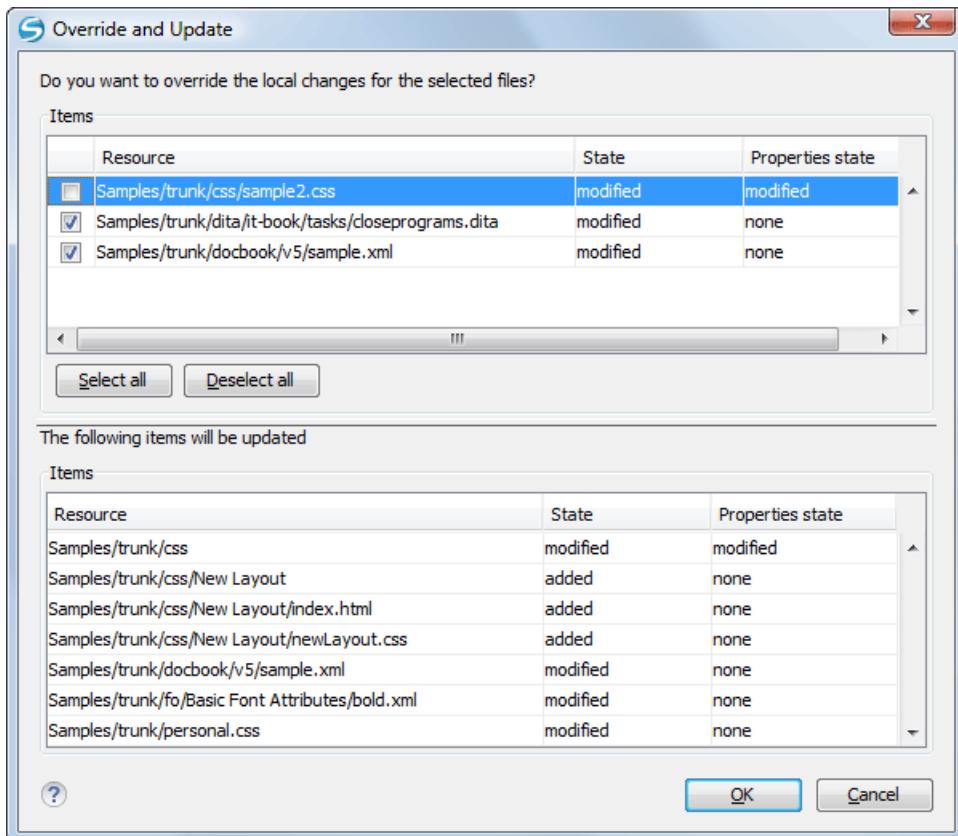

Figure 644: Override and Update Dialog Box

In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

Tip: If you want to roll-back out of your working copy changes that have already been committed to the repository, see [Merge Revisions](#).

Merge Conflicted Resources

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the [Properties view](#). Before you can commit you must *mark as resolved* the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must be overridden or modified. After saving your local file you have to use the *Mark as merged* action from the contextual menu before committing.

Drop Incoming Modifications

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action **Mark as merged** proves to be useful in this case too. After opening the conflicting files with **Compare view, Editor** or editing their properties in the **Properties** view and deciding that your file can be committed in the repository replacing the existing one, you should use the **Mark as merged** action. When you want to override completely the remote file with the local file you should run the **Override and commit** action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the **Compare** view and only after to update and commit.

Tree Conflicts

A *tree conflict* is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
- It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the **Edit conflict** action:

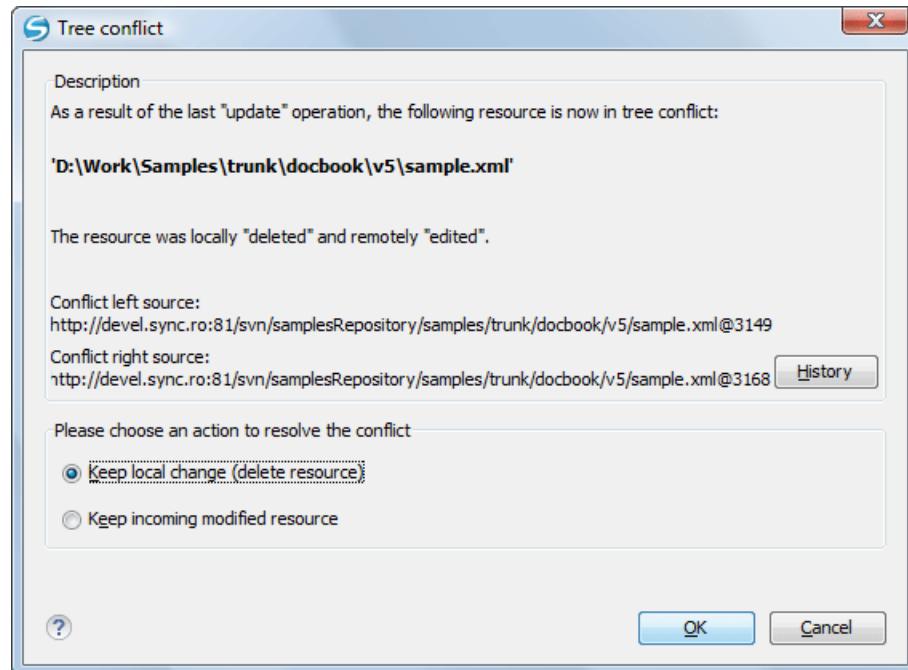

Figure 645: Resolve a tree conflict

- **Keep local change (delete resource)** - Keeps the incoming change that comes from the repository.
- **Keep incoming modified resource** - If there is a renamed version of the file committed by other user that will be added to the working copy too.

Update the Working Copy

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to *update* your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from **Working Copy view**. It updates the selected resources to the last synchronized revision (if remote information is available) or to the **HEAD** revision of the repository.

There are three different kinds of incoming changes:

- *Non-conflicting* - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.
- *Conflicting, but auto-mergeable* - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files)
- *Conflicting* - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.

If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Editor allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the **Update to revision/depth** action from the **Working Copy** view (**All Files** view mode) or the **Update to revision** action from the **History view** contextual menu.

If you select multiple files and folders and then you perform an **Update** operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an **Override and update** action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

Send Your Changes to the Repository

Sending the changes you made to your working copy is known as *committing* the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.

The **Commit** action sends the changes from your local working copy to the repository. The **Commit** dialog box presents all the items that you can commit.

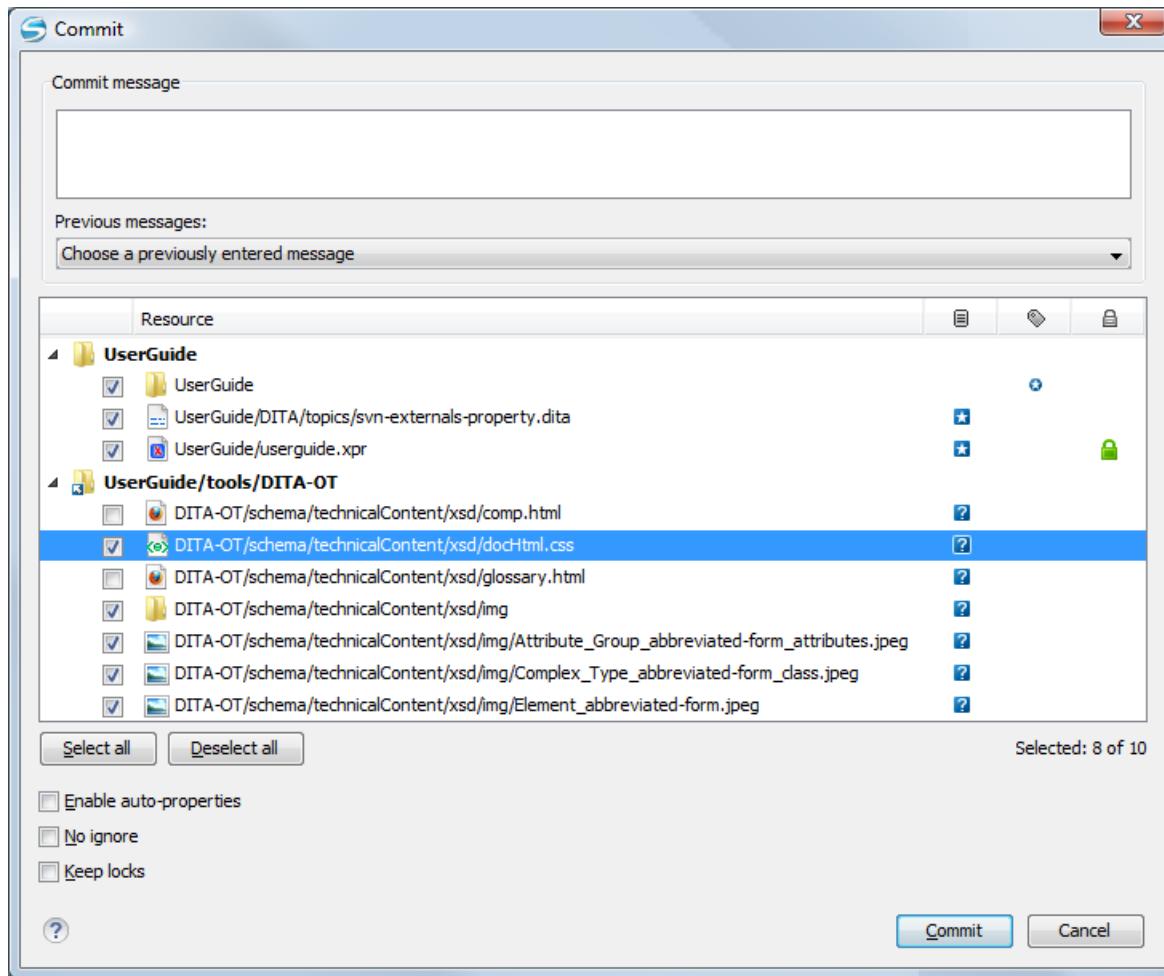

Figure 646: Commit dialog box

Enter a message to associate with the commit, or choose a previous message from the **Previous messages** list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: *added*, *modified* (content or properties), *replaced*, and *deleted*. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, uncheck it.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being *unversioned* or *missing* and these items are handled automatically:

- *Unversioned* items are added under version control.
- *Missing* items are deleted.

Note: If the **Show unversioned directories content** is disabled, the **Commit** dialog box does not display the items inside an *unversioned* directory.

Unversioned or *missing* items are not selected by default in the **Commit** dialog box, unless you have selected them explicitly when issuing the commit command.

Note: In some cases, items that have one of the above states are not presented in the **Commit** dialog box.

For example:

- Items that have been *added* or *replaced* previously, but now are presented as *missing* after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the **Delete** action to remove them from your working copy.

- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

Note: Due to dependencies between items, when you select or clear an *unversioned* () or *added* () item in the **Commit** dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double clicking a file in the **Commit** dialog box, or by right clicking and selecting the **Show Modifications** action from the contextual menu. This option is available to review only file content changes, not property changes.

The  **Local file status** column indicates the actual state of the items and the  **Local properties status** column indicates whether or not the properties of an item are modified.

The  **Lock information** column is displayed if at least one of the files in the **Commit** dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:

- **Enable automatic properties or Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the config file of the Subversion configuration directory.

Note: This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the config file of the Subversion configuration directory, in the auto-props section. Based on the value of the enable-auto-props runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

- **Keep locks** - selecting the **Keep locks** option preserves any locks you set on various files.

Note: This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item for which the option can be applied.

Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the **Update** action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

Committing to Multiple Locations

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding *external* items.

If items to be committed belong to different *external* definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow () if they are *external* definitions. The working copy root directory is never decorated and is not presented if there are no *external* items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

Note: When an *external* directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for *external* files.

The sets of items belonging to *external* definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of *externals*. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.

Note: *External* files are always from the same repository as the parent directory that defines them, so they are always committed together with the changes from their parent directory.

Integration with Bug Tracking Tools

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message

that they enter in the **Commit** dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following [SVN properties](#) that must be set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the [Commit dialog box](#) will display a text field for entering the bug ID. It must contain the string %BUGID%, which is replaced with the bug number on commit.
- **bugtraq:label** - A string property that sets the label for the text field configured with the **bugtraq:message** property.
- **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring %BUGID% which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.
- **bugtraq:warnifnoissue** - A boolean property with the values *true/yes* or *false/no*. If set to *true*, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.
- **bugtraq:number** - A boolean property with the value *true* or *false*. If this property is set to *false*, then any character can be entered in the bug ID text field. If the property is set to *true* or is missing then only numbers are allowed as the bug ID.
- **bugtraq:append** - A boolean property. If set to *false*, then the bug ID is inserted at the beginning of the commit message. If yes or not set, then it's appended to the commit message.
- **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID's must be matched in the groups of the regular expression string (for example, [Ii]ssue #?(\d+)). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, Issue #123 or resolves issue 123). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern issue #XXX and issue #890, #789 inside a log message you could use the following strings:
 - [Ii]ssue #?(\d+)(, ? ?#?(\d+))+
 - (\d+)

The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tools can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the **bugtraq:url** property was filled in with the URL of the bug tracking system and this URL includes the %BUGID% substring as specified above in the description of the **bugtraq:url** property then the [History view](#) presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.

Obtain Information for a Resource

This section explains how to obtain information for a SVN resource:

Request Status Information for a Resource

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the **Synchronize** action from the [Working Copy view](#) comes in handy. The **Working Copy** view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the  [Show SVN Information](#) action. This action is available from the **File** menu or the contextual menu of the **Working Copy**, **Repositories**, **History**, or **Directory Change Set** views, or from the **Revision Graph** dialog box. The **SVN Information** dialog box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number

- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the **Copy** action.

Request History for a Resource

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from [Repositories view](#), [Working Copy view](#), [Revision Graph](#), or [Directory Change Set view](#). From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Related information

[History View](#) on page 1503

Management of SVN Properties

In the [Properties view](#) you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the [Working Copy view](#) and run the **Show properties** action from the contextual menu. The [Properties view](#) will show the local properties for the resource in the working copy. Once the [Properties view](#) is visible, it will always present the properties of the currently selected resource. There are actions available in the [Properties view toolbar](#) that allow you to add, change, and delete the properties.

If you choose the **Add a new property** action, a new dialog box will appear that contains the following:

- **Name** - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as `svn:ignore`, `svn:externals`, `svn:needs-lock`, etc.)
- **Current value** - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by checking the **Set property recursively** checkbox.

If you want to change the value for a previously set property, you can use the **Edit property** action, which will display a dialog box with the following information:

- **Name** - Property name (cannot be changed).
- **Current value** - The current value (can be changed).
- **Base value** - The value of the property, if any, from the resource in the pristine copy (cannot be changed).

If you want to completely remove a property previously set you can choose the **Remove property** action. It will display a confirmation dialog box in which you can also choose if the property will be removed recursively.

There is a **Refresh** action in the [Properties view](#) that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an **Update** operation.

Branches and Tags

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a *branch*. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (*trunk*).

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as *tagging*. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a *tag* and a *branch*. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.

Create a Branch / Tag

To create a branch or tag by copying a directory, use the **Branch/Tag** action that is available in the **Tools** menu when an item is selected in the **Working Copy view** or **Repositories view**, or from the contextual menu of the **Repositories** view.

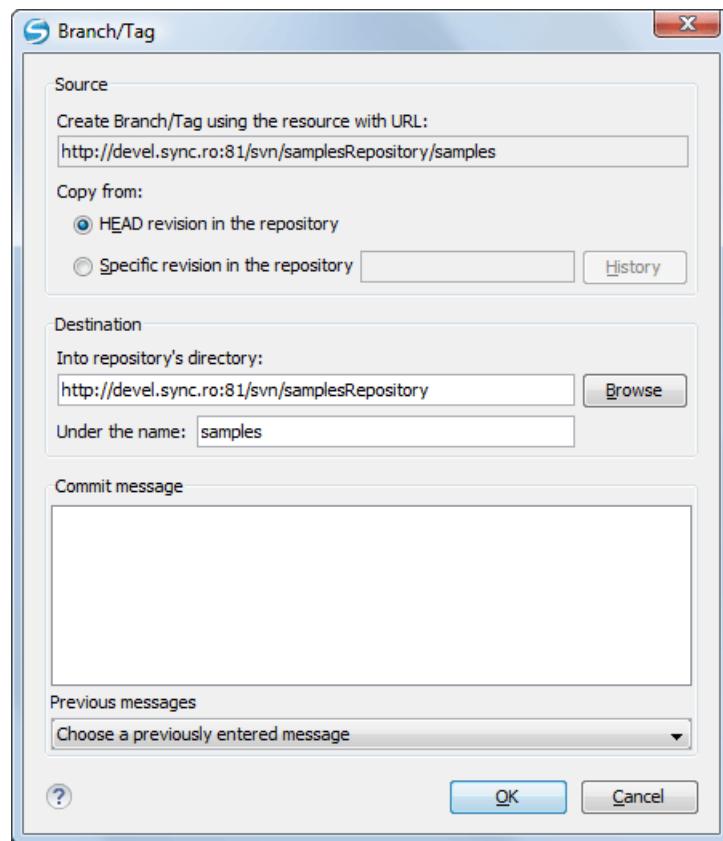

Figure 647: Branch/Tag Dialog Box

You can configure the following options in this dialog box:

You can specify the source revision of the copy in the **Copy from** section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the HEAD revision. The branch will be created very quickly, as the repository will make a *cheap* copy.

- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the **History** button you can select the revision number from *the History dialog box*. This type of branch will also be created very quickly.
- **Working copy** - (Available only if the item is selected from the **Working copy** view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the **Destination** section:

- **Into repository's directory** - *The URL of the parent directory* of the new branch or tag.

Note: Peg revisions have no effect for this operation since it is used to send information to the repository.

- **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the **Repositories** or **Working copy** view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

Merging

At some stage during the development process, you will want to merge the changes made on a *branch* back into the *trunk*, or vice-versa. The *merge* is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the *diff* concept.

Note: A *branch* is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A *branch* always begins life as a *copy of something* (such as a *trunk*, another *branch*, or *tag*), and moves on from there, generating its own history.

The  **Merge** action is available in the **Tools** menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the *merge* operation will be performed on the entire working copy.

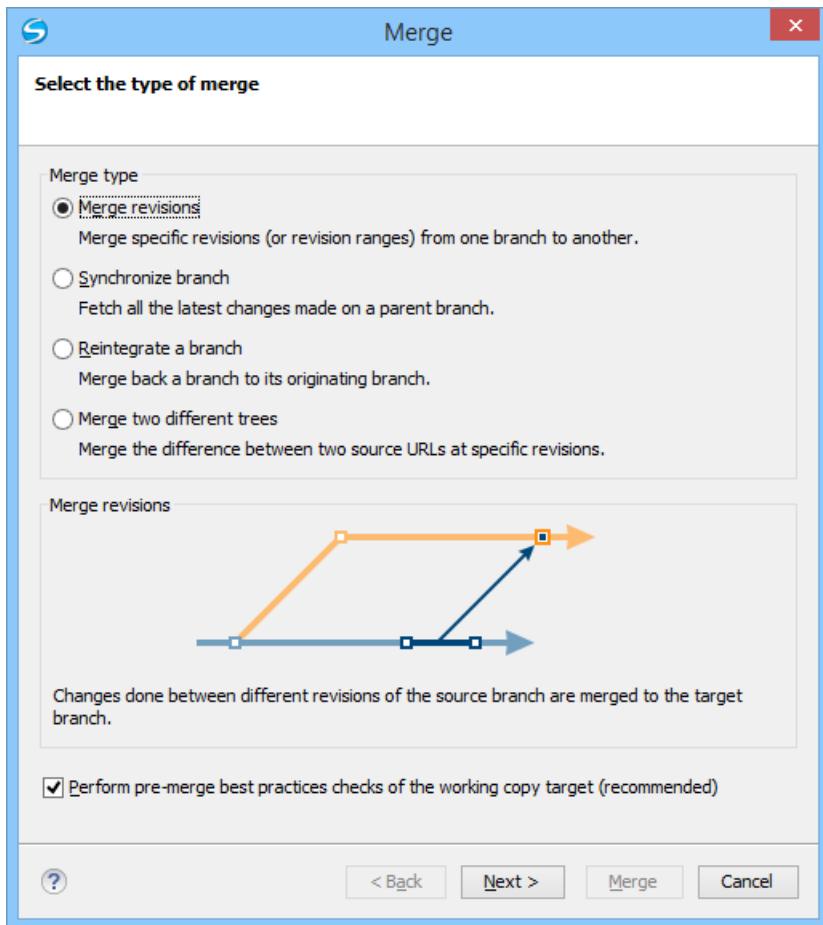

Figure 648: Merge Wizard

The four types of merging are as follows:

- **Merge revisions** - Port changes from one branch to another. Note that the *trunk* can also be considered a branch, in this context.
- **Synchronize branch** - Fetch all the changes made on a parent branch (or the *trunk*) to a child branch.
- **Reintegrate a branch** - Merge a branch back to its parent branch (can also be the *trunk*).
- **Merge two different trees** - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check option:

- **Perform pre-merge best practices checks of the working copy target** - When enabled, the SVN Client checks if the working copy target item is ready for the merge operation and displays the **Pre-merge checks** wizard page.

Remember: It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the merge does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.

Important: The above recommendation becomes mandatory when *reintegrating a branch*.

Pre-Merge Checks

Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By enabling the **Perform pre-merge best practices checks of the working copy target** option in the first page of the **Merge** wizard, the **Pre-merge checks** wizard page is displayed to give you a summary of the verified conditions.

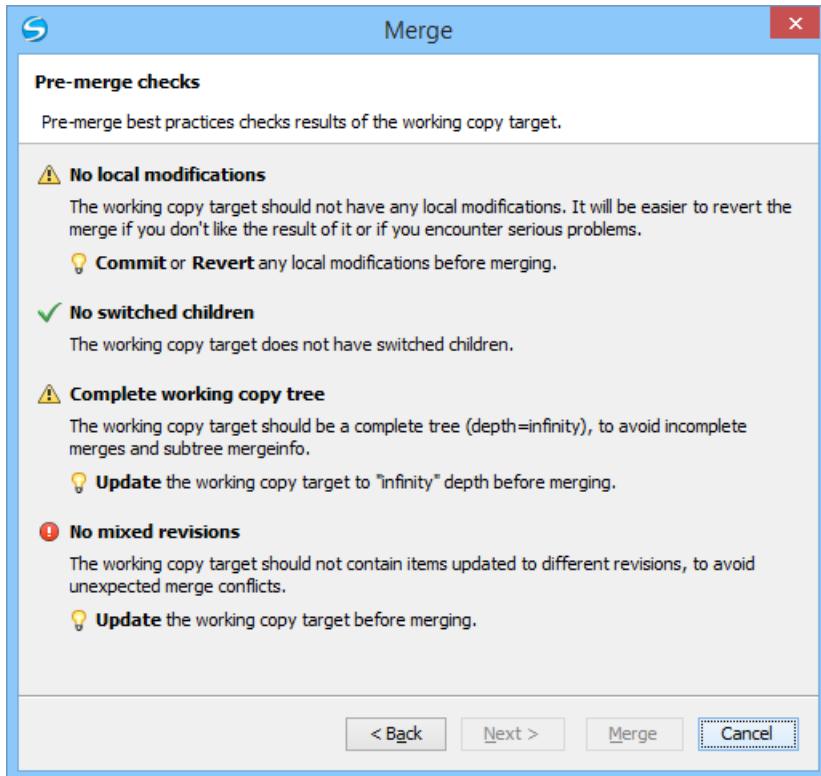

Figure 649: Pre-Merge Checks Wizard Page

The following conditions are checked in this operation:

No local modifications

The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

Tip: If this condition fails, you should *commit* or *revert* the local modifications before merging.

No switched children

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and *subtree mergeinfo*.

Tip: If this condition fails, you should switch back all the children before merging.

Complete working copy tree

The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and *subtree mergeinfo*.

Tip: If this condition fails, you should change the *sticky* depth of the working copy item receiving the merge to *infinity* value.

No mixed revisions

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

Tip: If this condition fails, you should *update* the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

- ✓ (Successful) - The condition is fulfilled successfully.
- ⚠ (Warning) - The condition is not fulfilled, but it is not mandatory.
- ❗ (Error) - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).

Tip: For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

Important: After solving any of the warnings or errors, it is recommended that you perform the *pre-merge checks* again to make sure your new changes are valid.

Merge Revisions

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, we know that a problem has been fixed by committing revisions 17, 20, and 25 on branch B1. These changes are also needed in branch B2. Thus, to merge them, we need a working copy of the B2 branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu **Tools > Merge**.
The **Merge** wizard is opened.
2. Select the **Merge revisions** option.
3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
 - a) Press the **Next** button.
If the **Perform pre-merge best practices checks of the working copy target** option was enabled, [the Pre-Merge Checks wizard page](#) is displayed.

Note: If errors are found you need to solve them before proceeding.

4. Press the **Next** button.
The **Merge revisions** wizard page is displayed.
5. In the **Merge from (URL)** text box, enter [the URL of the branch or tag](#) that contain the changes that you want to duplicate in your working copy. In our example, it is the URL of the B1 branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

Note: If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option, in the [Merge Options wizard page](#), will be enabled automatically (and you cannot change this). This is because the [Subversion client cannot track changes between different repositories](#).

Tip: You can also specify a [peg revision](#) at the end of the URL (for example, URL@rev1234). The peg revision does not affect the merge range you select. By default, the HEAD revision is assumed.

6. In the **Revisions to merge** section, choose between the **all revisions** and **specific revision(s)** options.
 - **all revisions** - The operation will include *all eligible revisions* that were not yet merged.
 - **specific revision(s)** - You can specify one or more individual revisions and/or revision ranges. Also, you can mix *forward* ranges (for example, 1–5), *backward* ranges (for example, 20–15), and subtract specific revisions from a range (for example, 1–5, –3).

Note: If using the Subversion command-line client, a revision range of the form 1–5 means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in Syncro SVN Client the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.

 **Attention:** The HEAD revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, 10–HEAD). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

Tip: If you want to perform a *reverse merge* and roll-back your working copy changes that have already been committed to the repository, use the *negative revisions* notation (for example, –7) or *backward revision ranges* (for example, 20–10).

- a) If you press the **History** button, [the History dialog box](#) is displayed, which allows you to select one or more revisions to be merged.

7. Optionally, if you want to [configure the options](#) for your merge, press the **Next** button.

The [Merge Options wizard page](#) is displayed that allows you to configure options for the operation.

Warning: If the **Ignore ancestry / Disable merge tracking** option is enabled and you selected **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

8. Press the **Merge button.**

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, *you may need to resolve conflicts* after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Synchronize a Branch

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the *trunk* itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a *synchronize merge*, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized. Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses *merge tracking* to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

Important: It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the *synchronize merge*, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the *trunk* since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:

1. Go to **Tools > Merge.**

The **Merge** wizard is opened.

2. Select the **Synchronize branch option.**

3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.**

a) Press the **Next button.**

If the **Perform pre-merge best practices checks of the working copy target** option was enabled, *the Pre-Merge Checks wizard page* is displayed.

Note: If errors are found you need to solve them before proceeding.

4. Press the **Next button.**

The **Synchronize branch** wizard page is displayed.

5. In the **Parent branch (URL) text box, enter *the URL of the branch from which you created your branch*. This means that the URL must belong to the same repository as your working copy that was created from the child branch.**

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

Tip: You can also specify a *peg revision* at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

6. Optionally, if you want to *configure the options* for your merge, press the **Next button.**

The [Merge Options wizard page](#) is displayed that allows you to configure options for the operation.

Note: The **Ignore ancestry / Disable merge tracking** option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts](#) after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Reintegrate a Branch

There are some conditions that apply to reintegrate a branch:

- The server must support merge tracking.
- The source branch (to be reintegrated) must be coherently synchronized with its parent branch. This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
- The working copy **must not** contain the following:
 - Local modifications.
 - A mixture of revisions (all items must point to the same revision).
 - Sparse directories (all directories must be of depth *infinity*).
 - Switched items.
- The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.

Tip: You can use [the pre-merge checks option](#) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the **Reintegrate a branch** option.

This method uses the *merge-tracking* features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.

Tip: Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.

To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu **Tools > Merge**.

The **Merge** wizard is opened.

2. Select the **Reintegrate a branch** option.

Note: This option is disabled if the selected working copy item (or if it is a directory, any of the items inside of it) has any type of modification. This is because it is mandatory for the target item to have no modifications.

3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.

a) Press the **Next** button.

If the **Perform pre-merge best practices checks of the working copy target** option was enabled, [the Pre-Merge Checks wizard page](#) is displayed.

Note: If errors are found you need to solve them before proceeding.

4. Press the **Next** button.
The **Reintegrate a branch** wizard page is displayed.
5. In the **Child branch (URL)** text box, enter [the URL of the child branch to be reintegrated](#). This means that the URL must belong to the same repository as your working copy that was created from the parent branch.
You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

Tip: You can also specify a [peg revision](#) at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

The [Merge Options wizard page](#) is displayed that allows you to configure options for the operation.

Note: Since a *reintegrate* merge is so specialized, most of the merge options are not available, except for those in the **File Comparison** category.

6. Press the **Merge** button.
The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts](#) after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Merge Two Different Trees

This merge type is useful when you need to duplicate changes from one child branch (for example, CB1) to another child branch (CB2) from the same parent branch. The SVN client will calculate the changes necessary to get from the HEAD revision of the parent branch (or the *trunk*) to the HEAD revision of one of its child branches (CB1), and apply those changes to your working copy of the other branch (CB2). The result is that the latter child branch (CB2) will also include the changes made on the original child branch (CB1), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support *merge tracking*.

Note: If the server does not support *merge-tracking*, then this is the only way to merge a branch back to its parent.

1. Go to menu **Tools > Merge**.
The **Merge** wizard is opened.
2. Select the option **Merge two different trees**.
3. It is recommended that you enable the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
 - a) Press the **Next** button.
If the **Perform pre-merge best practices checks of the working copy target** option was enabled, [the Pre-Merge Checks wizard page](#) is displayed.

Note: If errors are found you need to solve them before proceeding.

4. Press the **Next** button.
The **Merge two different trees** wizard page is displayed.
5. In the **From (starting URL and revision)** section enter [the URL of the first branch](#).

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

Tip: If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

Note: If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option, in the [Merge Options wizard page](#), will be enabled automatically (and you cannot change this). This is because the [Subversion client cannot track changes between different repositories](#).

Tip: You can also specify a [peg revision](#) at the end of the URL (for example, URL@rev1234). By default, the HEAD revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.

- **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
- **other revision** - Use this option to input a specific revision number and avoid losing recent commits. You can use the **History** button to see a list of all revisions.

7. In the **To (ending URL and revision)** section enter [the URL of the second branch](#).

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

Tip: If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

Attention: The URL must point to the same repository as the one in the **From (starting URL and revision)** field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

Tip: You can also specify a [peg revision](#) at the end of the URL (for example, URL@rev1234). By default, the HEAD revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between **HEAD revision** and **other revision**.

- **HEAD revision** - This is the default selected revision.
- **other revision** - Use this option if you want to enter a previous revision. You can use the **History** button to see a list of all revisions.

9. Optionally, if you want to [configure the options](#) for your merge, press the **Next** button.

The [Merge Options wizard page](#) is displayed that allows you to configure options for the operation.

Warning: If the **Ignore ancestry / Disable merge tracking** option is enabled and you selected **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

10. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, [you may need to resolve conflicts](#) after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Merge Options

Here is the list of options that can be used when merging:

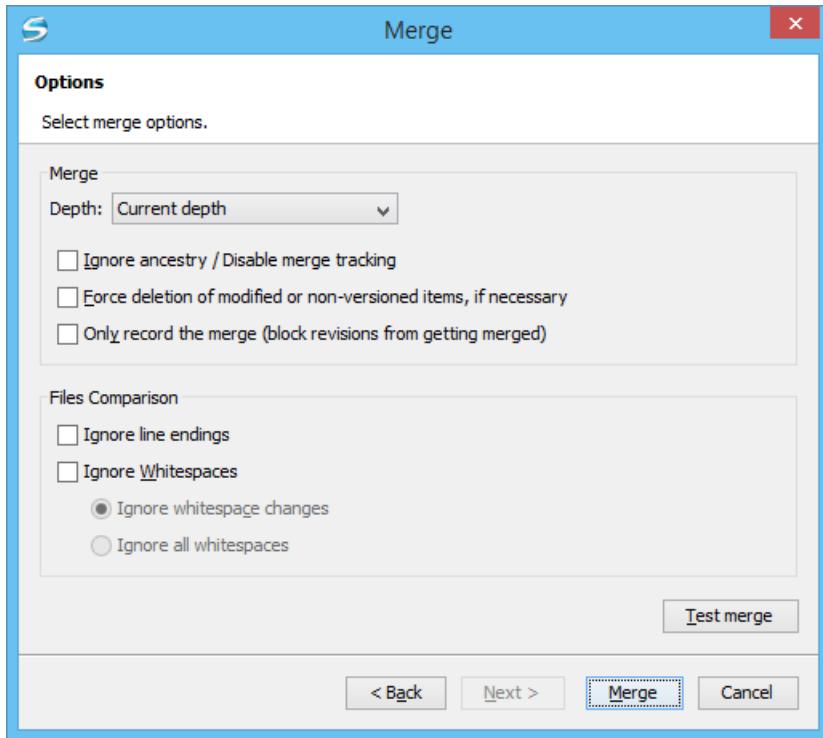

Figure 650: Merge Wizard - Advanced Options

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
 - **Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.
 - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and *subtree mergeinfo*.
 - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
 - **File children only (files)** - Merges only the child files.
 - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).
- **Note:** The *depth* term is described in the [Sparse checkouts](#) section. The default depth is the current depth of the working copy item receiving the merge.
- **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is disabled, the first item will be replaced with the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, disabling the option replaces one of the files with the other one, and enabling it merges their contents.
- **Note:** If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot change this). This is because the [Subversion client cannot track changes between different repositories](#).
- **Force deletion of modified or non-versioned items, if necessary** - If disabled, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.
- **Only record the merge (block revisions from getting merged)** - Available when the [Ignore ancestry / Disable merge tracking option](#) is disabled. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to enable this option for two possible reasons:
 - You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
 - You want to prevent one or more particular changes from being fetched in subsequent merges.

- **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
- **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
 - **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

Note: Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

 - **Ignore all whitespaces** - Ignores all types of whitespace changes.
- **Test merge** - Performs a dry run of the merge operation, allowing you to *preview* it without actually performing the merge. In the **Console** view you will see a list of the working copy items that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

Resolving Merge Conflicts

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the **Merge conflicts** dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.

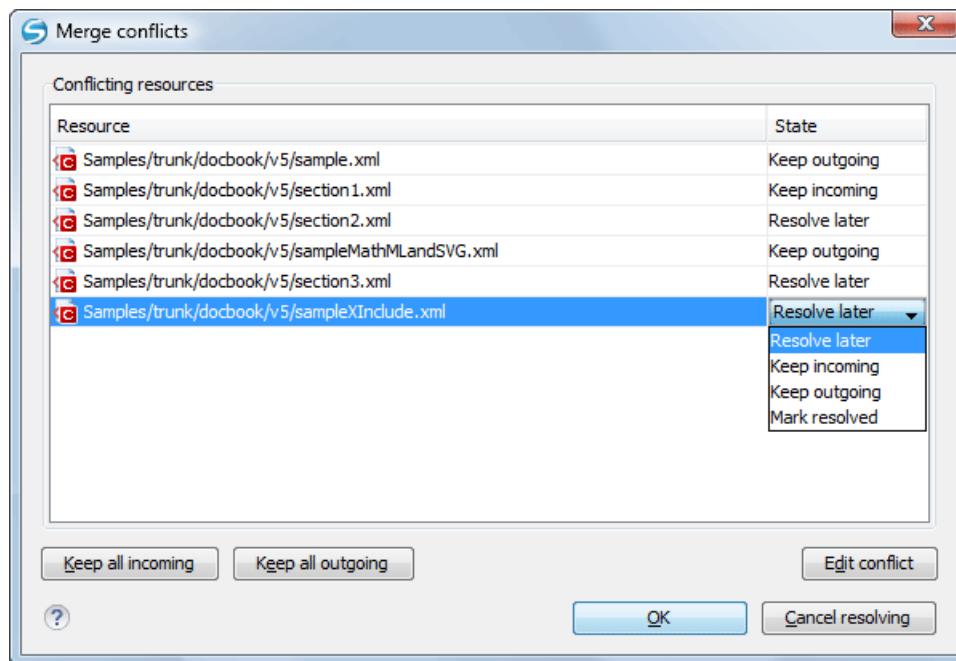

Figure 651: Merge Conflicts Dialog Box

The options to resolve a conflict are as follows:

- **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
- **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
- **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
- **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).

Sub-tree Merges

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid *sub-tree mergeinfo*. *Sub-tree mergeinfo* is the *mergeinfo* recorded to describe a *sub-tree merge*. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about *sub-tree merges* or *sub-tree mergeinfo* except that the complete record of merges to a branch may not be contained solely in the *mergeinfo* on the branch root and you may have to look to any *sub-tree mergeinfo* to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

Merging from Foreign Repositories

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source. However, copies made in the merge source will be transformed into plain additions in the merge target. Also, *merge-tracking* is not supported for merges from foreign repositories.

Note: When performing merges from repositories other than the one corresponding to the target item (from the working copy), the [Ignore ancestry / Disable merge tracking option](#), in the [Merge Options wizard page](#), will be enabled automatically (and you cannot change this).

General Merge Recommendations

As a recommendation, you should only merge into clean working copies that **do not** contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.

Important: This recommendation becomes mandatory when performing a [reintegrate merge](#) operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

Remember: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Switch the Repository Location

The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the [Working Copy view](#).

Note: *External* items cannot be switched using this action. Instead, change the value of the `svn:externals` property set on the parent directory of the external item and update the parent directory.

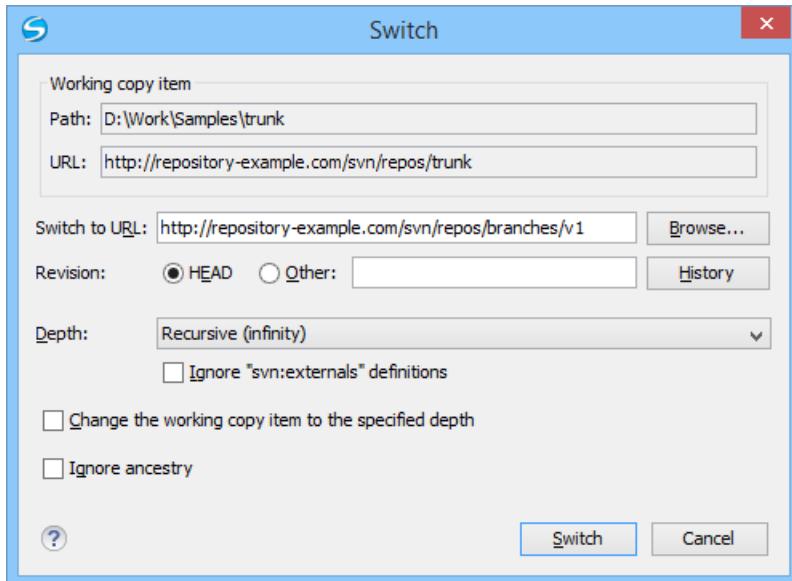

Figure 652: Switch Dialog Box

The following options can be configured in the **Switch** dialog box:

Switch to URL

The new location in the same repository you are switching to.

Tip: You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

Note: For items that are already *switched* that you want to switch back, the proposed URL is the original location of the item.

Revision

The specific version of the location that you are switching to.

Depth - (This option is applicable only for directories)

Current depth

Obeys the depths registered for the directories in the working copy that are to be switched.

Recursive (infinity)

Switches the location of the selected folder and all of its files and folders.

Immediate children (immediates)

Switches the location of the selected folder and its child files and folders without recursing subfolders.

File children only (files)

Switches the location of the selected folder and its child files.

This folder only (empty)

Switches the location of the selected folder (no child files or folders are included).

Ignore "svn:externals" definitions

When enabled, external items are ignored in the switch operation. This option is only available if you choose the **Current depth** or **Recursive (infinity)** depth.

Change the working copy item to the specified depth

Changes the *sticky* depth on the directory in the working copy.

Ignore ancestry

When disabled, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If enabled, the SVN does not check for a common ancestry.

Relocate a Working Copy

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to [the new URL of the repository](#).

Note: Peg revisions have no effect for this operation.

This **Relocate** action is available in the **Tools** menu when selecting the root item of the working copy.

Note: External items that are defined using absolute URLs and that point to the same repository as the working copy are not affected by the **Relocate** action (the URL is not updated). To relocate these items, change the value of the svn:externals property for each external item (set on their parent directories). For example, if an external item is defined as externalDir http://host/path/to/repo/to/dir and the repository was moved to another server (host2) and its protocol changed to https, then the value of the property needs to be updated to externalDir https://host2/path/to/repo/to/dir.

Tip: If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

Patches

This section explains how to work with patches in Syncro SVN Client.

What is a Patch

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in [the Unified Diff format](#), but it can also use [the Git format](#).

Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:

- *Two revisions of a version item* - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- *Two different versioned items from the repository* - the items are remote and you need to specify a revision for both.

Warning: The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

Generating a Patch - Local Items

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

To open the **Create patch** wizard, use the  **Create patch** action from the **Tools** menu or from the contextual menu in the **Modified**, **Incoming**, **Outgoing**, or **Conflicts** modes.

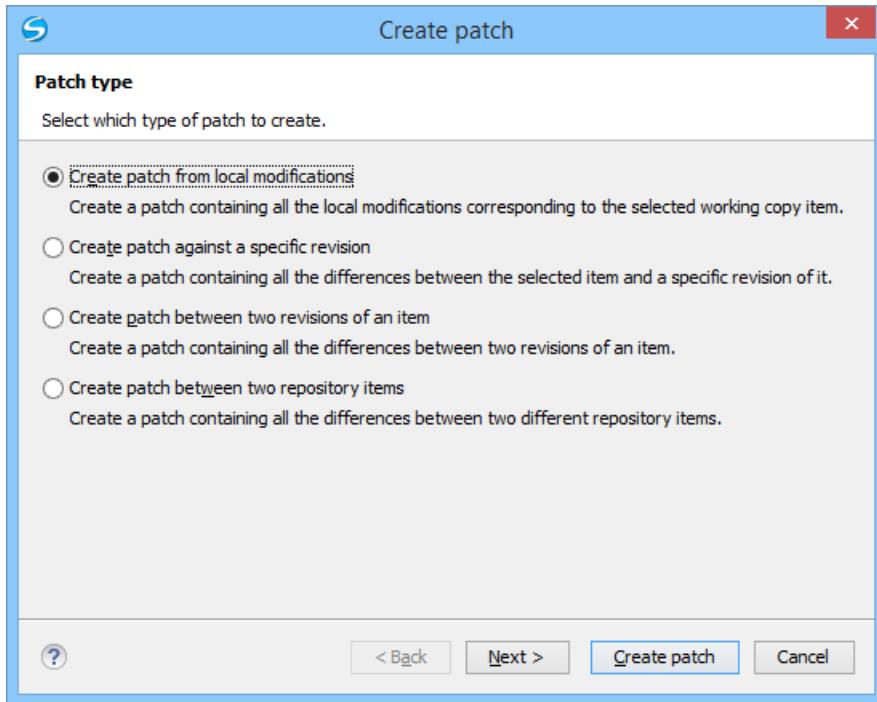

Figure 653: Create Patch Wizard - Local Items

Create Patch from Local Modifications

This is the most commonly used type of patch and contains only the local changes for the selected item.

This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items in which the local file status is *unversioned or ignored, and in some cases missing or obstructed*.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch from local modifications** option in the dialog box.
3. Optionally, if you want *to configure the options* for your patch, press the **Next** button.
This options page does not remember your selections when creating future patches. It will revert to the default values.
The **Options** wizard page is displayed.
4. Press the **Create patch** button.
If the patch is applied on a folder of the working copy and that folder contains *unversioned files*, this step of the wizard offers the option of selecting the ones that will be included in the patch.

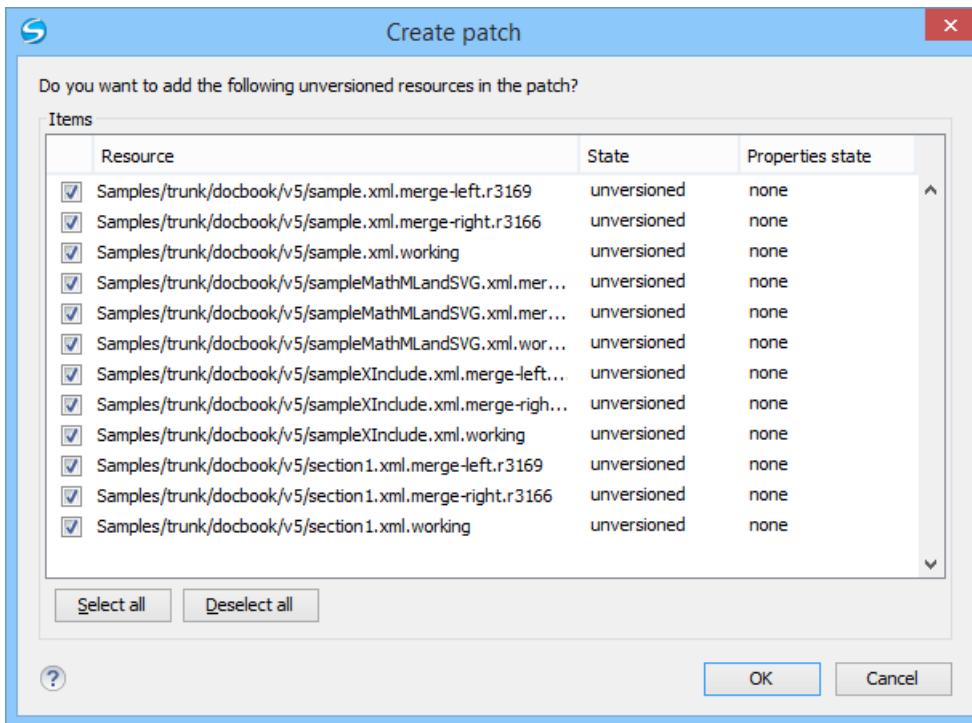

Figure 654: Create Patch Dialog Box - Add Unversioned Resources

The patch is created and stored in the path specified in [the Output section of the Options page](#) or in the default location.

Create Patch Against a Specific Revision

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.

This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch against a specific revision** option in the dialog box.
3. Press the **Next** button.
The second step of the wizard is opened:

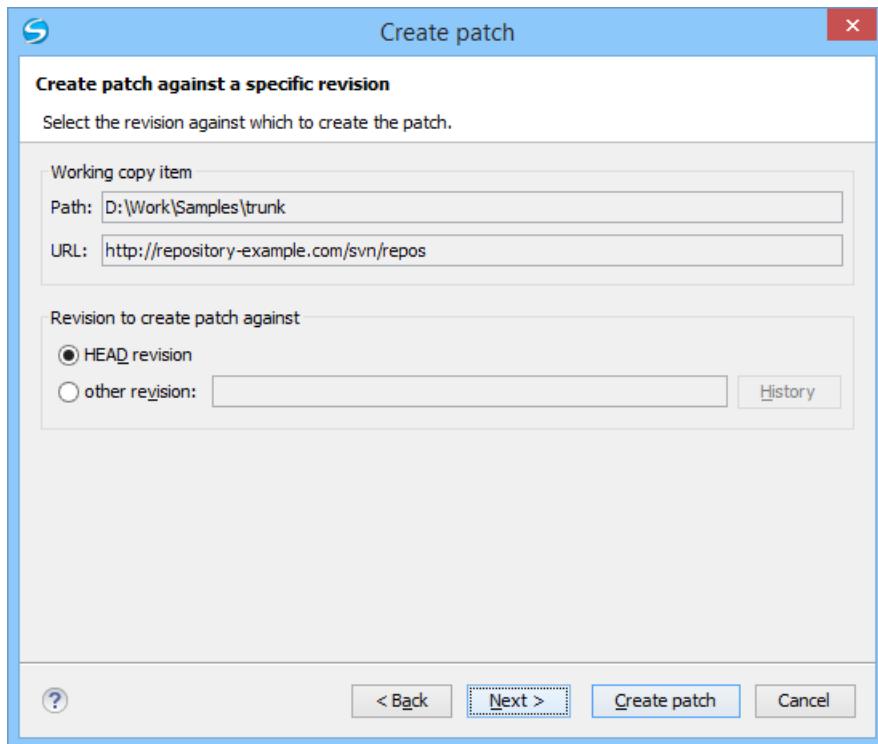

Figure 655: Create Patch Wizard - Step 2

4. Select the revision to create patch against.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press [the History button](#) to display a list of the item revisions.

Note: If the **revision to create patch against** is older than the revision for which the working copy item was updated, the patch will include changes that were made **after** the selected revision.

5. Optionally, if you want to configure the options for your patch, press the Next button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the Create patch button.

The patch is created and stored in the path specified in [the Output section of the Options page](#) or in the default location.

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

Tip: If you need to generate a patch between two revisions of a previously *deleted*, *moved*, or *replaced* item, you should use [the Create patch between two repository items option](#) instead.

The steps are as follows:

1. Go to menu Tools > Create patch.

This opens the **Create patch** wizard.

2. Select the Create patch between two revisions of an item option in the dialog box.

3. Press the Next button.

The second step of the wizard is opened:

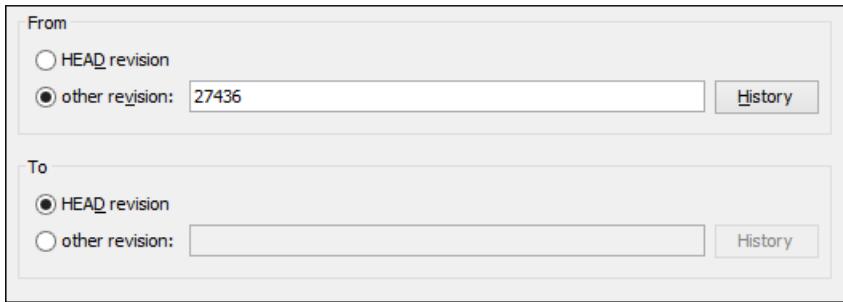

Figure 656: Create Patch Wizard - Step 2

4. Select the starting and ending revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press *the History button* to display a list of the item revisions.

Note: The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

Tip: If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

Tip: To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch between two repository items** option in the dialog box.
3. Press the **Next** button.
The second step of the wizard is opened:

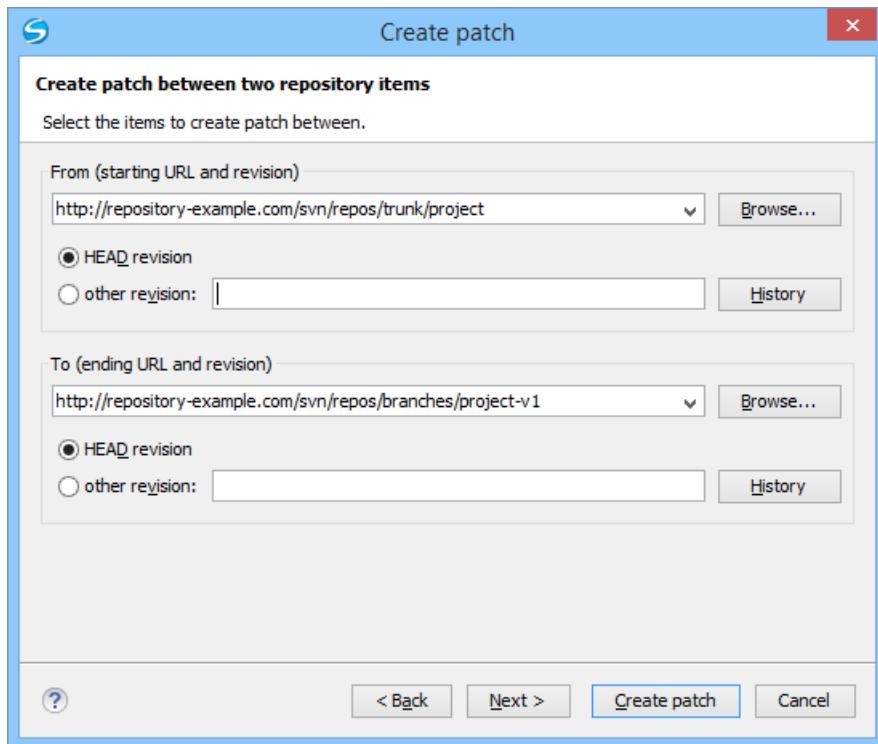

Figure 657: Create Patch Wizard - Step 2

4. Select *the starting and ending URLs* and revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press *the History button* to display a list of the item revisions.

Important: Both URLs must point to items from the same repository.

Note: If you use a peg revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want *to configure the options* for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in *the Output section of the Options page* or in the default location.

Generating a Patch - Remote Items

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the **Create patch** wizard, use the  **Create patch** action from the **Tools** menu.

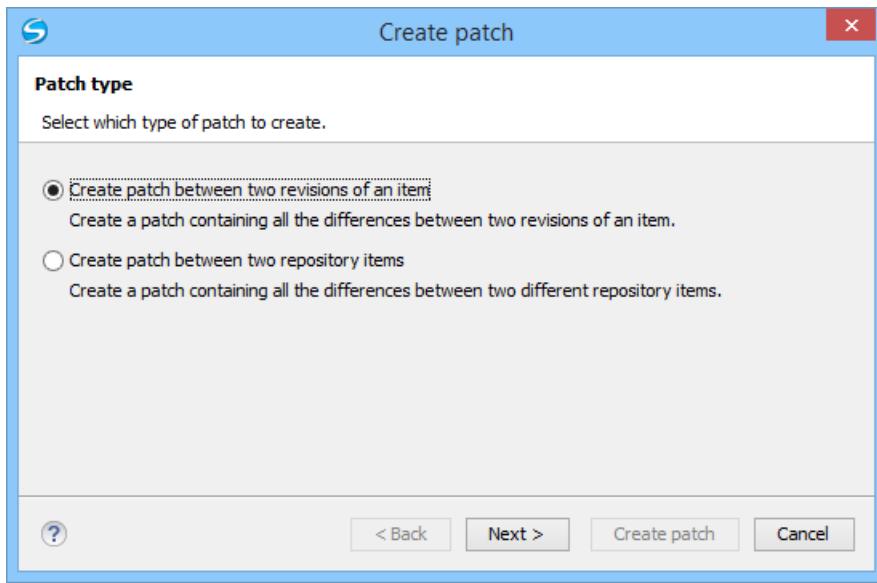

Figure 658: Create Patch Wizard - Remote Items

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

Tip: If you need to generate a patch between two revisions of a previously *deleted*, *moved*, or *replaced* item, you should use [the Create patch between two repository items option](#) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
This opens the **Create patch** wizard.
2. Select the **Create patch between two revisions of an item** option in the dialog box.
3. Press the **Next** button.
The second step of the wizard is opened:

Figure 659: Create Patch Wizard - Step 2

4. Select the starting and ending revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press [the History button](#) to display a list of the item revisions.

Note: The patch will only include changes between the two specified revisions, starting with the changes that were made **after** the older revision.

Tip: If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want [to configure the options](#) for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in [the Output section of the Options page](#) or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

Tip: To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a [peg revision](#) at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu **Tools > Create patch**.

This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.

3. Press the **Next** button.

The second step of the wizard is opened:

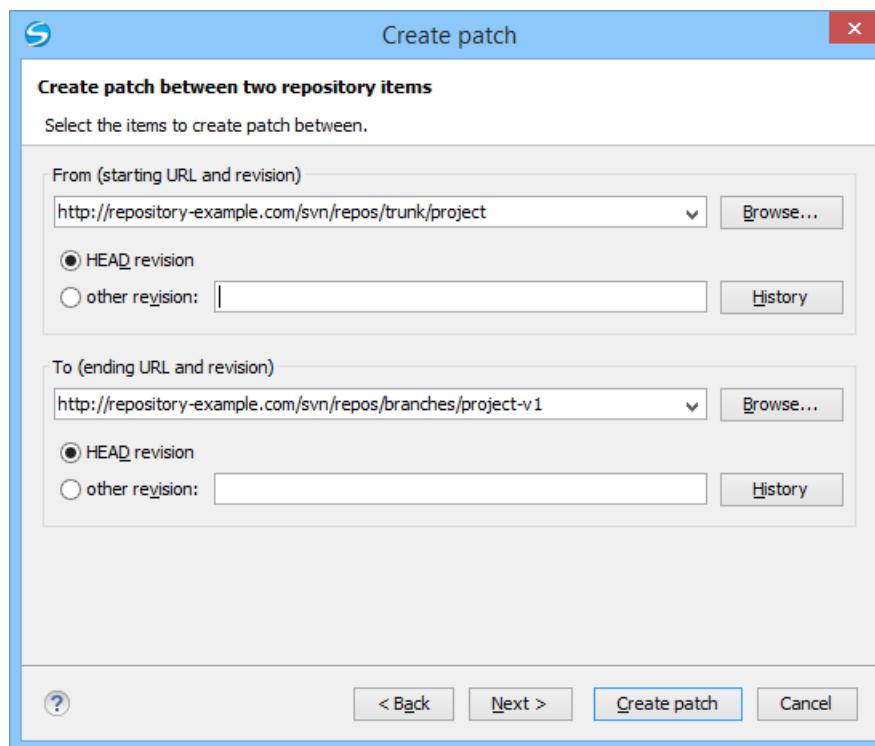

Figure 660: Create Patch Wizard - Step 2

4. Select [the starting and ending URLs](#) and revisions in the **From** and **To** sections.

You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can press [the History button](#) to display a list of the item revisions.

Important: Both URLs must point to items from the same repository.

Note: If you use a peg revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want [to configure the options](#) for your patch, press the **Next** button.

This options page does not remember your selections when creating future patches. It will revert to the default values.

The **Options** wizard page is displayed.

6. Press the **Create patch** button.

The patch is created and stored in the path specified in [the Output section of the Options page](#) or in the default location.

Patch Options

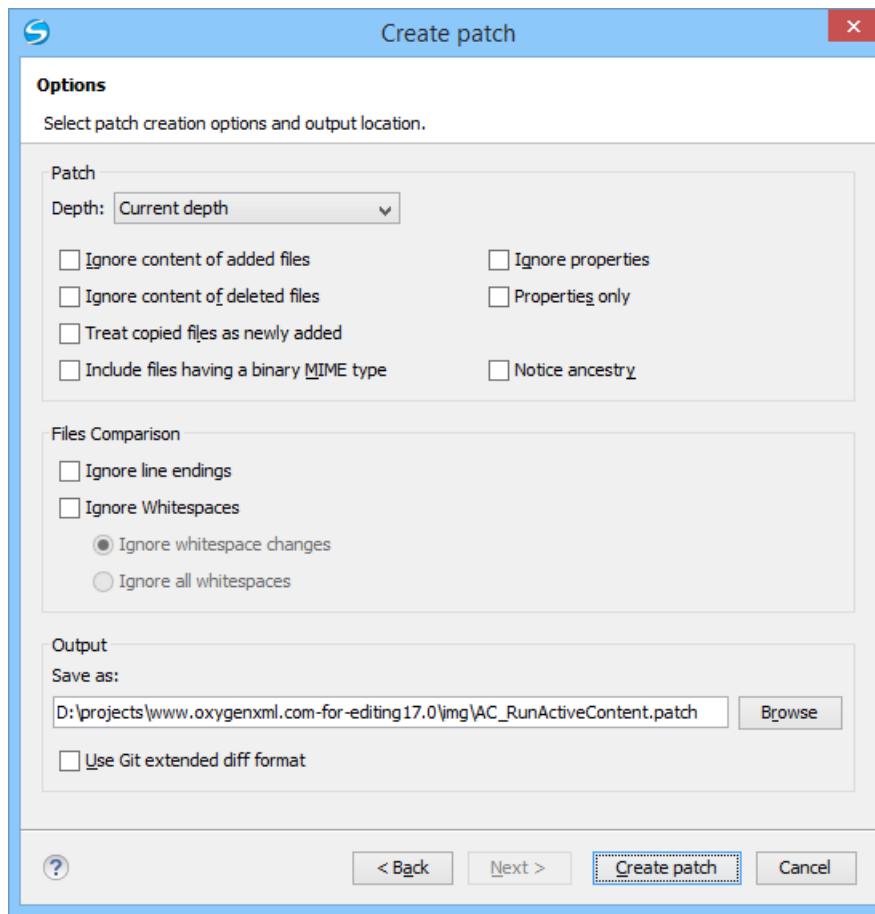

Figure 661: Create Patch Wizard - Options

Patch Section

Depth - (This option is applicable only for directories)

Current depth

The depth of recursing the folder for creating the patch is the same as the depth of that same folder in the working copy (available only when generating patches that contain changes from the working copy).

Recursive (infinity)

The patch is created on all the files and folders contained in the selected folder.

Immediate children (immediates)

The patch is created only on the child files and folders without recursing subfolders.

File children only (files)

The patch is created only on the child files.

This folder only (empty)

The patch is created only on the selected folder (no child file or folder is included in the patch).

Ignore content of added files

When enabled, the patch file does not include the content of the *added* items. This option corresponds to the --no-diff-added option of the svn diff command.

Ignore content of delete files

When enabled, the patch file does not include the content of the *deleted* items. This option corresponds to the --no-diff-deleted option of the svn diff command.

Treat copied files as newly added

When enabled, copied items are treated as new, rather than comparing the items with their sources. This option corresponds to the --show-copies-as-adds option of the svn diff command.

Include files having a binary MIME type

When enabled, the application is forced to compare items that are considered binary file types. This option corresponds to the --force option of the svn diff command.

Ignore properties

When enabled, differences in the properties of items are ignored. This option corresponds to the --ignore-properties option of the svn diff command.

Properties only

When enabled, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the --properties-only option of the svn diff command.

Note: The **Ignore properties** and **Properties only** options are mutually exclusive.

Notice ancestry

If enabled, the SVN common ancestry is taken into consideration when calculating the differences. This option corresponds to the --notice-ancestry option of the svn diff command.

Files Comparison Section

Ignore line endings

If enabled, the differences in line endings are ignored when the patch is generated. This option corresponds to the --ignore-eol-style option of the svn diff command.

Ignore whitespaces

If enabled, it allows you to specify how the whitespace changes should be handled. When enabled, you can then choose between two options:

- **Ignore whitespace changes** (--ignore-space-change) - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).
Note: Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.
- **Ignore all whitespaces** (--ignore-all-space) - Ignores all types of whitespace changes.

Output Section

Save as

The patch will be created and saved in the specified file.

Use Git extended diff format

When enabled, the patch is generated using the *Git* format. This option corresponds to the --git option of the svn diff command.

Working with Repositories

This section explains how to locate and browse SVN repositories in Syncro SVN Client.

Importing Resources Into a Repository

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for [using an existing working copy](#).

The **Import folder** and **Import Files** actions are available from the **Import** submenu of the **Repository** menu or of the contextual menu in the **Repositories** view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The **Import folder** action opens the **Import folder** dialog box.

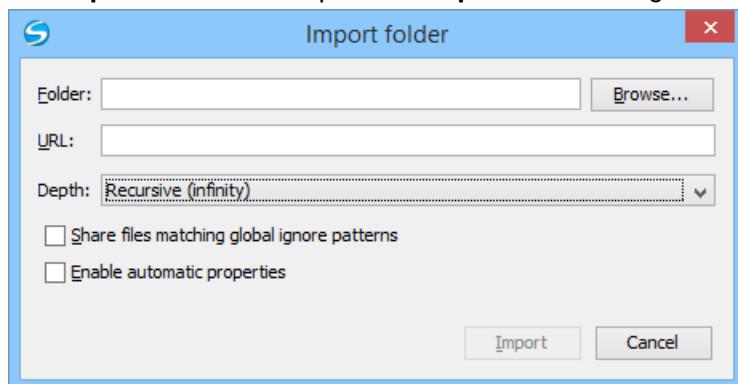

Figure 662: Import Folder Dialog Box

You can configure the following options:

Folder

Specify [the local folder](#) by using the text box or the **Browse** button. This folder should not be empty or already under version control.

Important: By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the **Browse** button to select the local folder so that the client will automatically append the name of it to the specified URL.

URL

Specify [the repository location](#) that will be used to access the folder to be imported.

Note: Peg revisions have no effect for this operation since it is used to send information to the repository.

Attention: If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

Depth

Recursive (infinity)

Imports all the files and folders contained in the selected folder.

Immediate children (immediates)

Imports only the child files and folders without recursing subfolders.

File children only (files)

Imports only the child files.

This folder only (empty)

Imports only the selected folder (no child file or folder is included).

Share files matching global ignore patterns

When enabled, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in [the SVN configuration file](#).
- The [File name ignore patterns option](#) in the [SVN > Working Copy preferences page](#).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in [the SVN configuration file](#).

Note: This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the auto-props section). Based on the value of the enable-auto-props runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

Exporting Resources From a Repository

This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.

The **Export** dialog box is similar to the **Check out** dialog box:

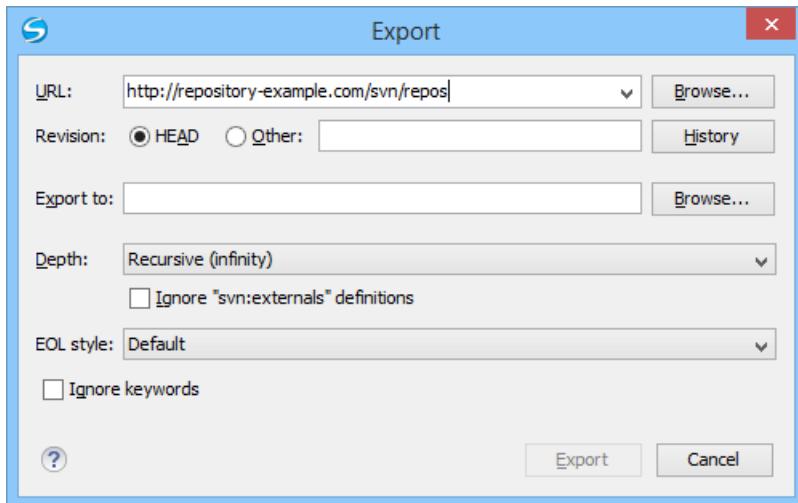

Figure 663: Export from Repository Dialog Box

You can configure the following options:

URL

Specify *the source directory from the repository* by using the text box or the **Browse** button.

Tip: To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* at the end (for example, URL@rev1234).

Note: The content of the selected directory from the repository and not the directory itself will be exported to the file system.

Revision

You can choose between the **HEAD** or **Other** revision. If you need to export a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box.

Export to

Specify *the location where you want to export* the repository directory by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

Important: By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the export location so that the client will automatically append the name of the remote directory to the path of the selected directory.

 **Warning:** The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

Depth

Recursive (infinity)

Exports all the files and folders contained in the selected folder.

Immediate children (immediates)

Exports only the child files and folders without recursing subfolders.

File children only (files)

Exports only the child files.

This folder only (empty)

Exports only the selected folder (no child file or folder is included).

Ignore "svn:externals" definitions

When enabled, external items are ignored in the export operation. This option is only available if you choose the **Recursive (infinity)** depth.

EOL style

Defines the *end-of-line (EOL)* marker that should be used when exporting files that have the value or the `svn:eol-style` property set to native. You can choose between the following styles:

- **Default** - It uses the system-specific *end-of-line* marker.
- **CRLF** - The **Windows**-specific *end-of-line* marker (*carriage return - line feed*).
- **LF** - The **Unix / OS X**-specific *end-of-line* marker (*line feed*).
- **CR** - The **Mac OS 9 (or older)**-specific *end-of-line* marker (*carriage return*).

Ignore keywords

When enabled, the export operation does not expand the SVN keywords found inside the files.

Copy / Move / Delete Resources From a Repository

Once you have a location defined in the [Repositories view](#), you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The **Copy to** and **Move to** action allows you to copy and move individual or multiple resources to a specific directory from the *HEAD* revision of the repository.

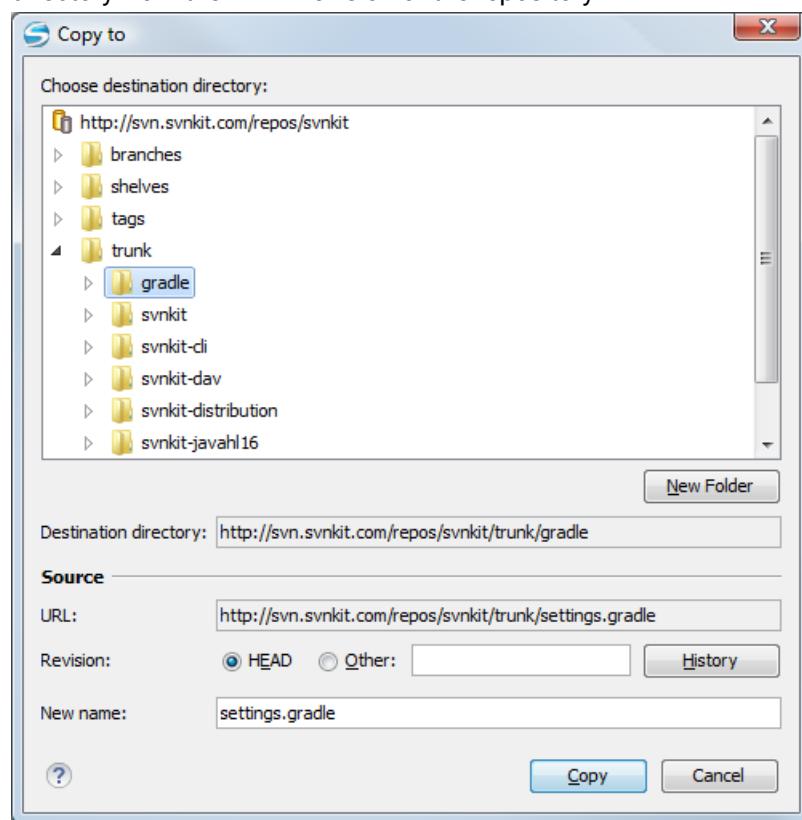

Figure 664: Copy/Move Items in Repository

The dialog box used to copy or move items allows you to browse the *HEAD* revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The **Source** section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision from which you copy one or more items, allowing you to also choose another revision.

Note: Since only items from the HEAD revision can be moved, the **Revision** options are not presented for the **Move to** action.

Note: When you copy a single item while browsing a revision other than HEAD, the **Revision** options present this revision but does not allow you to change it. The same applies if copying multiple items.

- **New name** - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is **Delete**, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the **Commit message** dialog box.

Sparse Checkout

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the [Check out action from the Repositories view](#)) and then recursively update only the needed directories (using the [Update action from the Working Copy view](#)). Each directory then has a depth set to it, with four possible values:

- **Recursive (*infinity*)** - Updates all descendant directories and files recursively.
- **Immediate children (*immediates*)** - Updates the directory, including direct child directories and files, but does not populate the child directories.
- **File children only (*files*)** - Updates the directory, including only child files without the child directories.
- **This folder only (*empty*)** - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value **Current depth**). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the [Working Copy view](#) with a marker corresponding to each depth value, in the top left corner, as follows:

-  **Recursive (*infinity*)** - This is the default value and it is has no mark. The directory has no limiting depth.
-  **Immediate children (*immediates*)** - The directory is limited to direct child directories (without contents) and files.
-  **File children only (*files*)** - The directory is limited to direct child files only.
-  **This folder only (*empty*)** - The directory has *empty* depth set.

A depth set on a directory means that some operations process only items within the specified depth range. For example, **Synchronize** on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the **SVN Information** dialog box and in the tool tip displayed when hovering a directory in the [Working Copy](#) view.

Syncro SVN Client Views

The main working area occupies the center of the application window, which contains the most important views:

- [Repositories View](#)
- [Working Copy View](#)
- [History View](#)
- [Console View](#)

The other views that support the main working area are also presented in this section.

Repositories View

The **Repositories** view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If no connections to your repository are available, you can [add a new repository location](#). Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

- **Date** - Date when the resource was last modified.
- **Revision** - The revision number at the time the resource was last modified.
- **Author** - Name of the person who made the last modification on the resource.
- **Size** - Resource size on disk.
- **Lock information** - Information about the lock status of a file. When a repository file is locked by a user the icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
 - **Owner** - The name of the user who created the lock.
 - **Date** - The date when the user locked the file.
 - **Expires on** - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
 - **Comment** - The message attached when the file was locked.
- **Type** - Contains the resource type or file extension.

Figure 665: Repositories View

Toolbar

The **Repositories** view's toolbar contains the following buttons:

-  **New Repository Location** - Allows you to enter a new repository location by means of the **Add SVN Repository** dialog box.
-  **Move Up** - Move the selected repository up one position in the list of repositories in the **Repositories** view.
-  **Move Down** - Move the selected repository down one position in the list of repositories in the **Repositories** view.
-  **Collapse all** - Collapses all repository trees.
-  **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.
-  **Settings** - Allows you to configure the resource table appearance.

Repositories View Contextual Menu Actions

The **Repositories** view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:

New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))

Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

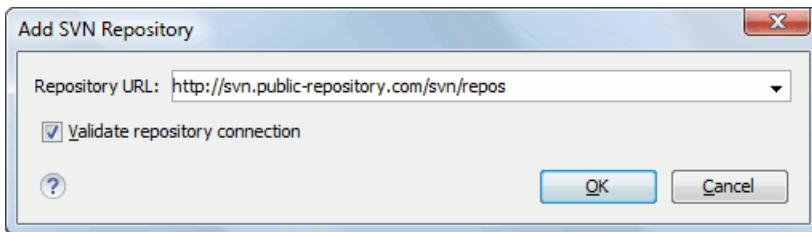

Figure 666: Add SVN Repository Dialog Box

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

Open

Opens the selected file in the Editor view in read-only mode.

Open with

Displays the **Open with** dialog box to specify the editor in which the selected file is opened. If multiple files are selected, only external applications can be used to open the files.

Save as

Saves the selected files locally, as they are in the browsed revision.

Refresh (F5)

Refreshes the resource selected in the **Repositories** view.

Check out (Ctrl + Alt + O (Command + Alt + O on OS X))

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section [Check out a working copy](#).

Branch/Tag

Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the [Creation and management of Branches/Tags](#) section.

Share project

Allows you to [share a new project](#) using an SVN repository. The local project is automatically converted into an SVN working copy.

Import:

Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section [Importing resources into a repository](#).

Note: The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))

Imports the files selected from the files system into the selected folder in the repository.

Export

Opens [the Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

Show History (Ctrl + H (Command + T on OS X))

Displays the history of the selected resource. At the start of the operation, you can set filtering options.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view](#), along with the history of the file in the **History** view.

Revision Graph (Ctrl + G (Command + G on OS X))

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see the section [Revision Graph](#). This operation is enabled for any resource selected into the **Repositories** view or **Working Copy** view.

Copy URL Location (Ctrl + Alt + U (Command + Alt + U on OS X))

Copies to clipboard the URL location of the selected resource.

Copy to

Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (*HEAD*), to allow restoring previous versions of an item.

Move to (Ctrl + M (Command + M on OS X))

Moves to a specified location the currently selected resource(s).

Rename ((F2))

Renames the selected resource.

Delete ((Delete))

Deletes selected items from the repository via an immediate commit.

New Folder (Ctrl + Shift + F (Command + Shift + F on OS X))

Allows you to create a folder in the selected repository path (available only for folders).

Locking

The following options are available only for files:

Lock (Ctrl + K (Command + K on OS X))

Allows you to lock certain files for which you need exclusive access. For more details on the use of this action, see [Locking a file](#).

Unlock (Ctrl + Shift + K (Command + Shift + K on OS X))

Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

Show SVN Properties (Ctrl + Shift + P (Command + Shift + P on OS X))

Brings up the *Properties view* displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

Show SVN Information (Ctrl + I (Command + I on OS X))

Provides additional information for the selected resource. For more details, go to [Obtain information for a resource](#).

Assistant Actions

When there is no repository configured, the **Repositories** view mode lists the following two actions:

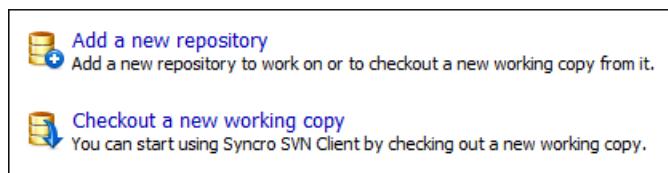

Figure 667: Repositories View Actions

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the **Repositories** view. These operations behave in the same way with the **Copy to/Move to** operations.

Working Copy View

The **Working Copy** view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- **Settings** menu.

If you click any of the view modes (**All Files, Modified, Incoming, Outgoing, Conflicts**), the information displayed changes as follows:

-  **All Files** - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

Figure 668: Working Copy View - All Files View Mode

- **Modified** - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:

- Incoming modification from repository:

- - File content or properties modified remotely.
- - New file added remotely.
- - File deleted remotely.

- Outgoing modification to repository:

- - File content or properties modified locally.
- - New file added locally.
- - File deleted locally.

- - **Pseudo-conflict state** - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.

- - **Real conflict state** - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

Figure 669: Working Copy View - Modified View Mode

- ← **Incoming** - The resource tree presents only incoming changes.
- **Outgoing** - The resource tree presents only outgoing changes.
- ↔ **Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).

The following columns provide information about the resources:

- Name** - Resource name. Resource icons can have the following decorator icons:
 - Additional status information:
 - Propagated modification marker** - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.
 - External** - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a svn:externals property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.
 - Switched** - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of [the Switch action](#) executed from the contextual menu of the Working Copy view.
 - Grayed** - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the [Add to svn:ignore](#) action.
 - Current SVN depth of a folder:
 - Immediate children (immediates)** (a variant of [sparse checkout](#)) - The directory contains only direct file and folder children. Child folders ignore their content.
 - File children only (files)** (a variant of [sparse checkout](#)) - The directory contains only direct file children, disregarding any child folders.

-  **This folder only (empty)** (a variant of [sparse checkout](#)) - The directory discards any child resource.

Note:

- Any folder not marked with one of the depth icons, has recursive depth (*infinity*) set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Editor presents *unversioned* and *ignored* folders with *empty* depth when **Show unversioned directories content** or **Show ignored directories content** options are disabled.
-  **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:
 -  - Resource is *not under version control (unversioned)*.
 -  - Resource is being *ignored* because it is not under version control and its name matches a file name pattern defined in one of the following places:
 - *global-ignores* section in the SVN client-side [config file](#).
 -  **Attention:** If you do not explicitly set the *global-ignores* runtime configuration option (either to your preferred set of patterns or to an empty string), Subversion uses the default value.
 - [**Application global ignores**](#) option of Oxygen XML Editor.
 - The value of a [*svn:ignore* property](#) set on the parent folder of the resource being ignored.
-  - Marks a newly created resource, *scheduled for addition* to the version control system.
-  - Marks a resource *scheduled for addition*, created by copying a resource already under version control and inheriting all its SVN history.
-  - The content of the resource has been *modified*.
-  - Resource has been *replaced* in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
-  - Resource is *deleted* (scheduled for deletion from **Repository** upon the next commit).
-  - The resource is *incomplete* (as a result of an interrupted *check out* or *update* operation).
-  - The resource is *missing* because it was moved or deleted without using an SVN-aware application.
-  - The contents of the resource is in [*real conflict state*](#).
-  - Resource is in a *name conflict* state.
-  - Resource is in *tree conflict* state after an update operation because:
 - Resource was locally modified and incoming deleted from repository.
 - Resource was locally scheduled for deletion and incoming modified.
 -  - Resource is *obstructed* (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).
-  **Local properties status** - Marks the resources that have SVN properties, with the following possible states:
 -  - The resource has SVN properties set.
 -  - The resource properties have been modified.
 -  - Properties for this resource are in [*real conflict*](#) with property updates received from the repository.
- **Revision** - The current revision number of the resource.
- **Date** - Date when the resource was last time modified on the disk.
- **BASE Revision** - The revision number of the pristine version of the resource.
- **BASE Date** - Date when the pristine version of the resource was last time committed in the repository.
- **Author** - Name of the person who made the last modification on the pristine version of the resource.
-  **Remote file status** - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
 -  - Resource is newly added in repository.
 -  - The content of the resource has been modified in repository.
 -  - Resource was replaced in repository.

-  - Resource was deleted from repository.
-  **Remote properties status** - Resources marked with the  icon have incoming modified properties from the repository.
- **Remote revision** - Revision number of the resource latest committed modification.
- **Remote date** - Date of the resource latest modification committed on the repository.
- **Remote author** - Name of the author who committed the latest modification on the repository.
-  **Lock information** - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.

A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the  symbol. To clear the locked state of a folder, use the **Clean up** action.

Note: Users can lock only files.

The following lock states are displayed:

- *no lock* - the file is not locked. This is the default state of a file in the SVN repository.
- *remotely locked* () - shown when:
 - Another user has locked the file in the repository.
 - The file was locked by the same user from another working copy.
 - The file was locked from the **Repositories** view.

If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

Note: To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to *break* or *steal* the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- *locked* () - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.

Note: Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not *stolen* or *broken*).

- *stolen* () - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.
- *broken* () - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

Note: To remove the *stolen* or *broken* states from your working copy files, you have to **Update** them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- Lock type - current file lock state
- Owner - the name of the user who created the lock
- Date - the date when the user locked the file
- Expires on - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- Comment - the message attached when the file was locked
- **Size** - Resource size on disk
- **Type** - Contains the resource type or file extension

Note: The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.

The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Editor is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the **Working Copy** view.
-  **Working Copies Manager** - Opens a dialog box that displays the working copies Oxygen XML Editor is aware of. In this dialog box, you can add existing working copies or remove those you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Editor warns you that the selected directory is not under version control.

Note: Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

Working Copy Settings

The **Settings** button from the toolbar of the **Working Copy** view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.
Note: If this option is disabled, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except **All Files**.
- **Show ignored items** - Displays the ignored resource when **All Files** mode is selected.
- **Show ignored directories content** - Displays the content of ignored directories when **All Files** mode is selected.
Note: Although *ignored* items are not presented in the **Modified**, **Incoming**, and **Conflicts** modes, they will be if, after a synchronize, they are reported as incoming from the repository.
- **Show deleted items** - Displays the deleted resource when **All Files** mode is selected. All other modes always display deleted resources, disregarding this option.
-    **Tree / Compressed / Flat** - Affect the way information is displayed inside the **Modified**, **Incoming**, **Outgoing**, and **Conflicts** view modes.
- **Configure columns** - Allows you to customize the structure of the **Working Copy** view data. This action opens the following dialog box:

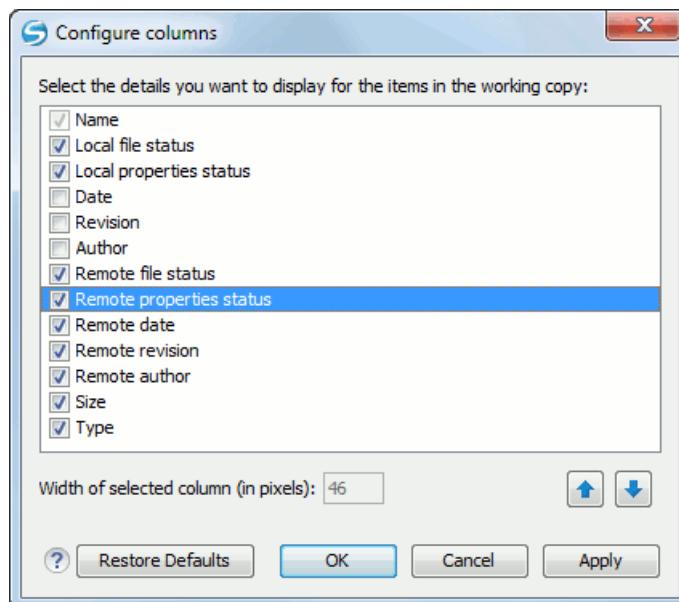

Figure 670: Configure Columns of Working Copy View

The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width and enabled/disabled state from the installation of the application.

Working Copy Format

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the ***When loading an old format working copy option***.

To change how working copy formats are handled, [open the Preferences dialog box \(Options > Preferences\)](#), go to **SVN > Working copy**, and configure the options in the **Administrative area** section.

Note:

- The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the **Tools** menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
- SVN 1.7 working copies cannot be downgraded to older formats.

Refresh a Working Copy

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the **Working Copy** view and when you switch between Oxygen XML Editor and other applications.

The **Working Copy** view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

Working Copy View Contextual Menu Actions

The contextual menu in the **Working Copy** view contains the following actions:

Edit conflict (Ctrl (Command on OS X) + E)

Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see [Edit conflicts](#).

Open in Compare Editor (Ctrl (Command on OS X) + Alt + C)

Displays changes made in the currently selected file.

Open (Ctrl (Command on OS X) + O)

Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on OS X, etc).

Open with...

Submenu that allows you to open the selected resource either with Oxygen XML Editor or with another application.

Show in Explorer/Show in Finder

Opens the parent directory of the selected working copy file and selects the file.

Expand All (Ctrl (Command on OS X) + Alt + X)

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

Refresh (F5)

Re-scans the selected resources recursively and refreshes their status in the working copy view.

Synchronize (Ctrl (Command on OS X) + Shift + S)

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the [**Always switch to 'Modified' mode option**](#) is selected.

Update (Ctrl (Command on OS X)+ U)

Updates the selected resources to the **HEAD** revision (latest modifications) from the repository. If the selection contains a directory, it will be updated depending on its depth.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the [sparse checkouts](#) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

Revert (Ctrl (Command on OS X) + Shift + V)

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is enabled only for modified resources. See [Revert your changes](#) for more information.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the [Revert your changes](#) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see [Drop incoming modifications](#).

Mark Resolved (Ctrl (Command on OS X) + Shift + R)

Instructs the Subversion system that you resolved a conflicting resource. For more information, see [Merge conflicts](#).

Mark as Merged (Ctrl (Command on OS X) + Shift + M)

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts](#) section for more information about how you can solve the pseudo-conflicts.

Create patch (Ctrl (Command on OS X) + Alt + P)

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see [the section about patches](#).

Compare with:

- **Latest from HEAD (Ctrl (Command on OS X) + Alt + H)** - Performs a 3-way diff operation between the selected file and the *HEAD* revision from the repository and displays the result in the **Compare view**. The common ancestor of the 3-way diff operation is the *BASE* version of the file from the local working copy.
- **BASE revision (Ctrl (Command on OS X) + Alt + C)** - Compares the working copy file with the *BASE* revision file (the so-called *pristine copy*).
- **Revision (Ctrl (Command on OS X) + Alt + R)** - Displays the **History view** that contains the log history of that resource.
- **Branch/Tag** - Opens the **Compare with Branch/Tag** dialog box that allows you to specify [another file from the repository](#) (**To URL** field) to compare with the working copy file. You can specify the revision of the repository file by choosing between **HEAD revision** or specific **Other revision**.

Tip: To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a [peg revision](#) at the end (for example, URL@rev1234).

- **Each other** - Compares two selected files with each other.

These compare actions are enabled only if the selected resource is a file.

Replace with:

- **Latest from HEAD** - Replaces the selected resources with their versions from the *HEAD* revision of the repository.
- **BASE revision** - Replace the selected resources with their versions from the pristine copy (the *BASE* revision).

Note: In some cases it is impossible to replace the currently selected resources with their versions from the **BASE/HEAD** revision:

- For the **Replace with BASE revision** action, the resources being unversioned or added have no **BASE** revision, and thus cannot be replaced. However, they will be deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders
- For the **Replace with latest from HEAD** action, you must be aware that there are cases when resources will be completely deleted or reverted to the **BASE** revision and then updated to a **HEAD** revision to avoid conflicts. These cases are:
 - The resource is *unversioned, added, obstructed, or modified*.
 - The resource is affected by a `svn:ignore` or `svn:externals` property that is locally added on the parent folder and not yet committed to the repository.

Show History (Ctrl (Command on OS X) + H)

Displays the **History view** where the log history for the selected resource will be presented. For more details about resource history, see the sections about [the resource history view](#) and [requesting the history for a resource](#).

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view](#), along with the history of the file in the **History** view.

Revision Graph (Ctrl (Command on OS X) + G)

This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see [Revision Graph](#).

Copy URL Location (Ctrl (Command on OS X) + Alt + U)

Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

Mark as copied

You can use this action to mark an item from the working copy as a copy of an other item under *version control*, when the copy operation was performed outside of an SVN client. The **Mark as copied** action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The **Mark as moved** action is available when you select two items from different locations (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

Copy to

Copies the currently selected resource to a specified location.

Move to Ctrl + M (Command + M on OS X)

Moves the currently selected resource to a specified location.

Rename (F2)

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

Delete (Delete)

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

New:

-  **New File** - Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.
- **New Folder (Ctrl (Command on OS X) + Shift + F)** - Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.
- **New External Folder (Ctrl (Command on OS X) + Shift + W)** - This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a [URL of a versioned directory](#), and ideally a particular revision, stored in the svn:externals property of the selected folder.

Tip: You can specify a particular revision of the external item by using a [peg revision](#) at the end of the URL (for example, URL@rev1234). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- .. - Relative to the URL of the directory that the svn:externals property is set.
- ^ - Relative to the root of the repository in which the svn:externals property is versioned.
- // - Relative to the scheme of the URL of the directory that the svn:externals property is set.
- / - Relative to the root URL of the server in which the svn:externals property is versioned.

Important: To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the svn:externals property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

Note: Syncro SVN Client does not support definitions of local relative external items.

Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)

Allows you to add files that should not participate in the *version control* operations inside your working copy . This action can only be performed on resources not under *version control*. It actually modifies the value of the svn:ignore property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control](#) section.

Add to version control (Ctrl (Command on OS X) + Alt + V)

Allows you to add resources that are not under *version control*. For further details, see [Add Resources to Version Control](#) section.

Remove from version control

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

Clean up (Ctrl (Command on OS X) + Shift + C)

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under *version control*.

Locking:

- **Scan for locks (Ctrl (Command on OS X) + L)** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under *version control*. For more details see [Scanning for locks](#).
-  **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under *version control*. For more details on the use of this action see [Locking a file](#).

-  **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (*break the lock*).

Show SVN Properties (Ctrl + P (Command + P on OS X))

Brings up the *Properties view* and displays the SVN properties for the selected resource.

Show SVN Information (Ctrl + I (Command + I on OS X))

Provides additional information for the selected resource from the working copy. For more details, go to [Obtain information for a resource](#).

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the **Working Copy** view. These operations behave in the same way with the **Copy to/Move to** operations.

Also, files and folders can be added to the file tree of the view as *unversioned* resources by drag and drop operations from other applications (for example, from Windows Explorer or Mac OS X Finder). In this case, the items from the file system are only copied, without removing them from their original location.

 **Attention:** When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as *missing* in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).

Assistant Actions

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the **All Files** view mode lists the following two actions:

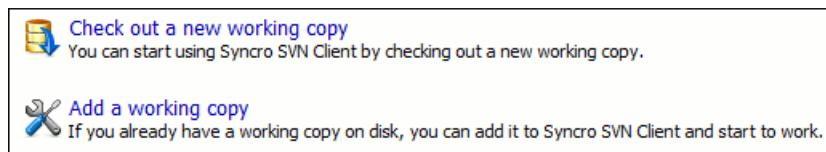

Figure 671: All Files Panel

For **Modified**, **Incoming**, **Outgoing**, **Conflicts** view modes, the following actions may be available, depending on the current working copy state in various contexts:

-  **Synchronize with Repository** - Available only when there is nothing to present in the **Modified** and **Incoming** view modes.
-  **Switch to Incoming** - Selects the **Incoming** view mode.
-  **Switch to Outgoing** - Selects the **Outgoing** view mode.
-  **Switch to Conflicts** - Selects the **Conflicts** view mode.
-  **Show all changes/incoming/outgoing/conflicts** - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.
-  **(Information message)** - Informs you why there are no resources presented in the currently selected view mode.

History View

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from [Repositories view](#), [Working Copy view](#), [Revision Graph](#), or [Directory Change Set view](#). From

the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The view consists of four distinct areas:

- The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author's name, and a fragment of the commit message.

Some revisions may be highlighted to emphasize:

- The current revision of the resource for which the history is displayed - a bold font revision.
- The last revision in which the content or properties of the resource were modified - blue font revision.

Note: Both font highlights may be applied for the same revision.

- The complete commit message for the selected revision.
- A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.
- The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:
 - **+** - A newly created resource.
 - **+** - A newly created resource, copied from another repository location.
 - ***** - The content/properties of the resource were *modified*.
 - **R** - Resource was *replaced* in the repository.
 - **-** - Resource was *deleted* from the repository.

Revision	Date	Changes	Author	Message
Today (1 revision)

Figure 672: History View

You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

History Filter Dialog Box

The **History view** does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more

recent ones. That is why you can specify the criteria for the revisions displayed in the **History view** by selecting one of several options presented in the **History** dialog box that is displayed when you invoke the **Show History** action.

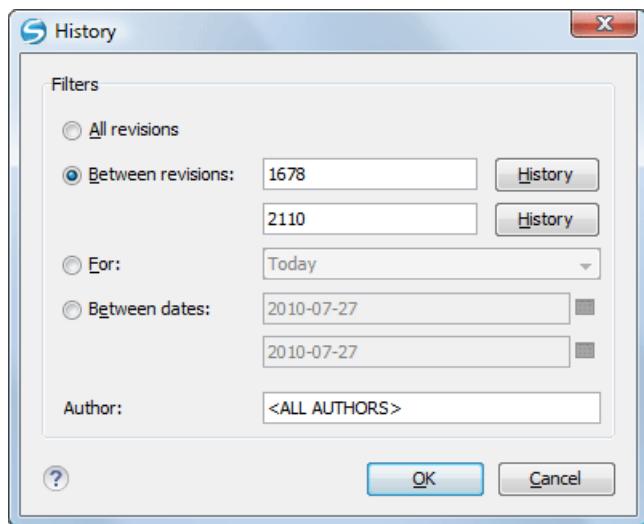

Figure 673: History Filters Dialog Box

Options for the set of revisions presented in the History view are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the **History view** has two buttons for extending the set of revisions presented in the view: **Get next 50** and **Get all**.

History Filter Field

When only the history entries that contain a specified substring need to be displayed in the **History** view, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the **Find** label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the **History** view. When you press the **Search** button, the filter action is executed and the content of the table is updated.

History View Contextual Menu Actions

The **History** view contains the following contextual menu actions:

Compare with working copy

Compares the selected revision with your working copy file. It is enabled only when you select a file.

Open

Opens the selected revision of the file into the Editor. This is enabled only for files.

Open with

Displays the **Open with** dialog box to specify the editor in which the selected file will be opened.

Get Contents

Replaces the current version from the working copy with the contents of the selected revision from the history of the file. The *BASE* version of the file is not changed in the working copy so that after this action the file will appear as modified in a synchronization operation, that is newer than the *BASE* version, even if the contents is from an older version from history.

Save as

Allows you to save the contents of a file as it was committed at a certain revision. This option is available only when you access the history of a file.

Copy to

Copies to the repository the item whose history is displayed, using the selected revision. This option is active only when presenting the history for a repository item (URL).

Note: This action can be used to resurrect deleted items also.

Revert changes from this revision

Reverts changes that were made in the selected revisions. The changes are reverted only in your working copy and does not affect the repository items. It does not replace your working copy items with those from the selected revisions. This action is enabled when the resource history was launched for a local working copy resource.

Note: For items displayed in the **Affected Paths** section that were *added*, *deleted*, or *replaced*, this action has no effect because such changes are considered to be changes to the parent directory. To revert these type of changes, follow these steps:

1. Request the history for the parent directory.
2. Identify the revision that contains the changes you want to revert.
3. Invoke the action on that revision.

Warning: There are instances where the SVN Client is not able to identify the corresponding working copy item for the selected item in the **Affected Paths** section. In this case, the action does not proceed and an error message is displayed. For example, the selected item in the **Affected Paths** section is from a different repository location than the working copy item for which the history is displayed.

Update to revision

Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file. Otherwise, your working copy is inconsistent and you are unable to commit your changes.

Check out

Checks out a new working copy of the directory for which the history is presented, from the selected revision.

Export

Opens [the Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view](#), along with the history of the file in the **History** view.

Change

Allows you to change commit data for a file:

- *Author* - Changes the name of the SVN user that committed the selected revision.
- *Message* - Changes the commit message of the selected revision.

When two resources are selected in the **History** view, the contextual menu contains the following actions:

Compare revisions

When the resource is a file, the action compares the two selected revisions using the **Compare** view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

Revert changes from these revisions

Similar to the `svn merge` command, it merges two selected revisions into the working copy resource. This action is only enabled when the resource history was requested for a working copy item.

For more information about the **History view** and its features, see the [Request history for a resource](#) and [Using the resource history view](#) sections.

Directory Change Set View

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.

The screenshot shows a 'Directory Change Set' window with the title 'Directory Change Set - /userguide/trunk'. It indicates a comparison from revision 8913 to revision 10857. On the left, a tree view shows the directory structure under '/userguide/trunk', specifically focusing on the 'DITA' and 'concepts' folders. A file named 'AuthorDeveloperGuide.ditamap' is selected in the tree. On the right, a table lists all revisions made between the two reference revisions. The columns are 'Action', 'Revision', 'Date', 'Author', and 'Message'. The table contains 14 rows of data. At the bottom of the right panel, there is a 'Commit message' area containing the text: 'EXM-17248 Display child map AuthorDevelGuide as one entry in parent map EditorUserManual.ditamap.'

Action	Revision	Date	Author	Message

Figure 674: Directory Change Set View

The set of changed resources displayed in the tree is obtained by running the action **Compare revisions** available on the contextual menu of the **History** view when two revisions of a folder resource are selected in the **History** view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message of that revision in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right side list of the view performs a diff operation between that revision and the previous one of the same file.

The contextual menu of the right side list contains the following actions:

Compare with previous version

Performs a diff operation between the selected revision in the list and the previous one.

Open

Opens the selected revision in the associated editor type.

Open with

Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

Save as

Saves the selected file as it was in the selected revision.

Copy to

Copies to the repository the item whose history is displayed, using the selected revision.

Note: This action can be used to resurrect deleted items also.

Check out

Checks out a new working copy of the selected directory, from the selected revision.

Export

Opens [the Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

Show Annotation ([Ctrl + Shift + A \(Command + Shift + A on OS X\)](#))

Opens the **Show Annotation** dialog box that computes [the annotations for a file and displays them in the Annotations view](#), along with the history of the file in the **History** view.

Show SVN Information ([Ctrl \(Command on OS X\) + I](#))

Provides additional information for a selected resource. For more details, go to [Obtain information for a resource](#).

Editor Panel of SVN Client

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in [the File Types preferences panel](#).

The internal editor can be accessed either from the [Working copy view](#) or from the [History view](#). No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file's content type is unknown you will be prompted to choose the proper way the file should be opened.

After editing the content of the file in an internal editor you can save it to disk by using the **Save** action from the **File** menu or the [Ctrl + S \(Command + S on OS X\)](#) key shortcut. After saving your file you can see the file changed status in [the Working Copy view](#).

If the internal editor associated with a file type is not the XML Editor, then the encoding set in [the preferences for Encoding for non XML files](#) is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

Annotations View

Sometimes you need to know not only what was changed in a file, but also who made those changes. The **Annotations** view displays the revision and the author that changed every line in a file. The annotations of a file are computed and this view is opened with the  **Show Annotation** action, which is available in the **History** menu, and from the contextual menu of the following views: [the Repositories view](#), [Working copy view](#), [History view](#), and [Directory Change Set view](#)..

This action opens a dialog box that allows you to configure some options for showing the annotations.

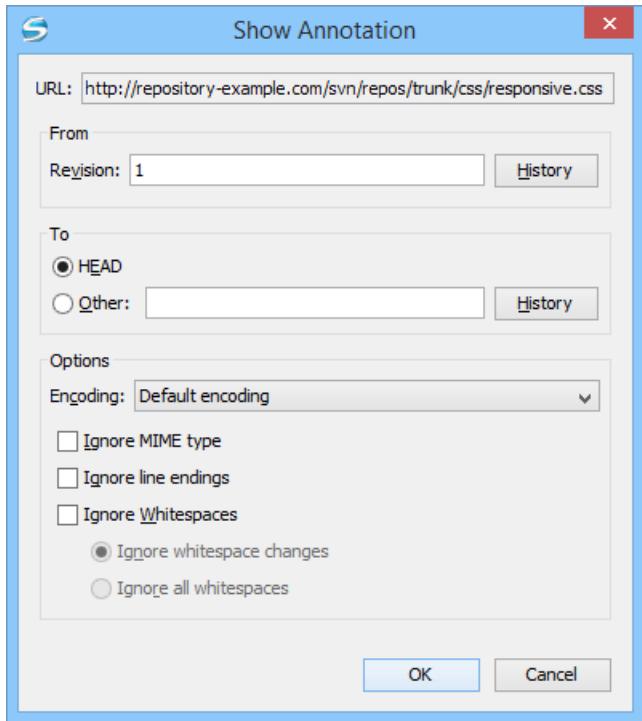

Figure 675: Show Annotation Options Dialog Box

Once you have configured the options and click **OK**, the **Annotations** view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to see the revision in which the line was last modified. The same revision is highlighted in the **History view** and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the **Annotations view** corresponding to that revision are highlighted. Therefore, the **Annotations view**, **History view**, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.

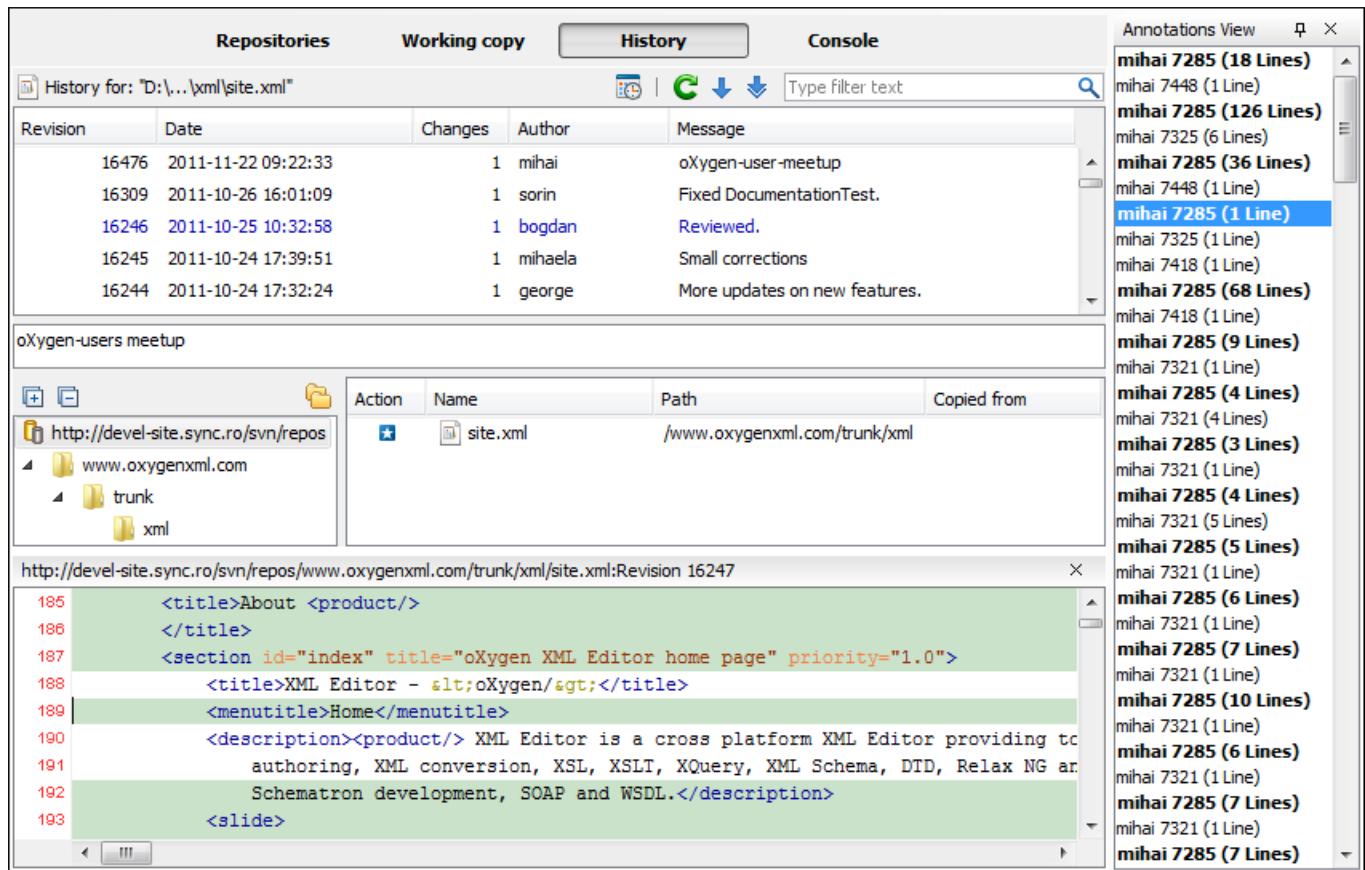

Figure 676: Annotations View

The following options can be configured in the **Show Annotation** dialog box:

From Revision Section

Select the revision from which to start computing the annotation. If you press the **History** button, the **History dialog box** is displayed, which allows you to select a revision.

To Revision Section

Select the ending revision by choosing between the **HEAD** revision or specify it in the **Other** text box . If you press the **History** button, the **History dialog box** is displayed, which allows you to select a revision.

Encoding

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file. Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

Ignore MIME type

If enabled, the file is treated as a text file and ignores what the SVN system infers from the `svn:mime-type` property.

Ignore line endings

If enabled, the differences in line endings are ignored when the annotation is computed.

Ignore whitespaces

If enabled, it allows you to specify how the whitespace changes should be handled. When enabled, you can then choose between two options:

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

Note: Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

Tip: Enabling any of these *ignore* options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and press **OK**, the annotations will be computed and the **Annotations** view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

Note: If the file has a very long history, the computation of the annotation data can take a long time to process.

Compare View

In the Oxygen XML Editor, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in **Compare** view. This view is automatically opened if you select two files and use the **Compare with > Each Other** action in the contextual menu.

Figure 677: Compare View

At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a *line differencing algorithm*. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a **Refresh** operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the **Synchronize** operation, you can examine the exact differences between your local file and the **HEAD** revision file.

- You can use the **Compare view** from the **History view** to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see [View Differences](#).

Compare View Toolbar

The toolbar of the **Compare** view contains the operations that can be performed on the source and target files.

Figure 678: Compare View Toolbar

The following actions are available:

Algorithm

The algorithm to be used for performing a comparison. The following options are available:

- Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Save action

Saves the content of the left editor when it can be edited.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespace

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When enabled, a selected difference can be seen in both panels.

Format and Indent Both Files (**Ctrl + Shift + P (Command + Shift + P on OS X)**)

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (**Ctrl + Period (Command + Period on OS X)**)

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

Ignore Nodes by XPath

You can use this text field to enter an [XPath expression](#) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

Note: If an XPath expression is specified in the [Ignore nodes by XPath option](#) in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Most of these actions are also available from the [Compare](#) menu.

Image Preview

You can view your local files by using the built-in **Image Preview** component. The view can be accessed from the [Working copy view](#) or from the [Repository view](#). It can also be used from the [History view](#) to view a selected revision of a image file.

Only one image file can be opened at a time. If an image file is opened in the *Image preview* and you try to open another one it will be opened in the same window. Supported image types are **GIF, JPEG/JPG, PNG, BMP**. Once the image is displayed in the **Image Preview** panel using the actions from the contextual menu, you can scale the image at its original size (**1:1** action) or scale it down to fit in the view's available area (**Scale to fit** action).

Compare Images View

The images are compared using the **Compare Images** view. This view is automatically opened if you select two image files and use the **Compare with > Each Other** action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view's available area.

The supported image types are: **GIF, JPG / JPEG, PNG, BMP**.

Properties View

The properties view presents Apache Subversion™ properties for the currently selected resource from either the [Working Copy](#) view or the [Repositories](#) view. If the view is not displayed, it can be opened from the **Window > Show View** menu.

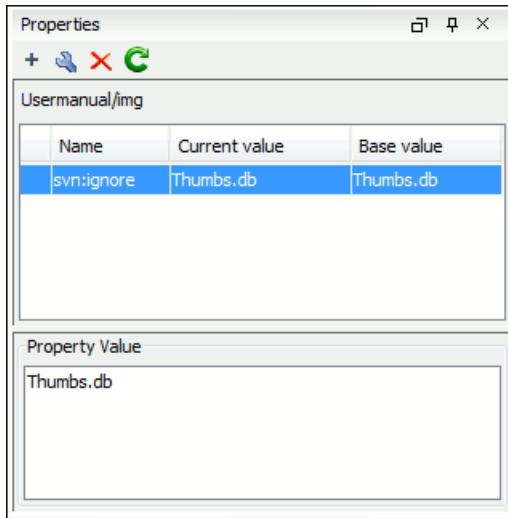

Figure 679: Properties View

The table includes four columns:

- **State** - Can be one of the following:
 - (empty) - Normal unmodified property (same current and base values)
 - * (asterisk) - Modified property (current and base values are different)
 - + (plus sign) - New property
 - - (minus sign) - Removed property
- **Name** - The property name.
- **Current value** - The current value of the property.
- **Base value** - The base (original) value of the property.

svn:externals Property

The svn:externals property can be set on a folder or a file. In the first case it stores *the URL of a folder from other repository*.

In the second case it stores the URL of a file from other repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and file externals:

- The path to the file external must be in a working copy that is already checked out. While directory externals can place the external directory at any depth and it will create any intermediate directories, file externals must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the file external will be inserted into; interrepository file externals are not supported.
- While commits do not descend into a directory external, a commit in a directory containing a file external will commit any modifications to the file external.

The differences between a normal versioned file and a file external:

- File externals cannot be moved or deleted; the svn:externals property must be modified instead; however, file externals can be copied.

A file external is displayed as a X in the switched status column.

Toolbar / Contextual Menu

The properties view toolbar and contextual menu contain the following actions:

- **Add a new property** - This button invokes the *Add property* dialog box in which you can specify the property name and value.
- **Edit property** - This button invokes the *Edit property* dialog box in which you can change the property value and also see its original(base) value.

-  **Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
-  **Refresh** - This action will refresh the properties for the current resource.

Console View

The **Console View** shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the Subversion command-line notation. For a detailed description of the Subversion console output read the **SVN User Manual**.

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

Clear

Erases all the displayed messages.

Lock scroll

Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the [Preferences](#) page. By default, this value is set to 100.

Dynamic Help View

Dynamic Help view is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Revision Graph of a SVN Resource

The history of a SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

The graphical representation of a resource history is invoked with the  **Revision graph** action available on the right-click menu of a SVN resource in [the Working Copy view](#) and [the Repository view](#).

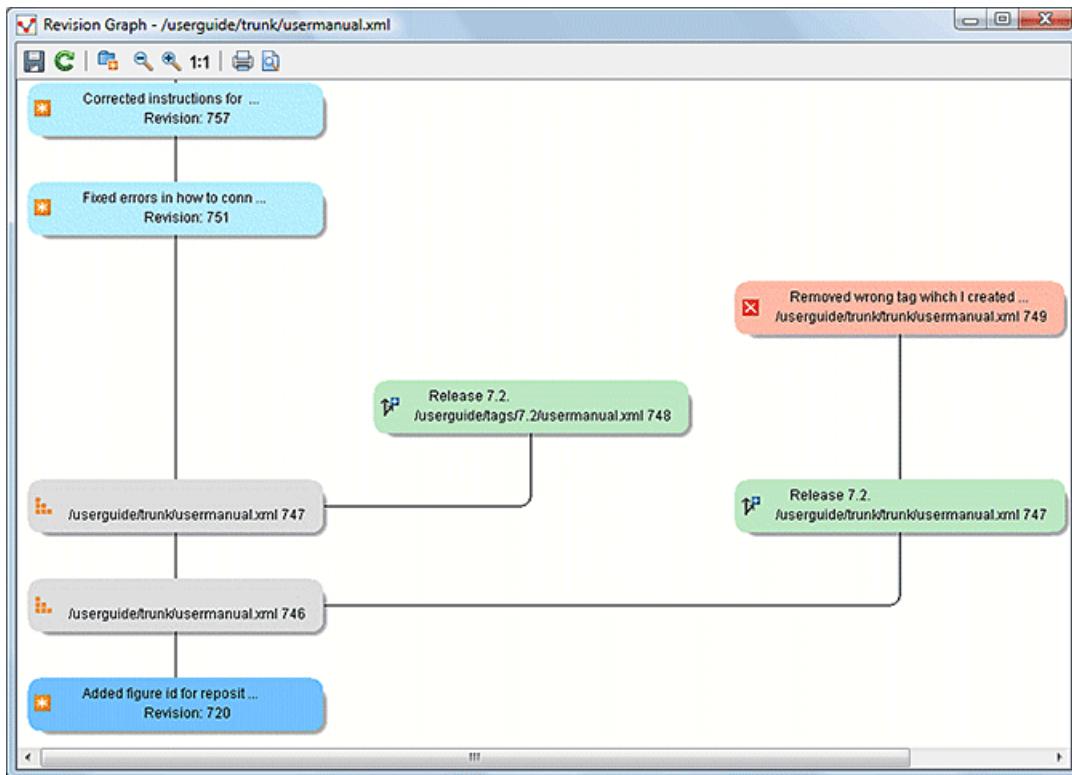

Figure 680: Revision Graph of a File Resource

In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who created the revision of that node, the revision number, the date of creation, the commit message, the modification type and *the affected paths*.

The types of nodes used in the graph are:

Added resource

The icon for a new resource added to the repository and a green background.

Copied resource

The icon for a resource copied to other location (for example, when a SVN tag is created and a green background).

Modified resource

The icon for a modified resource and a blue background.

Deleted resource

The icon for a resource deleted from the repository and a red background.

Replaced resource

The icon for a resource removed and replaced with another one on the repository and a orange background.

Indirect resource

The icon for a revision from where the resource was copied or an indirectly modified resource, that is a directory in which a resource was modified and a gray background. The *Modification type* field of the tooltip specifies how that revision was obtained in the history of the resource.

A directory resource is represented with two types of graphs:

Simplified graph

Lists only the changes applied directly to the directory;

Complete graph

Lists also the indirect changes of the directory resource, that is the changes applied to the resources contained in the directory.

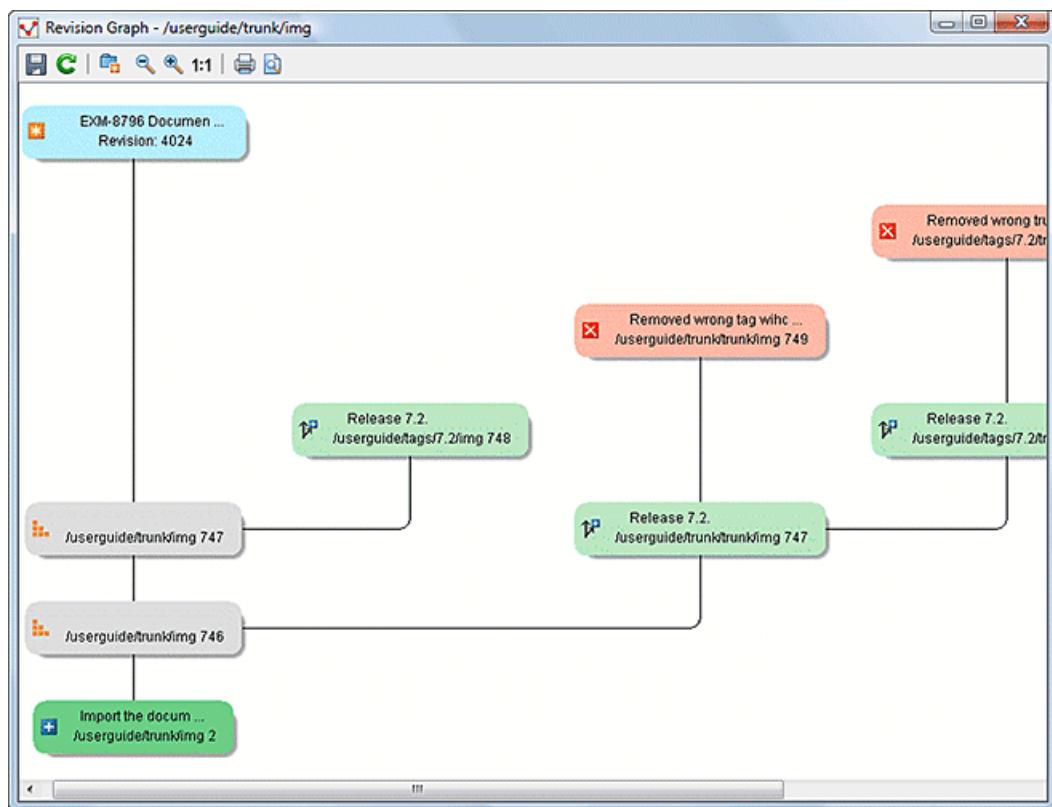

Figure 681: Revision Graph of a Directory (Direct Changes)

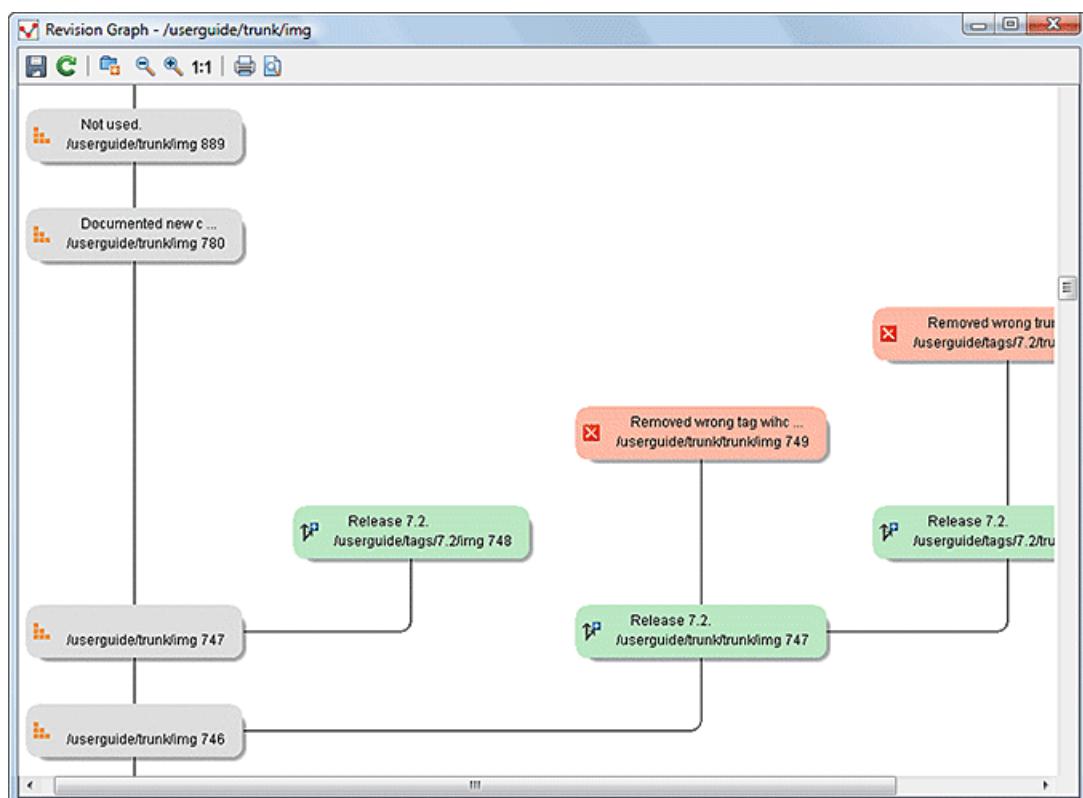

Figure 682: Revision Graph of a Directory (Including Indirect Changes)

The **Revision graph** toolbar contains the following actions:

 **Save as image**

Saves the graphical representation as image. For a large revision graph you have to [set more memory in the startup script](#). The default memory size is not enough when there are more than 100 revisions that are included in the graph.

 **Show/Hide indirect modifications**

Switches between simplified and complete graph.

 **Zoom In**

Zooms in the graph.

 **Zoom Out**

Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

 **1:1 Reset scale**

Resets the graphical scale to a default setting.

 **Print**

Prints the graph.

 **Print preview**

Offers a preview of the graph to allow you to check the information to be printed.

The contextual menu of any of the graph nodes contains the following actions:

Open

Opens the selected revision in the editor panel. Available only for files.

Open with

Opens the selected revision in the editor panel. Available only for files.

Save as

Saves the file for which the revision graph was generated, based on the selected node revision.

Copy to

Copies to the repository the item whose revision graph is displayed, using the selected revision.

Note: This action can be used to resurrect deleted items also.

Compare with HEAD

Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

 **Show History**

Displays the history of the resource in [the History view](#). Available for both files and directories.

 **Check out**

[Checks out](#) the selected revision of the directory. Available only for directories.

Export

Opens [the Export dialog box](#) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the **Compare** for comparing the two revisions corresponding to the selected nodes. If the resource for which the revision graph was built is a folder then the right-click menu displayed for a two nodes selection also contains the **Compare** action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the [Directory Change Set](#) view.

Attention: Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.

Oxygen XML Editor SVN Preferences

The options used in the SVN client are saved and loaded independently from the Oxygen XML Editor options. However, if Oxygen XML Editor cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).

There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the **Global Runtime Configuration** submenu of the **Options** menu. These actions, **Edit 'config' file** and **Edit 'servers' file**, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.

Entering Local Paths and URLs

The Oxygen XML Editor includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Editor provides support in these text boxes to make it easier to specify these paths and URLs.

Local Item Paths

The text boxes used for specifying local item paths support the following:

- *Absolute Paths* - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
- *Relative Paths* - The Oxygen XML Editor only accepts relative paths in the form `~[/ . . .]`, where `~` is the user home directory.
- *Path Validation* - Oxygen XML Editor validates the path as you type and invalid text becomes red.
- *Drag and Drop* - You can drag files and folders from the file system or other applications and drop them into the text box.
- *Automatic Use of Clipboard Data* - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

Repository Item URLs

- *Local Repository Paths* - You can use local paths (absolute or relative) to access local repositories. When you use the **Browse** button, the Oxygen XML Editor will convert the file path to a `file://` form of URL, provided that the location is a real repository.
 - *Absolute Paths* - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
 - *Relative Paths* - The Oxygen XML Editor only accepts relative paths in the form `~[/ . . .]`, where `~` is the user home directory.
- *Peg Revisions* - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can [use peg revisions at the end of the URLs](#) (for example, `URL@rev1234`).

Note: If you try to use a *peg revision* number in a dialog box where you are sending information to the repository then the *peg revision* number will become part of the name of the item rather than searching for the specified revision. For example, in the URL `http://host/path/inside/repo/item@100`, the item name is considered to be `item@100`.

- Tip:** You can even use *peg revisions* with local repository paths. For example, `C:\path\to\local\repo@100` will be converted to `file:///C:/path/to/local/repo@100` and the **Repository browser** will display the content of the local repository as it is at revision 100.
- *URL Validation* - Oxygen XML Editor validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the **Browse** button to convert them to valid URLs.
 - *Drag and Drop* - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid `file://` type URLs.
 - *Automatic Use of Clipboard Data* - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to `file://` type URLs.

Note: The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the **Repositories** view.

Technical Issues

This section contains special technical issues found during the use of Syncro SVN Client.

Authentication Certificates Not Saved

If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the *Subversion* configuration folder (write access to *Subversion* folder and all its subfolders). Usually, it is located in the following locations:

- Windows: [HOME_DIR]\AppData\Roaming\Subversion
- Mac OS X and Linux: [HOME_DIR]/.subversion

Updating Newly Added Resources

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

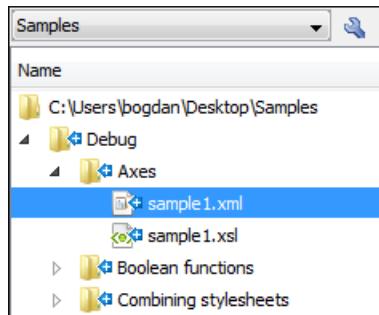

Figure 683: Incoming Changes

Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

Update ancestor directories recursively

This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

Update selected files only (leave ancestor directories empty)

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to *empty* in your working copy, thus subsequent **Synchronize** operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the **Update to revision/depth action** from the working copy view.

Cannot Access a Repository through HTTPS

If you have issues when trying to access a repository through HTTPS protocol, one of the possible causes can be the encryption protocol currently used by the application. This is happening when:

- You are running Oxygen XML Editor with Java 1.6 or older.
- The repository is set to use only one of the SSLv3 or TLSv1 encryption protocols.

To solve this issue, set the **HTTPS encryption protocols** option to **SSLv3 only** or **TLSv1 only** (depending on the repository configuration).

Accessing Old Items from a Repository

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a *peg revision* is needed.

A Subversion repository tracks any change made to its items by using *revisions*, which contain information such as the name of the author who made the changes, the date when they were made, and a number that

uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a *peg revision* comes in handy. A *peg revision* is nothing more than a normal revision, but the difference between them is made by their usage. Many of the Subversion commands accept also a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision we are interested in, regarding the used command).

To illustrate an example, consider the following:

- We created a new repository file `config`, identified by the URL `http://host.com/myRepository/dir/config`.
- The file has been created at revision 10.
- Over time, the file was modified by committing revisions 12, 15, 17.

To access a specific version of the file identified by the `http://host.com/myRepository/dir/config` URL, we need to use a corresponding revision (the operative revision):

- If we use a revision number less than 10, an error is triggered, because the file has not been created yet.
- If we use a revision number between 10 and 19, we will obtain the specific version we are interested in.

Note: Although the file was modified in revisions 12, 15, 17, it existed in all revisions between 10 and 19. Starting with a revision at which the file is modified, it has the same content across all revisions generated in the repository until another revision in which it is modified again.

At this point, we delete the file, creating revision 20. Now, we cannot access any version of the file, because it does not exist anymore in the latest repository revision. This is due to the fact that Subversion automatically uses the HEAD revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the 10-19 interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If we use a revision number greater than 19, this will also trigger an error.

Continuing our example, suppose that at revision 30 we create a directory called `config` in the same repository location as our deleted file. This means that our new directory will be identified by the same repository address: `http://host.com/myRepository/dir/config`. If we use only this URL in any Subversion command, we will access the new directory. We will also access the same directory if we use any revision number equal with or greater than 30 as peg revision. However, if we are interested in accessing an old version of the previously existing file, then we must use one of the revisions that existed (10-19), as a peg revision, similar to the previous case.

Checksum Mismatch Error

A *Checksum Mismatch* error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).
Note: If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.
2. Identify the *current depth* of that directory.

3. Update the parent directory using the **Update to revision/depth** action that is available from the contextual menu or the **Working copy** menu.

- a. For the **Depth** option, select **This folder only (empty)**.

Warning: If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking **OK** the contents of the directory will be erased and the directory is be marked as having *an empty depth*.

5. Once again, update the same directory using the **Update to revision/depth** action.

- a. This time, for the **Depth** option, select the depth that was previously identified in step 2.

6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.

External Tools

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. Oxygen XML Editor offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

The [External Tools preferences page](#) presents a list of the external tools that have been configured. Once [a tool has been configured](#), you can open it by selecting it from the **Tools > External Tools** menu or from the **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be enabled in the [Configure Toolbars dialog box](#)). You can also [assign a keyboard shortcut](#) to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Editor, the [Save all files before calling external tools option](#) (in the **Open/Save** preference page) should be enabled so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon () and you can use this button to stop the tool. When the tool has finished running (or you close it), the icon changes back to the original icon ().

Note: Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

Integrating the Ant Tool

This is an example for integrating [the Ant build tool](#) into Oxygen XML Editor:

1. [Download](#) and [install](#) Apache Ant on your computer.
2. Test your Ant installation from the command-line interface in the directory where you want to use Ant from. For example, run the clean target of your build.xml file C:\projects\XMLproject\build.xml:

```
ant clean
```

3. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).
4. Click the **New** button to create a new external tool entry and enter the following information:
 - **Name** - For example, Ant tool.
 - **Working directory** - For example, C:\projects\XMLproject.

- **Command line** - For example, "C:\projects\XMLproject\ant.bat" clean.
5. Click **OK** to add the new tool to the list of external tools.
6. Run the tool from **Tools > External Tools > Ant tool**. You can see the output in the **Command results panel**:

```
Started: "C:\projects\XMLproject\ant.bat" clean
Buildfile: build.xml

clean:
[echo] Delete output files.
[delete] Deleting 5 files from C:\projects\XMLproject

BUILD SUCCESSFUL
Total time: 1 second
```

Topics:

- [Performance Problems and Solutions](#)
- [Misc Problems and Solutions](#)

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor.

[External Tools](#) on page 1522

Display Problems on Linux or Solaris

Problem

I experience display problems (such as screen freezes) on Linux or Solaris.

Solution

[Add the following startup parameter](#): -Dsun.java2d.pmoffscreen=false.

Out of Memory on External Processes

Problem

Oxygen XML Editor throws an *Out Of Memory* error when trying to generate PDF output with the built-in Apache FOP processor.

Solution

[Open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XSLT-FO-XQuery > FO Processors**, and increase the value of the **Memory available to the built-in FOP** option.

For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the `-Xmx` parameter set to the Java virtual machine.

Too many nested apply-templates calls Error When Running a Transformation

Problem

I'm getting the error message **Too many nested apply-templates calls** when I try to transform my DocBook file to HTML using default Oxygen XML Editor DocBook to HTML transformation scenario.

Solution

Most likely, this is the result of a masked stack overflow error that can be solved by increasing the stack size (`-Xss`) to 4MB. Try setting a new VM option with the value `-Xss4m`. You can try to slowly increase this to larger values (e.g. `-Xss5m` or `-Xss6m`). Note that this consumes memory on a per thread basis (Oxygen XML Editor can have tens of threads), so using a very large value here can backfire and leave Oxygen XML Editor without memory.

Related information

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor](#) on page 173

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when editing large documents.

Solution

A possible cause is that the application needs more memory to run properly. You can increase the maximum amount of memory available to Oxygen XML Editor by [setting the -Xmx parameter in a configuration file](#) that is specific to the platform that runs the application.

Attention: The maximum amount of memory should not be equal to the physical amount of memory available on the machine because in that case the operating system and other applications will have no memory available.

When installed on a multiple user environment, each instance of Oxygen XML Editor will be allocated the amount stipulated in the memory value. To avoid degrading the general performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

Note: When starting Oxygen XML Editor from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40% of the amount of physical RAM, but not more than 700 MB.

When starting Oxygen XML Editor from a command-line script, the default maximum memory is 512 MB.

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

'Address Family Not Supported by Protocol Family; Connect' Error

Problem

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Solution

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

A quick fix for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (`java.net.preferIPv4Stack=true`), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and add on a single line –
`Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor installation folder (may need admin access).
2. Restart Oxygen XML Editor.
3. Make sure the procedure was successful by going to **Help > About > System properties** and check that the value of the `java.net.preferIPv4Stack` property is `true`.

Alignment Issues of the Main Menu on Linux Systems Based on Gnome 3.x

Problem

On some Linux systems based on Gnome 3.x (Ubuntu 11.x, 12.x), the main menu of Oxygen XML Editor has alignment issues when you navigate it using your mouse.

Solutions

This is a known problem caused by Java SE 6 1.6.0_32 and earlier. You can resolve this problem using the latest Java SE 6 JRE from Oracle. To download the latest version, go to <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

To bypass the JRE bundled with Oxygen XML Editor, go to the installation directory of Oxygen XML Editor and rename or move the `jre` folder. If Oxygen XML Editor does not seem to locate the system JRE, either set the `JAVA_HOME` environment variable to point to the location where you have installed the JRE, or you can simply copy that folder with the JRE to the installation directory and rename it to `jre` to take the place of the bundled JRE.

Archive Distribution Fails to Run on Mac OS 10.12 (Sierra)

Problem

For versions prior to 18.1, the classic archive distributions of Oxygen XML Editor (`.zip` or `.tar.gz`) fail to run on Mac OS 10.12 (Sierra).

Solution

This happens because the archives get quarantined and Mac OS 10.12 (Sierra) treats quarantined apps differently than older versions and isolates them from their parent folder at launch. If Oxygen XML Editor was already installed when you upgraded to Mac OS 10.12 (Sierra), there are no problems.

If Oxygen XML Editor was not already installed, or you need to reinstall an older version (prior to version 18.1), the quarantine flag must be removed for the entire content of the Oxygen XML Editor installation directory or the individual applications. To resolve this issue, follow these steps:

1. Open a *Terminal* window and change the directory to the folder where Oxygen XML Editor is located.
2. Run the following command:

```
xattr -dr com.apple.quarantine oxygen/
```

where "oxygen" is the actual name of the Oxygen XML Editor directory.

If Oxygen XML Editor is in a location that requires administrator privileges for write access, you need to run the command from an administrator account and prefix the command with `sudo`. You will then be prompted to enter your password.

Cannot Associate Oxygen XML Editor With a File Type on My Windows Computer

Problem

I cannot associate the Oxygen XML Editor application with a file type on my Windows computer by right clicking a file in Windows Explorer, selecting **Open With > Choose Program** and browsing to the file oxygen18.1.exe. When I select the file oxygen18.1.exe in the Windows file browser dialog box, the Oxygen XML Editor application is not added to the list of applications in the **Open With** dialog box. What can I do?

Solution

The problem is due to some garbage Windows registry entries remained from versions of Oxygen XML Editor older than version 9.0. Uninstall all your installed versions of Oxygen XML Editor and run a registry cleaner application for cleaning these older entries. After that just reinstall your current version of Oxygen XML Editor and try again to create the file association.

Cannot Connect to SVN Repository from Repositories View

Problem

I cannot connect to a SVN repository from the **Repositories** view of SVN Client. How can I find more details about the error?

Solution

First check that you entered the correct URL of the repository in the **Repositories** view. Also check that a SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command line SVN client from CollabNet.

If you try to access the repository with a svn+ssh URL also check that a SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository please generate a logging file on your computer and send the logging file to support@oxygenvml.com. For generating a logging file you need to create a text file called log4j.properties in the install folder with the following content:

```
log4j.rootCategory= debug, R2
log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=logging.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
```

Restart the application, reproduce the error, close the application and send the file logging.log generated in the install directory to support@oxygenvml.com.

Cannot Open XML Files in Internet Explorer

Problem

Before installing Oxygen XML Editor I had no problems opening XML files in Internet Explorer. Now when I try to open an XML file in Internet Explorer it opens the file in Oxygen XML Editor. How can I load XML files in Internet Explorer again?

Solution

XML files are opened in Oxygen XML Editor because Internet Explorer uses the Windows system file associations for opening files and you associated XML files with Oxygen XML Editor in the installer panel called **File Associations**. Therefore, Internet Explorer opens XML files with the associated Windows application.

By default, the association with XML files is disabled in the Oxygen XML Editor installer panel called **File Associations**. When you enabled it the installer displayed a warning message about the effect that you experience right now.

For opening XML files in Internet Explorer, again you have to set Internet Explorer as the default system application for XML files (for example by right-clicking an XML file in Windows Explorer, selecting **Open With > Choose Program**, selecting IE in the list of applications and selecting the checkbox **Always use the selected program**). Also, you have to run the following command from a command line:

```
wscript revert.vbs
```

where `revert.vbs` is a text file with the following content:

```
function revert()
    Set objShell = CreateObject("WScript.Shell")
    objShell.RegWrite "HKCR\xml\", "xmlfile", "REG_SZ"
    objShell.RegWrite "HKCR\xml\Content Type", "text/xml", "REG_SZ"
end function

revert()
```

Compatibility Issue Between Java and Certain Graphics Card Drivers

Under certain settings, a compatibility issue can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled. If you encounter this problem, update your graphics card driver. Another possible workaround is, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Appearance > Fonts**, and set the value of the **Text antialiasing option** to ON.

Note: If this workaround does not resolve the problem, set the **Text antialiasing option** to other values.

Crash at Startup on Windows with an Error About the `nvogl32.dll` File

Problem

I try to start Oxygen XML Editor on Windows but it crashed with an error message about "Fault Module Name: `nvogl32.dll`". What is the problem?

Solution

It is an OpenGL driver issue that can be avoided by creating an empty file called `opengl32.dll` in the Oxygen XML Editor install folder (if you start Oxygen XML Editor with the shortcut created by the installer on the Start menu or on Desktop) or in the subfolder `bin` of the home folder of the Java virtual machine that runs Oxygen XML Editor (if you start Oxygen XML Editor with the `oxygen.bat` script). The home folder of the Java virtual machine that runs Oxygen XML Editor is the value of the `java.home` property that is available in the **System properties** tab of the **About** dialog box (opened from the **Help > About** menu).

Damaged File Associations on OS X

Problem

After upgrading OS X and Oxygen XML Editor, it is no longer associated to the appropriate file types (such as XML, XSL, XSD, etc.) How can I create the file associations again?

Solution

The upgrade damaged the file associations in the LaunchService Database on your OS X machine. You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and will rescan the entire file system searching for applications that declare file associations and collecting them in a database used by Finder.

1. Find all the Oxygen XML Editor installations on your hard drive.
2. Delete them by dragging them to the Trash.

3. Clear the Trash.
4. Unpack the Oxygen XML Editor installation kit on your desktop.
5. Copy the contents of the archive into the folder / Applications / Oxygen.
6. Run the following command in a Terminal:

```
/System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/
LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -
domain system -domain user
```

7. Restart Finder with the following command:

```
killall Finder
```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor icon.
9. Double-click the file.
10. Accept the confirmation.

Result: When you start Oxygen XML Editor, the file associations should work correctly.

Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the [Randomize XML text content action](#) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Editor log file, follow these steps:

1. Create a text file called `log4j.properties` in the application installation folder, with the following content:

```
log4j.rootCategory= debug, R2
log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `log4j.properties` file because it might cause performance issues if you leave it in the installation folder.

Important: The logging mode may severely decrease the performance of the application. Therefore, please do not forget to delete the `log4j.properties` file when you are done with the procedure.

The resulting log file is named `oxygen#.log` (for example, `oxygen.log`, `oxygen.log.1`, `oxygen.log.2`, etc.) and is located in the `Desktop\oxygenLog` folder.

DITA Map Transformation Fails (Cannot Connect to External Location)

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the [the Proxy preferences page](#)

DITA PDF Transformation Fails

To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit.

If your transformation fails you can detect some of the problems that caused the errors by running [the Validate and Check for Completeness action](#). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA Map, broken links, and missing external resources.

You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the topic . fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or to support@oxygenvxml.com.

DITA to CHM Transformation Fails

Oxygen XML Editor uses the DITA Open Toolkit and the HTML Help compiler (part of the Microsoft HTML Help Workshop) to transform DITA content into *Compiled HTML Help* (or *CHM* in short).

It is a good practice to validate the DITA map before executing the transformation scenario. To do so, run [the Validate and Check for Completeness action](#). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

However, the execution of the transformation scenario may still fail. Reported errors include:

- [exec] HHC5010 : Error: Cannot open "fileName.chm". Compilation stopped. - This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content. To solve this issue, close the CHM help file and run the transformation scenario again.
- [exec] HHC5003 : Error: Compilation failed while compiling fileName - Possible causes of this error are:
 - The processed file does not exist. Fix the file reference before executing the transformation scenario again.
 - The processed file has a name that contains space characters. To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Related information

[Compiled HTML Help \(CHM\) Output Format](#) on page 1106

Drag and Drop Without Initial Selection Does Not Work

Problem

When I try to drag with the mouse an unselected file from the **Project** view or the **DITA Maps Manager** view, the drag never starts, it only selects the resource. I need to drag the resource again after it becomes selected. As a result any drag and drop without initial selection becomes a two step operation. How can I fix this?

Solution

This is a [bug](#) present in JVM versions prior to 1.5.0_09. This issue is fixed in 1.5.0_09 and newer versions. See [the installation instructions](#) for setting a specific JVM version for running the Oxygen XML Editor application.

Gray Window on Linux With the Compiz / Beryl Window Manager

Problem

I try to run Oxygen XML Editor on Linux with the Compiz / Beryl window manager but I get only a gray window that does not respond to user actions. Sometimes the Oxygen XML Editor window responds to user actions but after opening and closing an Oxygen XML Editor dialog or after resizing the Oxygen XML Editor window or a view of the Oxygen XML Editor window the content of this window becomes gray and it does not respond to user actions. What is wrong?

Solution

Sun Microsystems' Java virtual machine [does not support the Compiz window manager and the Beryl one very well](#). It is expected that better support for Compiz / Beryl will be added in future versions of their Java virtual machine. You should turn off the special effects of the Compiz / Beryl window manager before starting the Oxygen XML Editor application or switch to other window manager.

Image Appears Stretched Out in the PDF Output

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

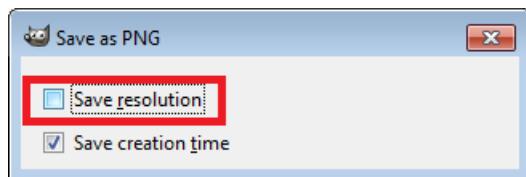

PDF output from XML content is obtained by first obtaining a intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `external-graphic` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA_OT_DIR]/plugins/org.dita.pdf2/fop/conf/fop.xconf`. The configuration file contains two XML elements called `source-resolution` and `target-resolution`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip: It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

For details about setting custom JVM arguments to the Ant build process see [this section](#).

JPEG CMYK Color Space Issues

JPEG images with CMYK color profile having the color profiles embedded in the image should be properly rendered in the **Author** mode.

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the `profileFileName.icc` to the `[OXYGEN_INSTALL_DIR]\lib` directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The **Unsupported Image Type** message is displayed above the image.

Keyboard Shortcuts Do Not Work

Problem

The keyboard shortcuts listed in the [Menu Shortcut Keys preferences](#) do not work. What can I do?

Solution

Usually this happens when a special keyboard layout is set in the operating system that generates other characters than the usual ones for the keys of a standard keyboard. For example if you set the extended Greek layout for your keyboard you should return to the default Greek layout or to the English one. Otherwise, the Java virtual machine that runs the application will receive other key codes than the usual ones for a standard keyboard.

MSXML 4.0 Transformation Issues

If the latest MSXML 4.0 service pack is not installed on your computer, you are likely to encounter the following error message in the **Results** panel when you run a transformation scenario that uses the MSXML 4.0 transformer.

Error Message

```
Could not create the 'MSXML2.DOMDocument.4.0' object.  
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to the web page was canceled when viewing CHM on a Network Drive

When viewing a CHM on a network drive, if you only see the TOC and an empty page displaying "Navigation to the web page was canceled" note that this is normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.

As a workaround, copy the CHM file on your local system and view it there.

Out Of Memory Error When Opening Large Documents

Problem

I am trying to open a file larger than 100 MB to edit it in Oxygen XML Editor, but it keeps telling me it runs out of memory (**OutOfMemoryError**). What can I do?

Solution

You should make sure that the minimum limit of document size that enables the support for editing large documents (the value of the [Optimize loading in the Text edit mode for files over option](#)) is less than the size of your document. That will enable the optimized support for large documents. If that fails and you still get an Out Of Memory error you should [increase the memory available to Oxygen XML Editor](#).

Other tips:

- Make sure that you close other files before opening the large file.

- You can set the default editing mode [in the Preferences dialog box](#). The **Text** editing mode uses less memory than other editing modes.
- If the file is too large for the editor to handle, you can [open it in for viewing in Large File Viewer](#).

Oxygen XML Editor Crashed on My Mac OS X Computer

Problem

Oxygen XML Editor crashed the Apple Java virtual machine/Oxygen XML Editor could not start up on my OS X computer due to a JVM crash. What can I do?

Solution

Usually it is an incompatibility between the Apple JVM and a native library of the host system. More details are available in the crash log file generated by OS X and reported in the crash error message.

Oxygen XML Editor Takes Several Minutes to Start

Problem: Some anti-virus software can cause Java applications, such as Oxygen XML Editor, to start very slowly due to scanning of compressed archives (such as the JAR libraries that all Java applications use).

Solution: The solution is to add the Oxygen XML Editor folder to the list of exceptions in the anti-virus software settings.

PDF Processing Fails to Use the DITA OT and Apache FOP

There are cases when publishing DITA content fails when creating a PDF file. This topic lists some common problems and solutions.

- The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:  
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo  
<Failed to open C:\samples\dita\out\pdf\test.pdf>  
Failed to open samples\dita\out\pdf\test.pdf  
.....  
[fop] Caused by: java.io.FileNotFoundException:  
C:\Users\radu_coravu\Desktop\bev\out\pdf\test.pdf  
(The process cannot access the file because it is being used by another process)
```

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

- One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:  
D:\projects\xml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo  
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:  
The column-number or number of cells in the row overflows the number of  
fo:table-columns specified for the table.  
(See position 179:-1)>net.sf.saxon.trans.XPathException:  
org.apache.fop.fo.ValidationException: The column-number or number of cells  
in the row overflows the number of fo:table-columns specified for the table.  
(See position 179:-1)  
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler  
(Fop.java:657)  
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent  
(ContentHandlerProxy.java:375)  
.....  
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->  
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and look in it at the line specified in the error message (See position 179:-1).

- 3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view) to find the original DITA topic for which the table was generated.
- There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

To resolve this issue:

1. Use the **Validate and Check for Completeness** action available in the **DITA Maps Manager** view to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the **DITA Map Completeness Check** dialog box.
3. If the **Validate and Check for Completeness** action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and search in it for the `unique_4_Connect_42_wrongID` id.
5. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view) to find the original DITA topic for which the table was generated.

Scroll Function of my Notebook Trackpad is Not Working

Problem

I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Editor.

Solution

It is a problem with the Synaptics™ trackpads that can be fixed by adding the following lines to the `C:\Program Files\Synaptics\SynTP\TP4table.dat` file:

```
*,* ,oxygen18.1.exe,*,*,*,WheelStd,1,9
*,* ,oxygenAuthor18.1.exe,*,*,*,Wheel1Std,1,9
*,* ,oxygenDeveloper18.1.exe,*,*,*,WheelStd,1,9
*,* ,syncroSVNClient.exe,*,*,*,WheelStd,1,9
*,* ,diffDirs.exe,*,*,*,WheelStd,1,9
*,* ,diffFiles.exe,*,*,*,WheelStd,1,9
```

Segmentation Fault Error on Mac OS X

Problem

On my Mac OS X machine the application gives a *Segmentation fault* error when I double-click the application icon. Sometimes it gives no error but it does not start. What is the problem?

Solution

Make sure you have the latest Java update from the Apple website installed on your Mac OS X computer. If installing the latest Java update does not solve the problem, copy the file `JavaApplicationStub` from the `/System/Frameworks/JavaVM.framework` folder to the `Oxygen.app/Contents/MacOS` folder. For browsing the `.app` folder you have to (**CMD+click**) the Oxygen XML Editor icon and select **Show Package Contents**.

Set Specific JVM Version on Mac OS X

Problem

How do I configure Oxygen XML Editor to run with the version X of the Apple Java virtual machine on my Mac OS X computer?

Solution

Oxygen XML Editor uses the first JVM from the list of preferred JVM versions set on your Mac computer that has a version number 1.6.0 or higher. You can move your desired JVM version up in the preferred list by dragging it with the mouse on a higher position in the list of JVMs available in the **Java Preferences** panel that is opened from **Applications > Utilities > Java > Java Preferences**.

Signature Verification Failed Error on a Resource from Documentum

Problem

When I try to open/edit a resource from Documentum, I receive the following error:

```
signature verification failed: certificate for All-MB.jar.checksum not signed by a certification authority.
```

Solution

The problem is that the certificates from the Java Runtime Environment 1.6.0_22 or later no longer validate the signatures of the UCF jars.

Set the `-Drequire.signed.ucf.jars=false` parameter, as explained in the [Setting a Parameter in the Launcher Configuration File / Startup Script](#) topic.

Special Characters are Replaced with a Square in Editor

Problem

My file was created with other application and it contains special characters (such as é, ©, ®, etc.) Why does Oxygen XML Editor display a square for these characters when I open the file in Oxygen XML Editor?

Solution

You must set a font able to render the special characters in the [Font preferences](#). If it is a text file you must set also [the encoding used for non XML files](#). If you want to set a font that is installed on your computer but that font is not accessible in the **Font** preferences that means the Java virtual machine is not able to load the system fonts, probably because it is not a True Type font. It is a problem of the Java virtual machine and a possible solution is to copy the font file in the `[JVM_DIR]/lib/fonts` folder. `[JVM_DIR]` is the value of the property `java.home` that is available in the **System properties** tab of the **About** dialog box that is opened from menu **Help > About**.

SVG 1.2 Rendering Issues

Oxygen XML Editor uses the [Apache Batik](#) open source library to render SVG images and it only has partial support for SVG 1.2. For more information, see <http://xmlgraphics.apache.org/batik/dev/svg12.html>.

This partial support could lead to some rendering issues in Oxygen XML Editor. For example, if you are using the *Inkscape* SVG editor, it is possible for it to save the SVG as 1.1, while using SVG 1.2 elements (such as `flowRoot`) inside it. This means that the image will not be properly rendered inside the application.

Note: SVG images shown in the **Author** visual editing mode are rendered as static images, without support for animations and JavaScript.

Syntax Highlight Not Available in Eclipse Plugin

Problem

I associated the .ext extension with Oxygen XML Editor in Eclipse. Why does an .ext file opened with the Oxygen XML Editor plugin not have syntax highlight?

Solution

Associating an extension with Oxygen XML Editor in Eclipse versions 3.6-3.8, 4.2-4.6 requires three steps:

1. Associate the .ext extension with the Oxygen XML Editor plugin..
 - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **General > Editors > File Associations**.
 - b. Add *.ext to the list of file types.
 - c. Select *.ext in the list by clicking it.
 - d. Add Oxygen XML Editor to the list of **Associated editors** and make it the default editor..
2. Associate the .ext extension with the **Oxygen XML** content type.
 - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **General > Content Types**.
 - b. Add *.ext to the **File associations** list for the **Text > XML > Oxygen XML Editor** content type.
3. Press the **OK** button in the Eclipse preferences dialog box.

Result: Now when an *.ext file is opened the icon of the editor and the syntax highlight should be the same as for XML files opened with the Oxygen XML Editor plugin.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The *TocJS* transformation of a DITA map does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete working set of output files, follow these steps:

1. Run the *XHTML* transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the *TocJS* transformation.
2. Copy the content of *DITA_OT_DIR/plugins/com.sophos.tocjs/basefiles* folder in the transformation output folder.
3. Copy the *DITA_OT_DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html* file in the transformation's output folder.
4. Edit *frameset.html* file.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace "concepts/about.html" with "index.html".

Topic References Outside the Main DITA Map Folder

Referencing to a DITA topic, map or to a binary resource (for example: image) that is located outside of the folder where the main DITA map is located usually leads to problems when publishing the content using the DITA Open Toolkit. The DITA OT does not handle it well when links to topics that are outside the directory where the published DITA map is found. By default it does not even copy the referenced topics to the output directory.

You have the following options:

1. Create another DITA map that is located in a folder path above all referenced folders and reference from it the original DITA map. Then transform this DITA map instead.
2. Edit the transformation scenario and in the **Parameters** tab edit the **fix.external.refs.com.oxygenxml** parameter. This parameter is used to specify whether or not the application tries to fix such references in a

temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. The allowed values are "false" and "true". The default value is false.

Important: The **fix.external.refs.com.oxygenxml** parameter is only supported when the DITA OT transformation process is started from Oxygen XML Editor)

Wrong Highlights of Matched Words in a Search in User Manual

Problem

When I do a keyword search in the User Manual that is included with the Oxygen XML Editor application, the search highlights the wrong word in the text. Sometimes the highlighted word is several words after the matched word. What can I do to get correct highlights?

Solution

This does not happen when Oxygen XML Editor runs with a built-in Java virtual machine, that is a JVM that was installed by Oxygen XML Editor in a subfolder of the installation folder (for example, on Windows and Linux when installing Oxygen XML Editor with the installation wizard specific for that platform). When Oxygen XML Editor runs from an All Platforms installation, it uses whatever JVM was found on the host system, which may be incompatible with the JavaHelp indexer used for creating the built-in User Manual. Such a JVM may offset the highlight of the matched word with several characters, usually to the right of the matched word. To see the highlight exactly on the matched word, it is recommended to install the application with the specific installation wizard for your platform (available only for Windows and Linux).

XML Document Takes a Long Time to Open

Problem

If Oxygen XML Editor takes a long time to open a document, check the following:

Solution

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

If the content is on a single line, you can speed up loading by enabling the [Format and indent the document on open option](#) (in the **Format** preferences page).

If the document is very large (above 30 MB), make sure that the value of the [Optimize loading in the Text edit mode for files over option](#) (in the **Open/Save** preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (**OutOfMemoryError**) you can [increase the memory available to Oxygen XML Editor](#).

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the **XSLT Debugger** perspective it is very slow. Can I increase the speed?

Solution

If the transformation produces HTML or XHTML output you should [disable rendering of output in the XHTML output view](#) during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the **Editor** perspective and make sure the [Open in Browser/System Application option](#) is enabled.
- Run the transformation in the **XSLT Debugger** perspective, save the text output area to a file, and use a browser application for viewing it (for example Firefox or Internet Explorer).

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor features that are specific to working with DITA documents and concepts.

DITA Resources

For more general information and technical details about working with DITA, refer to the following resources:

- [The DITA Specifications](#).
- [The DITA Style Guide Best Practices for Authors](#).
- Various sample DITA topics and maps can be found in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.

Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.

DITA Maps

A DITA map organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor provides support for [creating](#) and [managing DITA maps](#) through the [DITA Maps Manager](#). There are also specialized types of DITA maps, such as a [bookmap](#), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller [submaps](#) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The [DITA Maps Manager](#) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the [DITA Maps Manager](#) or in the XML editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the [DITA Maps Manager](#), simply double-click it (or right-click it and select **Open**).
- To open a map in the XML editor from the [DITA Maps Manager](#), right-click it and select **Open Map in Editor**.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- If you open a file with the .ditamap or .bookmap extension (from the **Project** view or a system browser), a dialog box is opened that offers you the choice of opening it in the XML editor or in the [DITA Maps Manager](#).

Note: If you select the **Do not show the dialog again** option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting **Always ask** for the [When opening a map option in the DITA preferences page](#).

- To open a map in the [DITA Maps Manager](#), you can right-click a map file in the **Project** view and select **Open with > DITA Maps Manager**.
- If you have a *DITA map* file open in the XML editor, you can open it in the [DITA Maps Manager](#) by right-clicking the title tab and selecting **Open in DITA Maps Manager View**.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to [output multiple topics as a single output page \(also known as chunking\)](#). To support this, Oxygen XML Editor provides an [Edit Properties dialog box](#) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should [validate your maps](#) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

To watch a video on DITA editing , go to https://www.oxygenxml.com/demo/DITA_Editing.html.

[DITA Map Document Type](#) on page 1080

DITA Maps Manager

Oxygen XML Editor provides a view for managing and editing *DITA maps*. The **DITA Maps Manager** view presents a DITA map as a Table of Contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats.

The **DITA Maps Manager** includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the **DITA Maps Manager**. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

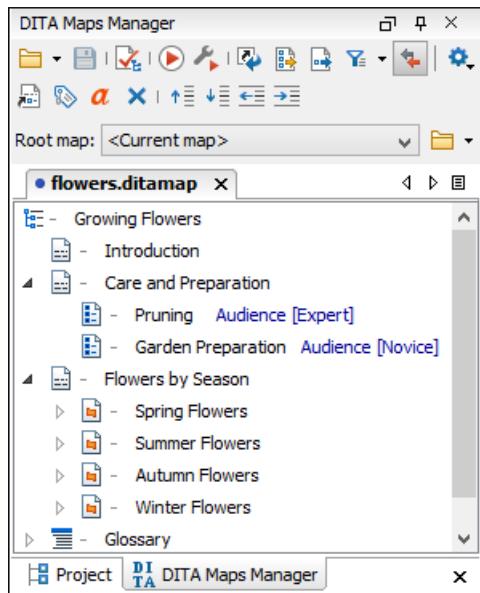

Figure 684: DITA Maps Manager View

Opening Maps in the DITA Maps Manager

The **DITA Maps Manager** view supports multiple open maps at the same time, with each one presented in its own tab. To open a DITA map in the **DITA Maps Manager**, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select **Open**).
- If you open a file with a **.ditamap** or **.bookmap** extension (from the **Project** view or a system browser), a dialog box is opened that offers you the choice of opening it in the **DITA Maps Manager** or the XML editor.

Note: If you select the **Do not show the dialog again** option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting **Always ask** for the [When opening a map option in the DITA preferences page](#).

- Right-click a map file in the **Project** view and select **Open with > DITA Maps Manager**.
- If you have a *DITA map* file open in the XML editor, you can right-click the title tab and select **Open in DITA Maps Manager View**.

If your map references other DITA maps, they will be shown, expanded, in the **DITA Maps Manager** view and you will be able to navigate their content. To edit the submaps and their content, you need to open each referenced map separately.

Drag and Drop in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can

arrange multiple topics by dragging them while pressing the **Ctrl** or **Shift** key. Drop operations can be performed before, after, or as child of the targeted node.

Drag and drop operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the **Ctrl** key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (**Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X)**)/Demote (**Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X)**)

You can move nodes between child and parent nodes by using the **Promote (**Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X)**)** and **Demote (**Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X)**)** operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the **DITA Maps** menu) and their availability depend on the nodes that are selected:

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open Drop-down Menu

You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:

- List of recently viewed DITA maps that can be selected to reopen them.
- **Clear history** - Clears the history list of the recently viewed DITA maps.
- **Open** - Allows you to open the map in the **DITA Maps Manager** view. You can also open a map by dragging it from the file system explorer and dropping it into the **DITA Maps Manager** view.
- **Open URL** - Displays the **Open URL** dialog box that allows you to access any resource identified through a URL (defined by a protocol, host, resource path, and an optional port). The following actions are available in this drop-down menu:
 - **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local DITA map.
 - **Browse for remote file** - Displays the **Open URL** dialog box that allows you to open a remotely stored DITA map.
 - **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to browse the content of an archive and choose a DITA map.
 - **Browse Data Source Explorer** - Opens the **Data Source Explorer** that allows you to browse the data sources defined in the **Data Sources preferences page**.

Tip: You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.

- **Search for file** - Displays the **Open/Find Resource dialog box** that allows you to search for a DITA map.

Save (**Ctrl (Meta on Mac OS)+S**)

Saves the current DITA map.

Validate and Check for Completeness

Checks the validity and integrity of the map.

Apply Transformation Scenario(s)

Applies the **DITA Map transformation scenario** that is associated with the current map.

Configure Transformation Scenario(s)

Allows you to [associate a DITA Map transformation scenario](#) with the current map.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor, the DITA map is updated automatically.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

Tip: If you want to print the expanded content, you should consider changing the **Styles** drop-down to **+ Print ready**.

Open Map in Editor

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Note: You can also use this action to open referenced DITA maps in the **Editor**.

***Profiling/Conditional Text Drop-down Menu**

This drop-down menu contains the following actions:

- **Show Profiling Colors and Styles** - Enable this option to turn on conditional styling. To configure the colors and styles [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.
- **Show Profiling Attributes** - Enable this option to display the values of the profiling attributes at the end of the titles of topic references. When enabled, the values of the profiling attributes are displayed in both the **DITA Maps Manager** view and in the **Author** view.
- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the **Outline** and **DITA Maps Manager** views. When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.
-  **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the **DITA Maps Manager** view and the **Author** view. When a profiling condition set is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

Link with Editor

Disables/Enables the synchronization between the file path of the current editor and the selected topic reference in the **DITA Maps Manager** view.

Note: This button is disabled automatically when you move to the **Debugger** perspective.

Settings

Show extended toolbar

Toggles whether or not the extended toolbar will be displayed in the **DITA Maps Manager** toolbar.

Show root map toolbar

Toggles whether or not the **Root map** option will be displayed in the **DITA Maps Manager** toolbar.

Show topic titles

Toggles how topics are presented in the **DITA Maps Manager**. If enabled, the title of each topic is shown. Otherwise, the file path (value of the href attribute) for each topic is shown.

Root map

Specifies a master DITA map that Oxygen XML Editor uses to establish a key space that you can use with any other DITA map that is contained by the master map.

Browse Drop-down menu

You can use this drop-down menu to browse for root maps with the following choices:

-  **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
-  **Browse for remote file** - Displays [the Open URL dialog box](#) that allows you to select a remotely stored root map.
-  **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to browse the content of an archive and choose a root map.
-  **Browse Data Source Explorer** - Opens the **Data Source Explorer** that allows you to browse the data sources defined in the [Data Sources preferences page](#).

Tip: You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.

-  **Search for file** - Displays the **Find Resource** dialog box to search for a root map.

The following additional actions are displayed in the toolbar when the **Show extended toolbar** option is selected in the  **Settings** menu:

Insert Topic Reference

Opens [the Insert Reference dialog box](#) that allows you to insert references to targets such as anchors, topics, maps, topic sets, or key definitions.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box](#) on page 1559.

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the [Attributes View in Author Mode](#) on page 219 topic.

Delete

Deletes the selected node.

Move Up

Moves the selected node up within the DITA map tree.

Move Down

Moves the selected node down within the DITA map tree.

Promote(Alt + LeftArrow)

Moves the selected node up one level to the level of its parent node.

Demote(Alt + RightArrow)

Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map

The following actions can be invoked from the contextual menu on the *root map* of an opened DITA map:

Open Map in Editor

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

Export DITA Map

Allows you to choose a destination for exporting the DITA map.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the DITA maps.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box](#) on page 1559.

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for [inserting a new topic](#).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References](#) topic.
- **Key Reference** - Opens an [Insert Key Definition dialog box](#) that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified [Insert Key Definition dialog box](#) that allows you to define a key and a value inside a keyword.
- A set of actions that open the [Insert Reference dialog box](#) that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Search References

Searches all references to the current topic in the entire DITA map.

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for [converting the Markdown document into a DITA topic](#).

Rename resource

Allows you to [change the name of a resource linked in the edited DITA map](#).

Move resource

Allows you to [change the location on disk of a resource linked in the edited DITA map](#).

XML Refactoring

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations](#) that are used will also appear in this submenu.

Find/Replace in Files

Allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to [spell check multiple files](#).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Child Nodes

The following actions are available when the contextual menu is invoked on a child node of a DITA map (submaps need to be opened in the **DITA Maps Manager** to access these actions since they are in a read-only state in the parent map):

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens in the editor the resources referenced by the nodes that you select.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box](#) on page 1559.

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for [Inserting a new topic](#).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References](#) topic.
- **Key Reference** - Opens an [Insert Key Definition dialog box](#) that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified [Insert Key Definition dialog box](#) that allows you to define a key and a value inside a keyword.
- A set of actions that open the [Insert Reference dialog box](#) that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Insert After submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for [Inserting a new topic](#).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References](#) topic.
- **Key Reference** - Opens an [Insert Key Definition dialog box](#) that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified [Insert Key Definition dialog box](#) that allows you to define a key and a value inside a keyword.
- A set of actions that open the [Insert Reference dialog box](#) that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Search References

Searches all references to the current topic in the entire DITA map.

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for [converting the Markdown document into a DITA topic](#).

Rename resource

Allows you to [change the name of a resource linked in the edited DITA map](#).

Move resource

Allows you to [change the location on disk of a resource linked in the edited DITA map](#).

XML Refactoring

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations](#) that are used will also appear in this submenu.

Find/Replace in Files

Allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to [spell check multiple files](#).

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete

Deletes the currently selected node from the DITA map.

Organize

Allows you to organize the DITA map with the several submenu actions:

-  **Move Up** - Moves the selected node up within the DITA map tree.
-  **Move Down** - Moves the selected node down within the DITA map tree.
-  **Promote**([Alt + LeftArrow](#)) - Moves the selected node up one level to the level of its parent node.
-  **Demote**([Alt + RightArrow](#)) - Moves the selected node down one level to the level of its child nodes.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Other Nodes

The following actions are available when the contextual menu is invoked from a node that is not an immediate child node of the *root map*:

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens in the editor the resources referenced by the nodes that you select.

Open Map in Editor (available when invoking on a submap)

Opens the currently selected DITA map in the editor.

Open parent DITA map (available when invoking on a topic reference or a submap reference)

Opens the parent DITA map of the currently selected reference in the **DITA Maps Manager**.

Edit Attributes (only available for relationship table nodes)

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the [Attributes View in Author Mode](#) on page 219 topic.

Edit Profiling Attributes (only available for relationship table nodes)

Allows you to change the *profiling attributes* defined on the selected node.

Search References

Searches all references to the current topic in the entire DITA map.

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for [converting the Markdown document into a DITA topic](#).

Rename resource

Allows you to [change the name of a resource linked in the edited DITA map](#).

Move resource

Allows you to [change the location on disk of a resource linked in the edited DITA map](#).

XML Refactoring

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations](#) that are used will also appear in this submenu.

Find/Replace in Files

Allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to [spell check multiple files](#).

Copy

Copies the currently selected node to the clipboard.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

To watch our video demonstration about the **DITA Maps Manager** view, go to https://www.oxygenxml.com/demo/DITA_Maps_Manager.html.

Related information

[DITA Map Author Mode Actions](#) on page 1081

[Finding and Replacing Text in Multiple Files](#) on page 459

Creating a Map

To create a **DITA map**, **subject scheme**, **bookmap**, or other types of DITA maps, follow these steps:

1. Go to **File > New**.
A **New** document dialog box is opened that allows you to select a document type from various folders.
2. Select one of the **DITA Map** templates from the **Framework templates** folder.
3. Click the **Create** button.
4. Select whether you want to open the map in the **DITA Maps Manager** or the **Editor**.
5. Save the map using the  **Save** button on the toolbar of the **DITA Maps Manager** view.

Selecting a Root Map

Oxygen XML Editor allows you to select a DITA map as a *key space*, or *root map*, for all the other DITA maps and topics in the project. Specifying the correct *root map* helps to prevent validation problems when you work with **keyrefs** and also acts as the foundation for content completion. All the **keys** that are defined in a *root map* are available in the maps that the *root map* contains.

There are several ways to select or change the *root map*:

- The easiest method is to use the **Root map** drop-down menu in the **DITA Maps Manager** toolbar to select the appropriate *root map*.
- If you insert a *key reference* using the **Cross Reference** action from the  **Link** drop-down menu (from the toolbar or **Link** submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the  **Choose Key Reference** button.
- If you insert a *content key reference* or *key reference* using the  **Reuse Content** action (from the toolbar, **DITA** menu, or **Reuse** submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the  **Choose Key Reference** button.

To watch our video demonstration about the DITA Root Map support, go to https://www.oxygenxml.com/demo/DITA_Root_Map.html.

Creating DITA Submaps

You can break up a large DITA map into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would [add a new topic or insert an existing topic into a map](#), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a **mapref** element or a **topicref** element with the **format** attribute set to **ditamap**. In most cases, Oxygen XML Editor takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.

2. To insert the submap as a child of the selected node, select **Append Child > New**. To insert the submap as a sibling to the current node, select **Insert After > New**. This opens a *New file template dialog box* that allows you to select the type of document and assists you with naming it.
3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file type should be **.ditamap**).
4. Click **Create** to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see [Managing DITA Maps](#) on page 1549.

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a *bookmap* to organize your topics into a book. A DITA bookmap is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as frontmatter, part, chapter, appendix, and backmatter to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the [DITA documentation](#) for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor.

To create a book in DITA using a bookmap, follow these steps:

1. Create a new bookmap (**File > New > Framework templates > DITA Map > map > Bookmap**). If you want the bookmap to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager**) and selecting **New** from **Append child** or **Insert After**.
2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a bookmap, or children to a section, right-click the bookmap or section icon and choose any of the reference actions in the **Append child** menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the [DITA documentation](#) to fully understand the structure of a DITA bookmap and where to create each element.
3. Create special elements such as an *index* and *table of contents*. The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.
4. [Add topics](#) to your chapters to add content to your book. You may find it easier to manage if you [use submaps](#) to create the content of your chapters. This keeps your bookmap from becoming long and difficult to manage.

Managing DITA Maps

You may want to manage your DITA maps in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the **DITA Maps Manager**.
- By highlighting a topic in the **DITA Maps Manager**, holding down the **Alt** key, and pressing the arrow keys.
- By showing the extended **DITA Maps Manager** toolbar (press the  **Settings** icon on the **DITA Maps Manager** toolbar and select the extended toolbar) and then using the node moving buttons () on the toolbar to move topics around in the map.

To understand how to organize topics in a [DITA map](#) using the **DITA Maps Manager**, you can examine and experiment with the sample map called `flowers.ditamap`, located in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor supports both approaches.

A DITA map organizes content hierarchically, so you can add a topic as a child of the map root or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the `topicref` element. See the [DITA documentation](#) for the full range of reference elements and their uses. Oxygen XML Editor provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The [Insert Reference dialog box](#) allows you to create various reference types and configure the most commonly used attributes. You can open the **Insert Reference** dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select **Append child** or **Insert After** and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select **Reference to the currently edited file**.
- Selecting an item in the map and click the  **Insert Reference** button from the **DITA Maps Manager** toolbar.
- Select  **Insert Reference** from the **DITA Maps** menu.

Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a DITA map by dragging and dropping the file into the **DITA Maps Manager**. You can drag and drop files from any of the following:

- Your OS file system explorer.
- The **Project** view.
- The **Open/Find Resource** view.

Adding topics this way will not open the **Insert Reference** dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting **Edit Properties**.

Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:

- **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a [New file dialog box](#) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
- **Insert After > New** - Select this action to insert the new topic as a sibling to the current node. This action opens a [New file dialog box](#) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

Step Result: The new topic is now referenced (as a `topicref`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager**, an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press **Delete**.
- Highlight the topic and click the **X Delete** button on the **DITA Maps Manager** extended toolbar.

Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Editor. To do this, use one of the following actions available in the **Refactoring** submenu of the contextual menu when invoked on a resource in the **DITA Maps Manager** view:

Refactoring > Rename resource

This action allows you to change the name of a resource linked in the edited DITA map, using the **Rename resource** dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Enable this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the *completeness* of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
- **Rename** - Executes the **Rename resource** operation.
- **Cancel** - Cancels the **Rename resource** operation. No changes are applied.

Refactoring > Move resource

This action allows you to change the location of a resource linked in the edited DITA map, using the **Move resource** dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Enable this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the *completeness* of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the **Move resource** operation. No changes are applied.

Note: If a root DITA map is not defined, the move and rename actions are executed in the context of the current DITA map.

Finding Resources Not Referenced in DITA Maps

Over the course of time large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing

the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps. To assist you with organizing project resources, Oxygen XML Editor includes an action, **Find Unreferenced Resources**, that searches for orphaned resources that are not referenced in DITA maps.

To perform this search, open the DITA map in the **DITA Maps Manager**, invoke the contextual menu on the DITA map, and select **Find Unreferenced Resources**. This action can also be selected from the **DITA Maps** menu. This action opens the **Find Unreferenced Resources** dialog box, which allows you to specify some search parameters:

- **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to **Add** maps to the list or **Remove** them.
- **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders.
- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
 - **Include files** - Allows you to filter specific files to include in the search.
 - **Exclude files** - Allows you to filter specific files to exclude from the search.
 - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

Note: In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

Insert References in DITA Maps

A DITA map may contain various types of references. The targets of the references can be a variety of references, such as anchors, chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference dialog box**.

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

Insert Reference Dialog Box

The **Insert Reference** dialog box allows you to insert and configure references in DITA maps. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, anchors, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

- Select  **Reference**, **Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child** and **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager**.
 - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
 - To insert the reference as a sibling of the current node (below the current node in the map), select the reference from the **Insert After** submenu.
- Click the  **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select  **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the  **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the

Append Child and **Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**.

Target Tab

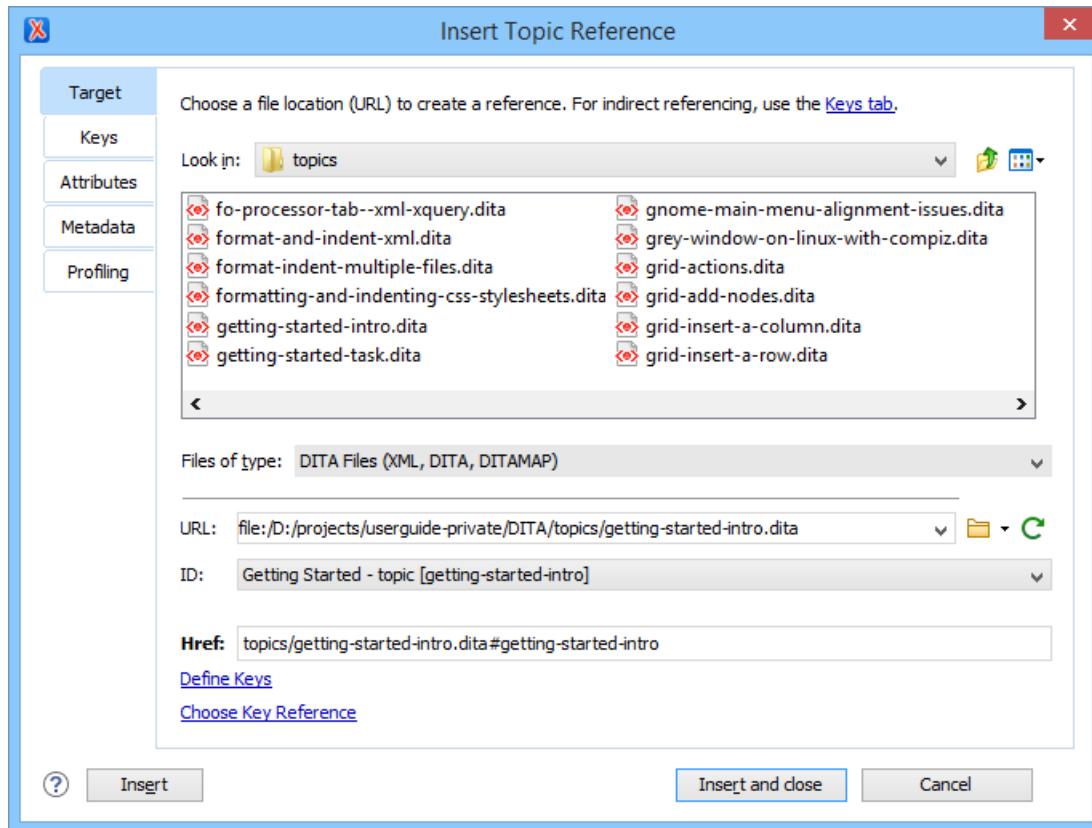

Figure 685: Insert Reference Dialog Box - Target Tab

The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

Choose a file location section

You can browse for and select the source target file by using the **Look in** drop-down list, browsing tools, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing tools.

ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding href attribute of the target element.

Note: If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a navref element requires a mapref attribute instead.

Keys Tab

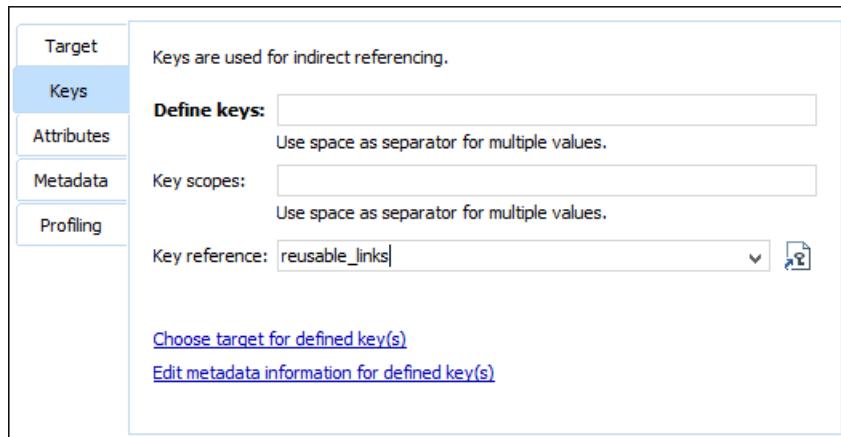

Figure 686: Insert Reference Dialog Box - Keys Tab

The **Keys** tab allows you to use and [define keys](#) for indirect referencing. For more information, see [Working with Keys](#) on page 1591. This tab includes the following:

Define keys

Use this text field to define the keys attribute for the target.

Key scopes [This option is only available if the [Built-in DITA-OT 2.x \(with DITA 1.3 support\) option is enabled in the DITA preferences page](#)]

Use this text field to define or edit the value of a [keyscope attribute](#). Key scopes allow you to specify different sets of key definitions for different map branches.

Key reference

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current root map.

Attributes Tab

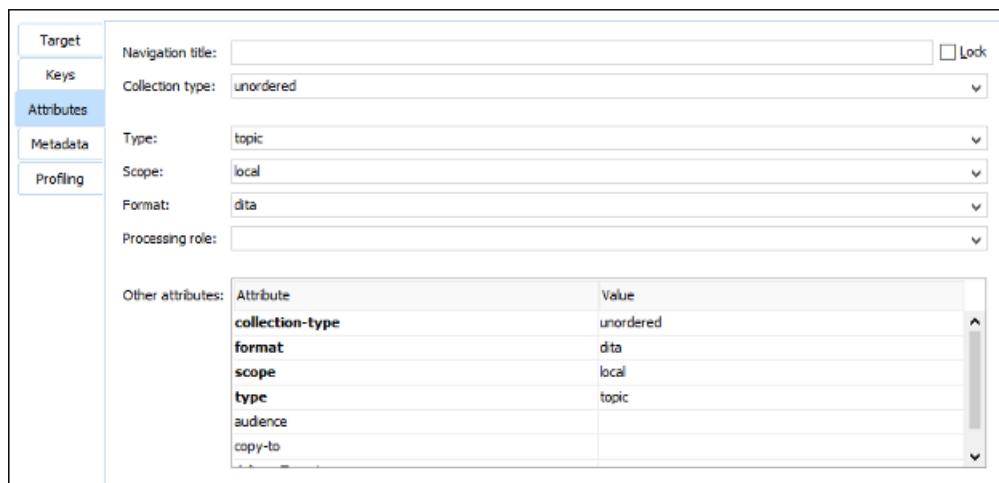

Figure 687: Insert Reference Dialog Box - Attributes Tab

The **Attributes** tab of the **Insert Reference** dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the **Navigation title** checkbox for the [Always fill values for attributes option in the DITA preferences page](#). You can enforce the use of the specified title by enabling the **Lock** checkbox.

Tip: You can also enable the [Prefer navigation title for topicref rendering option in the DITA preferences page](#) to always enforce the use of the navtitle value rather than enabling this **Lock** option on individual topics.

Collection type

This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

Type

Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the **Type** checkbox for the [Always fill values for attributes option in the DITA preferences page](#).

Scope

This property corresponds to the scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the **Scope** checkbox for the [Always fill values for attributes option in the DITA preferences page](#).

Format

This property corresponds to the format attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the **Format** checkbox for the [Always fill values for attributes option in the DITA preferences page](#).

Processing Role

This drop-down list allows you to set the processing-role attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

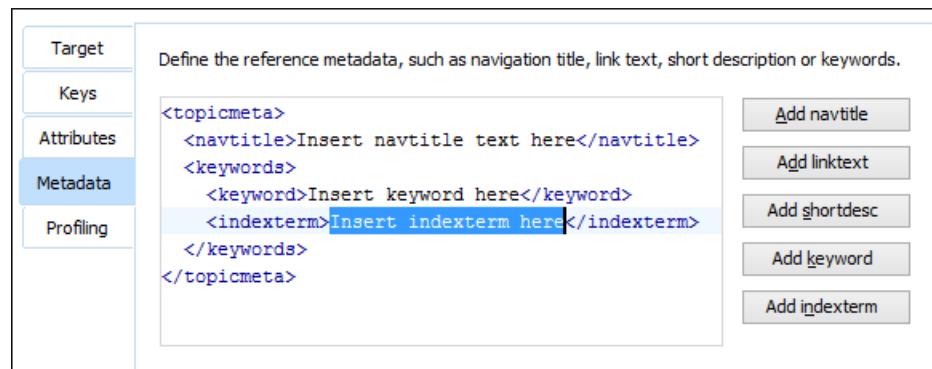

Figure 688: Insert Reference Dialog Box - Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: navtitle,

`linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

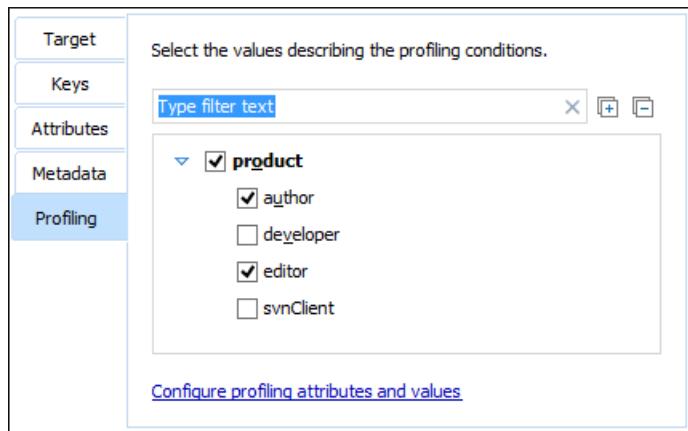

Figure 689: Insert Reference Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root DITA map references a DITA subject scheme map that defines values for the profiling attributes, those values are used.
- If your project defines *project-level configuration values for the profiling attributes*, those values are used.
- If Oxygen XML Editor defines *global-level configuration values for the profiling attributes*, they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see [DITA Profiling / Conditional Text](#) on page 1633.

Finalizing Your Insert Reference Configuration

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

Tip: You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

Related information

[DITA Profiling / Conditional Text](#) on page 1633

[Working with Keys](#) on page 1591

Inserting Topic Headings

The `topichead` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `topicref` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child** or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view.
- [Open the DITA map in the XML editor](#) and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the [Insert Topic Head dialog box](#) that allows you to easily insert a `topichead` element. A **Navigation title** (`navtitle` attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.).

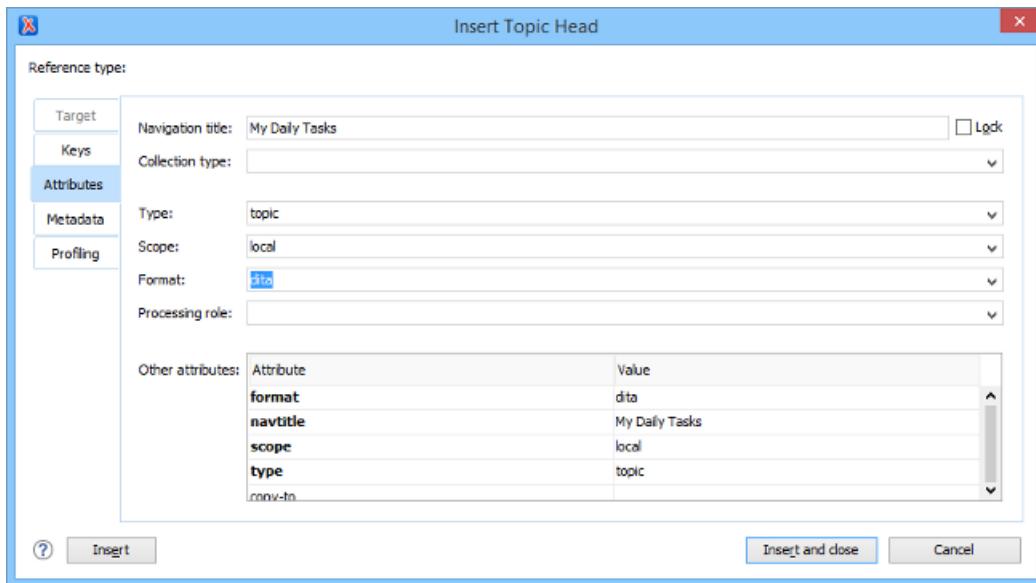

Figure 690: Insert Topic Heading Dialog Box

Related information

[Insert Reference Dialog Box](#) on page 1552

Inserting Topic Groups

The topicgroup element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A topicgroup can contain other topicgroup elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing topicgroup and its children. You can set the collection-type of a container topicgroup to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child** or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view.
- Open the [DITA map in the XML editor](#) and select the **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the [Insert Topic Group dialog box](#) that allows you to easily insert a topicgroup element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

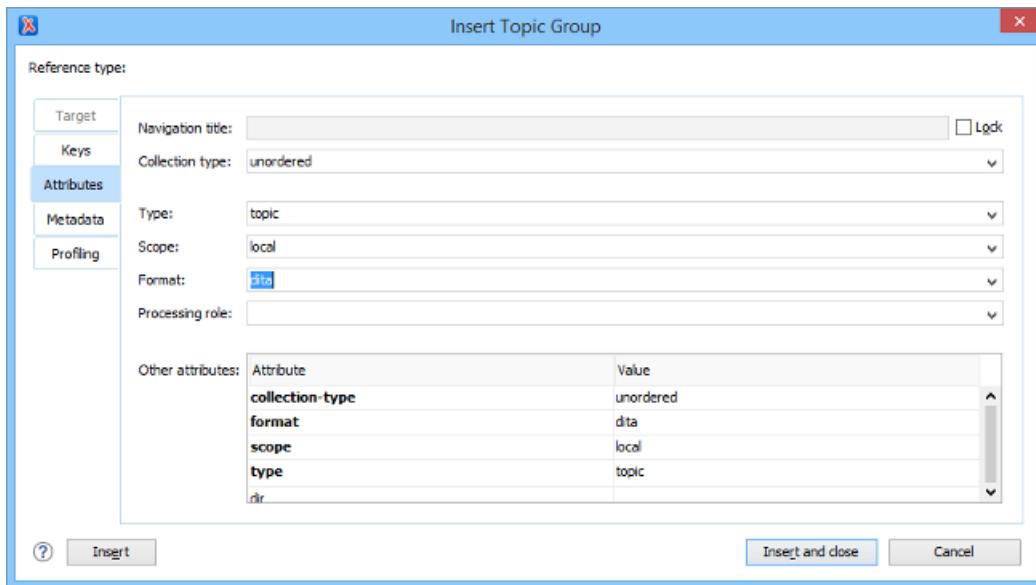

Figure 691: Insert Topic Group Dialog Box

[Insert Reference Dialog Box](#) on page 1552

Inserting and Defining Keys in DITA Maps

DITA uses **keys** to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map.

The following example is a DITA map that defines various values for the product key:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map>
  <!-- product name -->
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="enterprise">
    <topicmeta>
      <keywords>
        <keyword>Enterprise Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
</map>
```

Note: The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword

To insert a *key definition with a keyword* in a DITA map, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition** from the **Append Child** or **Insert After** submenu (depending on where you want to insert the *key definition* in the DITA map). This opens an **Insert Key Definition** dialog box.

3. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
4. Go to the **Metadata** tab and click **Add keyword**. In the editing window enter the key value inside the keyword element.

Note: You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

5. Once you are done configuring the *key definition*, click **Insert and close**.

Alternatively, there is a simplified method that can be used if you simply want to define a key with a value inside a keyword, without configuring any profiling or other attributes. To use the simplified method, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition with Keyword** from the **Append Child** or **Insert After** submenu (depending on where you want to insert the *key definition* in the DITA map). This opens a simplified **Insert Key Definition** dialog box.
3. Enter the name of the key in the **Key** field and its value in the **Keyword** field.
4. Click **Insert and close** to finalize the operation.

Key Definition with a Target

To insert a *targeted key definition* (for example, to target a resource such as an image or topic) in a DITA map, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition** from the **Append Child** or **Insert After** submenu (depending on where you want to insert the *key definition* in the DITA map). This opens an **Insert Key Definition** dialog box.
3. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
4. Go to the **Target** tab and select a target resource (such as an image or topic).

Note: You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

5. Once you are done configuring the *targeted key definition*, click **Insert and close**.

Edit Properties Dialog Box

The **DITA Maps Manager** view includes a feature that allows you to view and edit the properties of a selected node. The  **Edit properties** action is available on both the **DITA Maps Manager** toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map document in **Author** mode. The action opens the **Edit Properties** dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node for which the action was invoked.

Note: If you select multiple sibling nodes and invoke the  **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the **Edit Properties** dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps.

At the top of the **Edit Properties** dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node for which the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map, only the **Attributes**, **Metadata**, and **Profiling** tabs are enabled and the **Title** property can be configured. Also, if you select multiple nodes, only the **Profiling** tab is available.

Target Tab

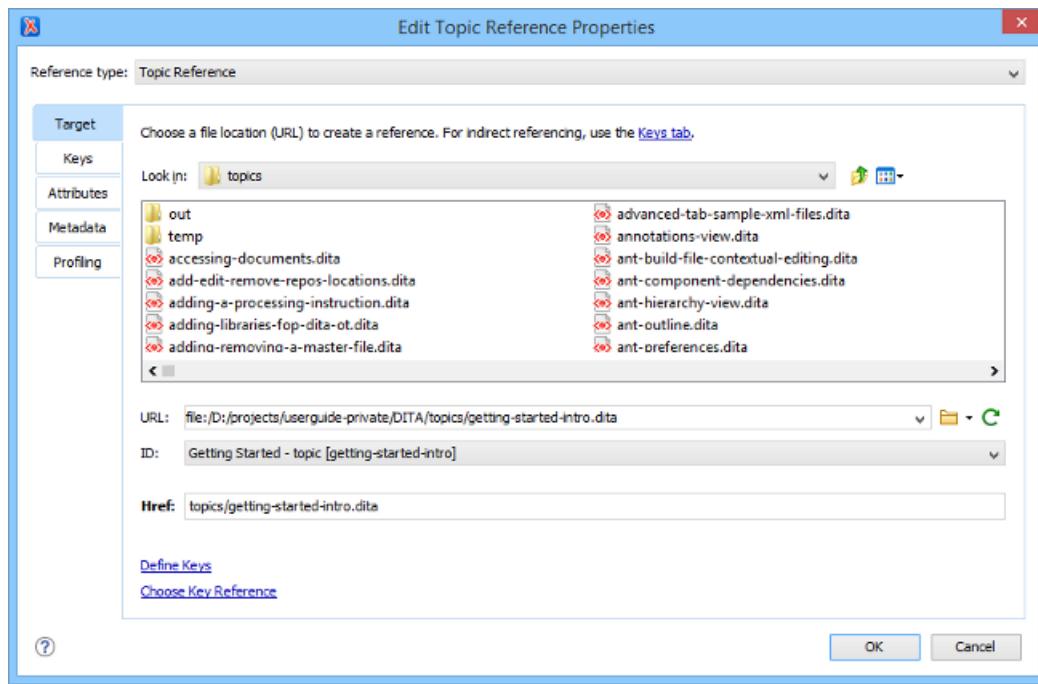

Figure 692: Edit Properties Dialog Box - Target Tab

The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

Choose a file location section

You can browse for and select the source target file by using the **Look in** drop-down list, browsing tools, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing tools.

ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding href attribute of the target element.

Note: If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a navref element requires a mapref attribute instead.

Keys Tab

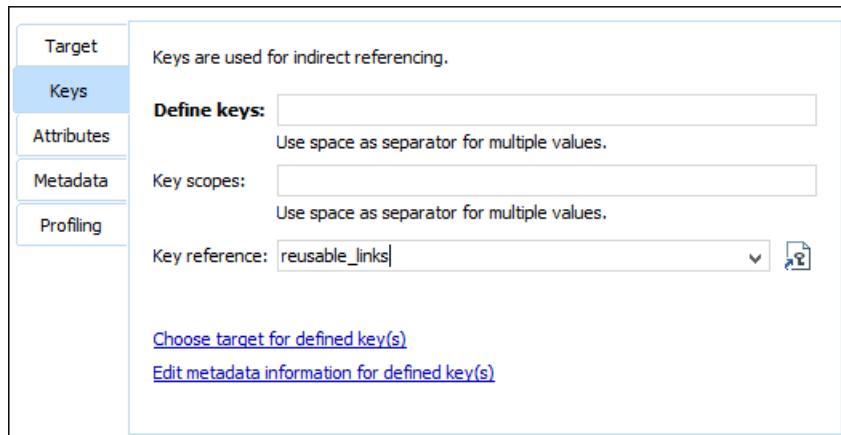

Figure 693: Edit Properties Dialog Box - Keys Tab

The **Keys** tab allows you to use and [define keys](#) for indirect referencing. For more information, see [Working with Keys](#) on page 1591. This tab includes the following:

Define keys

Use this text field to define the keys attribute for the target.

Key scopes [This option is only available if the [Built-in DITA-OT 2.x \(with DITA 1.3 support\) option is enabled in the DITA preferences page](#)]

Use this text field to define or edit the value of a [keyscope attribute](#). Key scopes allow you to specify different sets of key definitions for different map branches.

Key reference

Use this combo box (or the [Choose key reference](#) button) to select a key that is already defined in the root map.

Attributes Tab

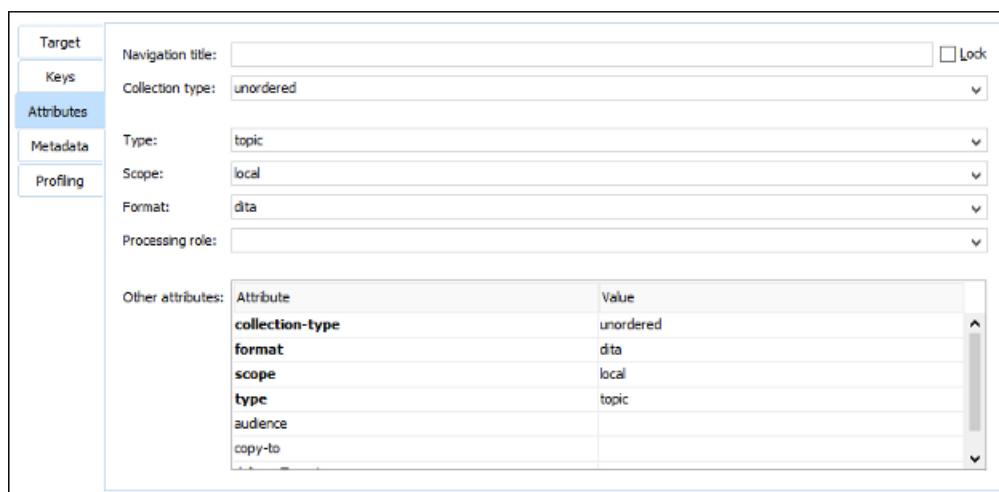

Figure 694: Edit Properties Dialog Box - Attributes Tab

The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node for which the action was invoked.

If the target is a root map, the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**.

Title:	DITA Authoring								
Set to:	<input checked="" type="radio"/> Attribute	<input type="radio"/> Element	<input type="radio"/> All						
Other attributes:	<table border="1"> <thead> <tr> <th>Attribute</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>id</td> <td>chapter.author-dita</td> </tr> <tr> <td>title</td> <td>DITA Authoring</td> </tr> </tbody> </table>			Attribute	Value	id	chapter.author-dita	title	DITA Authoring
Attribute	Value								
id	chapter.author-dita								
title	DITA Authoring								

Figure 695: Attributes Tab for a Root Map

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the **Navigation title** checkbox for the [Always fill values for attributes option in the DITA preferences page](#). You can enforce the use of the specified title by enabling the **Lock** checkbox.

Tip: You can also enable the [Prefer navigation title for topicref rendering option in the DITA preferences page](#) to always enforce the use of the navtitle value rather than enabling this **Lock** option on individual topics.

Collection type

This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

Type

Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), enable the **Type** checkbox for the [Always fill values for attributes option in the DITA preferences page](#).

Scope

This property corresponds to the scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the **Scope** checkbox for the [Always fill values for attributes option in the DITA preferences page](#).

Format

This property corresponds to the format attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), enable the **Format** checkbox for the [Always fill values for attributes option in the DITA preferences page](#).

Processing Role

This drop-down list allows you to set the processing-role attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

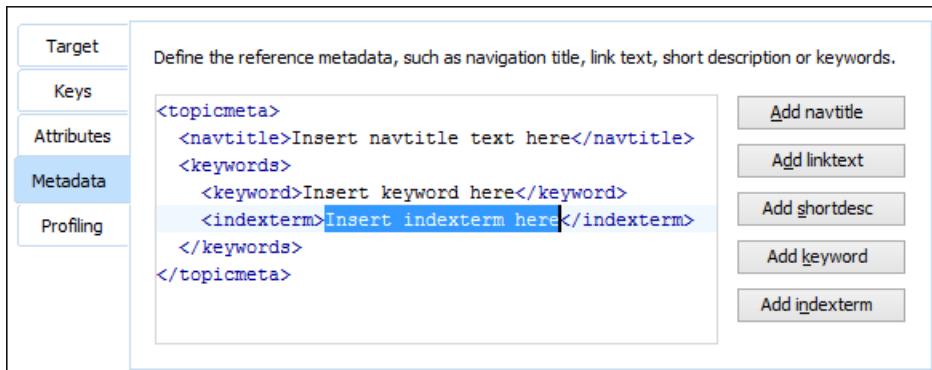

Figure 696: Edit Properties Dialog Box - Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

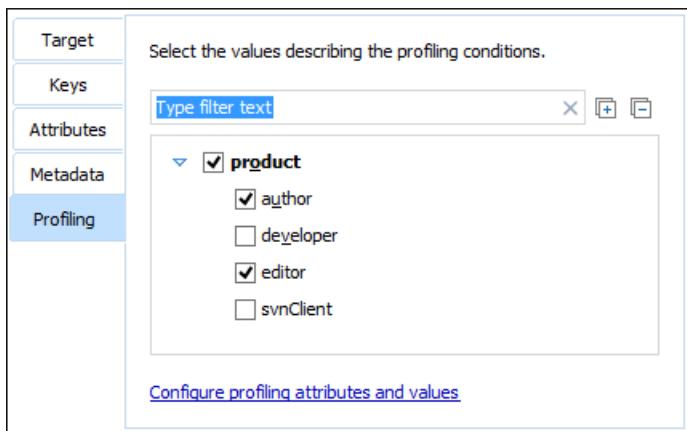

Figure 697: Edit Properties Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root DITA map references a DITA subject scheme map that defines values for the profiling attributes, those values are used.
- If your project defines *project-level configuration values for the profiling attributes*, those values are used.
- If Oxygen XML Editor defines *global-level configuration values for the profiling attributes*, they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **+ Expand All**/**- Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name..

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see [DITA Profiling / Conditional Text](#) on page 1633.

Note: If you invoke the **Edit properties** action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the **Profiling** tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this **Profiling** tab and the changes will be applied to all the selected nodes.

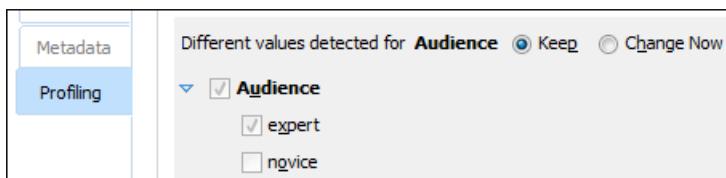

Figure 698: Profiling Conflict Panel

Finalizing Your Modifications

Once you click **OK**, all your changes are applied to the target node.

Creating a Table of Contents in DITA

In DITA, the order and hierarchy of the table of contents of a document is based directly on [the DITA map that defines the document](#). In many media, the creation of a table of contents, based on the map, is automatic. For example, you do not have to do anything special to create a table of contents in WebHelp output.

In other media, you need to tell DITA where the table of contents should occur. For example, in a book you need to tell DITA where to place the table of contents in the structure of the book, and if you want to generate other common content lists, such as a list of figures or tables. You do this by [using a bookmap to define your book](#), and adding the appropriate elements to the frontmatter.

To configure a table of contents and other book lists, follow these steps:

1. Open your [bookmap](#) in the **DITA Maps Manager**.
2. Right-click the bookmap and select **Append child > Frontmatter**. The [Insert Reference dialog box](#) appears.
3. Click **Insert and Close** to insert the frontmatter element.
4. Right-click the frontmatter element and create a booklist element using **Append child > Book Lists**.
5. Use the same steps to create a toc element and to add other booklist elements, such as tablelist.

Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an XML catalog:

- You customized your DITA map to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor. The **DITA Maps Manager** view will solve the displayed topic refs through the added XML catalog, as will DITA map transformations (for PDF output, XHTML output, etc.)

To add an XML catalog to the DITA framework, follow these steps:

1. Create an XML catalog using the guidelines described in [Working with XML Catalogs](#) on page 475.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.
3. Select the **DITA** document type and use the **Edit**, **Duplicate**, or **Extend** button to open a [Document type configuration dialog box](#).
4. Go to the **Catalogs** tab.
5. Click on the **+ Add** button to open a dialog box that allows you to add your created XML catalog to the list.
6. After adding your catalog, click **OK**. You may need to reopen any currently edited files that use the new catalog or run a [manual Validate action](#) for the changes to take effect.

Note: You could also add your created catalog to the list of global catalogs in the [XML Catalog preferences](#) page.

Chunking DITA Topics

By default, when a [DITA map](#) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as *chunking*.

To chunk DITA topics, you set the chunking attribute on the `topicref` that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, `by-topic` or `to-content`). See the [DITA documentation](#) for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `toc` and `collection-type` attributes on the sub-topics or container topic to suitable values. See the [DITA documentation](#) for details.

You can set the `collection-type` attribute on your topics using the **Edit Properties** action in the [DITA Maps Manager](#). To set the `toc` and `chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon  in the [DITA Maps Manager](#) to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your maps regularly to make sure that your topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In [the DITA Maps Manager view](#), make sure that the tab that holds your *root map* is selected and that the **Root map** selection is set either to the name of your *root map* or to `<current_map>`.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the [DITA Maps Manager](#) view and click  **Reload (F5)**.
3. Click the  **Validate and Check for Completeness** button on the [DITA Maps Manager](#) toolbar to open the [DITA Map Completeness Check dialog box](#).
4. If you are using profiling, check the **Use DITAVAL filters** box and select the appropriate option.
5. Select any other options you want to check.
6. Click **Check** to run the validation process.

Validation Process

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an `href` attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The [DITA Map Completeness Check](#) dialog box allows you to configure the DITA map validation.

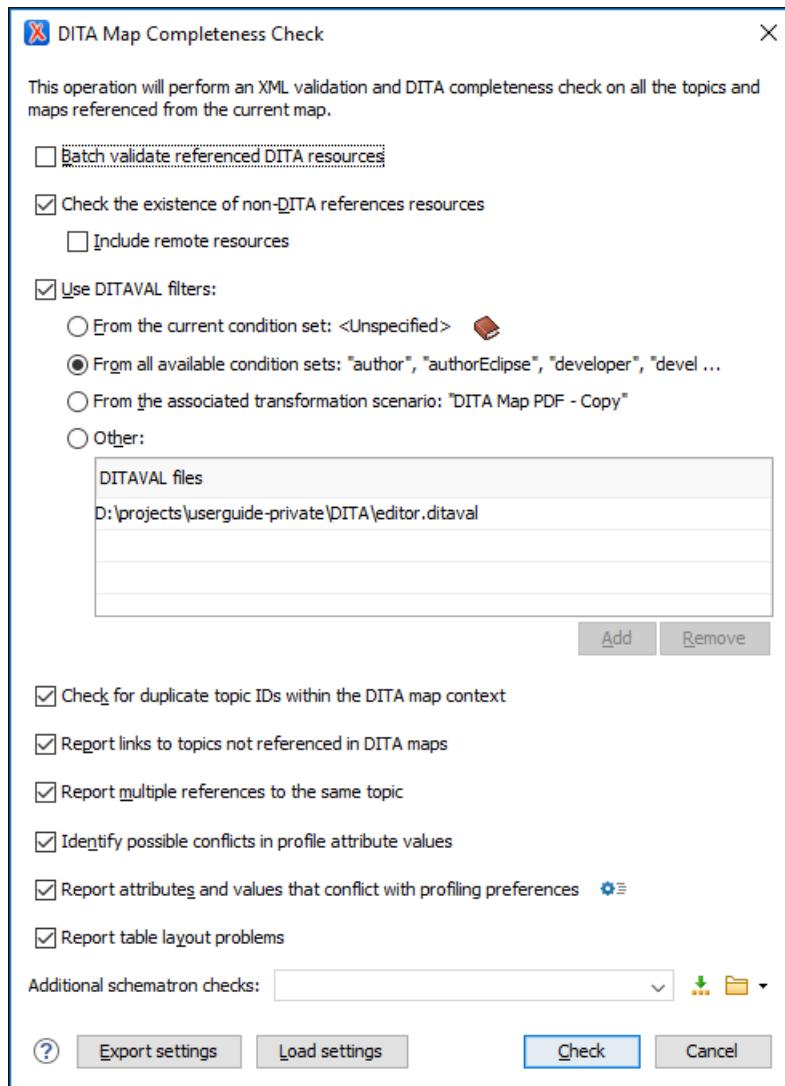

Figure 699: DITA Map Completeness Check Dialog Box

You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is checked, the DITA files will be validated using rules defined in their associated [validation scenario](#).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Enable this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a [profiling condition set](#) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager** view. Clicking the  **Details** icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.

Report multiple references to the same topic

If enabled, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique `copy-to` attribute is used on the `topicref` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `topicref` has a `copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `copy-to` attribute set or both of them have the `copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page](#) (you can click the  **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of colspecs is different than the number of columns detected from the table cols attribute.
- For a CALS table, if the number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the cols, rowsep, or colsep attributes are not numeric.
- For a CALS table, if the namest, nameend, or colname attributes point to an incorrect column name.

Additional schematron checks

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.

Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Load settings

Allows you to load settings for this dialog box from an XML file that was created by the **Export settings** action.

Check

Use the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

Related information

[DITA Maps Manager](#) on page 1540

DITA Map Validation and Completeness Check from the Command-Line Interface

Important: This command-line script requires a special **Oxygen-Scripting** license and does not work with a normal Oxygen XML Editor license. For more information and to obtain an **Oxygen-Scripting** license, see the [Oxygen Scripting Web Page](#).

You can execute a **Validate and Check for Completeness operation** with a script ran from the command-line interface. The operation can be executed by running the following script:

- **Windows:**

```
validateCheckDITA.bat -i mainDitamapPath -s settingsFile -r reportFile
```

- **Linux:**

```
sh validateCheckDITA.sh -i mainDitamapPath -s settingsFile -r reportFile
```

- **Mac OS X:**

```
sh validateCheckDITAMac.sh -i mainDitamapPath -s settingsFile -r reportFile
```

The script is located in the Oxygen XML Editor installation folder and can be integrated in an external batch process launched from the command-line interface. The script accepts a variety command line arguments that allow you to configure the validation.

The accepted arguments are as follows:

mainDitamapPath

The path to the main DITA map file to validate. This is a required parameter.

settingsFile

The options file for the validate and completeness check. This file can be obtained from the [DITA Map Completeness Check dialog box](#) by using the **Export Settings** action. If this parameter is missing, the default options for the validation will be used.

reportFile

The file where the validation report will be saved. If this parameter is missing, the report will be displayed in the console.

Note: When using this script, some of the options that appear in the [DITA Map Completeness Check dialog box](#) are ignored. The ignored options include:

- [Batch validate referenced DITA resources](#)
- [Use DITAVAL filters: From the current condition set](#)
- [Use DITAVAL filters: From all available condition sets](#)
- [Use DITAVAL filters: From the associated transformation scenario](#)

- ***Report attributes and values that conflict with profiling preferences***

Tip: You can use DITAVAL filter files with the script by specifying one or more ditaval files in the [Use DITAVAL filters: Other DITAVAL files](#) option in the **DITA Map Completeness Check** dialog box.

Result: The validation result is displayed in the command line interface. This includes whether or not the validation was successful, the number of issues, and the path to the report file (if the reportFile parameter was used), or the actual content of the validation result if the reportFile parameter was not used.

Restriction: When using this script, the Saxon 9 XSLT processor used to apply [custom Schematron checks](#) is not licensed and therefore the Schematron cannot call external Java extensions.

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as p, ol, and simpletable. [The DITA markup](#) specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A task element specifies that a block of content contains the description of a task.
- A codeblock element specifies that a block of text consists of programming code.
- A uicontrol element specifies that a word is the name of a control in a computer GUI.
- The platform profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`wintitle`), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an audience element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor provides a number of tools to help you create topic structures:

- **Content Completion Assistant** - Shows you which elements can be created at the current position.
- **Model** view - Shows you the complete structure supported by the current element.
- **Outline** view - Shows you the current structure of your document.
- **DITA** toolbar - Helps you to easily insert many common structures.

Related information

[Your First DITA Topic](#) on page 9

[DITA Topics Document Type](#) on page 1071

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- *Topic* - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- *Task* - For procedural information such as how to use a dialog box.
- *Concept* - For general, conceptual information such as a description of a product or feature.
- *Reference* - For reference information.

Oxygen XML Editor also supports numerous other specialized topic types that you will find templates for in the various folder in the [New DITA file dialog box](#). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and map types such as *Glossentry*, *Troubleshooting*, *Bookmap*, and *Subject Scheme*.

To create a new DITA topic and add a reference to it in your DITA map, follow these steps:

1. In the **DITA Maps Manager**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:

- **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a [New file dialog box](#) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
- **Insert After > New** - Select this action to insert the new topic as a sibling to the current node. This action opens a [New file dialog box](#) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

Step Result: The new topic is now referenced (as a `topicref`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

New DITA File Dialog Box

The **New DITA** file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

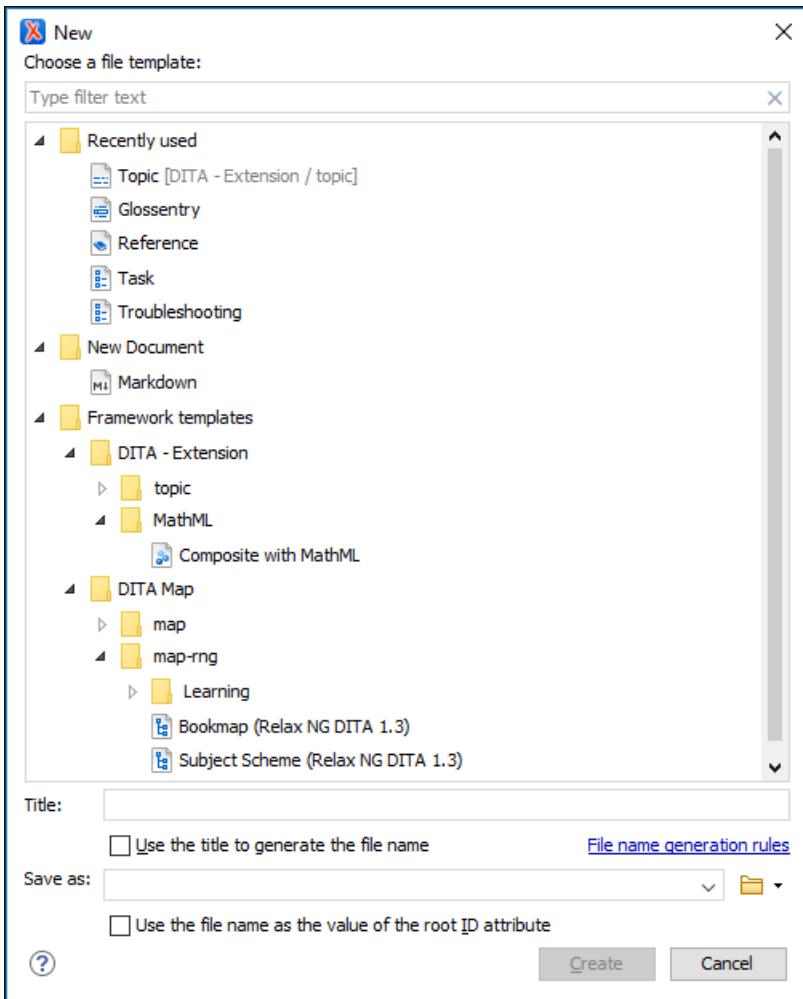

Figure 700: New DITA File Dialog Box

Note: The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in [Creating New Document Templates](#) on page 250.

The **New DITA** file dialog box includes the following features and options:

Choose a file template

Use the template preview pane to select the appropriate type of DITA file you want to create. You can use the filter text box to search for a template.

Title

Depending on the selected file template, the value of the **Title** field is set in:

- the `title` element of a DITA topic file. The `title` element needs to be the first child of the root element.
- the `glossterm` element of a *Glossentry* file.

Use the title to generate the file name

Select this option to use the text entered in the **Title** field to automatically generate a file name. By default, the generated name will transform spaces into underscores (_), all illegal characters will be removed, and all upper case characters changed to lower case (the generated name can be seen in the **Save as** field). You can configure these rules by clicking the [File name generation rules link](#).

Save as

Provide a file name and path in this field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the  **Browse** drop-down menu.

Use the file name as the value of the root ID attribute

Select this option to use the file name in the **Save as** field (without the file extension) as the value of the `root_id` attribute for the new topic.

Create

When you click this button, a reference (`topicref`) to the new topic is added to the current DITA map and the new topic is opened in the editor.

Editing DITA Topics

Oxygen XML Editor provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents also apply to DITA topics. Oxygen XML Editor also provides extensive additional support specifically for DITA.

Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** (or right-click the topic and select **Open**).
- Double-click the file in the **Project** view (or right-click the file and select **Open**).
- If you have a DITA map opened in the XML editor, you can click the  icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an [XML format](#), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor provides a graphical view of your topics in [Author mode](#). Your topics will likely open in **Author** mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in **Author** mode, just click **Author** at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author** mode is not a **WYSIWYG** view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat **Author** mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. **Author** mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to [Text mode](#). You, or someone in your organization, can change how the **Author** view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author** mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the **Author** view (though there are some exceptions) and cannot be edited directly in the **Author** view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place

your cursor on the element and press **Alt+Enter** to bring up the attribute editor. Alternatively, you can use the [Attributes view](#) to edit attributes.

Tip: You can select **Hints** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the [Selecting and Combining Multiple CSS Styles](#) section.

Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differ from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor has a number of content completion assistance features.

- **The Enter key:** In **Author** mode, the Enter key does not create line breaks, it brings up the **Content Completion Assistant** to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element p in DITA) and tools insert the line breaks in the output and on-screen.

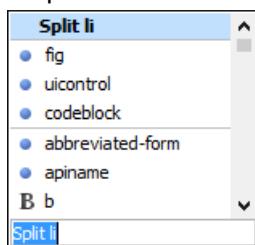

Figure 701: Content Completion Assistant

The **Content Completion Assistant** not only suggests new elements you can add. If you press **Enter** at the end of a block element (such as a paragraph) it suggests creating a new element of the same type. If you press **Enter** in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting **Enter** twice (just as you might in a text editor).

As you highlight an element name, a basic description of the element is displayed. Select the desired element and press **Enter** to create it.

To wrap an element around an existing element or piece of text, simply select it and press **Enter** and use the **Content Completion Assistant** to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the **Model** view (**Window > Show View > Model**, if the view is not already open). The **Model** view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip: You can also select **Inline actions** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the [Selecting and Combining Multiple CSS Styles](#) section.

PITA Editing Actions

A variety of actions are available in the DITA framework to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the **DITA** menu, the **DITA (Author Custom Actions)** toolbar, or the **Content Completion Assistant**.

The **DITA** toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the **DITA** toolbar is not displayed, right-click anywhere on the toolbar area, select **Configure Toolbars**, and select it from the displayed dialog box.

Note: The **DITA** toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press **Enter** to open the **Content Completion Assistant**.

Whenever the current document in the editor is a DITA document, the **DITA** menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the *DITA framework-specific actions*, the contextual menu also includes various *general Author mode contextual menu actions*.

[DITA Author Mode Actions](#) on page 1072

Adding Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

Adding an Image Inline

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the **Insert Image** action. The **Insert Image** dialog box appears.

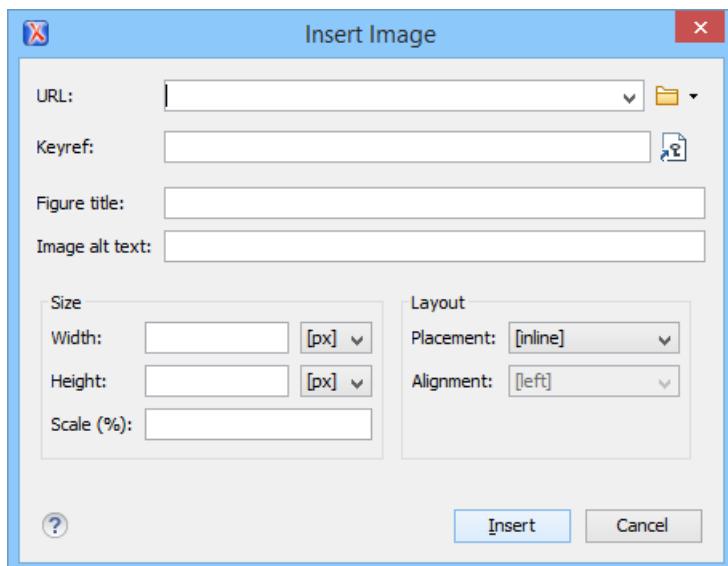

Figure 702: Insert Image Dialog Box

3. Configure the options in this dialog box and click **Insert**.

The **Insert Image** dialog box includes the following options for inserting images into a DITA document:

URL

Use this option to specify a URL for the image. It will insert the URL as the value of an `href` attribute inside an `image` element. You can type the URL of the image you want to insert or use the **Browse** drop-down menu to select an image using one of the following options:

- **Browse for local file** - Displays the **Open** dialog box to select a local file.
- **Browse for remote file** - Displays the **Open URL** dialog box to select a remote file.
- **Browse for archived file** - Opens the **Archive Browser** to select a file from an archive.

- **Browse Data Source Explorer** - Opens the **Data Source Explorer** to select a file from a connected data source.
- **Search for file** - Displays the **Find Resource** dialog box to search for a file.

Keyref

You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map. Use this dialog box to insert the selected key as the value of a `keyref` attribute inside an `image` element. All keys that are presented in the dialog box are gathered from the root map of the current DITA map. Elements that have the `keyref` attribute set are displayed as links.

Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link.

Figure title

Use this text box to insert a `title` and `image` element inside a `fig` element.

Alternate text

Use this text box to insert an `alt` element inside the `image` element.

Size

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `width`, `height`, and `scale` attribute, respectively.

Layout

Use the options in this section to insert `placement` and `align` attributes into the `image` element.

Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `fig` element to your document at the appropriate place.
2. Add a `title` and/or `desc` element to the `fig` element, according to your needs.
3. *Add an image element* to the `fig` element.

Note: The `fig` element has a number of other child elements that may be appropriate to your content. See the [DITA documentation](#) for complete information about the `fig` element.

Note: The order in which the `image`, `title`, and `desc` content are presented in output is determined by the output transformation. If you want to change how they are output, you may have to modify the output transformation, rather than your source content.

[Image Maps in DITA](#) on page 407

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs. There is a toolbar button () that allows you to insert and configure a reference to the media resource.

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. The **Insert Media** dialog box appears.

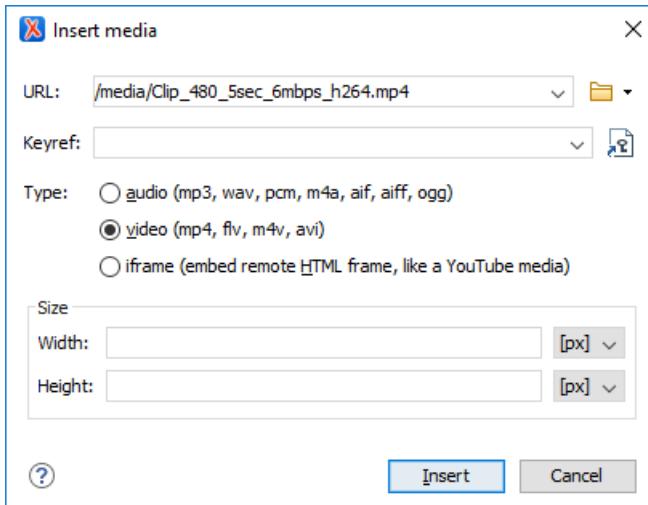

Figure 703: Insert Media Dialog Box

3. Configure the options in this dialog box and click **Insert**.

The **Insert Media** dialog box includes the following options:

URL

Use this option to specify a URL for a media resource. It will insert the URL as the value of a `data` attribute of an `object` element. You can type the URL of the resource you want to insert or use the **Browse** drop-down menu to select it.

Keyref

You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map. Use this dialog box to insert the selected key as the value of the `datakeyref` attribute of an `object` element. All keys that are presented in the dialog box are gathered from the root map of the current DITA map.

Tip: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link.

Type

Oxygen XML Editor detects and automatically selects the media type based upon the specified resource in the **URL field**. You can manually change the type, but keep in mind that in the publishing stage the **object element is converted to an HTML5 element** based upon the type selected here. You can choose between: **audio**, **video**, or **iframe**.

Size

Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a `width` and `height` attribute, respectively. For audio clips, only the **Width** can be adjusted.

Result in Author Mode: A reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in **Author** mode so that it can be played directly from there.

Result in Output: In the publishing stage, the `object` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `object` element is converted to an HTML5 `video` element.
- **Audio Clips** - The `object` element is converted to an HTML5 `audio` element.
- **Embedded HTML Frames** - The `object` element is converted to an HTML5 `iframe` element.

Tip: There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select **Copy embed code**), you can then paste the contents of the clipboard in the **URL field**, and the **Type** will automatically be set on **iframe**, while the **Width and Height** will be populated according to the detected size.

Image Maps in DITA

Oxygen XML Editor includes support for *image maps* in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

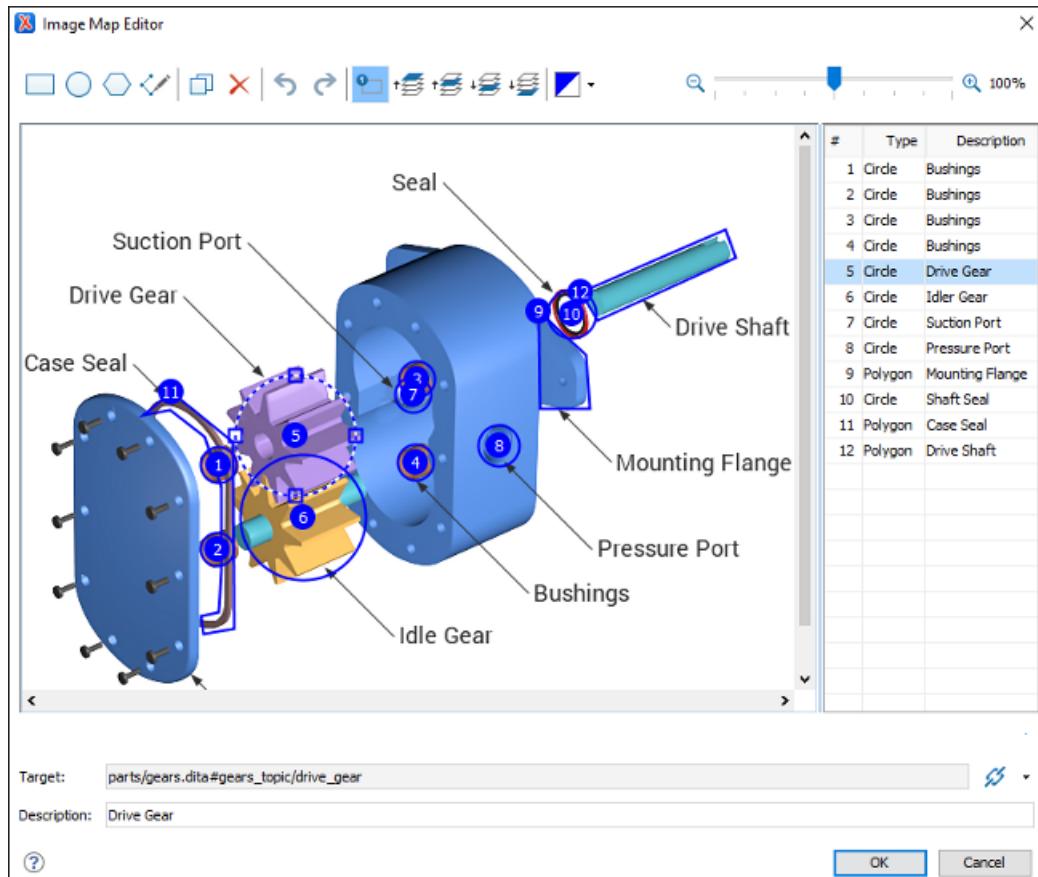

Figure 704: Image Map Editor in DITA

Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to *Polygon* or *Free Form* shapes.

Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the -Link drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of *Inserting links in DITA* by using the identical -Link drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see *Inserting a Link in Oxygen XML Editor* on page 1610.

Description

You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details section** in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar](#) to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, use one of the [linking options](#) in the Link drop-down menu to select a target resource (or enter its path in the [Target](#) text field).
5. (Optional) Enter a [Description](#) for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

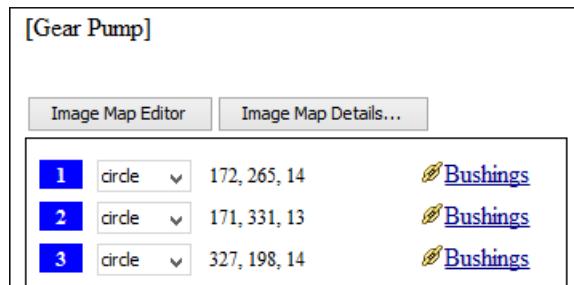

Figure 705: Image Map Details

How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the [Image Map Editor toolbar](#)). To change the layer order for a shape, use the layer buttons on the [Image Map Editor toolbar](#) (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a

shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Related information

[DITA 'imagemap' Element Specifications](#)

[Adding Images in DITA Topics](#) on page 1574

Adding Tables in DITA Topics

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- [DITA Simple table model](#) - This is the most commonly used model for basic tables.
- [CALS table model \(OASIS Exchange Table Model\)](#) - This is used for more advanced functionality.
- [DITA Choice table model](#) - This is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- [DITA Properties table model](#) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

To insert a *Simple* DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

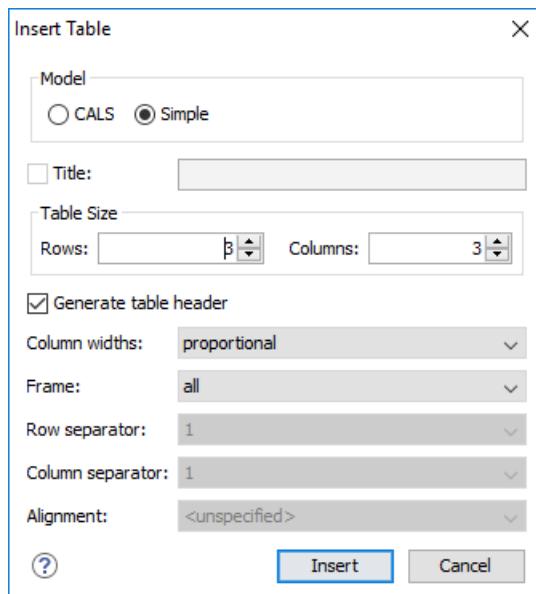

Figure 706: Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **Simple** table model:

Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Note: The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

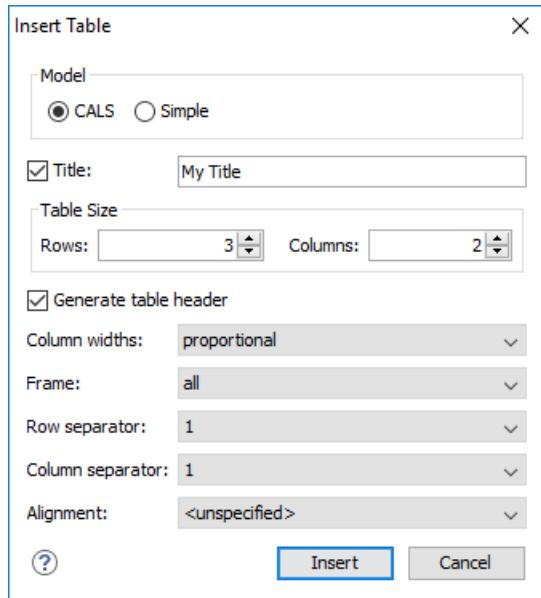

Figure 707: Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspeccs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.

- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Row separator

Specifies whether or not to include row separators (rowsep attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Column separator

Specifies whether or not to include column separators (colsep attribute). The allowed values are: 0 (no separator) and 1 (include separators).

Alignment

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Note: The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

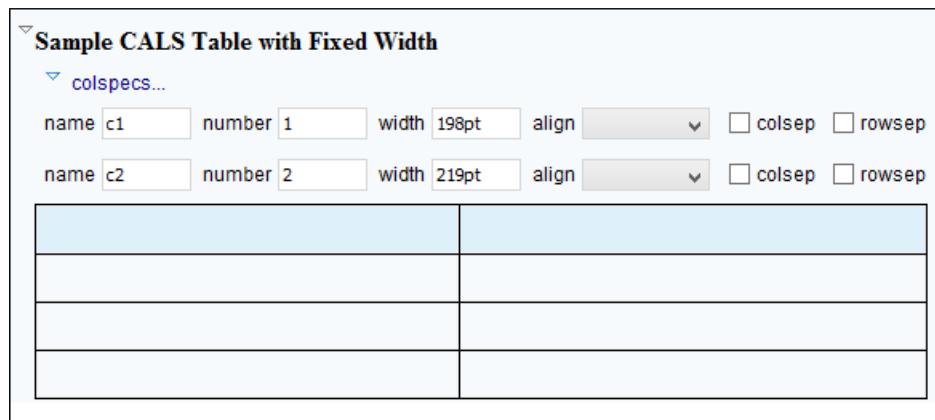

Figure 708: CALS Table in DITA

Inserting a Choice Table Model

To insert a **Choice** table within a **step** element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the **Content Completion Assistant**. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

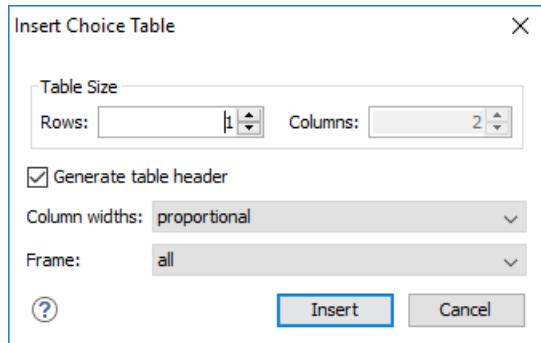

Figure 709: Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

Inserting a Properties Table Model

To insert a *Properties* table within a `refbody` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the **Content Completion Assistant**. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

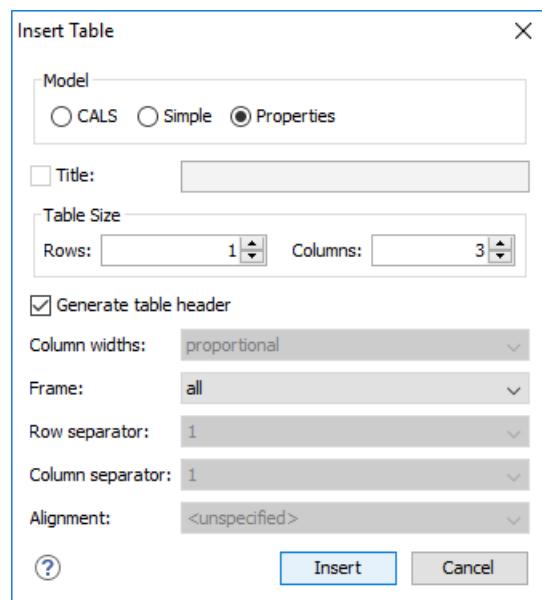

Figure 710: Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). See the **DITA documentation** for a full explanation of these attributes.

You can also use the  **Table Properties** (**Ctrl + T (Command + T on OS X)**) action from the toolbar or contextual menu (or **DITA** menu) to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

[Editing Tables in Author Mode](#) on page 377

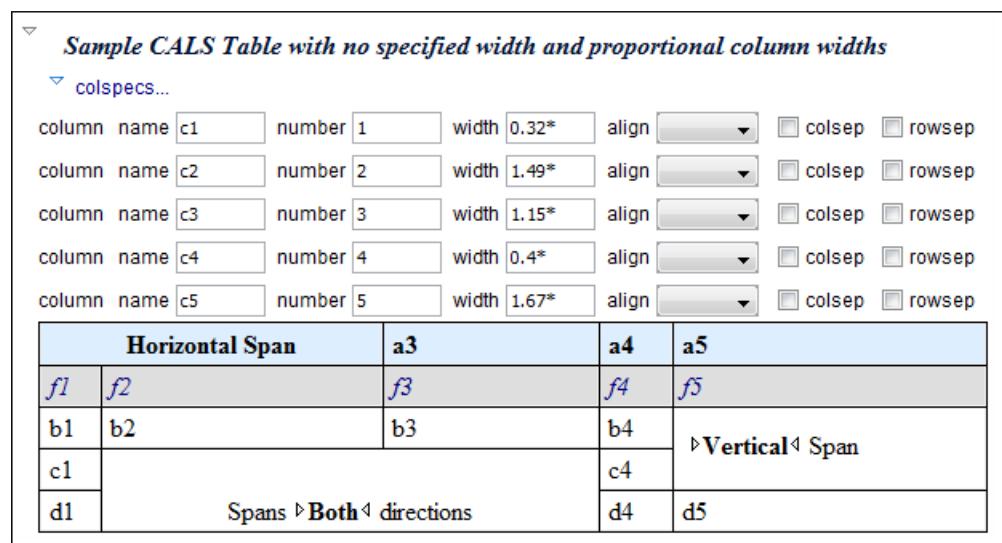

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- [CALS table model](#)
- [Simple table model](#)
- [Choice table model](#)
- [Properties table model](#)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a CALS table includes a **colspeсs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**colwidth** attribute) or the text alignment (**align** attribute). Although they appear as part of the **Author mode**, the colspeсs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The screenshot shows the 'Sample CALS Table with no specified width and proportional column widths' configuration. It includes a 'colspeсs...' button and five columns labeled c1 through c5 with their respective widths (0.32*, 1.49*, 1.15*, 0.4*, 1.67*) and align settings. Below this is a sample table with various cells labeled f1 through d5, demonstrating horizontal and vertical spans.

Horizontal Span		a3	a4	a5	
f1	f2	f3	f4	f5	
b1	b2	b3	b4	▷ Vertical [↓] Span	
c1					
d1	Spans ▷ Both [↓] directions				
			d4	d5	

Figure 711: CALS Table in DITA

Simple Table Model Layout

When choosing a *Simple* table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 712: DITA Simple Table

Choice Table Model Layout

A *Choice* table model is used within a *step* element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The *choicetable* element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting *choicetable* from the **Content Completion Assistant** (within a *step* element) or by using the

 **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

Figure 713: DITA Choice Table

Properties Table Model Layout

A *Properties* table model is used within a *refbody* element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting *properties(wizard)* from the **Content Completion Assistant** (within a *refbody* element) or by using the  **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Property Type	Property Value	Property Description
A	B	C

Figure 714: DITA Properties Table

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map with the  **Validate and Check for Completeness** action, if the [Report table layout problems option is enabled in the DITA Map Completeness Check dialog box](#), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table *cols* attribute.
- A row has more cells than the number of columns detected from the table *cols* attribute.
- A cell has a vertical span greater than the available rows count.
- The number of *colspecs* is different than the number of columns detected from the table *cols* attribute.
- The number of columns detected from the table *cols* attribute is different than the number of columns detected in the table structure.
- The value of the *cols*, *rowsep*, or *colsep* attributes are not numeric.
- The *namest*, *nameend*, or *colname* attributes point to an incorrect column name.

Simple or Choice Tables

- A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties** (**Ctrl + T (Command + T on OS X)**) action from the toolbar or the **Table** submenu of the contextual menu (or DITA menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

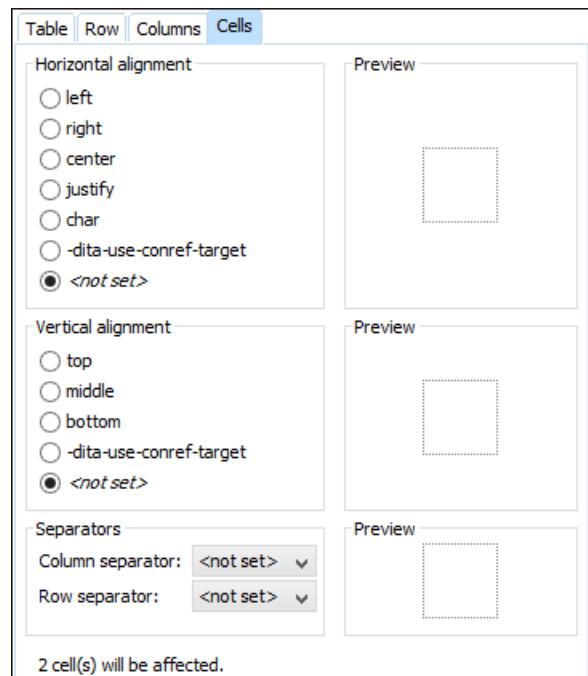

Figure 715: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

Frame (Available only in the Table tab)

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple*, *Choice*, *Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Row tab (not available for *Properties* tables)

Row type

Allows you change the row to a body or header type of row.

Related information

[Adding Tables in DITA Topics](#) on page 387

[Editing Tables in Author Mode](#) on page 377

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can start with the **Framework templates / DITA / topic / Composite with MathML** document template, available from the **New** file action wizard.
- Reference an external MathML file as an image, using the **Insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).

Note: MathML equations contained in DITA topics can only be published out-of-the-box in PDF using the **DITA PDF** transformation scenario. For other publishing formats, you must employ additional customizations for handling MathML content.

Working with Keys

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see [Working with Variable Text in DITA](#) on page 1605.

Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the `keys` attribute of the `topicref` element:

```
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the `topicref` element in its DITA map) is to use the **Keys tab** in the [Edit Properties dialog box](#). In the **DITA Maps Manager**, invoke the contextual menu on the topic for which you want to assign a key and select **Edit Properties**. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can [create a link](#) to it using `<xref keyref="feature.quick-heat" />`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).

- You can use it [in a map to create a reference to a topic](#) by key: <topicref keyref="feature.quick-heat". This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to [insert a content reference](#). In this case, the content reference uses the key to locate the topic to pull content from. It uses a conkeyref attribute: <procedure conkeyref="feature.quick-heat/preheat-procedure" />. In this example, feature.quick-heat is the key, and preheat-procedure is the id of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file) and [insert the image using the key](#).

[Inserting and Defining Keys in DITA Maps](#) on page 1558

Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Editor provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps.

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides two mechanisms for including content by reference: conref and conkeyref. A conref creates a direct reference to a specific element of another topic. A conkeyref creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map.

Oxygen XML Editor provides support for both conref and conkeyref mechanisms.

While the conref and conkeyref mechanisms can be used to reference any content element, it is considered best practice to only conref or conkeyref content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by conref. Oxygen XML Editor can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content, which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

Reusing Content with DITA 1.3 Concepts

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. Key Scopes (or scoped keys) allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. Branch Filtering allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

Related information

[Working with Keys](#) on page 1591

Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or *multiple locations within the same map*) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map is opened in the **DITA Maps Manager**.
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
 - a. If the topic already exists in this DITA map, do one of the following:
 - Simply drag the topic while pressing **Ctrl** (**Option** on OS X) and drop it in the new location within the map (or use the **Copy** and **Paste** contextual menu actions).
 - If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager**), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.
 - b. If the topic already exists in another DITA map, do one of the following:
 - Open the other map in the **DITA Maps Manager**, right-click the topic, select **Copy**, switch back to the original DITA map in the **DITA Maps Manager**, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions (**Paste**, **Paste Before**, or **Paste After**).
 - If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager**), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.
 - c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
 - Right-click the topic in the **Project** view (or the file system), select **Copy**, switch to the **DITA Maps Manager** view, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions (**Paste**, **Paste Before**, or **Paste After**).
 - If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager**), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.
3. If your topic uses a *key reference*, set up the appropriate *key definition in your map*.
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can *add a relationship table to your map*.
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this *validation*, click the **Validate and Check for Completeness** action on the toolbar in the **DITA Maps Manager**.

Reuse Topics Using Author Mode Editor

1. *Open the DITA map* in the **Author** mode editor.
2. Add a reference to an existing topic by dragging it from the **Project** view (or the file system) and dropping it in the desired location in the DITA map opened in **Author** mode. You can also accomplish the same thing by using the **Copy** and **Paste** contextual menu actions.

3. If your topic uses a [key reference](#), set up the appropriate [key definition in your map](#).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can [add a relationship table to your map](#).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this [validation](#), click the  [Validate and Check for Completeness action](#) on the toolbar in the **DITA Maps Manager**.

Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager**, an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the **DITA Maps Manager**.

Working with Content References

The DITA `conref` feature (short for *content reference*) lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place.

There are several strategies for managing content references:

- *Reusable components* - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.
- *Single-source content references* - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.
- *Arbitrary content references* - Although it is not recommended, you can create content references amongst topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

Oxygen XML Editor creates a reference to the external content by adding a `conref` attribute to an element in the local document. The `conref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor displays it in **Author** mode as if it is there in the referencing file. If you do not want referenced content displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Edit modes > Author**, and disable the [Display referenced content option](#).

Note: A reference also displays tracked changes and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select **Edit Reference**.

Tip: To search for references made through a direct content references, use the **Search References** action from the contextual menu.

[Working with the Conref Push Mechanism](#) on page 1602

Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or `conref`, is one of the main [content reuse features of DITA](#). It is a mechanism for reusing the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

Assigning an *ID* to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select **Edit Attributes** from the contextual menu (or simply press **Alt+Enter**) to open the [in-place attribute editor](#). Enter `id` as the **Name** of the attribute and a value of your choice in the **Value** field. You can also use [the Attributes view](#) to enter a value in the `id` attribute.

Note: The element may already have an `id`, since in some cases Oxygen XML Editor automatically generates an `id` value when the `id` attribute is created.

Creating a Content Reference

To create a content reference (`conref`), follow these steps:

1. Make sure the element you want to reference has an [id assigned to it](#).
2. In **Author mode**, place the cursor at the location where you want the reused content to be inserted.
3. Select the **Reuse Content** action on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The [Reuse Content dialog box](#) is displayed.
4. In the **Location** field of the **Reuse Content** dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the **Target ID** of the element (or elements) from which you want to insert the content, and verify the content in the **Preview** pane. The `id` value of the element that you select is automatically added to the **Reference to (conref)** field.
6. Make any other selections you need in the [Reuse Content dialog box](#). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `id` value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an `id` attribute. Also, the location in the document where you paste the element must be valid, although as long as the [Smart paste and drag and drop option](#) is enabled in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (`conref`) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an `id` attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the **Paste as Content Reference** action from the **Paste Special** submenu from the contextual menu.

Other Ways to Reuse Content

An alternate way to reuse content is to use the Oxygen XML Editor [Create Reusable Component](#) and [Insert Reusable Component](#) actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an `id` and `conref` and creates reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.

You can also [insert reusable content using content key references](#). This may also make reusable content easier to manage, depending on your particular situation and needs.

Creating a DITA Content Key Reference

DITA Content Key Reference

A DITA content key reference, or conkeyref, is a mechanism for inserting a piece of content from one topic into another. It is a version of the [DITA content reference mechanism](#) that uses [keys](#) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a *conref*, a *conkeyref* requires that the element to be reused has an *id* attribute. It also requires the topic that contains the reusable content to be assigned a [key](#) in a map. As with all uses of keys, you can substitute multiple maps or [use profiling](#) to create multiple definitions of keys in a single map. This allows the same *conkeyref* to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

Creating a Content Key Reference

To create a content key reference (*conkeyref*), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an *id* assigned to it.
2. In **Author mode**, place the cursor at the location where you want the reused content to be inserted.
3. Select  **Reuse Content** on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The [Reuse Content dialog box](#) is displayed.
4. Select the **Key** radio button for the content source and use the  **Choose Key Reference** button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the **Key** field). The elements that you can reference from the source are presented in the table in the middle of the **Reuse Content** dialog box.
5. Select the **Target ID** of the element (or elements) that you want to insert, and verify the content in the **Preview** pane. The *id* value of the element that you select is automatically added to the **Reference to (conkeyref)** field.
6. Make any other selections you need in the [Reuse Content dialog box](#). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the *id* value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an *ID* attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the [Smart paste and drag and drop option](#) is enabled in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (*conkeyref*) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.
3. In a topic with an assigned key, copy an entire DITA element that has an *ID* attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.

5. Select the **Paste as Content Key Reference** action from the Paste Special submenu from the contextual menu.

Related information

[Reuse Content Dialog Box](#) on page 1597
[Working with Reusable Components](#) on page 1604
[Editing DITA Content References](#) on page 1597

Editing DITA Content References

Oxygen XML Editor also includes some actions that allows you to quickly edit existing content references. When the element that contains a content reference (conref or conkeyref) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

Edit Content Reference

This action is available for elements with a conref or conkeyref attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (conref/conkeyref and conrefend attributes). For more information, see [Reuse Content Dialog Box](#) on page 1597.

Replace Reference with content

Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA conref, conkeyref, and keyref attributes can be used to insert references to reusable content. The conref attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The conkeyref attribute uses [keys](#) to locate the content to reuse rather than direct references to the topic that contains the reusable content. The keyref attribute also uses [keys](#) and can be used to indirectly reference metadata that may have different values in various circumstances.

Note: For a conref or conkeyref, to reference the content inside a DITA element, the source element must have an id attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA conref and conkeyref attributes, go to <https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html>.

Note: For the purposes of using a keyref, keys are defined at map level and referenced afterwards. For more information about the DITA keyref attribute, go to <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html>.

Oxygen XML Editor [displays the referenced content](#) of a DITA content reference if it can resolve it to a valid resource. If you use URLs instead of local paths in your XML documents and your DITA OT transformation needs an XML catalog to map the URLs to local paths, you need to [add the catalog to Oxygen XML Editor](#). If the URLs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a references to reusable content (conref, conkeyref, or keyref) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Go to **DITA > Reuse Content**.
- Click the **Reuse Content** action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse > Reuse Content**.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor will insert a conref, conkeyref, or keyref.

If you select **Location** for the content source, a *content reference* (conref) will be inserted. If you select **Key** for the content source, keys will be used to insert a *content key reference* (conkeyref) or a *key reference* (keyref).

Content Reference (conref) Options Using the Reuse Content Dialog Box

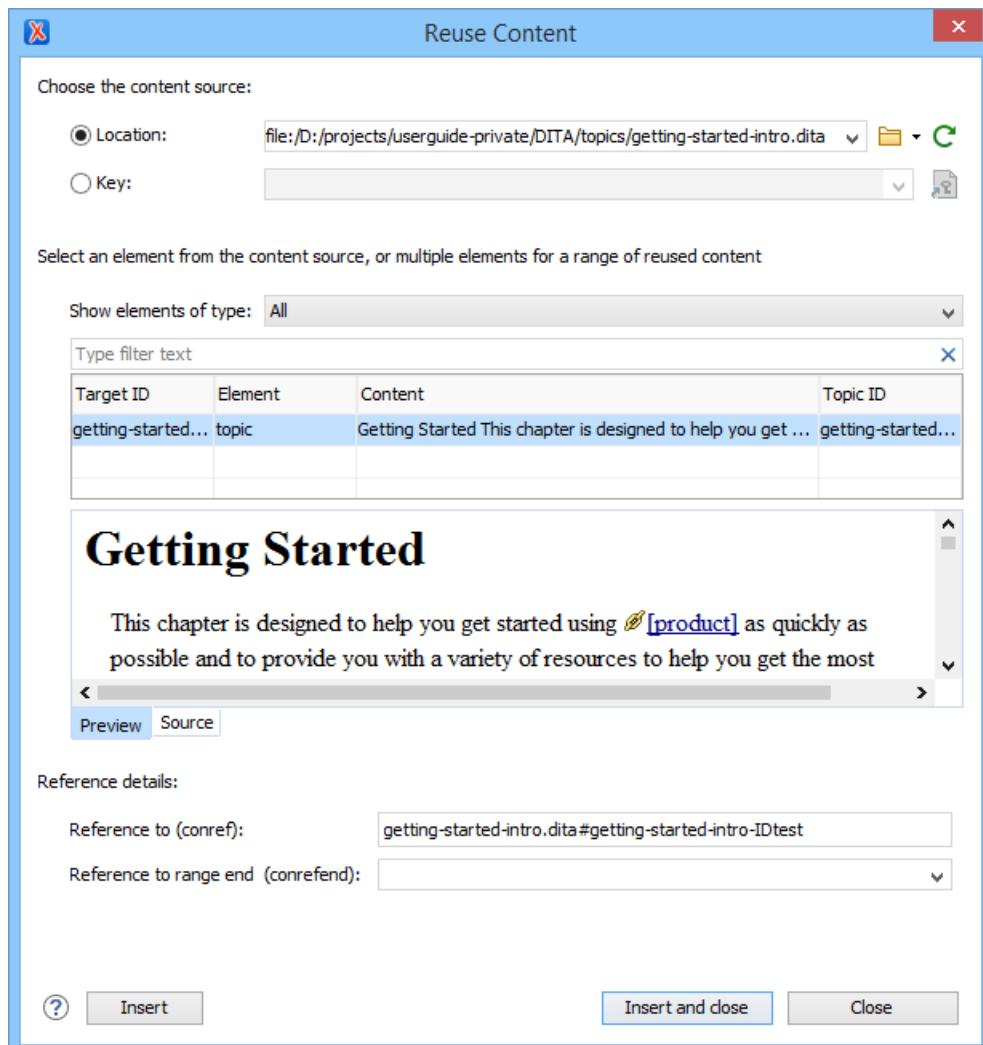

Figure 716: Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)

When **Location** is selected for the content source, a *content reference (conref)* will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor automatically fills this text field with the value of the conref attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the id value of the last element in your selection. This value will be inserted as a conrefend attribute, defining the end of the conref range.

Content Key Reference (conkeyref) Options Using the Reuse Content Dialog Box

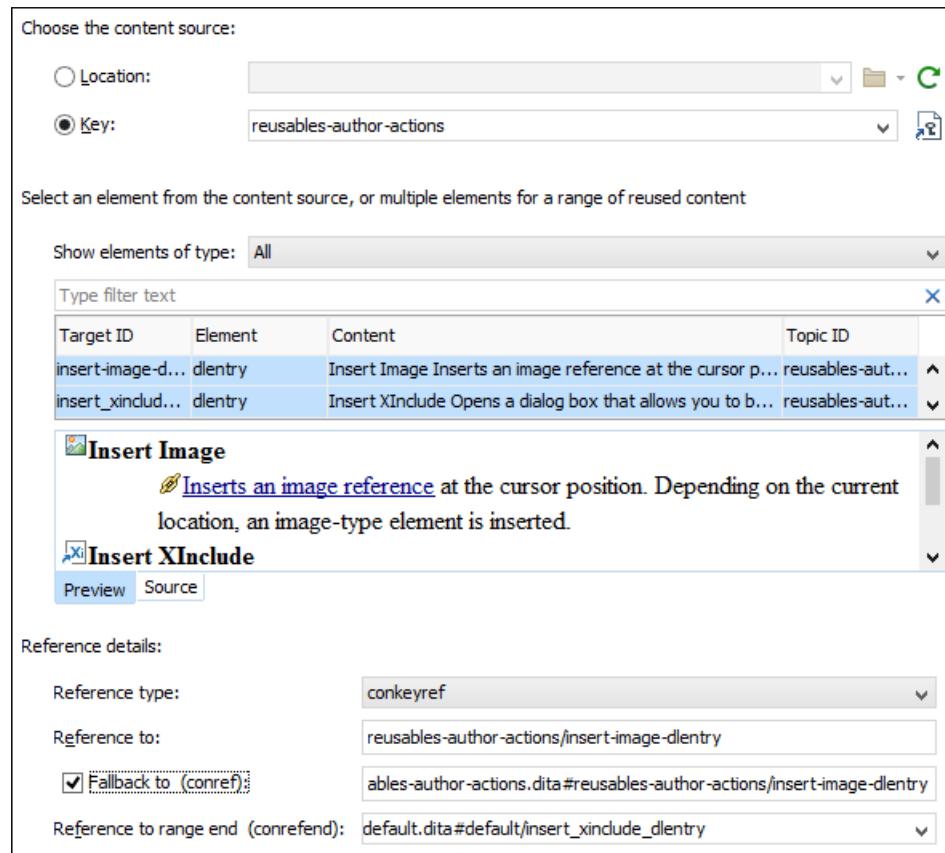

Figure 717: Insert Content Key Reference Options

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

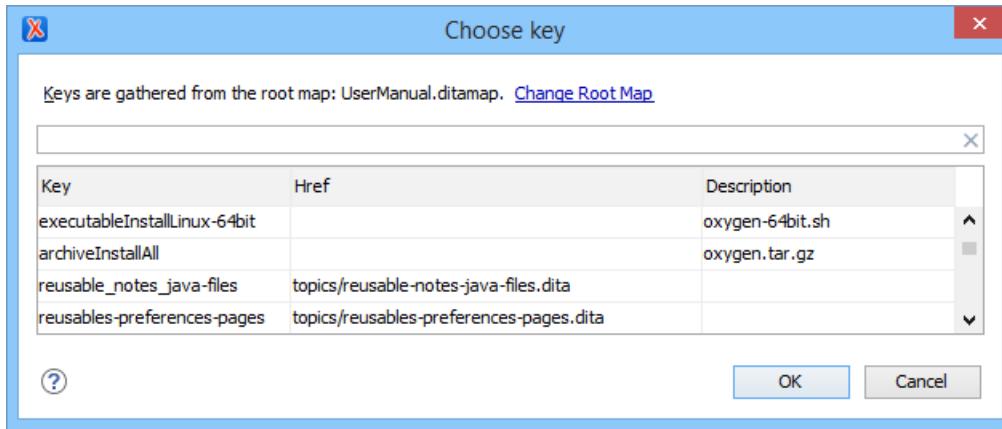

Figure 718: Choose Key Dialog Box

To insert a *content key reference* (`conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the **Href** column. Keys that do not have a value in the **Href** column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `conkeyref`, you need to select a key that has a value (file path) in the **Href** column. After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a *content key reference* has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `conkeyref`:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that `conkeyref` value is automatically selected.

Reference to

Oxygen XML Editor automatically fills this text field with the value of the `conkeyref` attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)

You can enable this option to define a `conref` attribute to be used as a fallback to determine the content reference relationship if the specified `conkeyref` cannot be resolved.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the `id` value of the last element in your selection. This value will be inserted as a `conrefend` attribute, defining the end of the conkeyref range.

Key Reference to Metadata (keyref) Options Using the Reuse Content Dialog Box

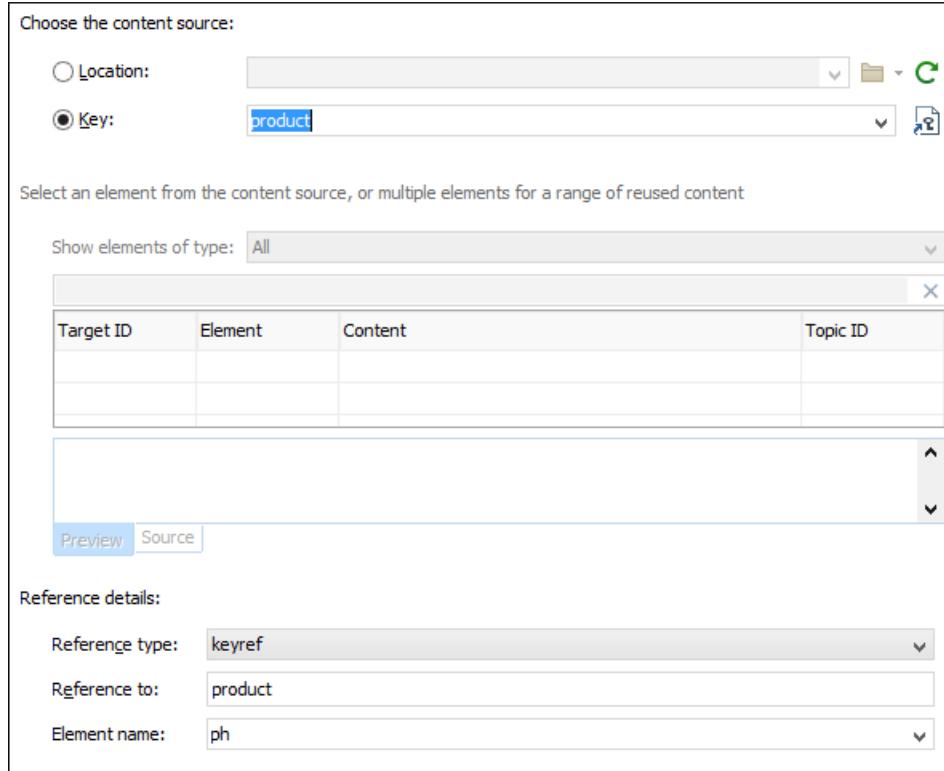

Figure 719: Insert Key Reference Options

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

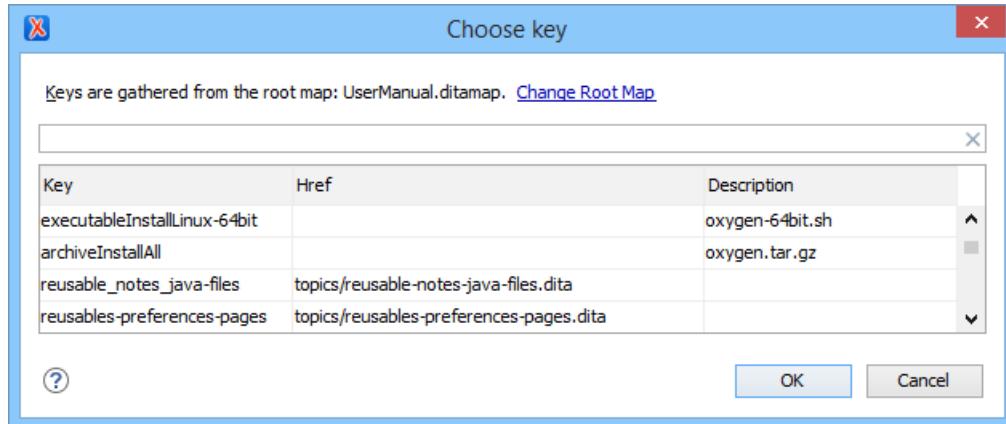

Figure 720: Choose Key Dialog Box

To insert a `key reference to metadata (keyref)`, select the key you want to reference.

Note: Keys that do not have a value in the **Href** column are for referencing metadata with a keyref attribute, whereas keys for referencing a conkeyref have a value (file path) shown in the **Href** column.

Note: The **Description** column collects data from the definition of the key, either from the navtitle element or, if missing, from the keyword element. The following example shows two key definitions that will be collected in the keys table. Their corresponding information from the **Description** column will display oxygen.sh and oxygen.tar.gz respectively.

```
<keydef keys="executableInstallLinux">
  <topicmeta>
    <keywords>
      <keyword>oxygen.sh</keyword>
    </keywords>
  </topicmeta>
</keydef>

<keydef keys="archiveInstallAll">
  <topicmeta>
    <navtitle>
      oxygen.tar.gz
    </navtitle>
  </topicmeta>
</keydef>
```

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a keyref:

Select an element from the content source Section

This section is not used when referencing metadata.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that **keyref** value is automatically selected.

Reference to

Oxygen XML Editor automatically fills this text field with the value of the keyref attribute to be inserted.

Element name

Oxygen XML Editor automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click **Insert** or **Insert and close**, the configured content reference is inserted into your document.

Tip: You can easily insert multiple content references by keeping the **Reuse Content** dialog box opened, using the **Insert** button.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference *push* mechanism (*conref push*).

The *conref push* mechanism requires elements in the target topic (the topic where the content is to be pushed) to have id elements, as the push mechanism inserts elements *before* or *after* a named element, or *replaces* the named element. Assuming the source topic is included in the DITA map, the *conref push* will be processed during publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario in which a *conref push* would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a *conref push* technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor includes an action that allows you to easily reference content with a *conref push* mechanism. The **Push Current Element** action is available in the **DITA** menu and in the **Reuse** subfolder of the contextual menu when editing in **Author** mode. Selecting this action opens the **Push current element** dialog box that allows you to select a target resource and element, and where to insert the current element content.

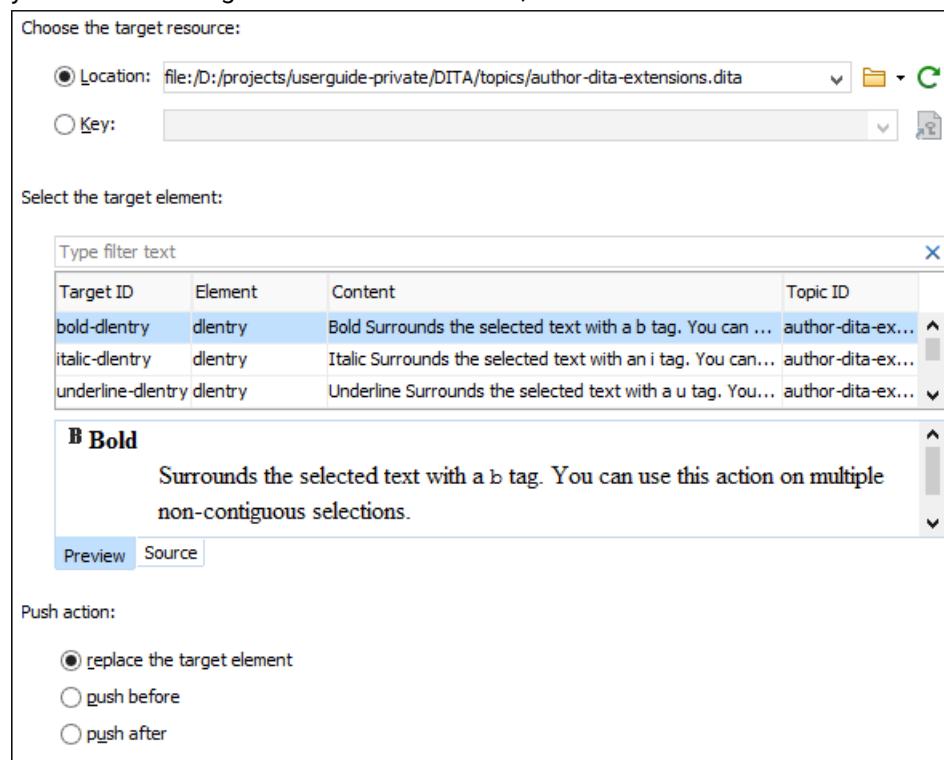

Figure 721: Push Current Element Dialog Box

This dialog box allows you to configure the following options for the *conref push* action:

Choose the target resource

Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

Select the target element

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

Push action

Allows you to choose one of the following options for where you want to insert the current element content:

replace the target element

The target element will be replaced with the current element content.

On the technical side, the value of the conaction attribute in the current element will be set to pushreplace and the conref or conkeyref attribute will be set to the specified reference.

push before

The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the conaction attribute in the current element will be set to pushbefore. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the conaction attribute set to mark and the conref or conkeyref attribute will be set to the specified reference.

push after

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the conaction attribute in the current element will be set to pushafter. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the conaction attribute set to mark and the conref or conkeyref attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the *conref push* mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the DITA map.

Related information

For more technical details about the conref push mechanism, refer to "The Conref Push Technique" section of The DITA Style Guide Best Practices for Authors.

Working with Reusable Components

In DITA, the content of almost any element can be made reusable simply by adding an *id* attribute to the element. The DITA content reference mechanism can reuse any element with an *id*. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.

Oxygen XML Editor allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the **Create Reusable Component** and **Insert Reusable Component** actions.

Creating a Reusable Content Component

Oxygen XML Editor makes it easy to create reusable content components from existing topic content.

Note: To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Editor creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In **Author** mode, select the content you want to make into a reusable component.
2. Select the **Create Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
The **Create Reusable Component** dialog box is displayed.
3. Use the **Reuse Content** drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.
5. If you want to replace the extracted content with a reference to the new component you should leave the **Replace selection with content reference** option enabled. This is recommended, since the point of reuse is to maintain only one copy of the content.
6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.

If the **Replace selection with content reference** option was enabled, Oxygen XML Editor replaces the current content with a conref attribute. The content of the content reference will be displayed in your current topic with a gray background, but it will no longer be editable since it is stored in a separate file. To edit the source of the reusable component, click the  icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu. You can also reference this new reusable component by using a [content reference](#) or [content key reference](#).

Inserting a Reusable Content Component

Oxygen XML Editor includes an **Insert Reusable Content** action that allows you to easily insert a reusable content component that you [created using the Create Reusable Component action](#).

CAUTION: This action is only designed to insert reusable components created using the Oxygen XML Editor **Create Reusable Component** action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The **Insert Reusable Content** action creates a DITA conref to insert the content, and creates a parent element for the conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the **Create Reusable Component** action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
The **Insert Reusable Component** dialog box is displayed.
3. Locate the reusable content file in which you want to insert its content.
4. If you select **Content reference** in the **Insert as** drop-down list, the action will add a conref attribute to the DITA element at the current location. If you select **Copy** in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click **Insert** to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

```
The quick-heat feature allows [product-name] to come up to temperature quickly.
```

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling, as in the following example:

```
<p>The quick-heat feature allows<br/><ph product="basic">Basic Widget</ph><br/><ph product="pro">Pro Widget</ph><br/><ph product="enterprise">Enterprise Widget</ph><br/>to come up to temperature quickly.</p>
```

Creating Variable Text Using Keys

In DITA, you can create variable text using [keys](#).

One way to do this would be to provide conditional values using the product profiling attribute.

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

Creating Variable Content Using a Key Reference

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/>  
to come up to temperature quickly.</p>
```

The key reference stands in for the name of the product. When the content is published, the current value of the key product will be inserted.

To insert a key reference into a document in Oxygen XML Editor **Author** mode, follow these steps:

1. Press **Enter** and select any DITA element that supports the `keyref` attribute.
2. Select **Edit Attributes** from the contextual menu (or simply press **Alt+Enter**) to bring up the attribute editor.
3. In the **Name** field, select `keyref`.
4. In the **Value** field, select or enter the name of the key.

Note: Additionally, if you have a need for reusing the key reference pattern while editing your documentation, you could add that pattern to a **code template** so that it appears in your list of content completion proposals.

Working with DITA 1.3 Key Scopes

DITA 1.3 includes the possibility of using a concept called *Key Scopes* (or scoped keys). It allows you to reuse a topic in multiple places within the same DITA map, but with slightly different content in each instance.

Key Scopes Use-Case

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

How to Use Key Scopes in Oxygen XML Editor

To use DITA 1.3 key scopes in Oxygen XML Editor, follow these steps:

1. **Define the keys** to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
 - a. Right-click the topic in the **DITA Maps Manager** and select **Edit properties**.
 - b. In the **Keys tab**, enter a value (or multiple values) in the **Key scopes** field.
3. Save the DITA map.

Result: In the **DITA Maps Manager**, you can now see the key scopes in brackets and when you open each topic reference.

Figure 722: Key Scopes in DITA Maps Manager

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the DITA map, the scoped keys will be reflected in the published content.

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the [DITA 1.3 Key Scopes - Next Generation of Reuse](#) blog post.
- You can also watch our [DITA 1.3 video tutorial](#) to see how key scopes can be used in Oxygen XML Editor.

[Oxygen Video Tutorial: DITA 1.3 \(Key Scopes, Branch Filtering\)](#)

Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called *Branch Filtering* that enables you to set filtering conditions for specific branches of a DITA map. This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 *Branch Filtering* mechanism, you can reuse content multiple times within the same map, each time using different filters.

How to Use Branch Filtering in Oxygen XML Editor

To use DITA 1.3 branch filtering in Oxygen XML Editor, follow these steps:

1. The support for DITA 1.3 must be enabled in the [DITA preferences page](#).
2. Assuming you have already [defined your profiling attributes, create a DITAVAL filter file](#).
3. Insert a reference to the DITAVAL filter file in the DITA map:
 - a. Right-click the DITA map reference in the **DITA Maps Manager** and select **Append Child > DITAVAL Reference**.
Tip: If you do not see the **DITAVAL Reference** option, make sure the support for DITA 1.3 (DITA-OT 2.x) is enabled in the [DITA preferences page](#).
 - b. Select the DITAVAL file.
 - c. Click **Insert and Close**.
4. Save the DITA map.
Result: You can now see the *ditaval* files referenced in the **DITA Maps Manager** and when you transform the DITA map, filtered content will be reflected in the published output.

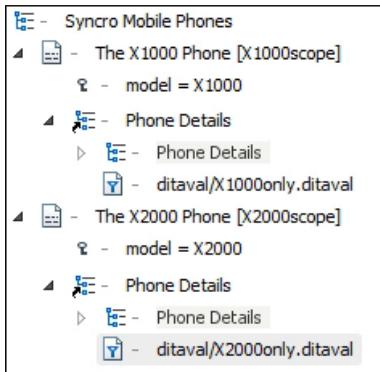

Figure 723: Branch Filtering in DITA Maps Manager

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the [DITA 1.3 Branch Filtering - Next Generation of Reuse](#) blog post.
- You can also watch our [DITA 1.3 video tutorial](#) to see how branch filtering can be used in Oxygen XML Editor.

[Oxygen Video Tutorial: DITA 1.3 \(Key Scopes, Branch Filtering\)](#)

Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A DITA map creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA [collection-type attribute](#).

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the `xref` element. The destination of the link can be expressed directly using the `href` attribute or indirectly using the `keyref` attribute. If you use the `keyref` attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the *related links* section of a topic and relationship tables in maps.

Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The **DITA Maps Manager** provides a way to *validate all the links in the documents that are included in the map*. This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a DITA map, you set the appropriate value of the collection-type attribute on the map. See the [DITA documentation](#) for the meaning of each of the values of the collection-type attribute.

Note: Publishing scripts determine when and how to create hierarchical links. The collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the linking attribute.

To add the collection-type to an item in a map:

1. Right-click the topic and choose  **Edit Properties**. The **Edit Properties** dialog box is displayed.
2. In the **Attributes** tab, select the appropriate value from the **Collection type** drop-down list.
3. You can use the **Other attributes** table to add a value to the linking attribute.

Linking in DITA Topics

Direct Links

You can create in-line links in the content of a DITA topic using the `xref` element. The destination of the link can be expressed directly by using the `href` attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct *related links* to topics, files, or websites in a DITA topic using the `related-links` element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using `keys` to create either in-line links or *related links* (with the `keyref` attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see [Inserting and Defining Keys in DITA Maps](#) on page 1558.
- Key Reference - Created in an `xref` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `topicref` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Editor

To insert a link in **Author mode**, use the actions available in the **Link** drop-down menu from the toolbar (or the **Link** submenu in the contextual menu or **DITA** menu). You can choose between the following types of in-line links:

Cross Reference

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- **xref** - Used to link to other topics or another location within the same topic and points to the target using the href or keyref attribute.
- **fragref** - A logical reference to a fragment element within a syntax diagram and points to the target using the href or keyref attribute.

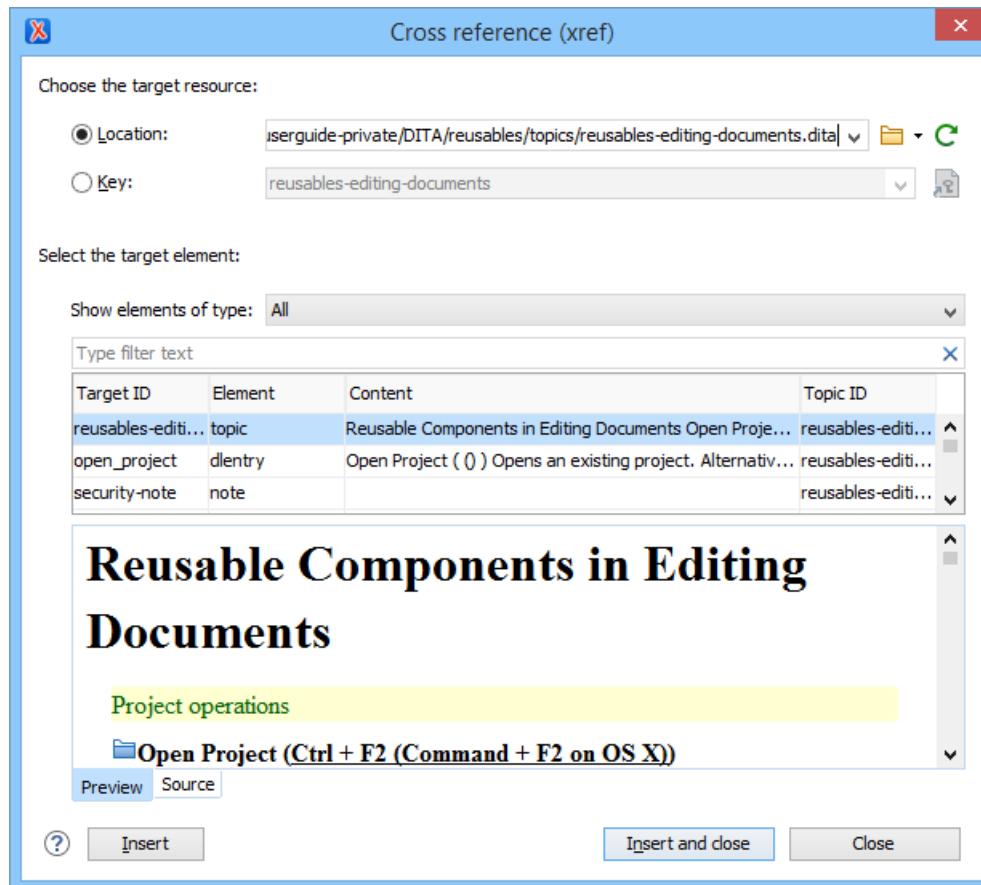

Figure 724: Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

If you select **Location** for the target, the link is expressed in an href attribute.

Key

If you select **Key** for the target, keys will be used to express the link in a keyref attribute. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one

from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

Preview Pane

Displays the content that will be references.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

File Reference

Opens the **File Reference** dialog box that allows you to insert a link to a target file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute.

Choose the Target Resource

Location

If you select **Location** for the target file, the link is expressed in an `href` attribute.

Key

If you select **Key** for the target file, keys will be used to express the link in a `keyref` attribute. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

Web Link

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute.

Choose the Target Web Resource

URL

If you select **URL** for the target resource, the link is expressed in an `href` attribute.

Key

If you select **Key** for the target resource, keys will be used to express the link in a `keyref` attribute.

You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output

transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a link element inside a *related-links element*.

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

If you select **Location** for the target, the link is expressed in an href attribute.

Key

If you select **Key** for the target, keys will be used to express the link in a keyref attribute. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (you can also select one from the drop-down list in the **Key** field).

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

Preview Pane

Displays the content that will be references.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

Related Link to File

Opens the **File Reference** dialog box that allows you to insert a link to a target file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a link element inside a *related-links element*.

Choose the Target Resource

Location

If you select **Location** for the target file, the link is expressed in an href attribute.

Key

If you select **Key** for the target file, keys will be used to express the link in a keyref attribute. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

Related Link to Web Page

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output

transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a link element inside a *related-links element*.

Choose the Target Web Resource

URL

If you select **URL** for the target resource, the link is expressed in an href attribute.

Key

If you select **Key** for the target resource, keys will be used to express the link in a keyref attribute.

You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map and defined as a non-DITA resource (you can also select one from the drop-down list in the **Key** field).

Using Copy/Paste Actions to Insert a Cross Reference

Oxygen XML Editor also includes support for inserting cross references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute or a topicref. Also, the location in the document where you paste the link must be valid, although as long as the **Smart paste and drag and drop option** is enabled in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it. You can paste the link as a cross reference with the link expressed in an href attribute or in a keyref attribute.

To insert a cross reference link (expressed in an href attribute) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it or a topicref.
2. Place the cursor at a location, where you want to insert the link.
3. Select the **Paste as Link** action from the  **Paste Special** submenu from the contextual menu.

To insert a cross reference link (expressed in a keyref attribute) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a topicref from a DITA map.
4. Place the cursor at a location, where you want to insert the link.
5. Select the **Paste as Link (keyref)** action from the  **Paste Special** submenu from the contextual menu.

[Inserting and Defining Keys in DITA Maps](#) on page 1558

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps :

- If the map is currently open in the **DITA Maps Manager**, double-click the map icon (map icon) to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.
- Move the insertion point inside the *map* root element (usually *map*, but it might be *bookmap*, or another specialization of the *map* element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the *map* root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the *map* root element.
- Select the **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu.
The **Insert Relationship Table** dialog box is displayed.
- Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.
- Enter the type of the topics in the header of each column.
The header of the table (the *relheader* element) already contains a *relcolspec* element for each table column. You should set the value of the attribute *type* of each *relcolspec* element to a value such as *concept*, *task*, or *reference*. When you click in the header cell of a column (that is a *relcolspec* element), you can see all the attributes of that *relcolspec* element, including the *type* attribute in the **Attributes** view. You can edit the attribute type in this view.
- To insert a topic reference in a cell, place the cursor in a table cell and select **Insert Reference** from the contextual menu or the **DITA Map** toolbar.
- To add a new row to the table or remove an existing row use **Insert Relationship Row**/ **Delete Relationship Row** from the contextual menu or the **DITA Map** toolbar.
- To add a new column to the table or remove an existing column, use **Insert Relationship Column**/ **Delete Relationship Column** contextual menu or the **DITA Map** toolbar. If you double-click the relationship table (or select it and press **Enter**, or choose **Open** from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.
- To add topic references to your relationship table, drag and drop topics from the **DITA Maps Manager** or the **Project** view into the appropriate cell in the relationship table.
See the [DITA documentation](#) for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the **Relationship Table** submenu of the contextual menu) or by editing the underlying XML in **Text** mode.

10. Save the DITA map.

Relationship tables are also displayed in the **DITA Maps Manager** view, along with the other elements in its DITA map.

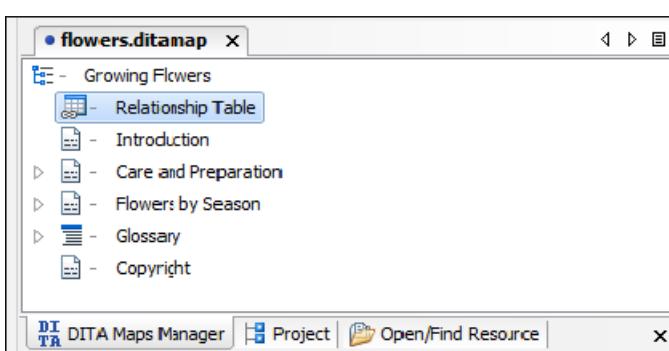

Figure 725: Relationship Table

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the **DITA Maps Manager**.
- Select the relationship table in the **DITA Maps Manager** and press **Enter**.
- Select **Open** from the contextual menu of the relationship table in the **DITA Maps Manager**.

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

This means that you can display the same DITA content in multiple ways, types of media, or publications. It also means that you cannot control every aspect of the presentation of your content in your DITA files. The only way to change the formatting is to change the transformation routines that create it.

Therefore, to create output from your DITA content you have to run a transformation on your content. Transformations for various types of output are provided by the DITA Open Toolkit. Oxygen XML Editor provides a mechanism called transformation scenarios to help you configure and run transformations.

Note: Oxygen XML Editor does not create any output formats itself. Oxygen XML Editor runs externally defined transformations that produce output, and displays the result in the appropriate application, but the output itself is produced by the external transformation, not by Oxygen XML Editor.

Running a Transformation Scenario

To select and run a transformation scenario on your map, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button. The **Configure Transformation Scenario(s)** dialog box appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor while the transformation is running. If there are errors or warnings, Oxygen XML Editor displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor opens the output in the appropriate application.
3. To rerun the same scenario again, click the  **Apply Transformation Scenario(s)** button.

Transforming DITA Content

Oxygen XML Editor uses the DITA Open Toolkit (DITA-OT) to transform DITA maps and topics into an output format. For this purpose, both the DITA Open Toolkit and Ant come bundled in Oxygen XML Editor.

For more information about the DITA Open Toolkit, see [DITA Open Toolkit Documentation](#).

This section includes information about how to create a DITA OT transformation and how to customize DITA transformations.

Related information

[Transforming Documents](#) on page 735

Creating or Editing a DITA OT Transformation

Creating a DITA OT Transformation Scenario

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.
- Use the  **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.

- Note:** If a scenario is already associated with the edited document, selecting **Apply Transformation Scenario(s)** runs the associated scenario automatically. You can check to see if transformation scenarios are associated with the edited document by hovering your cursor over the **Apply Transformation Scenario** button.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New** button and select **DITA OT Transformation**.

All three methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

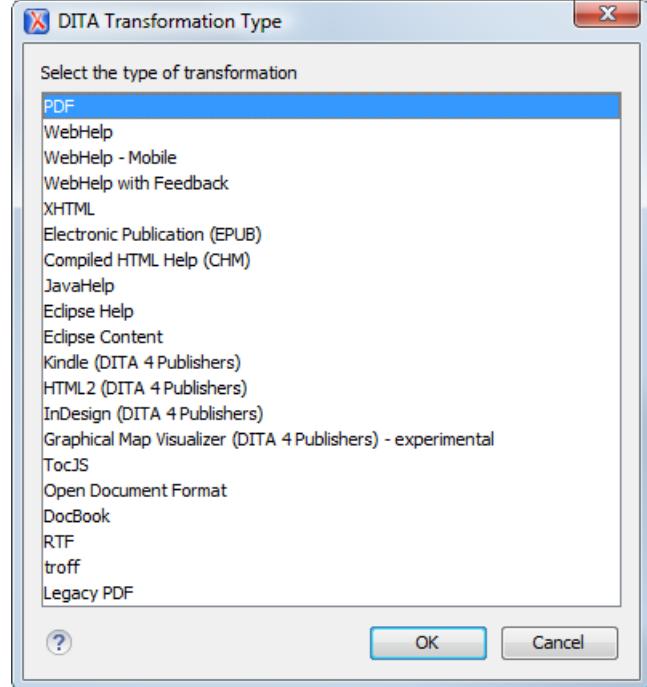

Figure 726: DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- Project Options** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- Global Options** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

Editing a DITA OT Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

- Select the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.
- Step Result:** The **Configure Transformation Scenario(s) dialog box** is opened.

- Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

Note: You can edit transformation scenarios that are defined at project level only. To edit a transformation scenario that is associated with a predefined document type, use the **Duplicate** button and then edit the duplicated scenario.

Result: This will open an **Edit scenario** configuration dialog box that contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

Skins Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of predefined skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

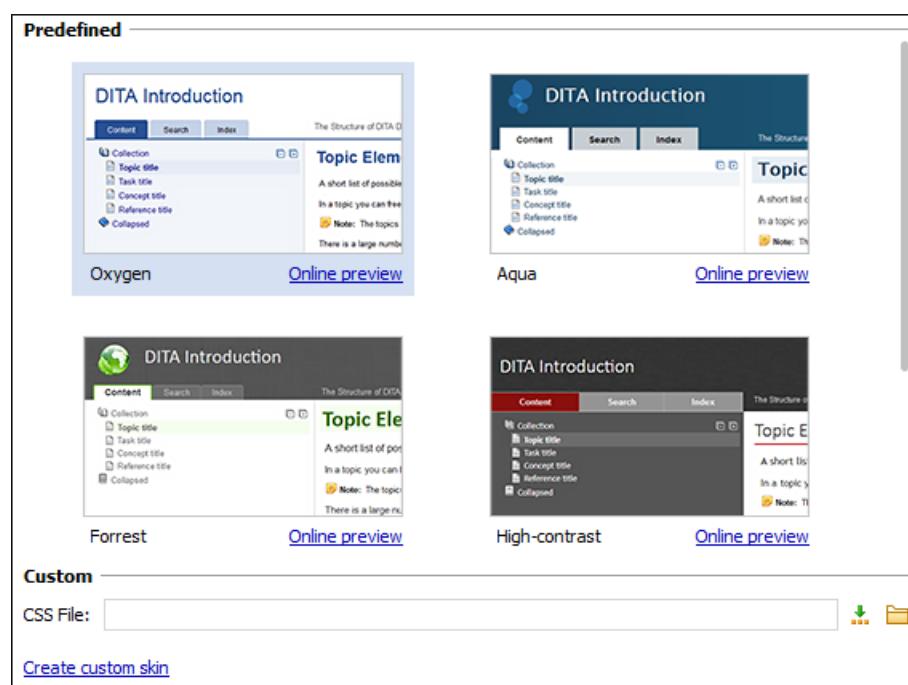

Figure 727: Skins Tab

The **Skins** tab includes the following sections:

Predefined Skins

This section presents the predefined skins that are included in Oxygen XML Editor. The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Editor website, press the [Online preview](#) link.

Custom Skins

You can use this section to customize the look of the output.

CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

Create custom skin

Use this link to open the [WebHelp Skin Builder](#) tool.

Templates Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive** or **WebHelp Responsive with Feedback** output types and it provides a set of predefined skins that you can use as a base for the layout of your WebHelp system output.

A **skin** is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output. You can choose predefined skins in a *tile* style of layout or a *tree* style of layout, and you can also [add your own customized skins](#).

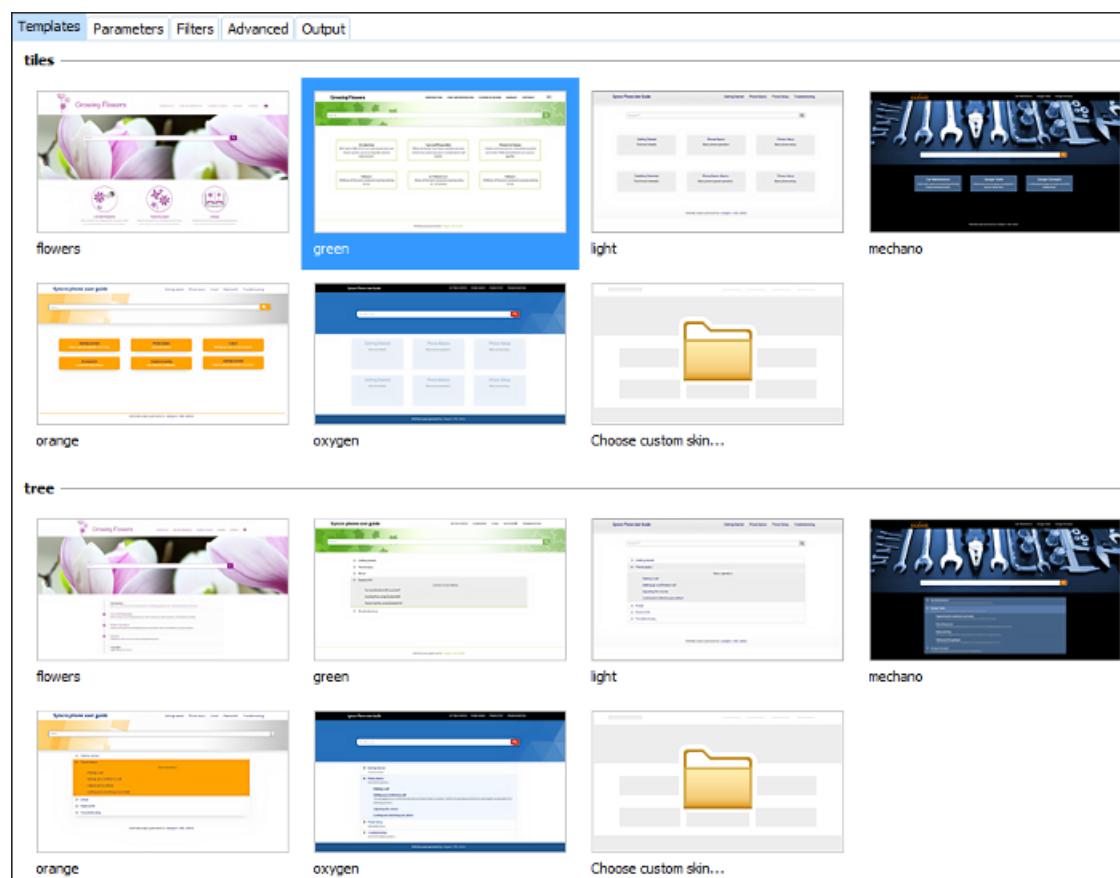

Figure 728: Templates Tab

The **Templates** tab comes by default with the following predefined collections of skins:

Tiles

This section presents the predefined skins that are arranged in a *tiles* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

Tree

This section presents the predefined skins that are arranged in a *tree* style of layout. These predefined skins include a variety of themes, ranging from a very light one to a high-contrast variant, and various styles. If you select **Choose custom skin**, you can select a custom CSS stylesheet to be used as your template.

When you add a new collection of skins, this tab will list them.

FO Processor Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

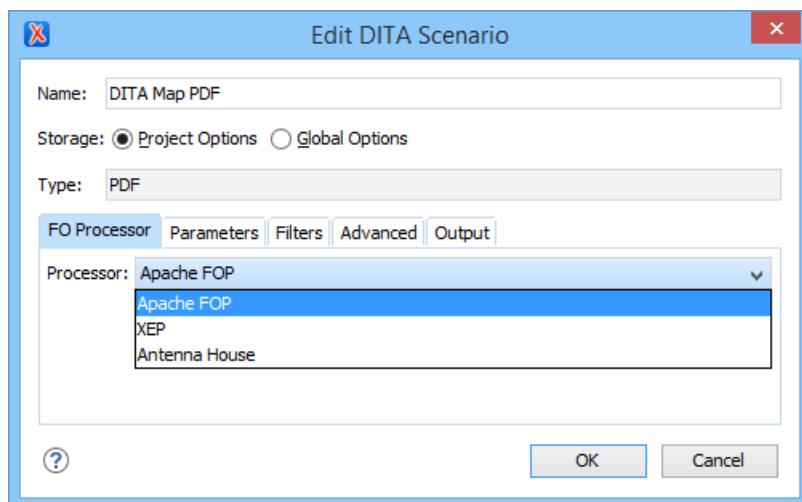

Figure 729: FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor.

XEP

The [RenderX](#) XEP processor. If XEP is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the [FO Processors option page](#).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA_OT_DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor installation directory.

Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab**.
3. Add the env .AXF_OPT parameter and point to the Antenna House configuration file.

[XSL-FO Processors](#) on page 816

Parameters Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA OT Documentation](#). You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the [ask editor variable](#) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  [Insert Editor Variables](#) button or the  [Browse](#) button.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is enabled only for new parameters that have been added to the list.

Related information

[DITA Open Toolkit Documentation](#)

Filters Tab (DITA Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

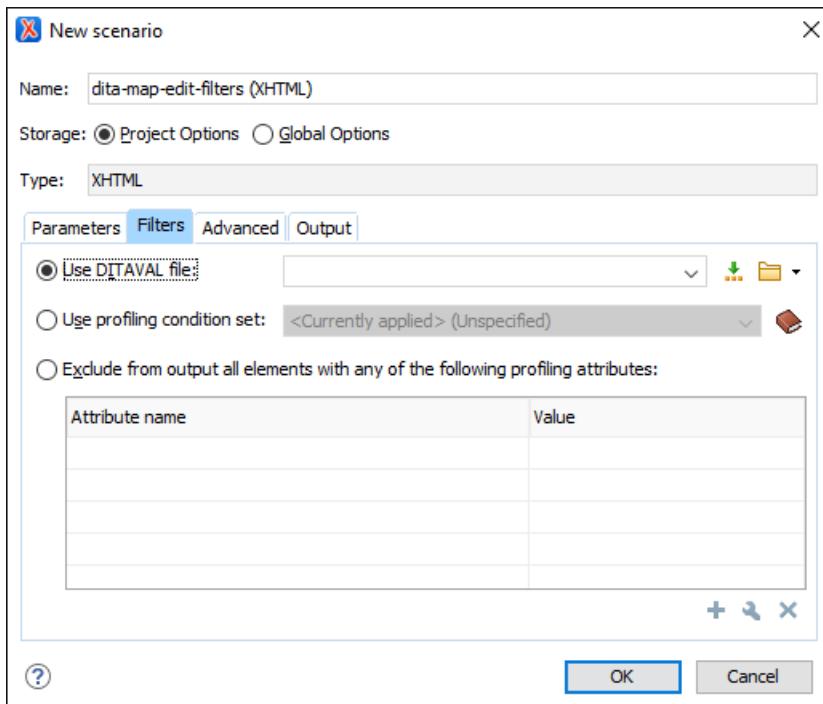

Figure 730: Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the DITA map, you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the [DITA Documentation](#).

Attention: If a filter file is specified in the `args.filter` parameter (in [the Parameters tab](#)), that file takes precedence over a *DITAVAL* file specified here.

Use profiling condition set

Sets the *profiling condition set* that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the **New**, **Edit**, or **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

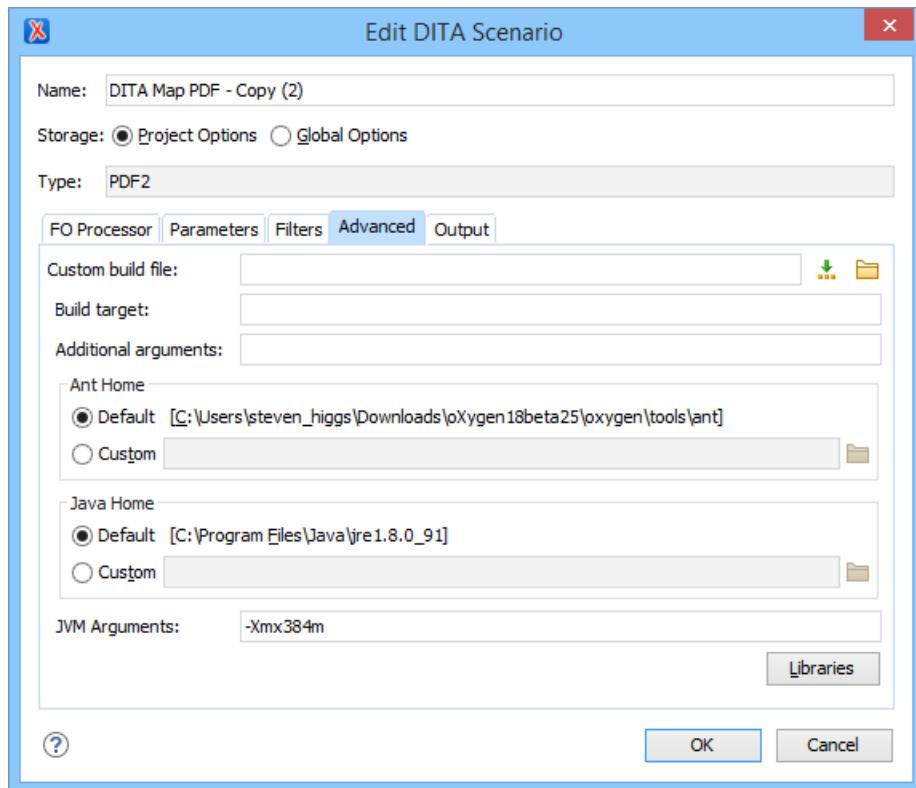

Figure 731: Advanced Settings Tab

You can specify the following parameters:

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the [Parameters tab](#) is used. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the [Ant preferences page](#).

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA OT 1.8 and older requires Java 1.6 or later, while DITA OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages ([OutOfMemoryError](#)).

Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (jar files or additional class paths) to be used by the Ant transformer.

Output Tab (DITA OT Transformations)

When you [create a new transformation scenario](#) or [edit an existing one](#), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

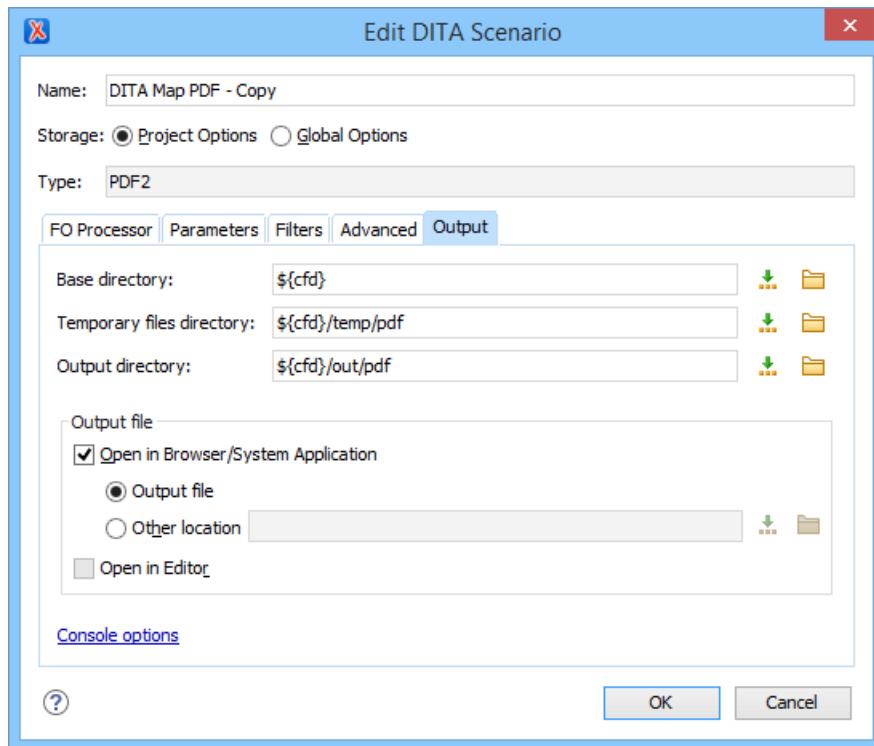

Figure 732: Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

Note: If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If enabled, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note: To set the web browser that is used for displaying HTML/XHTML pages, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  [Insert Editor Variables](#) button, or the  [Browse](#) button.

Open in editor

When this is enabled, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the [Console options](#) preferences page that contains options to control the display of the console output received from the publishing engine.

Customizing DITA Transformations

Oxygen XML Editor includes a bundled copy of the DITA-OT as an Oxygen XML Editor [framework](#). That framework includes a number of transformation scenarios for common output formats. This section includes topics about customizing DITA transformations, such as using a custom build file, customizing PDF output, and using DITA OT plugins to customize your needs.

Customizing Output Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor allows you to [set parameters](#) on a transformation scenario and you can [save and share them with others](#). You can also use the [\\${task} editor variable](#) in the **Parameters** tab to instruct Oxygen XML Editor to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the customization options, you can create a modified version of the transformation code. Some transformation scripts export specific forms of extension or customization. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options it supports. Oxygen XML Editor provides full editing and [debugging support from XSLT and CSS stylesheets](#), which you can use to modify transformation code.

You can also write your own output transformation scripts to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor transformation scenarios to run these scripts once they are complete.

[Transforming DITA Content](#) on page 1615

[DITA Open Toolkit Documentation](#)

Using a Custom Build File

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the  **Configure Transformation Scenario(s)** action to open the **Configure Transformation Scenario(s)** dialog box.
2. Select the transformation scenario and click **Edit**.
3. Go to the **Advanced** tab and change the **Custom build file** path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA OT, your custom build file would have the following content:

```
<project basedir=". " default="dist">
<!--The DITA OT default build file-->
```

```

<import file="build.xml"/>
<target name="dist">
  <!-- You could run your script here -->
  <!--<exec></exec>-->
  <!--Call the DITA OT default target-->
  <antcall target="init"/>
</target>
</project>

```

Note: If you use the built-in Ant 1.8.2 build tool that comes bundled with Oxygen XML Editor, it is located in the `[OXYGEN_INSTALL_DIR]/tools/ant` directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Ant lib directory.

DITA Map to PDF Output Customization

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps to PDF output. There are numerous ways that you can customize the PDF output and the topics in this section discuss some of those possibilities.

Creating a DITA Map to PDF Transformation Scenario

To create a *DITA Map to PDF* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your framework is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
 - `show.changes.and.comments` - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
 - `customization.dir` - Specifies the path to a customization directory.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Creating a Customization Directory for PDF Output

DITA Open Toolkit PDF output can be customized in several ways:

- Creating a DITA Open Toolkit plugin that adds extensions to the PDF plugin. More details can be found in the [DITA Open Toolkit Documentation](#).
- Creating a customization directory and using it from the PDF transformation scenario. A small example of this procedure can be found below.

How to Create a Customization Directory for PDF Output

The following procedure explains how to do a basic customization of the PDF output by setting up a customization directory. An example of a common use case is embedding a company logo image in the front matter of the book.

1. Copy the entire directory: `DITA_OT_DIR\plugins\org.dita.pdf2\Customization` to another location (for instance, `C:\Customization`).
2. Copy your logo image to: `C:\Customization\common\artwork\logo.png`.
3. Rename `C:\Customization\catalog.xml.orig` to `C:\Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: `C:\Customization\fo\xsl\custom.xsl.orig` to `C:\Customization\fo\xsl\custom.xsl`
6. Open the `custom.xsl` file in Oxygen XML Editor and create the template called `createFrontCoverContents` for DITA-OT 2.3.3 (or `createFrontMatter_1.0` for DITA-OT 1.8.5).

Tip: You can copy the same template from *DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl* and modify it in whatever way necessary to achieve your specific goal. This new template in the *custom.xsl* file will override the same template from *DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl*.

DITA OT 2.3.3 Example:

For example, if you are using DITA OT 2.3.3, the *custom.xsl* could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">

<xsl:template name="createFrontCoverContents">
    <!-- set the title -->
    <fo:block xsl:use-attribute-sets="__frontmatter__title">
        <xsl:choose>
            <xsl:when test="$map/*[contains(@class, 'topic/title')][1]">
                <xsl:apply-templates select="$map/*[contains(@class, 'topic/title')][1]" />
            </xsl:when>
            <xsl:when test="$map//*[contains(@class, 'bookmap/mainbooktitle')][1]">
                <xsl:apply-templates select="$map//*[contains(@class, 'bookmap/mainbooktitle')][1]" />
            </xsl:when>
            <xsl:when test="//*[contains(@class, 'map/map')]/@title">
                <xsl:value-of select="//*[contains(@class, 'map/map')]/@title" />
            </xsl:when>
            <xsl:otherwise>
                <xsl:value-of select="/descendant::*[contains(@class, 'topic/topic')][1]/*[contains(@class, 'topic/title')]" />
            </xsl:otherwise>
        </xsl:choose>
    </fo:block>

    <!-- set the subtitle -->
    <xsl:apply-templates select="$map//*[contains(@class, 'bookmap/booktitlealt')]" />
    <fo:block xsl:use-attribute-sets="__frontmatter__owner">
        <xsl:apply-templates select="$map//*[contains(@class, 'bookmap/bookmeta')]" />
    </fo:block>

    <!-- Load the image logo -->
    <fo:block text-align="center" width="100%">
        <fo:external-graphic
            src="url({concat($artworkPrefix,
                '/Customization/OpenTopic/common/artwork/logo.png'))}" />
    </fo:block>
</xsl:template>
</xsl:stylesheet>
```

DITA OT 1.8.5 Example:

For example, if you are using DITA OT 1.8.5, the *custom.xsl* could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="1.1">

<xsl:template name="createFrontMatter_1.0">
    <fo:page-sequence master-reference="front-matter"
        xsl:use-attribute-sets="__force_page_count">
        <xsl:call-template name="insertFrontMatterStaticContents"/>
        <fo:flow flow-name="xsl-region-body">
            <fo:block xsl:use-attribute-sets="__frontmatter">
                <!-- set the title -->
                <fo:block xsl:use-attribute-sets="__frontmatter__title">
                    <xsl:choose>
                        <xsl:when test="$map/*[contains(@class, 'topic/title')][1]">
                            <xsl:apply-templates select="$map/*[contains(@class, 'topic/title')][1]" />
                        </xsl:when>
                        <xsl:when test="$map//*[contains(@class, 'bookmap/mainbooktitle')][1]">
                            <xsl:apply-templates select="$map//*[contains(@class, 'bookmap/mainbooktitle')][1]" />
                        </xsl:when>
                        <xsl:when test="//*[contains(@class, 'map/map')]/@title">
                            <xsl:value-of select="//*[contains(@class, 'map/map')]/@title" />
                        </xsl:when>
                        <xsl:otherwise>
                            <xsl:value-of select="/descendant::*[contains(@class, 'topic/topic')][1]/*[contains(@class, 'topic/title')]" />
                        </xsl:otherwise>
                    </xsl:choose>
                </fo:block>
            </fo:block>
        </fo:flow>
    </fo:page-sequence>
</xsl:template>
```

```

<!-- set the subtitle -->
<xsl:apply-templates select="$map//*[contains(@class, ' bookmap/booktitlealt ')]" />

<fo:block xsl:use-attribute-sets="__frontmatter__owner">
    <xsl:apply-templates select="$map//*[contains(@class, ' bookmap/bookmeta ')]"/>
</fo:block>

<fo:block text-align="center" width="100%">
    <fo:external-graphic src="url(concat($artworkPrefix,
        '/Customization/OpenTopic/common/artwork/logo.png'))"/>
</fo:block>

</fo:block>

<!--<xsl:call-template name="createPreface"/><!--&gt;

    &lt;/fo:flow&gt;
&lt;/fo:page-sequence&gt;
&lt;xsl:call-template name="createNotices"/&gt;
&lt;/xsl:template&gt;
&lt;/xsl:stylesheet&gt;
</pre>

```

7. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab, set the customization.dir parameter to C:\Customization.

Related information

[Automatic PDF plugin customization generator by Jarno Elovirta.](#)

[DITA OT Documentation - PDF Customization Plugin](#)

Customizing the Header and Footer in PDF Output

The XSLT stylesheet [DITA_OT_DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl](#) contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is [DITA_OT_DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml](#). These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory as explained in [Creating a Customization Directory for PDF Output](#) on page 1625.

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a DITA map transformation, create a DITA-OT customization directory and use it from a DITA Map to PDF transformation scenario, as in the following procedure:

1. Copy the entire directory: [DITA_OT_DIR\plugins\org.dita.pdf2\Customization](#) to another location (for instance, C:\Customization).
2. Copy your watermark image (for example, `watermark.png`) to: C:\Customization\common\artwork\watermark.png.
3. Rename the C:\Customization\catalog.xml.orig file to: C:\Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->
```

The uncommented line should look like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: C:\Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl
6. Open the C:\Customization\fo\xsl\custom.xsl file in Oxygen XML Editor to overwrite two XSLT templates:

- The first template is located in the XSLT stylesheet `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl` and we override it specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:

```

<fo:static-content flow-name="odd-body-header">
    <fo:block-container absolute-position="absolute"
        top="-2cm" left="-3cm" width="21cm" height="29.7cm"
        background-image="{concat($artworkPrefix,
'Customization/OpenTopic/common/artwork/watermark.png')}">
        <fo:block>
            </fo:block>
        </fo:block-container>
        <fo:block xsl:use-attribute-sets="__body__odd__header">
            <xsl:call-template name="insertVariable">
                <xsl:with-param name="theVariableID" select="'Body odd header'" />
                <xsl:with-param name="theParameters">
                    <prodnname>
                        <xsl:value-of select="$productName"/>
                    </prodnname>
                    <heading>
                        <fo:inline xsl:use-attribute-sets="__body__odd__header__heading">
                            <fo:retrieve-marker retrieve-class-name="current-header"/>
                        </fo:inline>
                    </heading>
                    <pagenum>
                        <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">
                            <fo:page-number/>
                        </fo:inline>
                    </pagenum>
                </xsl:with-param>
            </xsl:call-template>
        </fo:block>
    </fo:static-content>
</xsl:template>

```

- The second template that we override is located in the XSLT stylesheet `DITA_OT_DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. We also override it by copying the original template content in our `custom.xsl` and adding the `block-container` element that references the watermark image file:

```

<xsl:template name="createFrontMatter_1.0">
    <fo:page-sequence master-reference="front-matter"
xsl:use-attribute-sets="__force__page__count">
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <fo:flow flow-name="xsl-region-body">
        <fo:block-container absolute-position="absolute"
            top="-2cm" left="-3cm" width="21cm" height="29.7cm"
            background-image="{concat($artworkPrefix,
'Customization/OpenTopic/common/artwork/watermark.png')}">
            <fo:block>
                </fo:block-container>
            <fo:block xsl:use-attribute-sets="__frontmatter">
                <!-- set the title -->
                <fo:block xsl:use-attribute-sets="__frontmatter__title">
                    <xsl:choose>
                        <xsl:when test="$map/*[contains(@class, ' topic/title ')][1]">
                            <xsl:apply-templates select="$map/*[contains(@class, ' topic/title ')][1]" />
                        </xsl:when>
                        <xsl:when test="$map//*[contains(@class, ' bookmap/mainbooktitle ')][1]">
                            <xsl:apply-templates select="$map//*[contains
(@class, ' bookmap/mainbooktitle ')][1]" />
                        </xsl:when>
                        <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
                            <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title" />
                        </xsl:when>
                        <xsl:otherwise>
                            <xsl:value-of select="/descendant::*[contains
(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]" />
                        </xsl:otherwise>
                    </xsl:choose>
                </fo:block>
                <!-- set the subtitle -->
                <xsl:apply-templates select="$map//*[contains
(@class, ' bookmap/booktitlealt ')]"/>
                <fo:block xsl:use-attribute-sets="__frontmatter__owner">
                    <xsl:apply-templates select="$map//*[contains
(@class, ' bookmap/bookmeta ')]"/>
                </fo:block>
            </fo:block>
        <!--<xsl:call-template name="createPreface"/-->
        </fo:flow>
        <fo:page-sequence>
            <xsl:if test="not($retain-bookmap-order)">
                <xsl:call-template name="createNotices"/>
            </xsl:if>
        </fo:page-sequence>
    </xsl:template>

```

```
</xsl:if>
</xsl:template>
```

7. Edit your **DITA Map PDF** transformation scenario. In the **Parameters** tab, set the customization.dir parameter to C:\Customization.

Related tasks

[Adding a Watermark in DITA Map to XHTML Output](#) on page 1632

Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two block level elements, such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```
<p>First para</p>
<?pagebreak?>
<p>Second para</p>
```

2. Locate the **DITA Open Toolkit** distribution and in the plugins directory create a new plugin folder (for example, *DITA_OT_DIR*/plugins/pdf-page-break).
3. In this new folder, create a new plugin.xml file with the following content:

```
<plugin id="com.yourpackage.pagebreak">
  <feature extension="package.support.name" value="Force Page Break Plugin"/>
  <feature extension="package.support.email" value="support@youremail.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the plugin is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named pageBreak.xsl with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

5. [Install your plugin in the DITA Open Toolkit](#).

Customizing note Images in PDF

To customize the images that appear next to each type of note in the PDF output, use a [PDF customization folder](#) with the following procedure:

1. Copy the *DITA_OT_DIR*/plugins/org.dita.pdf2/cfg/common/vars/en.xml file to the [CUSTOMIZATION_DIR]\common\vars folder.
2. Edit the copied en.xml file and modify, for example, the path to the image for <note> element with the type attribute set to notice from:

```
<variable id="notice Note Image Path">Configuration/OpenTopic/cfg/common/artwork/
important.png</variable>
```

to:

```
<variable id="notice Note Image Path">Customization/OpenTopic/common/artwork/
notice.gif</variable>
```

3. Add your custom **notice** image to [CUSTOMIZATION_DIR]\common\artwork\notice.gif.
4. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab set the path for the customization.dir property to point to the customization folder.

Show Comments and Tracked Changes in PDF Output

To make comments and tracked changes (stored within your DITA topics) appear in the PDF output, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your framework is read-only).
3. In the **Parameters** tab, set the value of the `show.changes.and.comments` parameter to yes.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a DITA map is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor](#) on page 817.

DITA OT PDF Font Mapping

The DITA OT contains a file `DITA_OT_DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the *font-mappings.xml*.

If it finds a mapping like this:

```
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *Monospaced* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
  <physical-font char-set="default">
    <font-face>Courier New, Courier</font-face>
  </physical-font>
  .....
</logical-font>
```

Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

Related information

DITA Map to PDF WYSIWYG Transformation

Oxygen XML Editor comes bundled with a DITA OT plugin that converts DITA maps to PDF using a CSS layout processor. Oxygen XML Editor supports the following processors (not included in the Oxygen XML Editor installation kit):

- **Prince Print with CSS** - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

The DITA-OT plugin is located in the following directory: *DITA_OT_DIR/plugins/com.oxygenxml.pdf.css*.

Although it includes a set of CSS files in its css subfolder, when this plugin is used in Oxygen XML Editor, the CSS files located in the \${frameworks} directory take precedence.

Creating the Transformation Scenario

To create an experimental *DITA map to PDF WYSIWYG* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **Dita Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG - Experimental**.
3. In the **Parameters** tab, configure the following parameters:
 - `css.processor.path.prince` (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
 - `css.processor.path.antenna-house` (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
 - `show.changes.and.comments` - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.
 - `dita.css.list` - Allows you to specify a list of CSS URLs to be used by the PDF processor. The files must have URL syntax and be separated using semicolons. If the value is empty, the current selection from the **Styles** drop-down menu is used.
 - `args.css` - Allows you to specify a list of CSS URLs to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
4. Click **OK** and run the transformation scenario.

Customizing the Styles (for Output and Editing)

If you need to change the styles in the associated CSS, make sure you install Oxygen XML Editor in a folder where you have full read and write privileges (for instance, your user home directory). This is due to the fact that the installed files are usually placed in a read-only folder (for instance, in Windows, Oxygen XML Editor is installed in the **Program Files** folder where the users do not have change rights).

To change the styles of an element you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Create an alternate CSS for the DITA document type:
 1. Follow the procedure for adding an alternate CSS file in *Customizing the Main CSS of a Document Type* on page 1204.
 2. Once you have configured your CSS as an additional layer, you can *select it from the **Styles** drop-down menu (on the toolbar)*.
 3. Run the **DITA Map PDF - WYSIWYG - Experimental** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and rendering **Author** mode while editing.

- Use the `args.css` parameter that allows you to specify a list of CSS URLs to be used in addition to the `dita.css.list` parameter:
 1. Configure a *DITA map to PDF WYSIWYG* transformation scenario, as described in the procedure *above*.
 2. In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.
 3. Click **OK** and run the transformation scenario.

This method is appropriate if you just want to apply the styling customization to the output.

Using the CSS Inspector to See Style Associated with an Element

To find the styles associated with an element, follow this procedure:

1. Open a document in the editor and select **Inspect Styles** from the contextual menu. This opens the [CSS Inspector view](#) that shows all the CSS rules that apply to the selected element.
2. Click the particular link for the CSS selector that you need to change and Oxygen XML Editor will open the CSS file and position the cursor at that selector.
3. After you identify the source of the styles you want to modify, copy the CSS rule in your customization CSS file and modify it according to your needs.

To see the changes in **Author** mode, press **F5** to reload the document.

How to Make Remote Resources Appear in the Output When Using the Prince Processor

If your documentation references external resources (such as images that are stored on a Web-based repository) and your system is behind an HTTP(S) proxy, you may find that they do not appear in the output when using the **Prince Print with CSS** processor. To solve this, follow this procedure:

1. Edit the **build.xml** file that is located in [DITA_OT_DIR/plugins/com.oxygenxml.pdf.css](#).
2. There are two instances in the file where a pair of arguments are commented out:

```
<!-- Please remove the comment wrapping the following two arguments
if you are behind a proxy and your documentation refers remote resources,
for example images.

Note: You also need to remove the backslash '\' that appears before the
property name: "http-proxy". That backslash is there because a sequence of
two dashes ('-') is not permitted inside a comment.
-->
<!--
  <arg value="--http-proxy=${http.proxyHost}:${http.proxyPort}"/>
  <arg value="--http-proxy=${https.proxyHost}:${https.proxyPort}"/>
-->
```

3. Remove the comment in both instances.
4. Make sure you also remove the slash that appears before the property name `http-proxy` in each instance.

Step Result: The arguments should now look like this:

```
<arg value="--http-proxy=${http.proxyHost}:${http.proxyPort}"/>
<arg value="--http-proxy=${https.proxyHost}:${https.proxyPort}"/>
```

5. Save the **build.xml** file.
6. Run the [DITA map to PDF WYSIWYG transformation scenario](#).

Result: Your external resources should now appear in your output.

Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA map transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```
body {
  background-image: url(MyWatermarkImage.png);
}
```

2. Edit a *DITA Map XHTML* transformation scenario and in the **Parameters** tab set the value of the `args.css` parameter as the path to your watermark image.
3. Set the value of the `args.copycss` parameter to yes.
4. Apply the transformation scenario.

5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

[Adding a Watermark to PDF Output](#) on page 1627

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. The profiling configuration can also be shared between content authors through the project file and there is no need for coding or editing configuration files.

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (product, platform, audience, rev, props, and otherprops). You can also create your own *custom profiling attributes* and *custom profiling condition sets*. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the platform profiling attribute:

```
<section platform="windows">
```

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

Apply Profiling to DITA Content

To apply a profiling attribute to DITA content, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile specific elements in a topic or map, right-click inside the element and select **Edit Profiling Attributes**. The **Edit Profiling Attributes** dialog box is displayed, allowing you to check each of the profiling tokens that apply for each attribute.

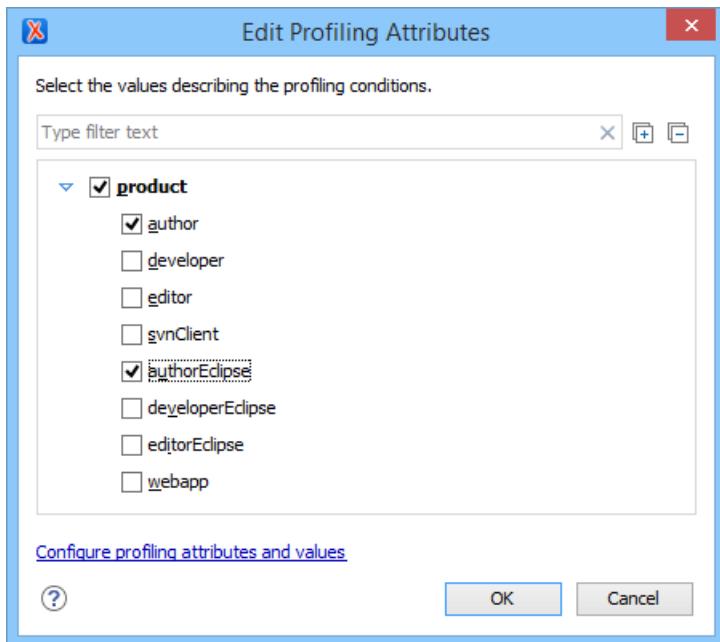

Figure 733: Edit Profiling Attributes Dialog Box

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/ **Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your *root DITA map* references a *DITA subject scheme map* that defines values for the profiling attributes, those values are used. Oxygen XML Editor collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the *DITA Maps Manager* (or set as the *root map*). In the *image above* (taken from the Oxygen XML Editor documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.
- If you have *defined profiling attribute values* for the DITA document type in the *Profiling/Conditional Text preferences page* and you store them at *project-level*, those values are displayed in the dialog box.
- If you have *defined profiling attribute values* for the DITA document type in the *Profiling/Conditional Text preferences page* and you store them at *global-level*, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

Visualizing Profiled Content

You can visualize the effect of profiling content by using the profiling tools in the **Profiling/Conditional Text** drop-down menu that is located on the **DITA Maps Manager** toolbar. You can select which profiles to show, or apply colors to text that is profiled in various ways, as shown in the following image:

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
 - Remove the oil fill cap;
 - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;
- product [Gasoline]
- Sharpen the blades:
 - Clamp the blade to a vice or to the edge of a solid surface;
 - Using an electric grinder or audience [ExpertUser] a file, grind the length of the blade until it is sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

Figure 734: Example: Profiled Content

If the **Show Profiling Attributes** option (available in the **Profiling / Conditional Text** drop-down menu) is enabled, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 735: Profiling Attribute Value Form Control Pop Up

Profiling DITA Content

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets.

Defining Profiling Attributes for DITA Content

To define or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling / Conditional Text**.
 2. In the **Profiling Attributes** section, there are already some default attributes for DITA documents (audience, platform, product, otherprops, and rev), although if a [Subject Scheme Map](#) is used for profiling your content, you will see the attributes defined in your subject scheme map instead. You can add new attributes and values by clicking the **New** button at the bottom of the table, or customize existing attributes and their values by selecting an attribute and clicking the **Edit** button.
- Step Result:** This opens a **Profiling Attribute** configuration dialog box that allows you to define attributes that exist in your schema.
3. In this configuration dialog box, use the **New**, **Edit**, **Delete** buttons to add, edit, or delete possible values of the selected attribute. You can also specify an optional description for each attribute value and you can choose whether the attribute accepts a **Single value** or **Multiple values separated by** a delimiter (DITA only accepts space as delimiters for attribute values).
 4. Click **OK** to accept your changes.

Result: You should see your changes in the **Profiling Attribute** table.

You can also use the [Profiling Condition Sets section](#) to apply more complex filters on your DITA content.

Applying Profiling Attributes in DITA

You can apply the DITA profiling attributes that were defined in the previous section in the following contexts:

DITA Topics

To profile DITA topics, right-click a topic reference in the **DITA Maps Manager**, select  **Edit Properties** from the contextual menu, go to the **Profiling** tab, and select the appropriate values.

DITA Content

To profile DITA content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu and select the appropriate values in the subsequent dialog box.

DITA Elements

To profile specific XML elements in **Author** mode, right-click inside the element (or right-click the element name in the breadcrumb navigation bar), select **Edit Profiling Attributes**, and select the appropriate values in the subsequent dialog box. You can also use the **Attributes** view to set the profiling attributes on the element at the current cursor position.

To [display the DITA profiling markup](#) in the **Author** editing mode, enable the **Show Profiling Attributes option** in the  **Profiling / Conditional Text** drop-down menu that is available on the toolbar (or from the **DITA > Profiling/ Conditional Text** menu).

Adding or Editing Profiling Attribute Values

There are several ways to add values to existing profiling attributes.

- Use the procedure in [Defining Profiling Attributes for DITA Content](#) on page 1636 to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor](#) in **Author** mode, the [Attributes view](#), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the [Profiling / Conditional Text preferences page](#) where you can edit the profiling configuration. The action selected by default is to preserve the current configuration.

Note: If the **Allow additional profiling attribute values collected from the document** option is disabled in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, the current conditional text configuration will be preserved, and therefore the second method mentioned above will not be available.

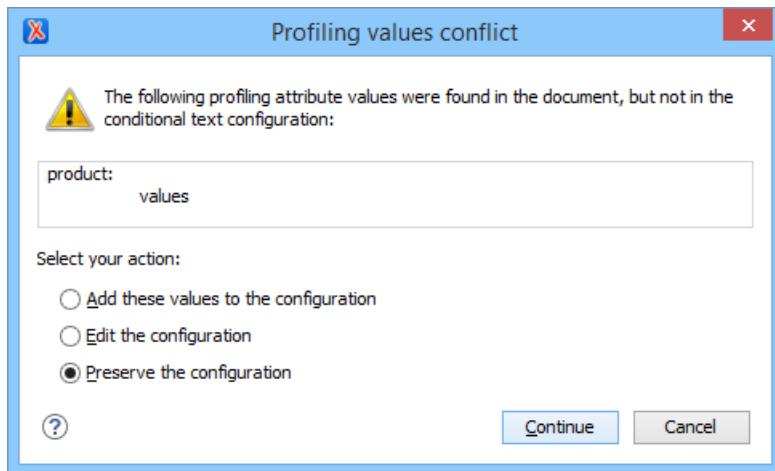

Figure 736: Profiling Values Conflict Dialog Box

[Apply Profiling Condition Sets](#) on page 374

[Customizing Colors and Styles for Rendering Profiling in Author Mode](#) on page 376

Profiling with a Subject Scheme Map

A subject scheme map allows you to create custom profiling values and to manage the profiling attribute values used in the DITA topics without having to write a DITA specialization.

Subject scheme maps use key definitions to define a collection of profiling values. A map that uses the set of profiling values must reference the subject scheme map in which the profiling values are defined at its highest level. To do this, you must add the `type="subjectScheme"` attribute on the `topicref` that references the subject scheme map, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme" />
```

A profiled value should be a short and readable keyword that identifies a metadata attribute. For example, the audience metadata attribute may take a value that identifies the user group associated with a particular content unit. Typical user values for a medical-equipment product line might include therapist, oncologist, physicist, radiologist, surgeon, and so on. A subject scheme map can define a list of these audience values.

EXAMPLE:

The following is an example of content from a subject scheme:

```
<subjectScheme>
  <!-- Pull in a scheme that defines audience user values -->
  <subjectdef keys="users">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
  <!-- Define an enumeration of the audience attribute, equal to
      each value in the users subject. This makes the following values
      valid for the audience attribute: therapist, oncologist, physicist,
```

```
radiologist, surgeon, neuro-surgeon and plastic-surgeon. -->
<enumerationdef>
  <attributedef name="audience"/>
  <subjectdef keyref="users"/>
</enumerationdef>
</subjectScheme>
```

Where the Profiling Attributes are Available in Oxygen XML Editor

When you edit a DITA topic in the **Text** or **Author** mode, Oxygen XML Editor collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the [DITA Maps Manager](#) (or set as the *root map*). The values of profiling attribute defined in a Subject Scheme Map are available in the [Edit Profiling Attribute dialog box](#), regardless of their mapping in the [Profiling/Conditional Text preferences page](#). They are also available as proposals for values in the [Content Completion Assistant](#).

Note: In the example above, the values therapist, oncologist, physicist, and so on, are displayed in the **Content Completion Assistant** as values for the audience attribute.

Filtering Attribute Values

By defining controlled values and using hierarchical levels in the subject scheme, you can classify content for filtering and flagging when the map is transformed. You can also filter attribute values by using a [DITAVAL filter file](#).

For more details about how hierarchical filtering, defining controlled values, and using *subject scheme maps*, refer to the following resources:

- [DITA 1.3 Specifications: Subject Scheme Maps](#)
- [Oxygen Video Tutorial: DITA Subject Scheme](#)

Related information

[Filtering Attribute Values with a DITAVAL File](#) on page 1640

Rendering Profiling Attributes and Condition Sets

The options in the  [Profiling / Conditional Text toolbar menu](#) allow you to choose how profiled content is rendered in **Author** mode, the **DITA Maps Manager** view, and other components in Oxygen XML Editor.

Rendering Profiled Content in Author Mode

The options in the  [Profiling / Conditional Text](#) drop-down menu affect the rendering of profiled content in **Author** mode as follows:

- **Show Profiling Colors and Styles** - If this toggle action is enabled, profiled content is rendered with colors and styles that are defined for each condition set. The colors and styles can be configured in the [Profiling/Conditional Text - Colors and Styles](#) preferences page.
- **Show Profiling Attributes** - If this toggle action is enabled, all profiling attributes set on the current element are listed with a colored background at the end of the content block and the profiled text is marked with a colored border.
- **Show Excluded Content** - If this toggle action is enabled, all profiled content that does not match the rules imposed by the current condition set is grayed-out, meaning that it will not be included in the published output. If it is disabled, the excluded content will not be shown at all for the current condition set.
- **List of profiling condition sets that match the current document type** - Selecting a condition set from this drop-down list will change the rendering of profiled content in **Author** mode according to the state of the other three toggle actions listed above. For example, if all three toggle actions are enabled, the content that matches the selected condition set will be rendered with the configured colors/styles, the profiling attribute set will be listed at the end of each profiled block of content, and all the profiled content that does not match the selected condition set will be grayed-out.

Compare Files

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison.

The utility is available from the **Tools** menu or can be opened as a stand-alone application from the **Oxygen XML Editor** installation folder (`diffFiles.exe`). The utility is available as a stand-alone application and can be opened by running its executable file (`diffFiles.exe`) from the Syncro SVN Client installation folder. The functionality of this standalone tool is similar to the **comparison feature in the Syncro SVN client** with a few slight differences in the interface and some options.

Figure 737: Rendering Profiled Content in Author Mode

Rendering Profiled Content in the DITA Maps Manager

The options in the **Profiling / Conditional Text** drop-down menu affect the rendering of profiled topics in the **DITA Maps Manager** view as follows:

- Show Profiling Colors and Styles** - If this toggle action is enabled, profiled topics are rendered with colors and styles that are defined for each condition set. The colors and styles can be configured in the **Profiling / Conditional Text - Colors and Styles** preferences page.
- Show Profiling Attributes** - If this toggle action is enabled, all profiling attributes set on the current topic are listed after the title.
- Show Excluded Content** - If this toggle action is enabled, all profiled topics that do not match the current condition set are grayed-out, meaning that it will not be included in the published output. If it is disabled, the excluded topics will not be shown at all for the current condition set.
- List of profiling condition sets that match the current document type** - Selecting a condition set from this drop-down list will change the rendering of profiled topics in the **DITA Maps Manager** view according to the state of the other three toggle actions listed above. For example, if all three toggle actions are enabled, the topics that match the selected condition set will be rendered with the configured colors/styles, the profiling attribute set will be listed at the end of each topic title, and all the profiled topics that do not match the selected condition set will be grayed-out.

Also, the following icons are used to mark profiled and non-profiled topics:

- ■ - The topic contains profiling attributes.
- □ - The topic inherits profiling attribute from its ancestors.
- □ - The topic contains and inherits profiling attributes.
- (dash) - The topic neither contains, nor inherits profiling attributes.

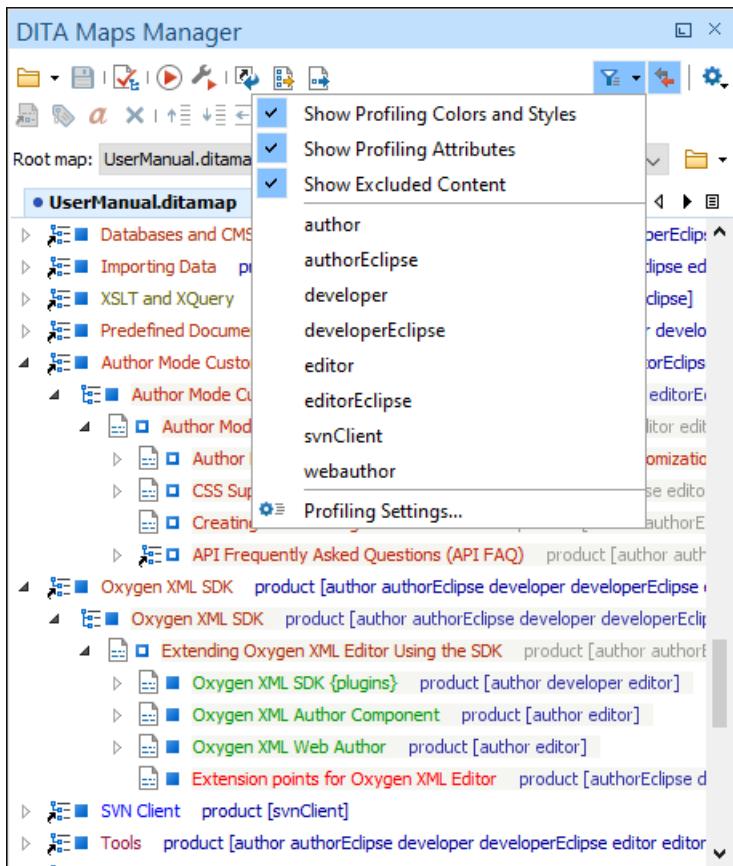

Figure 738: Rendering Profiled Topics in DITA Maps Manager

Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set into account during the transformation, as defined in the **Filters tab** when *creating a DITA transformation*.

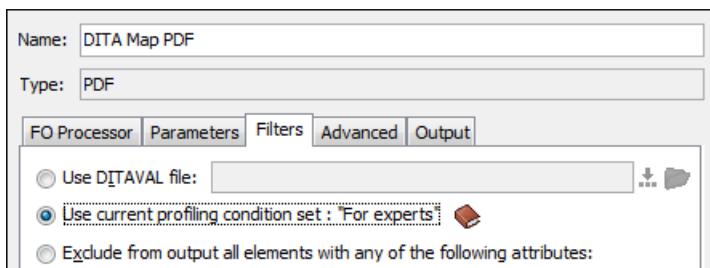

Figure 739: Profiling Option in the Filters Tab (DITA OT Transformations)

Filtering Attribute Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the audience attribute to profile the content for the following types of users: *therapist*, *physician*, and *surgeon*. Suppose that in the output, you want to exclude any content that is profiled as *surgeon* value for the audience attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as surgeon:

```
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as surgeon).

DITAVAL Filter File Editor in Author Mode

The **Author** editing mode in Oxygen XML Editor offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

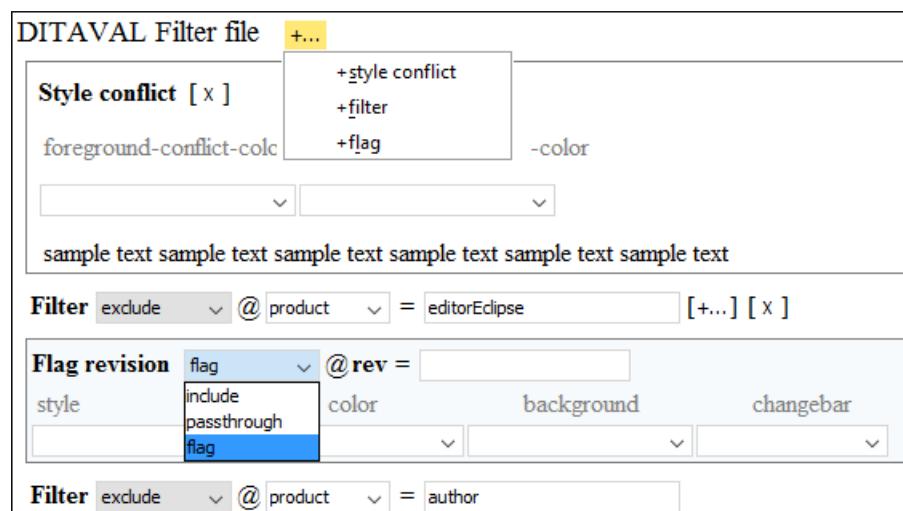

Figure 740: DITAVAL File Editor in Author Mode

Use the **+...** button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the **DITAVAL FILTER File** title, allows you to insert the following elements:

- **Style Conflict** - Inserts a *style-conflict element* that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the foreground-conflict-color and background-conflict-color attributes.
- **Filter** - Inserts a *prop element* that identifies an attribute to apply a filtering action on. The possible actions that you can select are *include*, *exclude*, *passthrough*, and *flag*. If you select the *flag* action, you can use the drop-down menus to select values for the style, color, and background attributes.
- **Flag** - Inserts a *revprop element* that Identifies a value in the rev attribute that should be flagged in some manner. The allowed actions are *include*, *passthrough*, and *flag*. If you select the *flag* action, you can use the drop-down menus to select values for the style, color, background, and changebar attributes.

See the [DITAVAL Element Specifications](#) for more details about the allowed filters and flags.

How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITAVAL** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a *Profiling Condition Set* with the [Use DITAVAL File option](#) in the [Condition Set configuration dialog box](#).

- You can use the [Import from DITAVAL option](#) in the [Profiling/Conditional Text preferences page](#) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the [DITAVAL file in the transformation scenario](#).
- You can use the filter file in the [DITA Map Completeness Check dialog box](#) when validating your DITA map.
- DITAVAL files are also used when working with the DITA 1.3 Branch Filtering mechanism. For more details, see: [Working with DITA 1.3 Branch Filtering](#) on page 1607.
- You can [define the colors and styles to be used for rendering profiled condition sets](#) in **Author** mode and the **DITA Maps Manager** view by using a **Flag** filter in the DITAVAL file.

Related information

[DITAVAL Element Specifications](#)

[Working with DITA 1.3 Branch Filtering](#) on page 1607

[Profiling with a Subject Scheme Map](#) on page 1637

[Styling the Rendering of Profiled Content Using a DITAVAL File](#) on page 1642

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in **Author** mode and the **DITA Maps Manager** by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

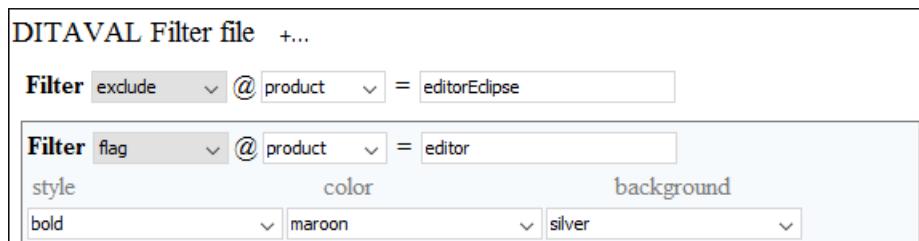

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. [Create or edit your DITAVAL file](#) to define your profiling condition set.
2. In **Author** mode, [define the filters for your condition set](#).
3. Select **Flag** from the drop-down menu on in a particular **Filter** or **Flag Revision** to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

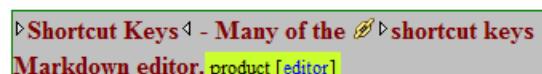

Result: Test your changes by opening profiled content in **Author** mode or the **DITA Maps Manager** and use the options in the **Profiling / Conditional Text** drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a **Flag** on a **Filter** to define the styling for a condition set like this:

will render the styling of the profiled content in **Author** mode to look like this:

and will render the styling in the **DITA Maps Manager** view to look like this:

▶	Editing Schematron Quick Fixes	product [developer developer]
▶	Editing SVG Files	product [author developer editor]
▶	Editing XHTML Documents	product [author authorEclipse developer developer]
▶	Editing Markdown Documents	product [author authorEclipse developer developer]
▶	Markdown Editor	product [author authorEclipse developer developer]
▶	Creating New Markdown Documents	product [author author developer developer]

DITA Open Toolkit Support

Oxygen XML Editor includes support for the DITA Open Toolkit. This section includes information about how to create a DITA OT plugin, how to install plugins in the DITA OT, and how to use an external instance of the DITA Open Toolkit.

Related information

[DITA Open Toolkit Documentation](#)

Creating a DITA OT Customization Plugin

To describe the steps involved in creating a **DITA Open Toolkit** plugin, this section uses an example of creating an **XSLT** customization plugin that provides syntax highlighting when publishing DITA codeblock elements to **HTML** and **PDF** output formats. This plugin (**com.oxygenxml.highlight**) that provides syntax highlighting is available in the **DITA Open Toolkit** distribution that comes bundled with the latest version of Oxygen XML Editor, but these instructions show you how to create it as if it were not included.

The steps to help you to create the plugin are as follows:

1. Create a folder for your plugin in the DITA OT **plugins** folder ([DITA_OT_DIR/plugins/](#)).

For example, if you are using DITA 1.8.5, the path would look like this:

`[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.oxygenxml.highlight`

2. Create a **plugin.xml** file (in the same plugin folder) that contains the extension points of the plugin.

Note: You can easily create this file by using the **DITA OT Plugin** new file template that is included in Oxygen XML Editor. From the **New** file wizard you can find this template in **Framework templates > DITA > plugin**.

For example, our syntax highlighting plugin example contains the following:

```
<plugin id="com.oxygenxml.highlight">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlHighlight.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfHighlight.xsl" type="file"/>
</plugin>
```

The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other **DITA OT** plugin extension points here: http://dita-ot.sourceforge.net/1.5.3/dev_ref/extension-points.html

3. Create an XSLT stylesheet to customize the output types. In our example, to customize the HTML output we need to create an XSLT stylesheet called **xhtmlHighlight.xsl** (in the same plugin folder).

Tip: You can use the **Find/Replace in Files** to find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. In our example we want to overwrite the creation of the HTML content from a DITA **codeblock** element. Since a DITA codeblock element has the **class** attribute value **+ topic/pre pr-d/codeblock** we can take part of the **class** attribute value (**topic/pre**) and search the **DITA OT** resources for a similar stylesheet.

Our search found the XSLT stylesheet [DITA_OT_DIR/org.dita.xhtml/xsl/xslhtml/dita2htmlImpl.xsl](#) that contains:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" name="topic.pre">
```

```
<xsl:apply-templates select=". " mode="pre-fmt" />
</xsl:template>
```

We use it to overwrite our **xhtmlHighlight.xsl** stylesheet, which results in the following:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]" name="topic.pre">
  <!-- This template is deprecated in DITA-OT 1.7. Processing will moved into the main element rule. -->
  <xsl:if test="contains(@frame, 'top')"><hr /></xsl:if>
  <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>
  <xsl:call-template name="spec-title-nospace"/>
  <pre>
    <xsl:attribute name="class"><xsl:value-of select="name()"/></xsl:attribute>
    <xsl:call-template name="commonattributes"/>
    <xsl:call-template name="setscale"/>
    <xsl:call-template name="setidaname"/>
    <!--Here I'm calling the styler of the content inside the codeblock.-->
    <xsl:call-template name="outputStyling"/>
  </pre>
  <xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>
  <xsl:if test="contains(@frame, 'bot')"><hr /></xsl:if><xsl:value-of select="$newline"/>
</xsl:template>
```

You could also use another XSLT template that applies the XSLTHL library as a Java extension to style the content.

4. Create additional XSLT stylesheets to customize all other desired output types. In our example, to customize the PDF output we need to create an XSLT stylesheet called **pdfHighlight.xsl** (in the same plugin folder).

In this case we found an appropriate XSLT stylesheet **DITA_OT_DIR/plugins/legacypdf/xslfo/dita2fo-elems.xsl** to use as a template that we use to overwrite our **pdfHighlight.xsl** stylesheet, which results in the following:

```
<xsl:template match="*[contains(@class, ' topic/pre ')]">
  <xsl:call-template name="gen-att-label"/>
  <fo:block xsl:use-attribute-sets="pre">
    <!-- setclass -->
    <!-- set id -->
    <xsl:call-template name="setscale"/>
    <xsl:call-template name="setframe"/>
    <xsl:apply-templates/>
  </fo:block>
</xsl:template>
```

Note: You can edit the newly created stylesheets to customize multiple outputs in a variety of ways. For example, in our case you could edit the **xhtmlHighlight.xsl** or **pdfHighlight.xsl** stylesheets that we created to customize various colors for syntax highlighting.

5. To install the created plugin in the **DITA OT**, run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the **Apply Transformation Scenario(s)** dialog box. If the integrator is not visible, enable the **Show all scenarios** action that is available in the **Settings** drop-down menu. For more information, see [Installing a Plugin in the DITA Open Toolkit](#).

Results of running the integrator using our example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

- For the HTML output, in the XSLT stylesheet **DITA_OT_DIR/xsl/dita2html-base.xsl** a new import automatically appeared:

```
<xsl:import href="../plugins/com.oxygenxml.highlight/xhtmlHighlight.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: <http://www.w3.org/TR/xslt#import>.

- Likewise, for the PDF output, in the top-level stylesheet **DITA_OT_DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl** a new import statement appeared:

```
<xsl:import href="../../../../com.oxygenxml.highlight/pdfHighlight.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA OT installation along with some simple installation notes. Your customization will work provided that the templates you are overwriting have not changed from one DITA OT distribution to the other.

Related information

[DITA Open Toolkit Documentation](#)

Installing a Plugin in the DITA Open Toolkit

The architecture of the **DITA Open Toolkit** allows additional plugins to be installed.

1. The additional plugin(s) should be copied to the `DITA_OT_DIR\plugins` directory.

Note: If the plugin is only supported in DITA-OT 2.3.3 version, make sure that you copy the plugin in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x` directory.

2. Run the predefined transformation scenario called **Run DITA OT Integrator** by executing it from the  **Apply Transformation Scenario(s)** dialog box. If the integrator is not visible, enable the **Show all scenarios** action that is available in the  **Settings** drop-down menu.

Important: The folder where the **DITA OT** is located needs to have full write access permissions set to it. For example if you are integrating plugins in the **DITA OT** folder bundled with Oxygen XML Editor and if you are running on **Windows** and your application is installed in the **Program Files** folder, you can start the Oxygen XML Editor main executable with administrative rights for the integrator process to be able to modify resources in the **DITA OT** folder.

Starting with version 17.0, Oxygen XML Editor detects the transformation type (`transtype`) declarations from **DITA OT** plugins and presents descriptions, which are contributed in the `transtype` declarations, in the **DITA Transformation Type** dialog box. Oxygen XML Editor also shows the contributed parameters from **DITA OT** plugins in the **Parameters** tab in the **Edit DITA Scenario** dialog box.

3. If the plugin contributed a new transformation type that is not detected (for instance, if you are using a previous version of Oxygen XML Editor that does not detect the `transtype` declarations), you can create a new **DITA OT** transformation scenario with a predefined type that is similar to the new transformation type. Then edit the transformation scenario, and in the **Parameters** tab add a `transtype` parameter with the value of the new transformation type.

Note: A transformation type can also extend another `transtype`. For example, the `pdf-prince` `transtype` extends a `commons` transformation type that contains all the common DITA OT parameters.

Example:

```
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
  <feature extension="dita.conductor.transtype.check" value="pdf-prince"
  type="txt"/>
  <feature extension="dita.conductor.target.relative" value="integrator.xml"
  type="file"/>
  <feature extension="dita.transtype.print" value="pdf-prince"/>
  <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
    <param name="princeExecPath" type="file" desc="Path to the Prince executable
    file that will produce the PDF"/>
  </ Transtype>
</plugin>
```

[Installing the DITA For Publishers Package](#)

[DITA Open Toolkit Documentation](#)

Use an External DITA Open Toolkit in Oxygen XML Editor

Oxygen XML Editor comes bundled with a DITA Open Toolkit, located in the `DITA_OT_DIR` directory. Starting with Oxygen XML Editor version 17, if you want to use an external DITA OT for all transformations and validations, you can [open the Preferences dialog box \(Options > Preferences\)](#) and go to the [the DITA page](#), where you can specify the DITA OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the **Parameters** tab change the value for the `dita.dir` parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the **Advanced** tab, click the **Libraries** button and uncheck **Allow Oxygen to add high priority libraries to classpath**.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Oxygen XML Editor preferences in the **Document Type Association** page, edit the **DITA** and **DITA Map** document types and modify the catalog entry in the **Catalogs** tab to point to the custom catalog file `catalog-dita.xml`.

Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 1.8.5 and 2.3.3 distributions that are bundled with Oxygen XML Editor include some pre-installed third-party open-source plugins that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Editor include:

- [DITA For Publishers](#) (installed only in DITA OT 1.8.5) - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- [DITA to Reveal JS](#) (installed only in DITA OT 1.8.5) - This plugin allows users to publish DITA content to web slides that can be used for presentations.
- [DITA to Word](#) (installed only in DITA OT 2.3.3) - This plugin allows users to publish DITA content to MS Word.
- [DITA Markdown](#) (installed only in DITA OT 2.3.3) - This plugin allows users to publish DITA content to Markdown, or to publish DITA Maps that refer to Markdown resources.
- [Lightweight DITA](#) (installed only in DITA OT 2.3.3) - This plugin allows users to create, edit, and validate Lightweight DITA topics and maps.
- [DITA Community](#) (installed only in DITA OT 2.3.3) - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

DITA Specialization Support

This section explains how you can integrate and edit a DITA specialization in Oxygen XML Editor.

Integration of a DITA Specialization

A DITA specialization usually includes:

- DTD definitions for new elements as extensions of existing DITA elements.
- Optional specialized processing that is new XSLT template rules that match the extension part of the class attribute values of the new elements and thus extend the default processing available in the DITA Open Toolkit.

A specialization can be integrated in the application with minimum effort:

1. If the DITA specialization is available as a DITA Open Toolkit plugin, copy the plugin to the location of the DITA OT you are using (by default `DITA_OT_DIR\plugins`). Then run the DITA OT integrator to integrate the plugin. In the [Transformation Scenarios view](#) there is a predefined scenario called **Run DITA OT Integrator** that can be used for this.

Important: The directory where the DITA OT is located needs to have full write access permissions set to it.

2. If the specialization is not available as a DITA OT plugin, you have the following options:

- If the DTD that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA OT catalog file for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the DITA maps or topics. The DITA OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA OT, these new stylesheets must be called from the Ant build scripts of DITA OT.

Important: If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** checkbox in the [Document Type Association preferences page](#).

- In your specialization plugin directory, create a folder called `template_folders`, which would contain all the folders with new file templates. In Oxygen XML Editor, the templates contributed by the plugin will be available in the **New** document wizard.

[DITA Configuration and Specialization Tutorials](#)

Editing DITA Map Specializations

In addition to recognizing the default DITA map formats (map and bookmap), the **DITA Maps Manager** view can also be used to open and edit specializations of DITA maps.

All advanced edit actions available for the map (such as insertion of topic refs, heads, properties editing) allow you to specify the element in an editable combo box. Moreover the elements that appear initially in the combo are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the **DITA Maps Manager** view are collected from the target files by matching the class attribute and not a specific element name.

When editing DITA specializations of maps in the main editor the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at cursor position. You can go to the **DITA Map** document type from the [Document Type Association preferences page](#) and edit the table actions to insert the element names as specified in your specialization. See [Adding or Editing a Document Type Association \(Framework\)](#) on page 1138 for more details.

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in the **Author** mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles in which the elements are rendered should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the [Document Type Association preferences page](#) and edit the actions to insert the element names, as specified in your specialization. See [Adding or Editing a Document Type Association \(Framework\)](#) on page 1138 for more details.

Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `prolog` element of a topic or inside the `topicref` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using subject scheme maps. When you are authoring, many of the values you choose from have been defined in subject scheme maps.

Creating an Index in DITA

In DITA, indexes are created from `indexterm` elements. You can insert index term elements:

- In the header of a topic. In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page in which the topic starts, even if it is not the page in which the indexed term occurs.
- In the `topicref` element in a map that references the topic. This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page in which the topic starts.
- In the body of a topic. In paginated media, this results in an index entry that points to the page in which the `indexterm` element occurs, even if that is not the page in which the topic starts.

To add index terms to the text of a topic or the topic header, [create the elements, as you normally would, in Oxygen XML Editor](#). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a bookmap, you need to add an `indexlist` element to the backmatter of the book.

1. Open your `bookmap` in the **DITA Maps Manager**.
2. Right-click the bookmap and select **Append child > Backmatter**. The **Insert Reference dialog box** appears.
3. Click **Insert and Close** to insert the backmatter element.
4. Right-click the backmatter element and create a `booklists` element using **Append child > Book Lists**.
5. Use the same steps to create an `indexlist` element.

 **CAUTION:** Adding index entries and an `indexlist` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

Migrating MS Office Documents to DITA

Oxygen XML Editor integrates the entire [DITA for Publishers plugins suite](#) and includes some helpful tools that allows you to migrate content from Microsoft Office® Word (and other similar types of documents) to DITA. Migration from proprietary formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case:

Method 1

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor and create a new DITA topic.
3. Paste the selected content in **Author** mode. The [smart paste functionality](#) will attempt to convert the content to DITA.

Method 2

1. Save your document as HTML.
2. Once you have converted it to HTML, you have two possibilities:

- In Oxygen XML Editor, select **File > Import > HTML File** to import it as XHTML. Then, open the XHTML in Oxygen XML Editor and use one of the [XHTML to DITA Transformation Scenarios](#) to convert the content to DITA.
- Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Editor, create a new **DITA** topic and paste the selected content in **Author** mode. The [smart paste functionality](#) will attempt to convert the HTML content to DITA.

Method 3

1. Open the document in the free *Libre Office* application and save it as **DocBook**.
2. Open the **DocBook** document in Oxygen XML Editor.
3. Run the predefined [transformation scenario called DocBook to DITA](#).

Method 4

1. If the document is in the MS Word DOCX format, you can open it in the [Archive Browser view](#) in Oxygen XML Editor and then open the **document.xml** file contained in the archive.
2. Run the predefined [transformation scenario](#) called **DOCX DITA**. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a DITA map and multiple topics.
3. You may need to do some manual reconfiguring to map DOCX styles to DITA content.

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor includes support for some DITA 1.3 features.

To enable DITA 1.3 support in Oxygen XML Editor and use the DITA Open Toolkit 2.3.3 for publishing, [open the Preferences dialog box \(Options > Preferences\)](#), go to **DITA**, and select the **Built-in DITA OT 2.x** radio button.

The Oxygen XML Editor publication of the full DITA 1.3 specifications can be found at <https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html>.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor:

Table 49: DITA 1.3 Features Implementation Status

Feature	Editing	Publishing [DITA Open Toolkit 2.3.3 is used]
DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.	New DITA 1.3 file templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3 Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements	N/A
Learning Object and Group maps	New file templates	No specific support implemented

Feature	Editing	Publishing [DITA Open Toolkit 2.3.3 is used]
Troubleshooting specialization	Create and edit new troubleshooting topics	No specific support implemented
XML markup domain	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Equation and MathML domain	Validation and content completion Display and Insert equations	Special rendering in PDF and XHTML-based outputs
SVG domain	Validation and content completion Display referenced SVG content	Special rendering in PDF and XHTML-based outputs
Other new DITA 1.3 elements (div, strike-through, overline, etc)	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Release management domain	Validation and Content Completion	No specific support implemented
<i>Scoped keys</i>	Define key scopes Validate and check for completeness Resolve <code>keyrefs</code> and <code>conkeyrefs</code> taking key scopes into account Key scope information is displayed in a tooltip when hovering over an item in the DITA Maps Manager	Partially implemented (Various issues may still be encountered)
<i>Branch filtering</i>	Display, create, and edit <code>ditavalref</code> elements	Partially implemented (Various issues may still be encountered)
Key-based cross deliverable addressing	Special display for references to DITA maps with <code>scope="peer"</code> and a defined keyscope Gather and present keys from peer maps	Not implemented.
Shorthand to address syntax that identifies elements in the same topic	Properly resolved for validation, links, and conrefs	Implemented
Various table attributes (orientation, rotation, scope, and headers on cells)	Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view	Not implemented
New Map topicref attributes (cascade, deliveryTarget)	Allow setting new attributes, propose proper values for them	Implemented

- [Block element](#)
- [Bookmap](#)
- [DITA Map](#)
- [DITA_OT_DIR](#)
- [Inline element](#)
- [Java Archive](#)
- [Named User](#)

Active cell

The selected cell in which data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Block element

A block element is intended to be visually separated from its siblings, usually vertically. For instance, a paragraph or a list item are block elements. It is distinct from a [inline element](#), which has no such separation.

Bookmap

A bookmap is a specialized [DITA map](#) used for creating books. A bookmap supports book divisions such as chapters and book lists such as indexes.

DITA Map

A DITA map is a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmap to generate a deliverable using an output type such as XHTML, PDF, HTML Help or Eclipse Help.

DITA_OT_DIR

DITA_OT_DIR is the default directory that is specified for your DITA Open Toolkit distribution in the [Options > Preferences > DITA preferences page](#).

For example, if you are using DITA OT 2.3.3, `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x` (or if you are using DITA OT 1.8.5, the default DITA OT directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`). You can also specify a custom directory.

Inline element

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a *block element*, which is visually separated from its siblings.

Java Archive

JAR (Java ARchive) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command or an archive tool.

Named User

Named User is defined as an individual full or part-time employee who is authorized by *You* (the individual or entity who owns the rights to Oxygen XML Editor) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, Named User licenses cannot be shared amongst multiple individuals and separate Named User licenses must be purchased for each individual user.

A Named User license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the Named User's employment with your company.
- (b) Permanent reassignment of a Named User to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen XML license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the Named User license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

Note: This definition is taken from the Oxygen XML Editor [End User License Agreement](#).
