

Oxygen XML Editor 18.1

User Guide

Contents

Chapter 1: Introduction.....	1
Chapter 2: Getting Started.....	2
What is Oxygen XML Editor.....	2
Getting Familiar with the Layout.....	3
Supported Document Types.....	4
Resources to Help You Get Started Using Oxygen XML Editor.....	4
Your First Document or Project.....	5
Your First XML Document.....	6
Your First DITA Topic.....	9
Creating a New Project.....	14
Getting Help.....	15
Help Menu.....	16
Frequently Used Shortcut Keys.....	17
Chapter 3: Installation.....	21
Installation Options.....	21
Windows Installation.....	22
Choosing an Installer.....	22
System Requirements.....	22
Install Using the Windows Installer.....	23
Unattended Installation.....	23
Mac OS X Installation.....	23
Choosing an Installer.....	23
System Requirements.....	23
OS X Installation.....	24
Linux Installation.....	24
Choosing an Installer.....	24
System Requirements.....	24
Linux Installation.....	25
Unattended Installation.....	25
Windows Terminal Server Installation.....	26
Choosing an Installer.....	26
System Requirements.....	26
Install Using the Windows Installer.....	26
Configuring Windows Terminal Server.....	27
Linux Server Installation.....	27
Choosing an Installer.....	27
System Requirements.....	27
Linux Installation.....	28
Unix / Linux Server Configuration.....	28
Java Web Start (JWS) Installation.....	28
Site-wide deployment.....	30
Licensing.....	30
Choosing a License Type.....	30
Obtaining a License.....	31
Register a Named-User or Subscription License.....	31
Registering a Floating License.....	32
Setting up a License Server.....	34
Setting up an HTTP Floating License Server.....	35

Setting up a TCP Floating License Server Using a 32-bit Windows Installer.....	38
Setting up a TCP Floating License Server Using All-Platforms Distribution.....	40
Transferring or Releasing a License.....	41
Upgrading.....	42
Checking for New Versions of Oxygen XML Editor.....	42
What is Preserved During an Upgrade?.....	42
Upgrading the Standalone Application.....	42
Installing and Updating Add-ons.....	42
Uninstalling.....	43
Uninstalling the Oxygen XML Editor Standalone.....	43
Unattended Uninstall.....	44
Oxygen XML Editor Installer Command Line Reference.....	44
 Chapter 4: Configuration.....	47
Preferences.....	47
Global Preferences.....	49
Appearance Preferences.....	50
Application Layout Preferences.....	53
Add-ons Preferences.....	54
Document Type Association Preferences.....	54
Encoding Preferences.....	71
Editor Preferences.....	72
CSS Validator Preferences.....	109
XML Preferences.....	109
DITA Preferences.....	132
Data Sources Preferences.....	134
SVN Preferences.....	138
Diff Preferences.....	141
Archive Preferences.....	144
Plugins Preferences.....	145
External Tools Preferences.....	146
Menu Shortcut Keys Preferences.....	148
File Types Preferences.....	149
Open/Find Resource Preferences Page.....	150
Custom Editor Variables Preferences.....	152
Network Connection Settings Preferences.....	152
XML Structure Outline Preferences.....	155
Views Preferences.....	155
Messages Preferences.....	156
Configuring Options.....	157
Customizing Default Options.....	157
Storing Global and Project Level Options.....	158
Sharing Application Settings.....	159
Importing/Exporting/Resetting Global Options.....	160
Associating a File Extension with Oxygen XML Editor.....	160
Configuring the Layout of the Views and Editors.....	160
Configure Toolbars.....	162
Scenarios Management.....	164
Editor Variables.....	164
Custom Editor Variables.....	169
Custom System Properties.....	170
Localizing the User Interface.....	172
Creating an Interface Localization File.....	172
Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor.....	173
Setting Parameters for the Application Launchers.....	173
Setting Parameters in the Command Line Scripts.....	174
Creating Custom Startup Parameters File.....	174

Chapter 5: Perspectives.....	175
Editor Perspective.....	175
XSLT Debugger Perspective.....	176
XQuery Debugger Perspective.....	177
Database Perspective.....	178
Chapter 6: Editing Modes.....	180
Text Editing Mode.....	180
Navigating the Document Content in Text Mode.....	180
Text Mode Views.....	182
Syntax Highlight Depending on Namespace Prefix.....	199
Presenting Validation Errors in Text Mode.....	200
Bidirectional Text Support in Text Mode.....	201
Grid Editing Mode.....	201
Layouts: Grid and Tree.....	203
Grid Mode Navigation.....	203
Bidirectional Text Support in Grid Mode.....	204
Author Editing Mode.....	205
Navigating the Document Content in Author Mode.....	206
Author Mode Views.....	208
Displaying the XML Markup (Tags).....	229
Displaying Referenced Content.....	229
Visual Hints for the Cursor Position.....	230
Presenting Validation Errors in Author Mode.....	231
Whitespace Handling in Author Mode.....	232
Bidirectional Text Support in Author Mode.....	233
Design Editing Mode (XML Schema Diagram Editor).....	235
Navigation in the XML Schema Design Mode.....	236
XML Schema Outline View.....	237
XML Schema Attributes View.....	239
XML Schema Facets View.....	241
XML Schema Palette View.....	242
Chapter 7: Editing Documents.....	243
Working with Unicode.....	244
Opening and Saving Documents with Unsupported Characters.....	244
Inserting Symbols.....	245
Unicode Fallback Font Support.....	246
Creating and Working with Documents.....	247
Creating New Documents and Templates.....	247
Opening Documents.....	252
Saving Documents.....	254
Opening and Saving Remote Documents.....	254
Switching and Moving File Tabs.....	260
Searching Documents.....	260
Closing Documents.....	267
Contextual Menu of the Current Editor Tab.....	267
Viewing File Properties.....	268
Using Projects to Group Documents.....	268
Creating a New Project.....	268
Project View.....	269
Sharing a Project - Team Collaboration.....	277
Master Files Support.....	279
Editing XML Documents.....	282
Editing XML Documents in Text Mode.....	282

Editing XML Documents in Grid Mode.....	317
Editing XML Documents in Author Mode.....	320
Validating XML Documents.....	437
Finding and Replacing Text in the Current File.....	454
Finding and Replacing Text in Multiple Files.....	459
Search and Refactor Actions for IDs and IDREFS.....	462
Associating a Schema to XML Documents.....	464
Working with Modular XML Files in the Master Files Context.....	472
XML Resource Hierarchy/Dependencies View.....	472
Working with XML Catalogs.....	475
Editing Large XML Documents with DTD Entities or XInclude.....	477
Viewing Status Information.....	479
Making a Persistent Copy of Results.....	479
Editor Highlights.....	480
Printing a File.....	481
XML Quick Fixes.....	482
Refactoring XML Documents.....	484
Editing XSLT Stylesheets.....	500
Editing XSLT Stylesheets in the Master Files Context.....	500
Validating XSLT Stylesheets.....	500
Content Completion in XSLT Stylesheets.....	502
Syntax Highlighting in XSLT.....	506
XSLT Outline View.....	507
XSLT/XQuery Input View.....	510
XSLT Resource Hierarchy/Dependencies View.....	513
XSLT Component Dependencies View.....	515
Highlight Component Occurrences.....	517
Finding XSLT References and Declarations.....	517
XSLT Stylesheet Component Documentation Support.....	517
Generating Documentation for an XSLT Stylesheet.....	518
XSLT Quick Assist Support.....	525
XSLT Quick Fix Support.....	527
XSLT Refactoring Actions.....	528
XSLT Unit Test (XSpec).....	530
Editing Ant Build Files.....	532
Editing Ant Build Files in the Context of Master Files.....	532
Validate Ant Build Files.....	532
Content Completion in Ant Build Files.....	533
Syntax Highlighting in Ant Files.....	533
Ant Outline View.....	534
Ant Resource Hierarchy/Dependencies View.....	536
Ant Component Dependencies View.....	537
Highlight Component Occurrences.....	538
Find References and Declarations of Ant Components.....	538
Ant Quick Assist Support.....	538
Ant Quick Fix Support.....	539
Ant Refactoring Actions.....	539
Editing XML Schemas.....	540
Design Editing Mode (XML Schema Diagram Editor).....	540
Editing XML Schema in Text Editing Mode.....	573
Editing XML Schema in the Master Files Context.....	573
Validating XML Schema Documents.....	573
Content Completion in XML Schema.....	574
XML Schema Outline View.....	575
XML Schema Attributes View.....	577
XML Schema Resource Hierarchy / Dependencies View.....	578
Component Dependencies View for XML Schema.....	580
Highlight Component Occurrences.....	582

Searching and Refactoring Actions in XML Schemas.....	582
Quick Fixes for DTD, XSD, and Relax NG Errors.....	583
XML Schema Quick Assist Support.....	584
Generating Sample XML Files.....	585
Generating Documentation for an XML Schema.....	589
Converting Schema to Another Schema Language.....	597
Converting Database to XML Schema.....	599
Flatten an XML Schema.....	600
XML Schema Regular Expressions Builder.....	602
XML Schema 1.1.....	603
Setting the XML Schema Version.....	604
Editing XQuery Documents.....	605
XQuery Outline View.....	605
Folding in XQuery Documents.....	606
Formatting and Indenting XQuery Documents.....	607
Generating HTML Documentation for an XQuery Document.....	607
Editing WSDL Documents.....	608
Editing WSDL Documents in the Master Files Context.....	608
Validating WSDL Documents.....	609
Content Completion Assistance in WSDL Documents.....	609
WSDL Outline View.....	610
WSDL Resource Hierarchy/Dependencies View in WSDL Documents.....	613
Component Dependencies View in WSDL Documents.....	615
Highlight Component Occurrences in WSDL Documents.....	616
Searching and Refactoring Operations in WSDL Documents.....	616
Quick Assist Support in WSDL Documents.....	619
Generating Documentation for WSDL Documents.....	620
WSDL SOAP Analyzer.....	624
Editing CSS Stylesheets.....	626
Validating CSS Stylesheets.....	627
Content Completion in CSS Stylesheets.....	627
CSS Outline View.....	628
Folding in CSS Stylesheets.....	628
Formatting and Indenting CSS Stylesheets (Pretty Print).....	629
Minifying CSS Stylesheets.....	629
Editing LESS CSS Stylesheets.....	629
Validating LESS Stylesheets.....	629
Content Completion in LESS Stylesheets.....	630
Compiling LESS Stylesheets to CSS.....	630
Editing Relax NG Schemas.....	630
Editing Relax NG Schema in the Master Files Context.....	631
Relax NG Schema Diagram Editor.....	631
Validating Relax NG Schema Documents.....	635
Relax NG Outline View.....	635
RNG Resource Hierarchy/Dependencies View.....	637
Component Dependencies View for RelaxNG Schemas.....	639
Searching and Refactoring Actions in RNG Schemas.....	640
Quick Fixes for DTD, XSD, and Relax NG Errors.....	641
RNG Quick Assist Support.....	642
Configuring a Custom Datatype Library for a RELAX NG Schema.....	643
Editing NVDL Schemas.....	643
NVDL Schema Diagram.....	643
NVDL Outline View.....	645
Validating NVDL Schema Documents.....	645
Component Dependencies View for NVDL Schemas.....	646
Searching and Refactoring Actions in NVDL Schemas.....	646
Editing JSON Documents.....	648
Editing JSON Documents in Text Mode.....	648

Editing JSON Documents in Grid Mode.....	650
Validating JSON Documents.....	651
JSON Outline View.....	651
XML to JSON Converter.....	652
Editing StratML Documents.....	653
Editing XLIFF Documents.....	653
Editing JavaScript Documents.....	653
JavaScript Editing Actions.....	653
Validating JavaScript Files.....	655
Content Completion in JavaScript Documents.....	655
JavaScript Outline View.....	656
Editing XProc Scripts.....	657
Editing Schematron Schemas.....	658
Editing Schematron Schema in the Master Files Context.....	659
Validating Schematron Documents.....	659
Presenting Schematron Validation Issues.....	660
Content Completion in Schematron Documents.....	660
XML Schema or RELAX NG with Embedded Schematron Rules.....	661
Schematron Outline View.....	662
Schematron Resource Hierarchy/Dependencies View.....	663
Highlight Component Occurrences in Schematron Documents.....	665
Searching and Refactoring Operations in Schematron Documents.....	666
Quick Assist Support in Schematron Documents.....	668
Editing Schematron Quick Fixes.....	668
Schematron Quick Fixes (SQF).....	669
Defining Schematron Quick Fixes.....	669
Validating Schematron Quick Fixes.....	674
Content Completion in SQF.....	674
Highlight Quick Fix Occurrences in SQF.....	675
Searching and Refactoring Operations in SQF.....	675
Embed Schematron Quick Fixes in Relax NG or XML Schema.....	676
Integrating SQF in a Framework.....	677
Editing SVG Files.....	677
Standalone SVG Viewer.....	678
Integrated SVG Viewer in the Results Panel.....	679
Editing XHTML Documents.....	680
Editing Markdown Documents.....	680
Markdown Editor.....	680
Creating New Markdown Documents.....	682
Actions Available in the Markdown Editor.....	682
Syntax Highlighting in the Markdown Editor.....	687
Automatic Validation in Markdown Documents.....	687
Working with Markdown Documents in DITA.....	687
Markdown Editor Syntax Rules and Specifications.....	689
Spell Checking.....	697
Spell Check Dictionaries and Term Lists.....	699
Learned Words.....	702
Ignored Words (Elements).....	703
Automatic Spell Check.....	703
Spell Check Multiple Files.....	704
AutoCorrect Misspelled Words.....	705
Add Dictionaries for the AutoCorrect Feature.....	706
Loading Large Documents.....	706
File Sizes Smaller than 300 MB.....	706
File Sizes Greater than 300 MB.....	707
Scratch Buffer.....	707
Handling Read-Only Files.....	707
Editing Documents with Long Lines.....	708

XML Digital Signatures.....	708
Digital Signatures Overview.....	708
Certificates.....	710
Canonicalizing Files.....	710
Signing Files.....	711
Verifying Signature.....	713
Example of How to Digitally Sign XML Files or Content.....	713
Compare Files or Directories.....	714
Compare Files.....	714
Compare Directories.....	726
Compare Directories Against a Base (3-Way).....	730
Chapter 8: Publishing.....	735
Transformation Scenarios.....	735
Built-in Transformation Scenarios.....	736
Creating New Transformation Scenarios.....	768
Editing a Transformation Scenario.....	805
Duplicating a Transformation Scenario.....	806
Configure Transformation Scenario(s) Dialog Box.....	806
Apply Batch Transformations.....	809
Sharing Transformation Scenarios.....	809
Transformation Scenarios View.....	810
Debugging PDF Transformations.....	812
Configuring Calabash with XEP.....	813
Integration of an External XProc Engine.....	813
XSLT Processors.....	813
XSL-FO Processors.....	816
WebHelp System Output.....	819
WebHelp Responsive System.....	820
WebHelp Classic System.....	866
WebHelp Classic Mobile System.....	897
Using the Oxygen XML WebHelp Plugin to Automate Output.....	917
Chapter 9: Querying Documents.....	927
Working with XPath Expressions.....	927
XPath Toolbar.....	927
XPath/XQuery Builder View.....	929
XPath Expression Results View.....	931
XPath and XML Catalogs.....	932
XPath Prefix Mapping.....	932
Working with XQuery.....	932
XQuery Syntax Highlights and Content Completion.....	933
XQuery Outline View.....	933
XPath/XQuery Builder View.....	935
XSLT/XQuery Input View.....	937
XQuery Validation.....	939
Transforming XML Documents Using XQuery.....	940
Chapter 10: Working with Archives.....	945
Browsing Archives.....	945
Working with Archive Files.....	947
Creating an Archive.....	948
Editing and Saving Files Inside an Archive.....	949
Migrating Archives to DITA or TEI.....	949

Chapter 11: Databases and CMS.....	950
Working with Databases.....	950
Data Source Explorer View.....	950
Table Explorer View.....	951
Database Connection Support.....	953
WebDAV Connections.....	991
SQL Execution Support.....	993
XQuery and Databases.....	995
Content Management System (CMS) Integration.....	1000
Integration with Documentum (CMS) (deprecated).....	1000
Integration with Microsoft SharePoint.....	1005
Chapter 12: Importing Data.....	1011
Import from Text Files.....	1011
Import from MS Excel Files.....	1013
Import Data from MS Excel 2007 or Newer.....	1014
Import Database Data as an XML Document.....	1014
Import from HTML Files.....	1016
Import Content Dynamically.....	1017
Chapter 13: XSLT and XQuery.....	1020
Debugger Layout.....	1021
Control Toolbar.....	1022
Debugging Information Views.....	1024
Multiple Output Documents in XSLT 2.0 and XSLT 3.0.....	1033
Working with the XSLT / XQuery Debugger.....	1033
Steps in a Typical Debugging Process.....	1034
Using Breakpoints.....	1034
Identify the XSLT / XQuery Expression that Generated Particular Output.....	1035
Debugging Java Extensions.....	1037
Supported Processors for XSLT / XQuery Debugging.....	1038
Performance Profiling of XSLT Stylesheets and XQuery Documents.....	1038
XSLT/XQuery Performance Profiling Overview.....	1038
Working with XSLT/XQuery Profiler.....	1038
Chapter 14: Predefined Document Types.....	1042
Predefined Document Types (Frameworks).....	1042
DocBook 4 Document Type.....	1044
DocBook 5 Document Type.....	1057
DocBook Targetset Document Type.....	1070
DITA Topics Document Type.....	1071
DITA Map Document Type.....	1080
XHTML Document Type.....	1107
TEI ODD Document Type.....	1112
TEI P4 Document Type.....	1117
TEI P5 Document Type.....	1122
JATS Document Type.....	1128
EPUB Document Type.....	1131
Chapter 15: Author Mode Customization.....	1132
Author Mode Customization Guide.....	1132
Simple Customization Tutorial.....	1133
Document Type Association Advanced Customization.....	1138

Example Files for a Custom Framework.....	1217
CSS Support in Author Mode.....	1222
Selecting and Combining Multiple CSS Styles.....	1222
Handling CSS Imports.....	1225
oxygen Media Type.....	1226
CSS At-Rules.....	1227
Standard W3C CSS Supported Features.....	1228
Oxygen XML Editor CSS Extensions.....	1240
Debugging CSS Stylesheets.....	1277
Creating and Running Automated Tests.....	1277
API Frequently Asked Questions (API FAQ).....	1279
Add Custom Actions to the Contextual Menu?.....	1279
Add Custom Callouts.....	1280
Add Custom Highlights to Content.....	1283
Auto-Generate an ID When a Document is Opened or Created.....	1283
Change the Default Track Changes (Review) Author Name.....	1284
Change the DOCTYPE of an Opened XML Document.....	1285
Control XML Serialization in the Oxygen XML Author Component.....	1285
Customize the Default Icons for Toolbars/Menus.....	1286
Customize the Outline View in Text Mode?.....	1286
Difference Between a Document Type (Framework) and a Plugin Extension.....	1289
Disable Context-Sensitive Menu Items for Custom Author Actions.....	1290
Dynamically Add Form Controls Using a Styles Filter.....	1290
Dynamically Modify the Content Inserted by the Author.....	1291
Dynamically Open File in Oxygen XML Editor Distributed via JavaWebStart.....	1292
Extend the Java Functionality of an Existing Framework (Document Type).....	1293
Impose Custom Options for Authors.....	1293
Insert an Element with all the Required Content.....	1294
Modify the XML Content on Open.....	1294
Modify the XML Content on Save.....	1295
Multiple Rendering Modes for the Same Document in Author Mode.....	1296
Obtain a DOM Element from AuthorNode or AuthorElement.....	1297
Obtain the Currently Selected Element Using the Author API.....	1297
Run XSLT or XQuery Transformations.....	1297
Save a New Document with a Predefined File Name Pattern.....	1298
Split Paragraph on Enter (Instead of Showing Content Completion List).....	1299
Use Custom Rendering Styles for Entity References, Comments, or PIs.....	1299
Chapter 16: Extending Oxygen XML Editor Using the SDK.....	1302
Oxygen XML SDK.....	1302
Introduction to Plugins.....	1302
General Configuration of an Oxygen XML Editor Plugin.....	1302
Installation.....	1304
Types of Plugin Extensions.....	1304
Oxygen XML Editor Plugin How to.....	1313
Creating and Running Automated Tests.....	1318
Debugging a Plugin Using the Eclipse Workbench.....	1319
Debugging an Oxygen SDK Extension Using the Eclipse Workbench.....	1320
Disabling a Plugin.....	1320
Oxygen XML Author Component.....	1320
Licensing.....	1320
Installation Requirements.....	1321
Customization.....	1321
Deployment.....	1323
Sample SharePoint Integration of the Oxygen XML Author Component.....	1328
Frequently Asked Questions.....	1333
Feature Matrix.....	1336
Oxygen XML Web Author Component.....	1337

Oxygen XML Web Author Component Customization Overview.....	1337
Oxygen XML Web Author Component How to	1343
Deploying Oxygen XML Web Author Component.....	1349
Oxygen XML Web Author Component Form Controls.....	1357
Oxygen XML Author Options Supported by Oxygen XML Web Author Component.....	1358
Feature Matrix.....	1360
Chapter 17: Tools.....	1361
XML Refactoring.....	1361
Predefined Refactoring Operations.....	1364
Custom Refactoring Operations.....	1368
Storing and Sharing Refactoring Operations.....	1376
Localizing XML Refactoring Operations.....	1376
Generate Sample XML Files.....	1377
Schema Tab (Generate Sample XML Files Tool).....	1377
Options Tab (Generate Sample XML Files Tool).....	1379
Advanced Tab (Generate Sample XML Files Tool).....	1381
Running the Generate Sample XML Files Tool from the Command Line.....	1381
Generate/Convert Schema.....	1382
Convert DB Structure to XML Schema.....	1384
Flatten Schema.....	1384
XML to JSON.....	1386
Format and Indent Files.....	1387
Generate Documentation.....	1388
XML Schema Documentation.....	1388
XSLT Stylesheet Documentation.....	1391
XQuery Documentation.....	1394
WSDL Documentation.....	1395
Canonicalize.....	1397
Sign.....	1398
Verify Signature.....	1400
WSDL SOAP Analyzer.....	1400
Composing a SOAP Request.....	1400
Testing Remote WSDL Files.....	1402
UDDI Registry Browser.....	1402
XML Schema Regular Expressions Builder.....	1403
Large File Viewer.....	1405
Hex Viewer.....	1407
SVG Viewer.....	1407
Tree Editor.....	1409
Compare Files.....	1409
Toolbar and Contextual Menu Actions of the Compare Files Tool.....	1415
Compare Files Tool Menus.....	1417
Compare Directories.....	1420
Toolbar and Contextual Menu Actions of the Compare Directories Tool.....	1422
Compare Directories Tool Menus.....	1423
Compare Images.....	1424
Compare Directories Against a Base (3-Way).....	1424
Syncro SVN Client.....	1429
Main Window.....	1429
Getting Started.....	1439
Syncro SVN Client Views.....	1489
Revision Graph of a SVN Resource.....	1515
Oxygen XML Editor SVN Preferences.....	1519
Entering Local Paths and URLs.....	1519
Technical Issues.....	1520
External Tools.....	1522

Chapter 18: Common Problems.....	1524
Performance Problems and Solutions.....	1524
Display Problems on Linux or Solaris.....	1524
Out of Memory on External Processes.....	1524
<i>Too many nested apply-templates calls</i> Error When Running a Transformation.....	1525
Performance Issues with Large Documents.....	1525
Misc Problems and Solutions.....	1525
'Address Family Not Supported by Protocol Family; Connect' Error.....	1525
Alignment Issues of the Main Menu on Linux Systems Based on Gnome 3.x.....	1526
Archive Distribution Fails to Run on Mac OS 10.12 (Sierra).....	1526
Cannot Associate Oxygen XML Editor With a File Type on My Windows Computer.....	1527
Cannot Connect to SVN Repository from Repositories View.....	1527
Cannot Open XML Files in Internet Explorer.....	1527
Compatibility Issue Between Java and Certain Graphics Card Drivers.....	1528
Crash at Startup on Windows with an Error About the nvogl32.dll File.....	1528
Damaged File Associations on OS X.....	1528
Details to Submit in a Request for Technical Support Using the Online Form.....	1529
DITA Map Transformation Fails (Cannot Connect to External Location).....	1529
DITA PDF Transformation Fails.....	1530
<i>DITA to CHM Transformation</i> Fails.....	1530
Drag and Drop Without Initial Selection Does Not Work.....	1530
Gray Window on Linux With the Compiz / Beryl Window Manager.....	1531
Image Appears Stretched Out in the PDF Output.....	1531
Increasing the Memory for the Ant Process.....	1531
JPEG CMYK Color Space Issues.....	1532
Keyboard Shortcuts Do Not Work.....	1532
MSXML 4.0 Transformation Issues.....	1532
Navigation to the web page was canceled when viewing CHM on a Network Drive.....	1532
Out Of Memory Error When Opening Large Documents.....	1532
Oxygen XML Editor Crashed on My Mac OS X Computer.....	1533
Oxygen XML Editor Takes Several Minutes to Start.....	1533
PDF Processing Fails to Use the DITA OT and Apache FOP.....	1533
Scroll Function of my Notebook Trackpad is Not Working.....	1534
Segmentation Fault Error on Mac OS X.....	1534
Set Specific JVM Version on Mac OS X.....	1535
Signature Verification Failed Error on a Resource from Documentum.....	1535
Special Characters are Replaced with a Square in Editor.....	1535
SVG 1.2 Rendering Issues.....	1535
Syntax Highlight Not Available in Eclipse Plugin.....	1536
TocJS Transformation Does not Generate All Files for a Tree-Like TOC.....	1536
Topic References Outside the Main DITA Map Folder.....	1536
Wrong Highlights of Matched Words in a Search in User Manual.....	1537
XML Document Takes a Long Time to Open.....	1537
XSLT Debugger Is Very Slow.....	1537
Chapter 19: DITA Authoring and Publishing.....	1538
Working with DITA Maps.....	1539
DITA Maps Manager.....	1540
Creating a Map.....	1548
Managing DITA Maps.....	1549
Chunking DITA Topics.....	1565
DITA Map Validation and Completeness Check.....	1565
Working with DITA Topics.....	1569
Creating a New DITA Topic.....	1570
Editing DITA Topics.....	1572
Adding Images in DITA Topics.....	1574

Adding Video, Audio, and Embedded HTML Resources in DITA Topics.....	1575
Image Maps in DITA.....	1577
Adding Tables in DITA Topics.....	1581
Adding MathML Equations in DITA Topics.....	1591
Working with Keys.....	1591
Reusing DITA Content.....	1592
Reusing DITA Topics in Multiple Maps.....	1593
Working with Content References.....	1594
Working with the Conref Push Mechanism.....	1602
Working with Reusable Components.....	1604
Working with Variable Text in DITA.....	1605
Working with DITA 1.3 Key Scopes.....	1606
Working with DITA 1.3 Branch Filtering.....	1607
Linking in DITA.....	1608
Hierarchical Linking in DITA Maps.....	1609
Linking in DITA Topics.....	1609
Linking with Relationship Tables in DITA.....	1613
Publishing DITA Output.....	1615
Transforming DITA Content.....	1615
DITA Profiling / Conditional Text.....	1633
Profiling DITA Content.....	1635
Profiling with a Subject Scheme Map.....	1637
Rendering Profiling Attributes and Condition Sets.....	1638
Publishing Profiled DITA Content.....	1640
Filtering Attribute Values with a DITAVAL File.....	1640
Styling the Rendering of Profiled Content Using a DITAVAL File.....	1642
DITA Open Toolkit Support.....	1643
Creating a DITA OT Customization Plugin.....	1643
Installing a Plugin in the DITA Open Toolkit.....	1644
Use an External DITA Open Toolkit in Oxygen XML Editor.....	1645
Third-Party DITA Open Toolkit Plugins.....	1646

Welcome to the User Manual of Oxygen XML Editor 18.1.

Oxygen XML Editor is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful *Integrated Development Environment* and the intuitive *Graphical User Interface* of Oxygen XML Editor is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with XSLT and FOP transformation technologies, Oxygen XML Editor offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Editor to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

Getting Started

2

Topics:

- [What is Oxygen XML Editor](#)
- [Getting Familiar with the Layout](#)
- [Supported Document Types](#)
- [Resources to Help You Get Started Using Oxygen XML Editor](#)
- [Your First Document or Project](#)
- [Getting Help](#)
- [Frequently Used Shortcut Keys](#)

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Editor would be to install the software. For detailed information about that process, see the [Installation chapter](#).

After installation, when you launch Oxygen XML Editor for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

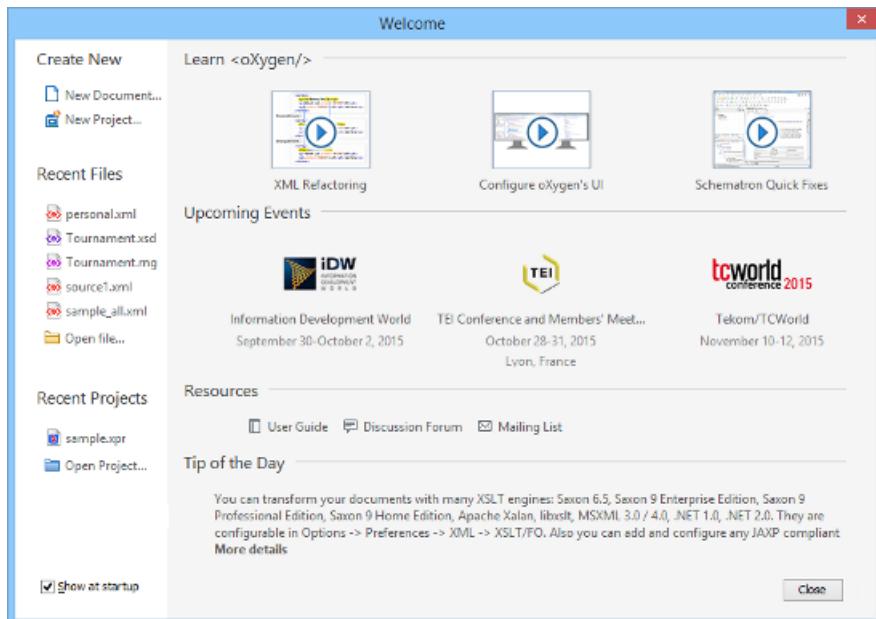

Figure 1: Welcome Dialog Box

If you do not want it to be displayed every time you launch Oxygen XML Editor, disable the **Show at startup** option. To display it any time, go to **Help > Welcome**.

What is Oxygen XML Editor

Oxygen XML Editor is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Editor to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Editor, see the [oxygen Website](#).

Getting Familiar with the Layout

Oxygen XML Editor includes several *perspectives* and *editing modes* to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

Regardless of the *perspective* or *editing mode* that you are working with, the default layout is comprised of the following areas:

Menus

Menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents, but Oxygen XML Editor also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited. All the *toolbars can be configured* to suit your specific needs.

Helper Views

Oxygen XML Editor includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs. The *layout of the views can also be configured* according to your preferences.

Editor Pane

The main editing area in the center of the application. Each *editing mode* provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each *editing mode* also includes a variety of contextual menu actions and other features to help streamline your editing tasks.

Perspectives

Oxygen XML Editor includes *several different perspectives* that you can use to work with your documents. The **Editor** perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Editor for the first time. Oxygen XML Editor also includes a **Database** perspective that allows you to manage databases and their connections and a few debugging perspectives that allow you to detect problems in XSLT or XQuery transformations.

Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The *Unicode value* for the character directly to the right of the current cursor position.
- The status of the current document. The status of **Modified** is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In *Text editing mode*, the current line and character position is displayed.
- If the *Check for notifications option* is enabled, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Editor website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.

- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the **Show memory status option** is enabled, a  **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

Supported Document Types

You can use the main editing pane in Oxygen XML Editor to edit a large variety of document types.

The supported document types include the following:

-  - XML documents
-  - XSLT stylesheets
-  - XML Schema
-  - DTD (Document Type Definition) schemas
-  - RELAX NG full syntax schemas
-  - RELAX NG compact syntax schemas
-  - NVDL (Namespace-based Validation Dispatching Language) schemas
-  - XSL:FO documents
-  - XQuery documents
-  - WSDL documents
-  - Schematron documents
-  - JavaScript documents
-  - Python documents
-  - CSS documents
-  - LESS documents
-  - XProc scripts
-  - SQL documents
-  - JSON documents
-  - Ant build scripts

Resources to Help You Get Started Using Oxygen XML Editor

Configuring Oxygen XML Editor

There are numerous ways that you can configure Oxygen XML Editor to accommodate your specific needs.

- See the [Configuring Oxygen section](#) for details on the various ways that you can configure the application and its features.

Video Tutorials

The Oxygen XML Editor website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Editor and show you how to complete specific tasks or how to use the various features.

- Go to the [Oxygen XML Editor Videos Page](#) to see the list of video tutorials and webinars.

Oxygen XML Editor Documentation

The Oxygen XML Editor documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in

any particular position in the interface and use the **F1** key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **[Text Editing Mode Section](#)** - Provides information about the **Text** editor.
- **[Author Editing Mode Section](#)** - Provides information about the visual WYSIWYG-like **Author** editing mode.
- **[Editing Documents Section](#)** - Includes information about editing numerous different types of documents.
- **[DITA Authoring and Publishing Section](#)** - Provides information about using DITA to edit and structure your content.
- **[WebHelp System Output Section](#)** - Provides information about the WebHelp system that can be used for publishing content.
- **[Importing Data Section](#)** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.

Sample Documents

Your installation of Oxygen XML Editor includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Editor. You will find files and folders for various types of documents, including the following:

- **sample.xpr file** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Project** view.
- **personal files** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Editor:

- See the [Oxygen XML Editor Blog Site](#) for a large variety of current and archived blogs in regards to numerous features, requests, and instructional topics.
- Take advantage of the [Oxygen XML Editor Forum](#) to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).
- To learn about the WebHelp features in Oxygen XML Editor, see the [Publishing DITA and DocBook to WebHelp](#) section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Editor, see the [Tools section](#).
- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the [oXygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Editor frameworks and plugins, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Editor, see the [What's New Section of the Website](#).
- You can select the **Tip of the Day** action in the **Help** menu to display a dialog box that includes a variety of tips for using Oxygen XML Editor.

Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Your First XML Document

To create your first XML document, select **File > New** or click the **New** button on the toolbar. The **New document wizard** is displayed:

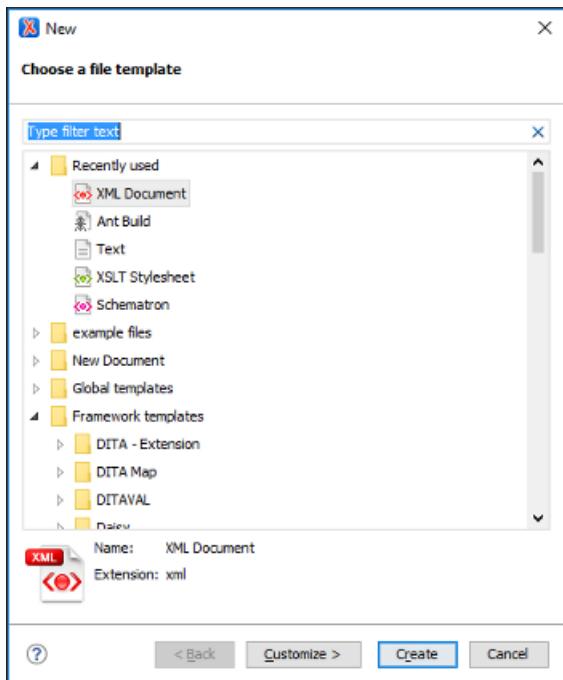

Figure 2: New Document Wizard

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there. After you use this dialog box to create a few documents, those document types will appear in the **Recently used** folder, which allows you to easily create other new documents of those types.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Editor interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Editor may open your document in **Text** or **Author** mode. **Text** mode shows the raw XML source file, while **Author** mode shows a graphical view of the document.

The availability of **Author** mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the **Author** mode. Oxygen XML Editor includes default **Author** mode views for most of the document types it supports. If your company has created its own document types, **Author** mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Editor built-in support, you need to edit it in **Text** mode or [create your own Author mode style sheet](#) for it.

You can switch back and forth between **Author** mode and **Text** mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from **Author** to **Text** mode. **Text** and **Author** modes are just different views for the same XML document. There is also a **Grid mode** available, which is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it to [sort things such as list items and table rows](#).

If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Editor assists you with a continuous validation of the XML markup.

Structuring Your First Document

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Editor helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, Oxygen XML Editor assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model** view (**Window > Show View > Model**).
- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Editor does its best to help you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Editor creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Editor presents **XML Quick Fixes** that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

Editing Your First Document

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Editor provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Editor provides many tools to help you edit your structure and to keep your structure valid while editing text.

The Document Breadcrumbs

Across the top of the editor window, there is a set of breadcrumbs that shows you exactly where the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

Showing Tags

To see exactly where you are in the structure of the document, you can show the tags graphically in the **Author** view. There are several levels of tag visibility that you can choose using the **Display tags mode** drop-down menu on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

Outline View

The **Outline** view shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

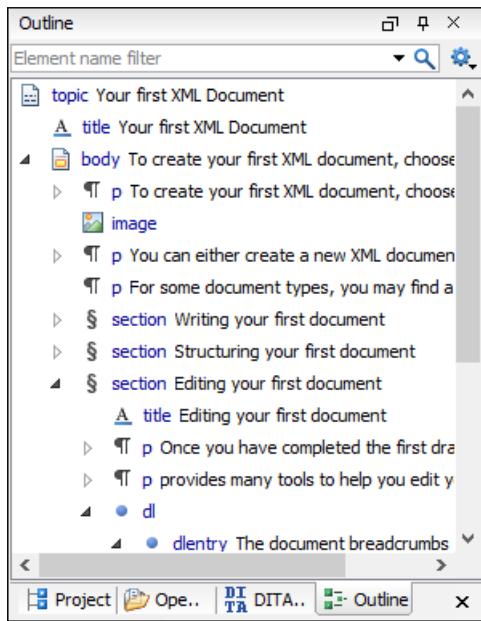

Figure 3: Outline View

You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

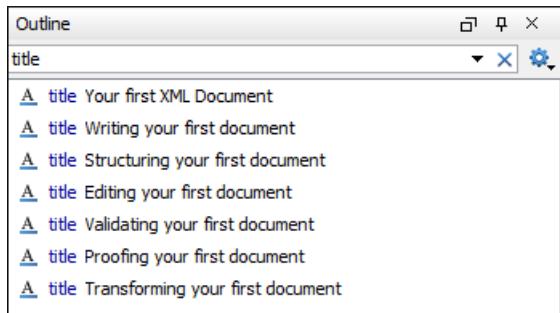

Figure 4: Outline View Filtered to only Show Element Names

Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or **Outline** view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Editor warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using **Author** mode, you can also switch to **Text** mode to see exactly which bits of XML you are selecting and moving.

Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the **Refactoring** menu of the contextual menu (or the **Document > Markup** menu). More advanced refactoring operations are also available using the **XML Refactoring tool** that is available in the **Tools** menu.

Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Editor knows how to find the schema, it validates the document for you as you type. Oxygen XML Editor finds the schema automatically for most of the document types created from templates. However, in some cases you may have to [tell it how to find the schema](#).

When Oxygen XML Editor validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Editor also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Editor cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu.. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

Note: Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select **Show Message**.

Proofing Your First Document

Oxygen XML Editor includes an [automatic \(as-you-type\) spell checking feature](#), as well as a manual spell checking action. To check the spelling of your document manually, use the **Check Spelling** action on the toolbar or from the **Edit** menu.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such as DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Editor uses [transformation scenarios](#) to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Editor or ones created by your organization.

To see the list of transformations available for your document, select the **Apply Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu. A list of available transformation scenarios are displayed. Choose one or more scenarios to apply, and click **Apply associated**. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Your First DITA Topic

To create your first DITA topic, select **File > New** or click the **New** button on the toolbar. The [New Document Wizard](#) is displayed:

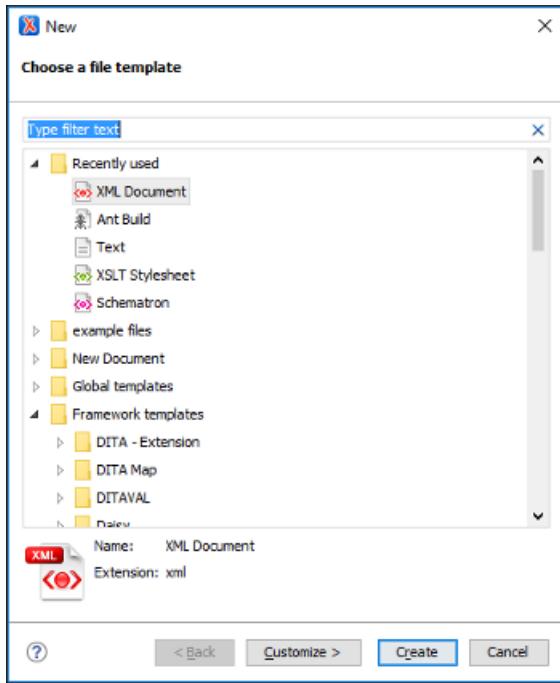

Figure 5: New Document Wizard

Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

Note: If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

Your DITA topic is an XML document, thus all [the editing features that Oxygen XML Editor provides for editing XML documents](#) also apply to DITA topics. Oxygen XML Editor also provides extensive additional support for [editing DITA topics, their associated DITA maps](#), and for [creating DITA output](#).

Understanding DITA Topics

It is important to understand the role that a [DITA topic plays in a DITA project](#). A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

Role of Maps

The basic method that DITA uses to express the relationship between topics is [through a DITA map](#). Other relationships between topics, such as cross references, generally need to be made between topics in the same map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a map to create each chapter and then organize the chapters in another map to create the book. If you are writing help topics, you might use a map to combine several DITA topics to create a single help topic and then create another map to organize your help topics in a help system. This allows you to reuse the content of a map in multiple projects.

Creating a Map

To add topics to a map, you must first [create the map](#). A map is an XML document, similar to a topic. To create a map, select **File > New** or click the **New** button on the toolbar, go to **Framework templates > DITA Map > map** and select the type of map you want to create. Oxygen XML Editor asks if you want to open your map in the editor or in the **DITA Maps Manager**. Usually, opening it in the **DITA Maps Manager** is the best choice, but you can also open the map in the editor from the **DITA Maps Manager**. The **DITA Maps Manager** presents a view of the DITA map that is similar to a table of contents.

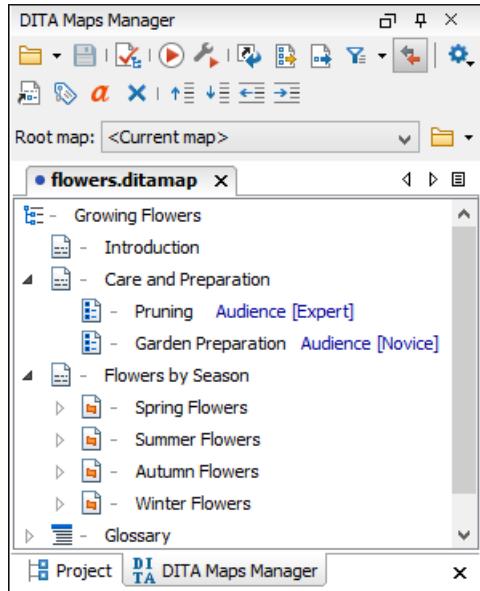

Figure 6: DITA Maps Manager View

Adding Topics to a Map

To [add a topic to a map](#), add a topic reference to the map using a **topicref** element. The easiest way to do this is to open the topic in the editor, then right-click the DITA map in the **DITA Maps Manager** view and choose **Reference to the currently edited file** from the **Append child** or **Insert After** submenus. This opens the **Insert Reference dialog box** with all of the required fields already filled in for you. You can fill in additional information in the various tabs in this dialog box or add it to the map later. When you select **Insert and close**, a reference to your topic is added to the map.

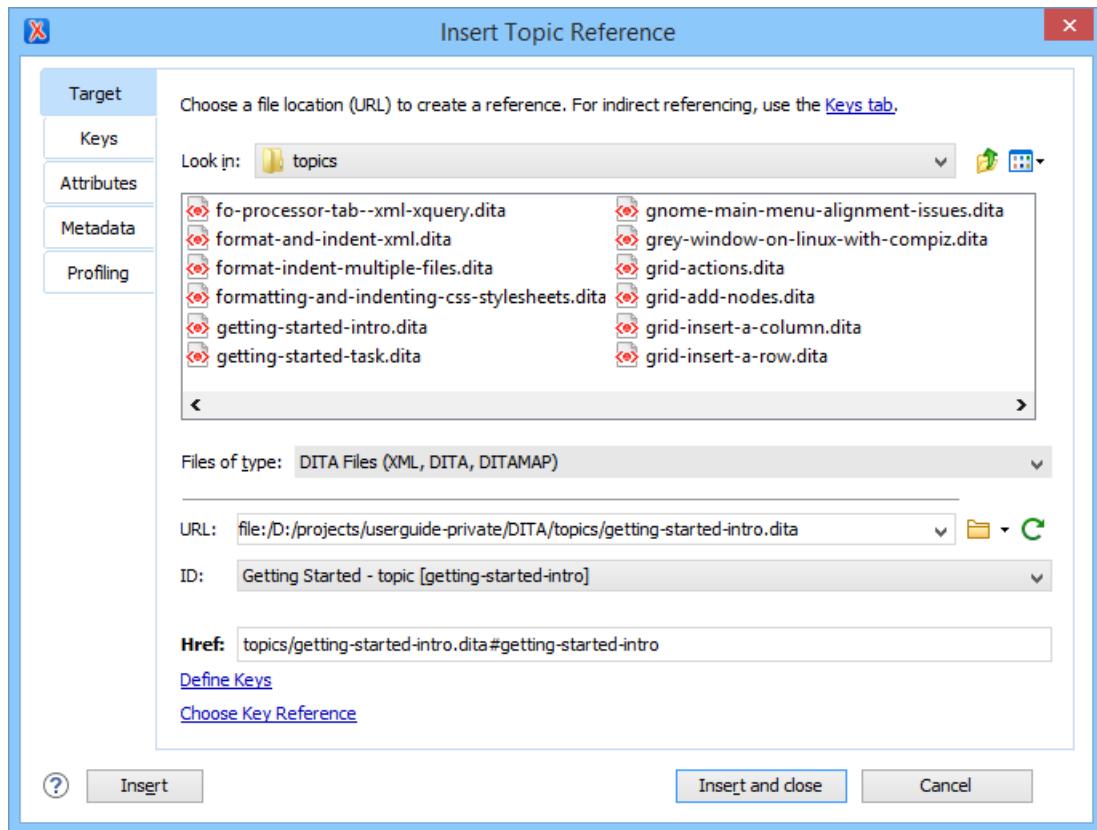

Figure 7: Insert Reference Dialog Box

If you want to see what the resulting map looks like in XML, save your map and then double-click the DITA map in the **DITA Maps Manager** view. The XML version of the map opens in the editor.

As you add topics to your map, you may want to make a topic the child or sibling of another topic. This is usually done at the map level. To create a child topic reference, right-click the parent topic in the **DITA Maps Manager** view and choose **Append child**. To create a sibling topic reference, right-click a topic in the **DITA Maps Manager** view and choose **Insert After**. From either of these submenus you can then choose one of the following options:

- **New** - Opens the **New file wizard** for creating a new topic.
-  **Reference** - Opens the **Insert Reference dialog box** that allows you to create a reference to an existing topic.
- **Reference to the currently edited file** - Opens the **Insert Reference dialog box** that helps you to easily create a reference to the file that is currently opened in the editor.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Child Maps

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can **break up the content into smaller submaps**. A submap might represent a chapter of a book, a section of a user manual, or a page on a website.

To build a publication out of these smaller maps, you must add them to a map that represents the overall publication. To add a child map to the current map, right-click the parent DITA map and choose **Append child > Map reference**.

Validating a Map

Just as it is with your individual topics, it is important to [validate your maps](#). Oxygen XML Editor provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them. To validate a map, click the  **Validate and Check for Completeness** button in the **DITA Maps Manager** view.

Publishing Your Topics

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you [create published output](#) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.

To publish output for a map, select the transformation scenario you want to run and set any of the parameters it requires. To select a transformation, click the  **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view. This opens the **Configure Transformation Scenario(s)** dialog box.

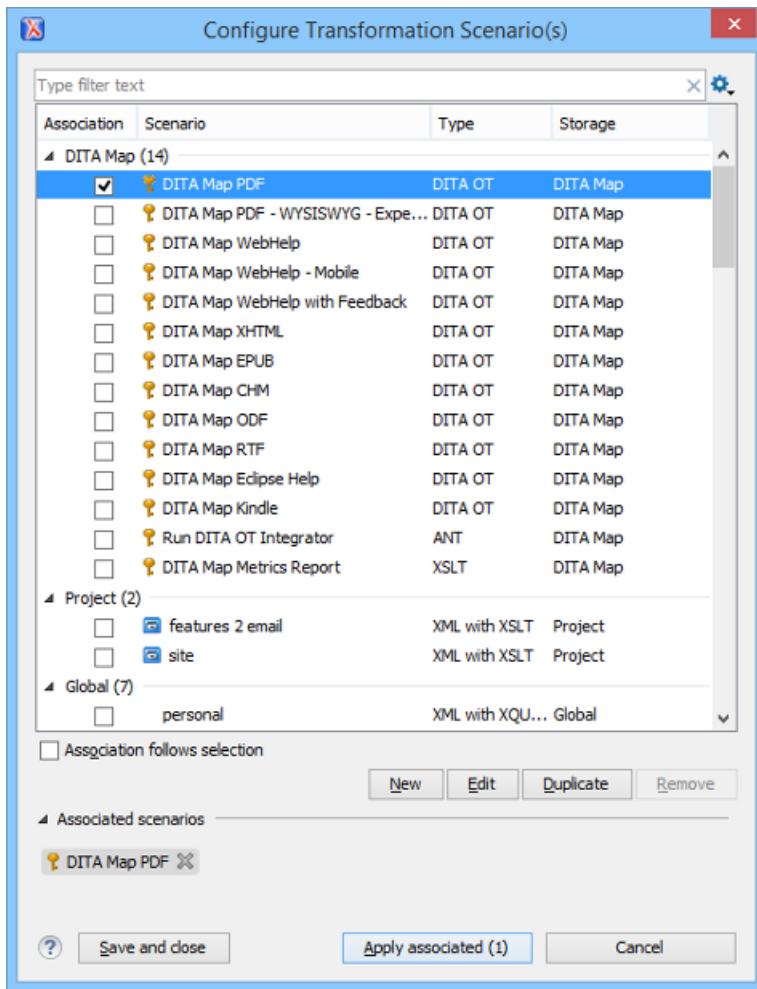

Figure 8: Configure Transformation Scenarios Dialog Box

Choose the transformation scenarios you want to apply and click **Apply associated**. Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

Related information

[DITA Authoring and Publishing](#) on page 1538

[Editing XML Documents in Author Mode](#) on page 320

Creating a New Project

Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also [share your project settings and transformation/validation scenarios](#) with other users. Use the [Project view](#) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the [Project view](#).

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

New > File

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

New > Logical Folder

Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  Refresh (**F5**) action from the toolbar or contextual menu and the **Project** view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting  Add Folder in the contextual menu from the *project root*. Linked folders are displayed in the **Project** view with bold text. To create a file inside a linked folder, select the **New >  File** action from the contextual menu. The linked files presented in the **Project** view are marked with a special icon.

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) on page 182.

Getting Help

If you run into specific problems while using Oxygen XML Editor you can take advantage of a variety of support related resources. Those resources include the following:

- [The Oxygen XML Editor Support Section of the Website](#)
- [The Oxygen XML Editor Forum](#)
- [The Oxygen XML Editor Video Tutorials](#)

- [The Common Problems and Solutions Section of the User Manual](#)
- [The Online Technical Support Form](#)

The application also includes various specific help-related resources in the **Help** menu.

Help Menu

The Oxygen XML Editor **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Editor.

Help (F1)

Use this action (or the **F1** key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the **Use online help** option is enabled, this action will open the User Manual in an online mode.

Use online help

If this option is enabled, the **Help (F1)** action will open the Oxygen XML Editor User Manual in an online mode.

Show Dynamic Help view

Use this action to open a view that loads the latest online WebHelp version of the Oxygen XML Editor User Manual, and dynamically opens a topic that is relevant to the focused editor, view, or dialog box. It requires Java 1.8 and an online connection. In Windows, if a Java 1.8 version is not detected, you will be advised to upgrade, while in Linux and Mac OS X with Java 1.7 and lower, Oxygen XML Editor will attempt to load an offline version of the documentation. In all three operating systems, with Java 1.8, if an online connection is not detected, you will receive an error message advising you to check your proxy settings.

Install new add-ons

Opens a dialog box that allows you to install new add-ons to extend the functionality of Oxygen XML Editor.

Check for add-ons updates

Opens a dialog box that allows you to check for updates on installed add-ons.

Manage add-ons

Opens a dialog box that allows you to manage installed add-ons.

Check for a New Version

Use this action to view information about the latest version of Oxygen XML Editor.

Browse <oxygen/> Website

Opens the Oxygen XML Editor website in your default internet browser.

Register

If you encounter problems with your Oxygen XML Editor license, you can use this option to open a dialog box that provides options for obtaining or using a license key.

Report problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

Tip: You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed plugins with your report.

- **Frameworks** - You can choose whether or not to include details about your installed frameworks with your report.

Support Center

Use this option to open the [Oxygen XML Editor Support Section of the Website](#).

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Editor. You can use the **Copy** button to copy all of this data and then paste it into an email to be sent to the oXygen support team.

Support Tools > Randomize XML text content

Use this action when you need to send samples to the oXygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the oXygen support team without fear of compromising sensitive or private data.

 **Warning:** Before using this action, you need to copy the XML resources and save them in a separate folder. Otherwise, you might lose your original information.

Tip of the Day

Opens a dialog box that offers tips for using Oxygen XML Editor.

About

Use this option to open a dialog box that contains information about Oxygen XML Editor and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the SGN number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third party libraries that Oxygen XML Editor uses. To view the End User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the frameworks that are bundled with Oxygen XML Editor.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

Frequently Used Shortcut Keys

Oxygen XML Editor includes numerous shortcut keys that are assigned to actions to help you edit content. All the shortcuts that are assigned to actions are displayed in the table in the [Menu Shortcut Keys preference page](#).

For information about how to assign or configure shortcut keys, see [How to Assign a Shortcut Key or Edit an Existing Shortcut](#) on page 149.

Table 1: Frequently Used Shortcut Keys in Oxygen XML Editor

Action	Windows/Linux Shortcut Keys	Mac/OS X Shortcut Keys	Description of Default As
Attribute Editor	Alt + Enter	Alt + Enter	• Opens the in-place a
Beginning	Ctrl + Home	Command + Home	• Navigates to the of the docu
Check Spelling	F7	F7	• Opens the spell check

Action	Windows/Linux Shortcut Keys	Mac/OS X Shortcut Keys	Description of Default As
Check Well-Formedness	<u>Ctrl + Shift + W</u>	<u>Command + Shift + W</u>	• Check well-formedness of current document
Configure Transformation	<u>Ctrl + Shift + C</u>	<u>Command + Shift + C</u>	• Opens the Configuration Transformation Scenario
Content Completion / New Line	<u>Enter</u>	<u>Enter</u>	• Author mode - Opens content completion • Text mode - Moves cursor
Content Completion (Text Mode)	<u>Ctrl + Space</u>	<u>Command + Space</u>	• Text mode - Opens content completion
Create Bookmark #	<u>Ctrl + Shift + 1-9</u>	<u>Command + Shift + 1-9</u>	• Create bookmarks numbered
Create Next Bookmark	<u>F9</u>	<u>F9</u>	• Create bookmark for whatever is next in list
Delete Next Word	<u>Ctrl + Delete</u>	<u>Command + Delete</u>	• Deletes the next word
Delete Previous Word	<u>Ctrl + Backspace</u>	<u>Command + Backspace</u>	• Deletes the previous word
Delete Tags	<u>Alt + Shift + X</u>	<u>Command + Alt + X</u>	• Deletes the start tag of the current element
End	<u>Ctrl + End</u>	<u>Command + End</u>	• Navigates to the end of the line
Exit	<u>Ctrl + Q</u>	<u>Command + Q</u>	• Exit the application
Find	<u>Ctrl + F</u>	<u>Command + F</u>	• Opens Find/Replace dialog
Find Next	<u>F3</u>	<u>Command + G</u>	• Finds next occurrence of the last search term
Find Previous	<u>Shift + F3</u>	<u>Command + Shift + G</u>	• Finds previous occurrence of the last search term
Go To Bookmark	<u>Ctrl + 1-9</u>	<u>Command + 1-9</u>	• Go to specific bookmark
Help	<u>F1</u>	<u>F1</u>	• Opens help documentation
Insert Para / Format Indent	<u>Ctrl + Shift + P</u>	<u>Command + Shift + P</u>	• Author mode - Inserts paragraph at cursor • Text mode - Formats current content with indents
Move Tab Left	<u>Ctrl + Alt + Comma</u>	<u>Ctrl + Alt + Comma</u>	• Moves the current tab left one position to the previous one
Move Tab Right	<u>Ctrl + Alt + Period</u>	<u>Ctrl + Alt + Period</u>	• Moves the current tab right one position to the next one

Action	Windows/Linux Shortcut Keys	Mac/OS X Shortcut Keys	Description of Default As
Move Node Down (Author)	<u>Alt + DownArrow</u>	<u>Alt + DownArrow</u>	• Moves the selected node down in Author mode.
Move Node Down (Text)	<u>Ctrl + Alt + DownArrow</u>	<u>Command + Alt + DownArrow</u>	• Moves the selected node down in Text mode.
Move Node Up (Author)	<u>Alt + UpArrow</u>	<u>Alt + UpArrow</u>	• Moves the selected node up in Author mode.
Move Node Up (Text)	<u>Ctrl + Alt + UpArrow</u>	<u>Command + Alt + UpArrow</u>	• Moves the selected node up in Text mode.
New File	<u>Ctrl + N</u>	<u>Command + N</u>	• Opens wizard for creating new file.
Next Word	<u>Ctrl + RightArrow</u>	<u>Command + RightArrow</u>	• Navigates to next word.
Open/Find Resource	<u>Ctrl + Shift + R</u>	<u>Command + Shift + R</u>	• Opens the Open/Find Resource dialog.
Previous Word	<u>Ctrl + LeftArrow</u>	<u>Command + LeftArrow</u>	• Navigates to previous word.
Print Preview	<u>Ctrl + P</u>	<u>Command + P</u>	• Opens the print (page setup) dialog.
Quick Assist	<u>Alt + 1</u>	<u>Command + Alt + 1</u>	• Opens Quick Assist dialog. Available actions are available in context (usually indicated by a bulb  icon in the status bar).
Quick Find	<u>Alt + Shift + F</u>	<u>Alt + Shift + F</u>	• Opens the Quick Find dialog at the bottom of the screen.
Redo	<u>Ctrl + Y (Windows) - Ctrl + Shift + Z (Linux)</u>	<u>Command + Shift + Z</u>	• Redo last edit.
Refresh	<u>F5</u>	<u>F5</u>	• Refreshes the current view.
Remove Bookmarks	<u>Ctrl + F7</u>	<u>Command + F7</u>	• Removes all bookmarks.
Reopen Last Closed Editor	<u>Ctrl + Alt + T</u>	<u>Command + Alt + T</u>	• Reopens the editor that was closed most recently.
Reset Zoom	<u>Ctrl + NumPad0</u>	<u>Command + NumPad0</u>	• Resets zoom (default 100%).
Save	<u>Ctrl + S</u>	<u>Command + S</u>	• Saves current document.
Save All	<u>Ctrl + Shift + S</u>	<u>Command + Shift + S</u>	• Saves all open documents.
Scroll Down	<u>Ctrl + DownArrow</u>	<u>Command + DownArrow</u>	• Scrolls the editor down.
Scroll Up	<u>Ctrl + UpArrow</u>	<u>Command + Up Arrow</u>	• Scrolls the editor up.

Action	Windows/Linux Shortcut Keys	Mac/OS X Shortcut Keys	Description of Default As
Shift Left	<u>Shift + Tab</u>	<u>Shift + Tab</u>	<ul style="list-style-type: none"> • Author mode - Moves cursor to the previous X • Text mode - Shifts content
Shift Right	<u>Tab</u>	<u>Tab</u>	<ul style="list-style-type: none"> • Author mode - cursor to the next • Text mode - Shifts content
Split Element	<u>Alt + Shift + D</u>	<u>Ctrl + Alt + D</u>	Splits the element the
Surround With	<u>Ctrl + E</u>	<u>Command + E</u>	Surrounds selected content with spe
Switch Tabs	<u>Ctrl + Tab</u>	<u>Command + Tab</u>	Switches between tabs
Transform	<u>Ctrl + Shift + T</u>	<u>Command + Shift + T</u>	Opens a dialog box for a transformation
Underline / Open URL	<u>Ctrl + U</u>	<u>Command + U</u>	<ul style="list-style-type: none"> • Underlines select content • Opens URL (which is outside the main window)
Undo	<u>Ctrl + Z</u>	<u>Command + Z</u>	Undo last editin
Validate	<u>Ctrl + Shift + V</u>	<u>Command + Shift + V</u>	Validates current
Zoom In	<u>Ctrl + NumPad+</u>	<u>Command + NumPad+</u>	Zooms in (increas
Zoom Out	<u>Ctrl + NumPad-</u>	<u>Command + NumPad-</u>	Zooms out (decreas

This chapter includes information about installing and licensing Oxygen XML Editor on various platforms. Oxygen XML Editor is available on Windows, Linux, and Mac OS X and there are a variety of methods and options for installing and running Oxygen XML Editor on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing add-ons, and uninstalling.

Installation Options for Oxygen XML Editor

Choosing how Oxygen XML Editor runs

You can install Oxygen XML Editor to run in a number of ways:

- As a desktop application (running standalone or as an Eclipse plugin) on [Windows](#), [Linux](#), or [Mac](#).
- As a desktop application (running standalone or as an Eclipse plugin) on a [Unix or Linux server](#) or on [Windows Terminal Server](#).
- From within a browser though the [Java Web Start](#) technology.

Choosing an installer

You have a choice of installers;

- The native installer for your platform. On Windows and Linux, the native installer can run also in unattended mode.

The installation packages were checked before publication with an antivirus program to make sure they are not infected with viruses, trojan horses, or other malicious software.

Choosing a license option

You must [obtain and register a license](#) key to run Oxygen XML Editor.

You can choose from two kinds of license:

- A named-person license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, transferring, and uninstalling.

You can also [upgrade](#) Oxygen XML Editor, [transfer a license](#), or [uninstall](#) Oxygen XML Editor.

Getting help with installation

If you need help at any point during these procedures, please send us an email at support@oxygenxml.com.

Install Oxygen XML Editor on Windows

Choosing an Installer

You can install Oxygen XML Editor on Windows using one of the following methods:

- [Windows installer](#)
- [Windows installer in unattended mode](#)

System Requirements

System requirements for a Windows install:

Operating systems

Windows Vista, Windows 7, Windows 8, Windows 10, Windows Server 2008, Windows Server 2012

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.7) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Editor updates and releases.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Editor using the batch file, oxygen.bat, you can edit the batch file to specify a particular version to use.

Install Using the Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. Download the Windows installer.
3. Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
 - Using one of the shortcuts created by the installer.
 - By running oxygen.bat, which is located in the install folder.
6. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your [license information](#).

Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the -q parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change many options for the unattended installer using the [installer command line parameters](#).

Install Oxygen XML Editor on Mac OS X

Choosing an Installer

You can install Oxygen XML Editor on Mac OS X using one of the following methods:

- Install using the Mac OS X installation package, oxygen.dmg.

System Requirements

System requirements for a Mac OS X install:

Operating system

OS X version 10.8 64-bit or later

CPU

- Minimum - Intel-based Mac, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java to run. OS X includes Java by default or it will install it on the first attempt to run a Java application.

Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0 from Apple). Oxygen XML Editor may work with JVM

implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Editor updates and releases.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you start Oxygen XML Editor with the application launcher (.app) file then:
 - a. If you use the zip distribution for OS X Oxygen XML Editor uses the Apple Java SE 6 available on your Mac computer
 - b. If you use the tar.gz distribution that contains a bundled JRE then Oxygen XML Editor will use that bundled JRE
2. If you start Oxygen XML Editor using a startup .sh script then:
 - a. If a bundled JRE is available then it will be used
 - b. Otherwise, if the JAVA_HOME environment variable is set then the Java distribution indicated by it will be used
 - c. Otherwise, the version of Java pointed to by your PATH environment variable will be used

If you run Oxygen XML Editor using the oxygen .sh script, you can change the version of Java used by editing to script file. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/System/Library/Frameworks/JavaVM.framework/Versions/1.6.0/Home/bin/java "-Xdock:name= ..."
```

OS X Installation

To install Oxygen XML Editor on OS X, follow these steps:

1. Download the OS X installation package (oxygen.dmg).
2. Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
3. Double-click the oxygen.dmg disk image file to mount it.
4. Drag/Copy the *Oxygen XML Editor* folder to your /Applications folder (or another location if you wish).
Do not copy the files/folders from within the *Oxygen XML Editor* folder (always copy the folder itself), otherwise you will omit invisible files/folders and the application may no longer start.
Oxygen XML Editor is now installed.
5. Start Oxygen XML Editor, using one of the following methods:
 - Double-click *Oxygen XML Editor*.app.
 - Run sh oxygenMac.sh in the command line interface.

Notice: You can start multiple instances on the same computer by running the following command for each new instance:

```
open -n Oxygen.app
```

6. To license your copy of Oxygen XML Editor, go to **Help > Register** to enter your [license key](#).

Install Oxygen XML Editor on Linux

Choosing an Installer

You can install Oxygen XML Editor on Linux using any of the following methods:

- Install using the Linux installer.
- Install using the Linux installer in unattended mode.

System Requirements

System requirements for a Linux install:

Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Editor updates and releases. Oxygen XML Editor does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your `PATH` environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, `oxygen.sh`. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

Linux Installation

Linux installation procedure.

To install Oxygen XML Editor on Linux, follow these steps:

1. Download the Linux installer.
2. Optionally, you can validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
3. Run the installer that you downloaded.
For example, open a shell, cd to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.
4. Start Oxygen XML Editor using one of the following methods:
 - Use the `oxygen` shortcut created by the installer.
 - From a command line, type `sh oxygen.sh`. This file is located in the installation folder.
5. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your [license key](#).

Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default

options and does not overwrite existing files. You can change many options for the unattended installer using the [installer command line parameters](#).

Installing Oxygen XML Editor on Windows Server

Choosing an Installer

You can install Oxygen XML Editor on Windows using one of the following methods:

- [Windows installer](#)
- [Windows installer in unattended mode](#)

System Requirements

System requirements for a Windows Server install:

Operating systems

Windows Server 2008, Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum values per user - 512 MB of RAM
- Recommended values per user - 2 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java. If you use the all platforms installer, your system must have a compatible Java virtual machine installed.

Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.7) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that those implementations will work with future Oxygen XML Editor updates and releases.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Editor using the batch file, `oxygen.bat`, you can edit the batch file to specify a particular version to use.

Install Using the Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the [system requirements](#).
2. Download the Windows installer.

3. Validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
 - Using one of the shortcuts created by the installer.
 - By running `oxygen.bat`, which is located in the install folder.
6. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your [license information](#).

Configuring Windows Terminal Server

Windows Terminal Server configuration procedure.

1. Install Oxygen XML Editor on the server and make its shortcuts available to all users.
2. If you need to run multiple instances of Oxygen XML Editor, make sure you add the `-Dcom.oxygenxml.MultipleInstances=true` parameter in the `.bat` startup script.
3. Make sure you allocate sufficient memory to Oxygen XML Editor by adding the `-Xmx` parameter either in [the .bat startup script](#), or in [the .vmoptions configuration file](#) (if you start it from an executable launcher).

Installing Oxygen XML Editor on a Linux / UNIX Server

Choosing an Installer

You can install Oxygen XML Editor on Linux using any of the following methods:

- Install using the Linux installer.
- Install using the Linux installer in unattended mode.

System Requirements

System requirements for a Linux install:

Operating system

Any Unix/Linux distribution with an available Java SE Runtime Environment version 1.6.0 or later from Oracle

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Oxygen XML Editor requires Java. Oxygen XML Editor only supports official and stable Java Virtual Machines with the version number 1.6.0 or later (the recommended version is 1.6.0) from Oracle available at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>. Oxygen XML Editor may work with JVM implementations from other vendors, but there is no guarantee that other implementations will work with future Oxygen XML Editor updates and releases. Oxygen XML Editor does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.

2. Otherwise, if the Linux environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your PATH environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, oxygen.sh. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.6.0_45/bin/java -Xmx256m ...
```

Linux Installation

Linux installation procedure.

To install Oxygen XML Editor on Linux, follow these steps:

1. Download the Linux installer.
2. Optionally, you can validate the integrity of the downloaded file by [checking it against the MD5 sum](#) published on the download page.
3. Run the installer that you downloaded.
For example, open a shell, cd to the installation directory, and at the prompt type sh ./oxygen-32bit.sh or sh ./oxygen-64bit.sh, depending on which installer you downloaded.
4. Start Oxygen XML Editor using one of the following methods:
 - Use the oxygen shortcut created by the installer.
 - From a command line, type sh oxygen.sh. This file is located in the installation folder.
5. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your [license key](#).

Unix / Linux Server Configuration

To install Oxygen XML Editor on a Unix / Linux server:

1. Install Oxygen XML Editor on the server and make sure the oxygen.sh script is executable and the installation directory is in the PATH of the users that need to use the application.
2. Make sure you allocate sufficient memory to Oxygen XML Editor by setting an appropriate value for the -Xmx parameter in the .sh startup script.
The default value of the -Xmx parameter is 512 MB. To avoid [performance issues with large documents](#), you may need to adjust it.
3. Make sure the X server processes located on the workstations allow connections from the server host. For this, use the xhost command.
4. Start telnet (or ssh) on the server host.
5. Start an xterm process with the **display** parameter set on the current workstation. For example: xterm -display workstationip:0.0.
6. Start Oxygen XML Editor by typing sh oxygen.sh from the command line. This file is located in the installation folder.

Installing Oxygen XML Editor using the Java Web Start (JWS) Installer

Oxygen XML Editor provides the tools to create your own JWS distribution that can be installed on a custom web server. The advantages of a JWS distribution include:

- Oxygen XML Editor is run locally, not inside a web browser, overcoming many of the browser compatibility problems common to applets.
- JWS ensures that the most current version of the application will be deployed, as well as the correct version of JRE.
- Applications launched with Java Web Start are cached locally. Thus, an already downloaded application is launched on par with a traditionally installed application.

- You can preconfigure Oxygen XML Editor and the rest of your team will use the same preferences and frameworks.

Important: If you want to create your own JWS distribution package, please [contact Syncro Soft](#) for permission through a *Value Added Reseller Agreement*.

Note: A code signing certificate is needed to sign the JWS distribution. The following procedure assumes that you already have such a certificate (for example, Thawte™, or Verisign™).

The following schematics depicts the Oxygen XML Editor Java Web Start deployment procedure:

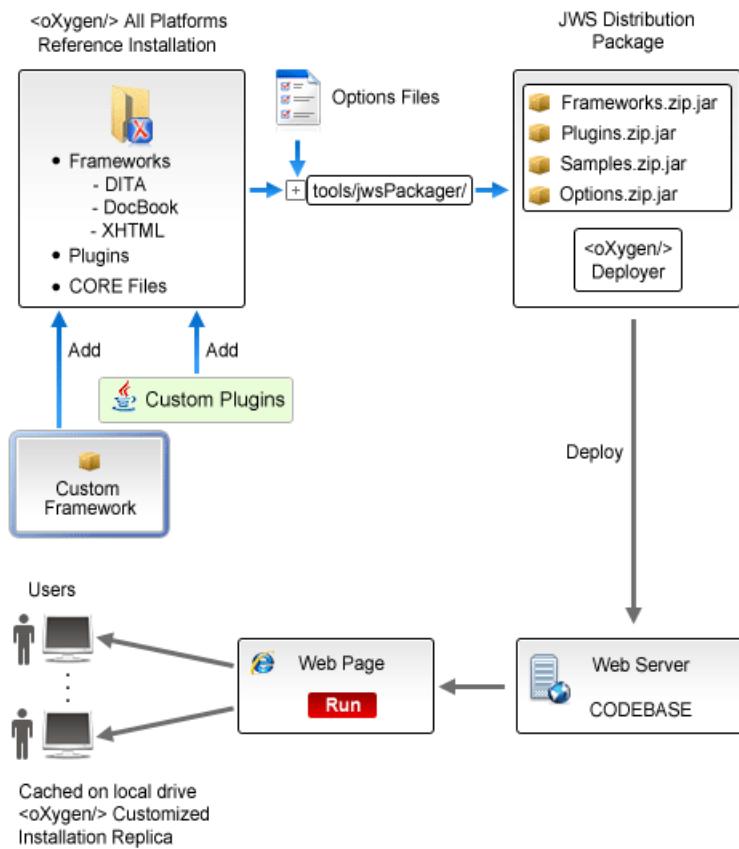

Figure 9: Java Web Start Deployment Procedure

To deploy an Oxygen XML Editor installation on a server.

1. Go to <https://www.oxygenxml.com/InstData/Editor/All/oxygen.tar.gz> and download the All Platforms Installation package to a local drive.
2. Expand the archive to a temporary location.
The oxygen folder is created.
3. Optionally, you can customize the content of the **frameworks** folder.
4. Edit the oxygen\tools\jwsPackager\packager.properties configuration file. Adjust the following properties appropriately for your server:
 - **codebase** - Represents the location of the future JWS distribution.
 - **keystore** - The keystore location path.
 - **storepass** - The password for keystore integrity.
 - **storetype** - The type of the certificate file, such as PKCS12 or JKS.
 - **alias** - The keystore alias.
 - **optionsDir** - Points to the options directory that may be distributed with the JWS installer. If the directory contains an XML document named options.xml or default.xml containing exported options, these options will be used. Otherwise, the structure of the options folder has to match the structure of a stand alone application options folder.

Note: This property is optional. It is provided only if *custom options* need to be delivered to the end users.

The values of **keystore**, **storepass**, and **alias** properties are all provided by the code signing certificate. For more information, please check the documentation for your *jarsigner* tool.

5. If you want to modify the default settings, edit the JNLP oxygen\tools\jwsPackager\dist\javawebstart\oxygen\oxygen.jnlp template file. You can specify the list of files opened at startup by modifying the <argument> list. To pass system properties directly to Oxygen XML Editor when it is started, add the oxy prefix to them (for example: <property name="oxyPropertyName" value="testValue" />). The system property is passed to Oxygen XML Editor with the prefix stripped.
 6. Open a command-line console and run ant in the oxygen\tools\jwsPackager folder. The **ant** process creates the oxygen\tools\jwsPackager\dist\InstData\oxygenJWS.zip archive that contains the actual remote JWS installer.
 7. Copy the expanded content of the archive to the folder specified in the **codebase** property, previously set in the **packager.properties** file.
 8. Using your favorite web browser, go to the address specified in the **codebase** property or to its parent folder and start the remote installer.
- Important:** When running the Java Web Start distribution on OS X, due to changes in this *security release*, clicking the link to the JNLP file does not start the application. The selected JNLP is downloaded locally. Right-click it and choose to open the resource.

Group Deployment

If you are deploying Oxygen XML Editor for a group, there are a number of things you can do to customize Oxygen XML Editor for your users and to make the deployment more efficient.

Creating custom default options

You can *create a custom set of default options* for Oxygen XML Editor. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Editor, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Editor project files are used to configure a project. You can create and deploy default project files for your projects so that your users will have a preconfigured project file to begin work with.

Shared project files

Rather than each user having their own project file, you can create and deploy shared project files so that all users share the same project configuration and settings and automatically inherit all project changes.

Using the unattended installer

You can speed up the installation process by using the *unattended installer for Windows* or *Linux installs*.

Using floating licenses

If you have a number of people using Oxygen XML Editor on a part-time basis or in different time zones, you can use a *floating license* so that multiple people can share a license.

Obtaining and Registering a License Key for Oxygen XML Editor

Oxygen XML Editor is not free software. To activate and use Oxygen XML Editor, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at <https://www.oxygenxml.com/register.html>. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

Choosing a License Type

You can use one of the following license types with Oxygen XML Editor:

1. A **Named-User License** may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of named users. It is your responsibility to keep track of the named users that each license is assigned to.
2. A **Floating License** may be used by any user on any machine. However, the total number of copies of Oxygen XML Editor in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Editor (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.
3. A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.
4. A special **Academic Group License** (*Classroom*, *Department*, or *Site* license) may be used by students and teachers in academic institutions. These licenses provide a cost effective way of getting access to Oxygen XML Editor for learning purposes.

For definitions and legal details of the license types, consult the End User License Agreement available at <https://www.oxygenxml.com/eula.html>.

Obtaining a License

You can obtain a license for Oxygen XML Editor in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Editor website at <https://www.oxygenxml.com/buy.html>. A license key will be sent to you by email.
- If your company or organization has already purchased licenses, please contact your license administrator to obtain a license key.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from <https://www.oxygenxml.com/registerCode.html>. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Editor website at <https://www.oxygenxml.com/register.html>.

Register a Named-User or Subscription License

To register a *Named-User License* or *Subscription License* on a machine owned by the *Named User*, follow these steps:

1. Purchase a license from the [Oxygen XML Editor website](#). You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Editor.

If this is a new install of Oxygen XML Editor, the registration dialog box is displayed. If the registration dialog box is not displayed, go to **Help > Register**.

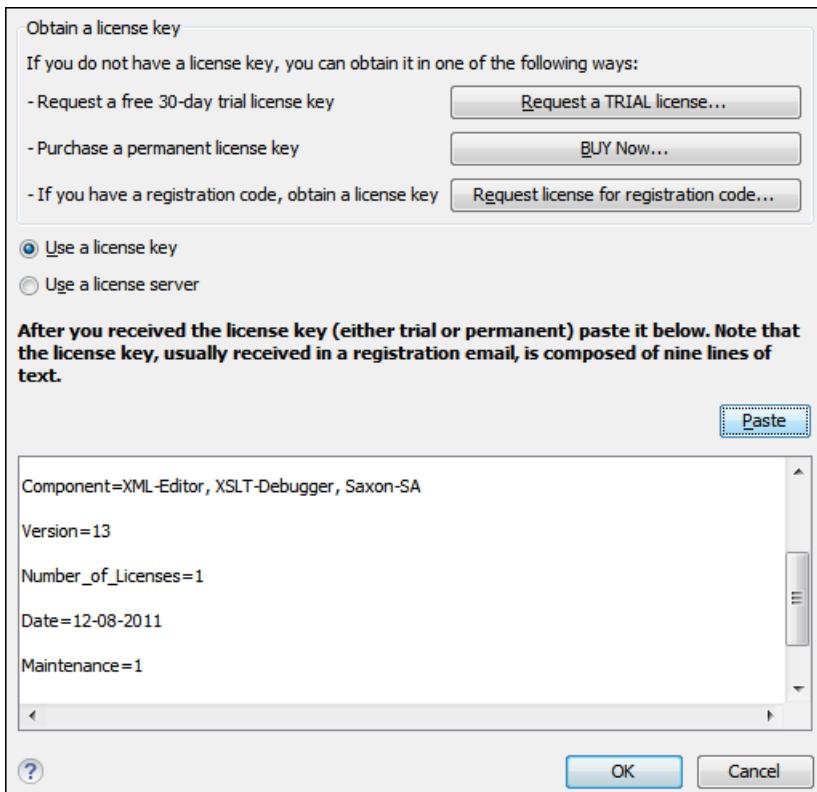

Figure 10: License Registration Dialog Box

4. Select **Use a license key** as licensing method.
5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Press **OK**.

Registering a Floating License

How you register to use a floating license will depend on how floating licenses are managed in your organization.

- If the machines that share the pool of floating licenses are on multiple network segments, someone in your company will need to [set up a license server](#). Consult that person to determine if they have set up a license server as a [TCP](#) or [HTTP](#) server as the registration process is different for each.
- If all the machines sharing a pool of floating licenses are on the same network segment, you will register your licence the same way you [register a Named-User Licence](#). Oxygen XML Editor will use your connection to a local area network, without additional notice, to automatically connect to other running instances of Oxygen XML Editor. These connections may transmit your IP address to the local network.

Note: [For System Administrators] Multiple running instances of Oxygen XML Editor communicate with each other using UDP broadcast on the 59153 port, to the 239.255.255.255 group.

Warning: This mechanism was deprecated starting with version 17.0 and it is scheduled for removal in a future version. It is recommended to switch to the license server licensing mechanism.

Request a Floating License from a TCP License Server

Use this procedure if your company uses an Oxygen XML Editor TCP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.
2. Start Oxygen XML Editor.
3. Go to **Help > Register** .
The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.

5. Select **TCP server** as server type.
6. In the *Host* field, enter the host name or IP address of the license server.
7. In the *Port* field, enter the port number used to communicate with the license server.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

Related tasks

[Setting up a TCP Floating License Server Using a 32-bit Windows Installer](#) on page 38

Setting up the TCP floating license server as a Windows process.

[Setting up a TCP Floating License Server Using All-Platforms Distribution](#) on page 40

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

Request a Floating License from an HTTP License Server

Use this procedure if your company uses an Oxygen XML Editor HTTP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.
2. Start Oxygen XML Editor.
3. Go to **Help > Register**.
The license registration dialog box is displayed.
4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.
6. In the *URL* field, enter the address of the license server.
The URL address has the following format: `http://hostName:port/oxygenLicenseServlet/license-servlet`
7. Complete the *User* and *Password* fields.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

Related information

[Setting up an HTTP Floating License Server](#) on page 35

Release a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Editor running on your machine are using your floating license.
- You register a **Named User** license with your copy of Oxygen XML Editor, and no other copies of Oxygen XML Editor running on your machine are using your floating license.

To release a floating license on demand, follow these steps:

1. Go to **Help > Register**.
The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.
A dialog box is displayed asking if you want to reset your license key.
5. Select between:

- **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User* license.
- **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.

Register a Floating License for Multiple Users

If you are an administrator registering floating licenses for multiple users, you can avoid having to open Oxygen XML Editor on each machine and configuring the registration details by using the following procedure:

1. Reset the registration details:
 - a. Select **Register** from the **Help** menu.
 - b. Click **OK** without entering any information in this dialog box.
 - c. Click **Reset** and restart the application.
2. Register the license using one of the *floating license registration procedures*.
3. Copy the `license.xml` file from the Oxygen XML Editor *preferences directory* to the installation folder on each installation to be registered.

Setting Up a Floating License Server

Installing a License Server to Manage Floating Licenses

If you are using floating licenses for Oxygen XML Editor, you must set up an Oxygen XML Editor floating license server. A floating license server can be installed as one of the following:

- An *HTTP server*. This is the recommended method.
- A *TCP server* (deprecated).

Note: Oxygen XML Editor version 17 or higher requires a license server version 17 or higher. License servers version 17 or higher can be used with any version of a floating license key.

Activating Floating License Keys

To help you comply with the Oxygen XML Editor EULA (terms of licensing), all floating licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Editor servers, which in turn will sign the license key.

Split or Combine License Keys to Work with Your License Servers

A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Editor version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact support@oxygenxml.com and ask for a new license key.

Setting up an HTTP Floating License Server

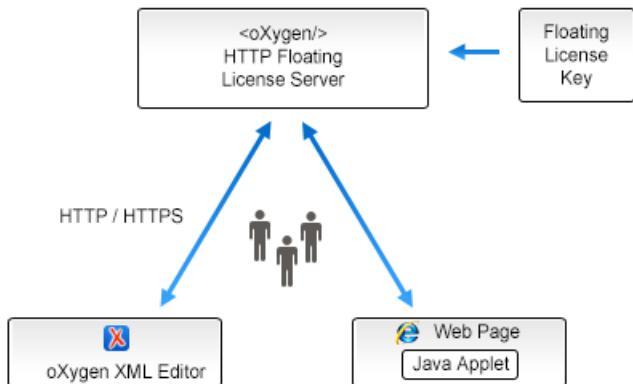

Figure 11: Floating License Server (HTTP Server)

The Oxygen XML Editor license server is available in several distributions, tailored for covering a variety of deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, Mac, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

Installation Steps for the HTTP License Server Installer Distribution for Windows

1. Download the HTTP license server installer from the [Oxygen XML Editor website](#).
2. Run the installer and follow the on-screen instructions.
3. You need to configure two sets of credentials:
 - a. **Administrator credentials** - used for accessing the Oxygen XML Editor license server administrative interface. Optionally you can choose to change the standard 8080 port.
 - b. **Standard user credentials** - used by an Oxygen XML Editor application to connect to the license server.
4. Optionally you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

Installation Steps for the HTTP License Server All-Platform Distribution

1. Download the HTTP license server all-platform archive from the [Oxygen XML Editor website](#).
2. Unpack the archive.
3. Run the license server scripts suitable for your operating system (licenseServer.bat for Windows or licenseServer.sh for Linux and Mac).

Note: To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, licenseServer.bat 8082).
4. On the first run, you will be prompted to set two sets of credentials:

- a. **Administrator credentials** - used for accessing the Oxygen XML Editor license server administrative interface.
- b. **Standard user credentials** - used by an Oxygen XML Editor application to connect to the license server.

Installation Steps for the HTTP License Server WAR Distribution

1. Make sure that Apache Tomcat 5.5 or higher is running on the machine you have selected to be the license server. To get it, go to <http://tomcat.apache.org>.

2. Download the HTTP license server **Web ARchive (.war)** from the [Oxygen XML Editor website](#).
3. Configure two Tomcat users:
 - a. One user with the role *user*, used by an Oxygen XML Editor application to connect to the license server. In the subsequent example, this user name is **John**.
 - b. Another user with the roles *admin* and *manager-gui*, used for accessing the Oxygen XML Editor license server administrative interface and the Tomcat management interface. In the subsequent example, this user name is **Mary**.

A typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat `zip/tar.gz` distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the two users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
  version="1.0">
  <!-- ... other user and role definitions ... -->
  <role rolename="user"/>
  <role rolename="admin"/>
  <role rolename="manager-gui"/>
  <user username="John" password="user_pass" roles="user"/>
  <user username="Mary" password="admin_pass" roles="admin,manager-gui"/>
</tomcat-users>
```

4. Go to the Tomcat Web Application Manager page and log-in with the user you configured with the *manager-gui* role (**Mary** in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oxygenLicenseServlet` application is now up and running, but the license key is not yet registered.
5. Go to the oxygen license server administration page by clicking the `oxygenLicenseServlet` link in the manager page. You will need to authenticate with the user configured with the *admin* role (Mary in our example).
6. Activate the floating license key. This process involves binding your license key to your license server deployment. Once the process is completed you cannot activate the floating license with another license server. Follow these steps to activate the license:
 - a. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the *admin* or *manager* users.

Result: A page is displayed that prompts for a license key.

 - b. Paste your floating license key into the form and press **Submit**. The browser used in the activation process needs to have Internet access.

Result: You will be redirected to an online form hosted on the Oxygen XML Editor website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

Note: If, for some reason, your browser does not take you to this activation form, refer to the [Manual Activation Procedure](#).

 - c. Press **Activate**.

If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Editor client applications.
7. By default, the license server logs its activity in the `TomcatInstallDir/logs/oxygenLicenseServlet.log` file. To change the log file location, edit the `log4j.appenders.R2.File` property from the `TomcatInstallDir/webapps/oxygenLicenseServlet/WEB-INF/lib/log4j.properties` configuration file.

Manual License Activation Procedure

1. Access the HTTP license server by following the link provided by the Tomcat Web Application Manager page. You will be taken to the license registration page.
2. Copy the license server activation code.
3. Go to the activation page at <http://www.oxygenxml.com/activation/>.
4. Paste the license server activation code and floating license key in the displayed form, then click **Activate**.
5. The activated license key is displayed on-screen. Copy the activated license key and paste it in the license registration page of the HTTP server.

Automatic Subscription Renewal

If the HTTP license server is configured with a subscription license, then the license server will automatically check to see if a new subscription license was purchased and will automatically download and install it for you.

Important: This automatic checking procedure implies a connection to a web service located at oxygenxml.com. You can deactivate this automatic behavior by disabling the **Automatically check for subscription renewal** option from the main management page of the license server.

If the automatic renewal process fails, you can try either of the following possible solutions:

- If your server uses a proxy to connect to the Internet, go to the main management page of the license server and configure the proxy settings by clicking the **Proxy settings** link in the **Management tasks** section.
- [Manually replace the floating license key](#).

Upgrading Your HTTP Floating License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the Oxygen XML Editor HTTP floating license server to its latest version.

Follow this procedure:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the *admin* or *manager* credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the *manager* role, and *Undeploy* the floating license server.
4. Go to Oxygen XML Editor website and [download the HTTP license server](#).
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the *admin* or *manager* users.
7. Paste the license key into the form and register it.

Replacing a Floating License Key in an HTTP Floating License Server

The following procedure assumes that your Oxygen XML Editor HTTP floating license server contains a previously [activated license key](#) and provides instructions for replacing it with another one. The goal of the procedure is to allow you to activate and configure the new license key without any downtime.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users](#).

To replace a floating license key that is activated on your HTTP floating license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page.
2. Click the **Replace license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Yes** button to begin the replacement procedure.
4. Paste the new floating license key in the displayed form, then click **Submit**. The browser used in the process needs to have Internet access.

You will be redirected to an online form hosted on the Oxygen XML Editor website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

Note: If for some reason your browser does not take you to this activation form, refer to the [Manual Activation Procedure](#).

5. Press **Activate**.

If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

Getting More Information From the Report Page

You can access a license server activity report at <http://hostName:port/oxygenLicenseServlet/license-servlet/report>.

It displays the following real time information:

- **License load** - A graphical indicator that shows how many licenses are available. When the indicator turns red, there are no more licenses available.
- **Floating license server status** - General information about the license server status, including the following information:
 - server start time
 - license count
 - rejected and acknowledged requests
 - average usage time
 - license refresh and timeout intervals
 - location of the license key
 - server version
- **License key information** - License key data, including the following information:
 - licensed product
 - registration name
 - company name
 - license category
 - number of floating users
 - Maintenance Pack validity
- **Current license usage** - Lists all currently acknowledged users, including the following information:
 - user name
 - date and time when the license was granted
 - name and IP address of the computer where Oxygen XML Editor runs
 - MAC address of the computer where Oxygen XML Editor runs

Note: The report is also available in XML format at <http://hostName:port/oxygenLicenseServlet/license-servlet/report-xml>.

Setting up a TCP Floating License Server Using a 32-bit Windows Installer

Setting up the TCP floating license server as a Windows process.

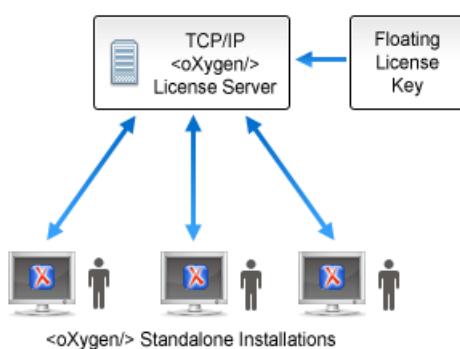

Figure 12: TCP Floating License Server (Process in Windows)

Installation Steps

1. Download the license server installation kit for Windows from the [Oxygen XML Editor website](#).
2. Run the downloaded installer and follow the on-screen instructions.

By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the **Start** menu for starting and stopping the Windows service manually. If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oxygenLicenseServer.vmoptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

Note: If you do not provide the `serviceName` argument, the default name `oxygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:

- `outLicenseServer.log` - Standard output stream of the server.
- `errLicenseServer.log` - Standard error stream of the server.

3. Manually add the `oxygenLicenseServer.exe` file in the Windows Firewall list of exceptions. Go to **Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program** and browse for `oxygenLicenseServer.exe` from the Oxygen XML Editor License Server installation folder.
4. Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a *command line interface*) or in the `outLicenseServer.log` log file.

Note: A license server can only manage one license key (which can cover any number of floating licenses). If you have multiple license keys for the same Oxygen XML Editor version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, please contact support@oxygentools.com and ask for a new license key.

Upgrading Your TCP Floating License Server

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor floating license server to its newest version.

Follow this procedure:

1. Go to the Oxygen XML Editor website and download the [latest floating license server](#).
2. Run the installation kit.
3. Leave the default **Update the existing installation** option enabled. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
4. Follow the on-screen instructions to complete the installation process.

Replacing a Floating License Key in a TCP Floating License Server

The following procedure assumes that your Oxygen XML Editor TCP floating license server contains a previously [activated license key](#) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users](#).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the service that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, [the server will fail to start](#).

4. Find the license activation procedure in the on-screen instructions (if the license server is started in a *command line interface*) or in the *outLicenseServer.log* log file.
5. After you copy the activated license key in the *license.txt* file, restart the license server.

Common Problems

This section includes some common problems that may appear when setting up a TCP floating license server.

Windows Service Reports 'Incorrect Function When Started'

The "Incorrect Function" error message when starting the Windows service usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

Windows Service Reports 'Error 1067: Process Terminated Unexpectedly'

This error message appears if the Windows service launcher quits immediately after being started.

This problem usually happens because the license key has not been correctly deployed (*license.txt* file in the *license* folder). For more information, see the [Setting up a Floating License Server section](#).

Setting up a TCP Floating License Server Using All-Platforms Distribution

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

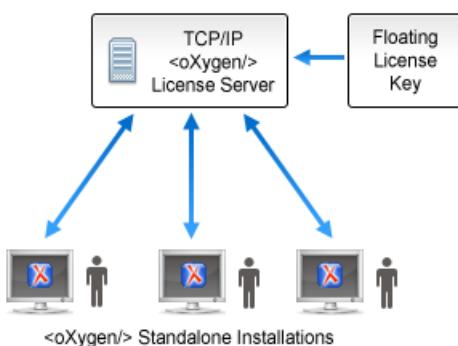

Figure 13: TCP Floating License Server (All-Platforms Distribution)

Installation Steps

1. Ensure that a Java runtime version 6 or later is installed on the server machine.
2. Download the license server installation kit for your platform from the [Oxygen XML Editor website](#).
3. Unzip the installation kit into a new folder.
4. Start the server using the startup script from a command line console.

The startup script is called *licenseServer.sh* for OS X and Unix/Linux or *licenseServer.bat* for Windows. The following parameters are accepted:

- *licenseDir* - The path of the directory where the license files will be placed. The default value is *license*.
- *port* - The TCP port number used to communicate with Oxygen XML Editor instances. The default value is **12346**.

The following is an example of the command line for starting the license server on Unix/Linux and OS X:

```
sh licenseServer.sh myLicenseDir 54321
```

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

Upgrading Your TCP Floating License Server

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor TCP floating license server to its newest version.

Follow this procedure:

1. Stop the current license server process.
2. Locate and open the floating server startup script. It should look like this:

```
sh licenseServer.sh pathToLicenseDir 54321
```

3. Make a note of the path to the license directory (in our example is `pathToLicenseDir`) and the port number (in our example is 54321).
4. Go to the license directory and copy the license key file (`license.txt`) for later use.
5. Go to the Oxygen XML Editor website and download the [all-platforms floating license server installation kit](#).
6. Unzip the archive and overwrite the content of your current floating license server installation.
7. Copy the license key file (`license.txt`) saved in step 4 to license directory of the floating license server installation.
8. Edit the floating server startup script and configure with the info you made note of in step 3.
9. Start the floating license server process.

Replacing a Floating License Key in a TCP Floating License Server

The following procedure assumes that your Oxygen XML Editor TCP floating license server contains a previously [activated license key](#) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the HTTP license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users](#).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the process that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

Transferring a License Key

If you want to transfer your Oxygen XML Editor license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then [register your license](#) on the new computer in the normal way.

1. Go to **Help > Register**.
The license registration dialog box is displayed.
2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.
A dialog box is displayed asking if you want to reset your license key.
5. Select between:
 - **Use the last one** - Falls back to your previous license key, if applicable.
 - **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.

Upgrading Oxygen XML Editor

From time to time, upgrade and patch versions of Oxygen XML Editor are released to provide enhancements that fix problems, and add new features.

Checking for New Versions of Oxygen XML Editor

Oxygen XML Editor checks for new versions automatically at start up. To disable this check, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and uncheck **Automatic Version Checking**.

To check for new versions manually, go to **Help > Check for New Versions**.

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Editor already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in [document type \(framework\) files](#), XSLT stylesheets, XML catalogs, and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in [Document type associations > Locations](#)) will be preserved and will be found by the new installation.

If you install in a new directory.

- All the files from the old install directory will be preserved, including any modification in [document type \(framework\) files](#), XSLT stylesheets, XML catalogs, and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks that were stored outside the installation directory (as configured in [Document type associations > Locations](#)) will be preserved and will be found by the new installation.

Upgrading the Standalone Application

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select **Help > Check for New Version**. Note that the application needs an Internet connection to check the license compatibility.
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Start Oxygen XML Editor.
5. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Installing and Updating Add-ons in Oxygen XML Editor

Oxygen XML Editor provides an add-on mechanism that can automatically discover and install [frameworks](#) and [plugins](#) from a remote location.

Note: Frameworks that you install through the add-ons system are read-only.

Installing Add-ons

To install a new add-on, follow these steps:

1. Go to **Help > Install new add-ons**.
2. In the displayed dialog box, fill-in the **Show add-ons from** with the *update site* that hosts add-ons. If you want to see all Oxygen XML Editor default add-ons, choose the **ALL AVAILABLE SITES** option from the **Show add-ons from** drop down. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.

Note: To see all the add-ons from the remote update site, disable **Show only compatible add-ons** and **Show only the latest version of the add-ons**. Incompatible add-ons are shown only to acknowledge their presence on the remote update site. You cannot install an incompatible add-on.

3. By default, only the latest versions of the add-ons that are compatible with the current version of Oxygen XML Editor are displayed.
4. Choose the add-ons you want to install, press the **Next** button, then follow the on-screen instructions.

Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Note: All add-ons are installed in the extensions directory inside the Oxygen XML Editor *preferences directory*.

Managing installed add-ons

To manage the installed add-ons, follow these steps:

1. Go to **Help > Manage add-ons**
2. The displayed dialog box presents a list of the available updates (compatible with the current version of Oxygen XML Editor) and with the already installed updates. Under the updates list, Oxygen XML Editor presents a short description of each update.
3. Check for box for a specific add-on, then press **Update** to update it (or **Uninstall** to remove it). If there is a newer version of the add-on available, Oxygen XML Editor will download the package and install it. Follow the on-screen instructions to complete the installation process.

Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Checking for add-on updates

To check if there are available updates for the installed add-ons, go to **Help > Check for add-ons updates**. This action only displays updates that are compatible with the current Oxygen XML Editor version.

To watch a video demonstration about the add-ons support in Oxygen XML Editor, go to <https://www.oxygenxml.com/demo/AddonsSupport.html>.

Related information

[Packing and Deploying Plugins or Frameworks as Add-ons](#) on page 1166

Uninstalling Oxygen XML Editor

Uninstalling the Oxygen XML Editor Standalone

-  **CAUTION:** The following procedure will remove Oxygen XML Editor from your system. **All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a back up of any data you want to keep before uninstalling Oxygen XML Editor.**

1. Backup any data you want to keep from the Oxygen XML Editor installation folder.
2. Remove the application.

- On Windows use the appropriate uninstaller shortcut provided with your OS.
 - On OS X and Unix manually delete the installation folder and all its contents.
- 3. If you want to remove the user preferences:**

- **On Windows Vista/7/8/10**, remove the directory: %APPDATA%\Roaming\com.oxygenxml (usually %APPDATA% has the value: [user-home-dir]\Application Data). Note that this directory is hidden.
- **On Windows XP**, remove the directory: %APPDATA%\com.oxygenxml (usually %APPDATA% has the value: [user-home-dir]\Application Data).
- **On Linux**, remove the directory: .com.oxygenxml from the user home directory.
- **On OS X**, remove the directory: Library/Preferences/com.oxygenxml of the user home folder.

Unattended Uninstall

The unattended uninstall procedure is available only on Windows and Linux.

Run the uninstaller executable from command line with the -q parameter.

The uninstaller executable is called `uninstall.exe` on Windows and `uninstall` on Linux and is located in the application's install folder.

Oxygen XML Editor Installer Command Line Reference

The Oxygen XML Editor installers for Windows and Linux creates a file called `response.varfile`, which records the choices that the user made when running the installer interactively. You can use a `response.varfile` to set the options for an unintended install. Here is an example of a `response.varfile`:

```
#install4j response file for Oxygen XML Editor 18.0
#Fri Jul 18 21:52:15 EDT 2014
sys.adminRights$Boolean=true
sys.programGroupDisabled$Boolean=false
createDesktopLinkAction$Boolean=true
autoVersionChecking=true
sys.fileAssociation.launchers$StringArray="19", "19", "19", "19", "19", "19", "19",
"19", "19", "19", "19", "19", "19", "19", "19", "19", "19", "19", "19",
"19", "19", "19", "19", "19", "19", "19", "19", "19", "19", "19", "19"
sys.programGroupAllUsers$Boolean=true
reportProblem=true
downloadResources=true
sys.languageId=en
sys.installationDir=C:\\\\Program Files (x86)\\\\Oxygen XML Editor 18
createQuickLaunchIconAction$Boolean=true
sys.programGroupName=Oxygen XML Editor 18.0
executeLauncherAction$Boolean=true
sys.fileAssociation.extensions$StringArray="xml", "dita", "ditamap", "ditaval",
"xsl", "xslt", "xspec", "xsd", "rng", "rnc", "sch", "dtd", "mod", "ent", "nvd1", "fo",
"wsdl", "xquery", "xq", "xqy", "xqm", "xql", "xpl", "css", "json", "xpr"
```

The following table describes some of the settings that can be used in the `response.varfile`:

Table 2: response.varfile Options Parameters

Parameter Name	Description	Values
<code>autoVersionCheck</code>	Automatic version checking.	true / false. Default setting is true.
<code>reportProblem</code>	Allows you to report a problem encountered while using Oxygen XML Editor.	true / false. Default setting is true.
<code>downloadResources</code>	Allows Oxygen XML Editor to download resources (links to video demonstrations, webinars and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen.	true / false. Default setting is true.

The Oxygen XML Editor installation uses the `install4j` installer. A description of the `response.varfile` format can be found on the [install4j site](#).

Command line parameters

The Oxygen XML Editor installer supports the following command line parameters:

Option	Meaning
<code>-q</code>	<p>Run the installer in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a response.varfile is specified using the <code>-varfile</code> option or individual settings are specified using</p> <p>- on Windows:</p> <pre data-bbox="910 508 1062 536">oxygen.exe -q</pre> <p>- on Linux:</p> <pre data-bbox="910 629 1051 656">oxygen.sh -q</pre>
<code>-overwrite</code>	<p>In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Editor is installed in the same folder. The <code>-overwrite</code> parameter added after the <code>-q</code> parameter forces the overwriting of these files.</p> <p>- on Windows:</p> <pre data-bbox="910 931 1184 958">oxygen.exe -q -overwrite</pre> <p>- on Linux:</p> <pre data-bbox="910 1051 1175 1079">oxygen.sh -q -overwrite</pre>
<code>-console</code>	<p>To display a console for the unattended installation, add a <code>-console</code> parameter to the command line.</p> <p>- on Windows:</p> <pre data-bbox="910 1262 1299 1290">start /wait oxygen.exe -q -console</pre> <p>Note: The use of <code>start /wait</code> on Windows is required to make the installer run in the foreground. If you run it without <code>start /wait</code>, it will run in the background.</p> <p>- on Linux:</p> <pre data-bbox="910 1516 1152 1543">oxygen.sh -q -console</pre>
<code>-varfile</code>	<p>Points to the location of a <code>response.varfile</code> to be used during an unattended installation. For example:</p> <p>- on Windows:</p> <pre data-bbox="910 1727 1352 1755">oxygen.exe -q -varfile response.varfile</pre> <p>- on Linux:</p> <pre data-bbox="910 1839 1339 1867">oxygen.sh -q -varfile response.varfile</pre>
<code>-V</code>	<p>Is used to define a variable to be used by an unattended installation. For example:</p>

Option	Meaning
	<p>- on Windows:</p> <pre data-bbox="899 234 1361 261">oxygen.exe -q -VusageDataCollector=false</pre> <p>- on Linux:</p> <pre data-bbox="899 350 1348 378">oxygen.sh -q -VusageDataCollector=false</pre>

The Oxygen XML Editor installation uses the install4j installer. A full list of the command line parameters supported by the install4j installer can be found on the [install4j site](#).

Topics:

- [Preferences](#)
- [Configuring Options](#)
- [Associating a File Extension with Oxygen XML Editor](#)
- [Configuring the Layout of the Views and Editors](#)
- [Configure Toolbars](#)
- [Scenarios Management](#)
- [Editor Variables](#)
- [Custom System Properties](#)
- [Localizing the User Interface](#)
- [Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor](#)

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the editor variables that are available for customizing user-defined commands..

Preferences

You can configure Oxygen XML Editor options using the **Preferences** dialog box.

To open the preferences dialog box, go to **Options > Preferences**.

You can select the preference page you are interested in from the tree on the left of the **Preferences** dialog box. You can filter the tree by using the filter text box and the following buttons are available to the right of the text box:

-  **Expand All** - Expands the structure of the tree to show all preference pages.
-  **Collapse All** - Collapses the structure of the tree to show only the 1st level preference pages.
-  **Project-Level Options Only** - If toggled on, it filters the tree to only show the preference pages that are *saved at project level*.

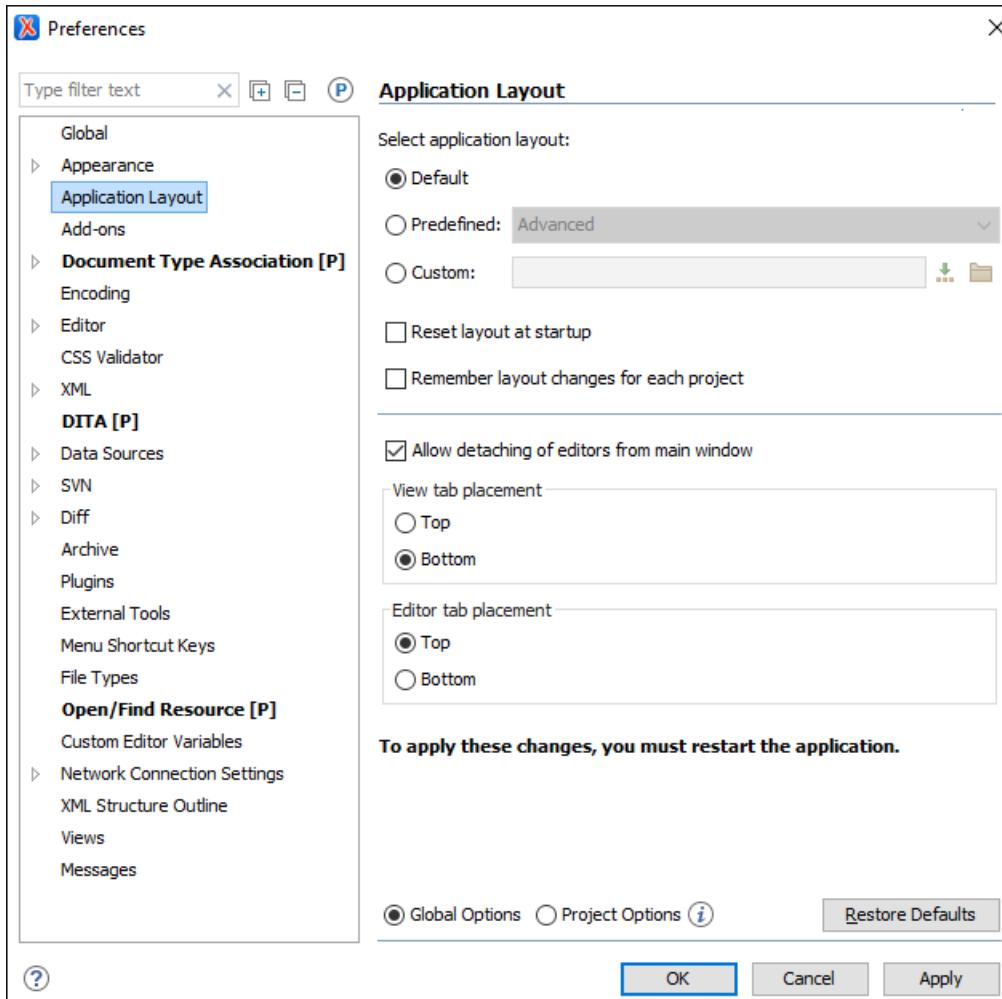

Figure 14: Preferences Dialog Box

Press or F1 for help on any preferences page.

Some preference pages include an option to control how the options are stored, either as **Global Options** or **Project Options**.

Figure 15: Controlling the Storage of the Preferences

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (com.oxygenxml) that is in the following locations:

- **Windows (Vista, 7, 8, 10)** - [user_home_directory]\AppData\Roaming\com.oxygenxml
- **Windows XP** - [user_home_directory]\Application Data\com.oxygenxml
- **Mac OS X** - [user_home_directory]/Library/Preferences/com.oxygenxml
- **Linux/Unix** - [user_home_directory]/.com.oxygenxml

Global Preferences

The global options cover a number of aspects of the overall operation of Oxygen XML Editor. To configure the **Global** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Global**.

The following options are available in the **Global** preferences page:

Automatic Version Checking

If this option is enabled, Oxygen XML Editor will check for a new version on startup.

Check for notifications

If enabled, the application will check for various types of messages from the Oxygen XML Editor website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more. This option is enabled by default.

Language

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, or Japanese. You must restart Oxygen XML Editor for the change to take effect.

Other language

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see [Localizing the User Interface](#) on page 172. You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Editor.

Note: If some interface labels are not rendered correctly after restarting the application, (for example, Chinese or Korean characters are not displayed correctly), make sure that your operating system has the appropriate language pack installed (for example, the East-Asian language pack).

Line separator

This option sets the line separator used when saving files. Use **System Default** to select the normal line separator for your OS. If you want the existing file separator of a file to be maintained, regardless of your current OS, check **Detect the line separator on file open**.

Detect the line separator on file open

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. New files are saved using the line separator defined by the [Line separator option](#).

Default Internet browser

This option sets the Web browser that Oxygen XML Editor will use to do the following:

- Open (X)HTML or PDF transformation results.
- Open a web page (for example, pointing to specific paragraphs in the W3C recommendation of XML Schema if there are XML Schema validation errors).

If you leave this setting blank, the system default browser will be used.

Open last edited files from project

When this option is enabled, Oxygen XML Editor opens the files you had open the last time you used a project whenever you open the application or switch to that project.

Beep on operation finished

When this option is selected, Oxygen XML Editor beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.

Show memory status

When this option is selected, the memory Oxygen XML Editor uses is displayed in the status bar. To free memory, click the  **Free unused memory** button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Editor uses too much memory. You can change the amount of memory available to Oxygen XML Editor by [changing the parameters of the application launcher](#).

Check opened files for file system changes

When this option is selected, Oxygen XML Editor checks the content of the all opened editors to see if they have been updated by another application. If the file has changed, Oxygen XML Editor will ask you if you want to reload the file.

Auto update unmodified editors on file system changes

If this option is selected, Oxygen XML Editor automatically updates unmodified editors if the edited file changes externally.

Show Java vendor warning at startup

If this option is selected, Oxygen XML Editor displays a warning on startup if a non-recommended version of the Java virtual machine is being used.

File Chooser Dialog

This options specifies the directory that will be shown when the [Open file dialog box](#) is displayed. You can choose between:

- **Last visited directory** - The last visited folder will be displayed.
- **Directory of the edited file** - The folder where the currently edited file is stored will be displayed.

Show hidden files and directories

If this option is selected, Oxygen XML Editor shows system hidden files and folders in the file browser dialog box and the folder browser dialog box. This setting is not available on OS X.

Appearance Preferences

This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Editor. To configure the **Appearance** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance**.

The following options are available in the **Appearance** preferences page:

Look and Feel

This option allows you to change the graphic style (look and feel) of the user interface. Depending on the operating system, you can choose between various predefined style options.

Theme

This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in MAC OS)

Note: In Windows, if a high contrast theme is detected and the **Theme** option is set to **Classic** and the [Look and Feel option](#) is set to **Default** or **Windows**, Oxygen XML Editor inherits the high contrast theme colors that are set in the operating system.

- **Graphite**
- **Ultramarine**

You can also change various appearance related options in other preference pages for the selected theme by clicking on the various links in this section.

Custom Themes

You can also create custom themes to share with others or use in other installations of Oxygen XML Editor. To create a custom theme, follow these steps:

1. Select a **Theme** to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.
3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** drop-down list. Otherwise, if you save it to another location, you can use the [Import button](#) to make it appear in the drop-down list.

Note: In OS X (starting with Yosemite), if you choose **Graphite** for the **Theme**, it is recommended that you enable the *Use dark menu and Dock* option that is found in **System Preferences > General**.

Theme preview area

Displays a preview of the current [Theme selection](#) (available for predefined color themes).

Theme management section

Reset

Resets the theme to its default values (this option is available when the theme is modified).

Rename

Changes the name of the theme (not available for default or predefined themes).

Delete

Removes the selected theme (not available for default or predefined themes).

Import

Allows you to import a color theme from an XML theme file. You can use this option to load an exported *custom theme*.

Export

Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Editor.

Configure icon saturation and brightness link

This link is available if you are using a dark *theme* (such as **Graphite** or **Ultramarine**). It opens a dialog box that allows you to configure the saturation and brightness for all the icons in Oxygen XML Editor.

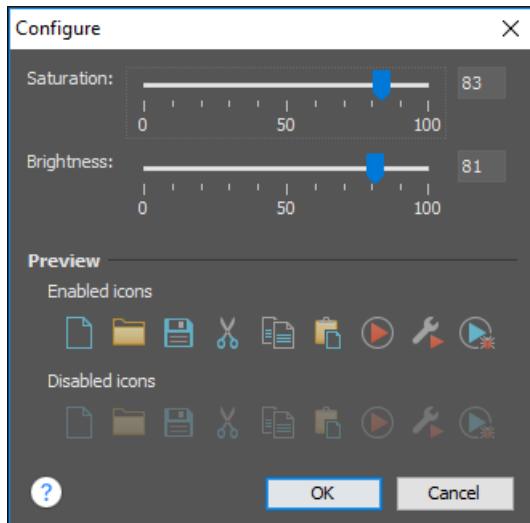

Figure 16: Configure Icon Saturation and Brightness Dialog Box

Colors Preferences

Oxygen XML Editor allows you to configure the colors for frames, dialog boxes, controls, and commands. To configure the **Colors**, open the **Preferences** dialog box (**Options > Preferences**) and go to **Appearance > Colors**.

Clicking the color button for any of the options opens a **Choose color** dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

Background Colors

Background

Background color for various general user interface items.

Components background

Background color for various components (such as text fields, views, tables, and dialog boxes).

Components selection background

Background color for the current selections in certain components, such as some views and panes.

Components inactive selection background

Background color for a selection in a view that is not the current focus.

Menus, toolbars and frame background

Background color for specific components such as menus, toolbars, and the application frame.

Menus and toolbars selection background

(This option is not available for Mac OS) Background color for menu selections and toolbar buttons.

View titles background

Background color for the titles of view and tabs.

Status bar background

Background color of the status bar at the bottom of the editor.

Foreground Colors

Foreground

Foreground color for various general user interface items.

Component selection foreground

Foreground color for the current selection.

Disabled foreground

Foreground color for various components that are not the current focus (such as views other than the currently selected one).

Link foreground

Foreground color for links in views and dialog boxes.

View titles foreground

Foreground color for the title bar of views.

Status bar foreground

Foreground color for the text in the status bar at the bottom of the editor.

Other Colors

Borders and table grids

Color for certain borders and table grid lines.

Text component border

Color for the borders of text fields and drop-down lists.

View/Editor tabs border

Color for the borders of views and tabs.

Scroll bars, chevrons

Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

Separator

Color for the separators in toolbars, menus, and dialog boxes.

Note: You must restart the application for your changes to be applied.

Fonts Preferences

Oxygen XML Editor allows you to choose the fonts to be used in the **Text**, **Design**, and **Grid** editor modes, and fonts for the **Author** mode that are not specified in the associated CSS stylesheet. To configure the font options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance > Fonts**.

The following options are available:

Editor

Allows you to choose the font that will be used in the editor.

Note: On Mac OS X, the default font, Monaco, cannot be rendered in bold.

Author mode default font

This option allows you to choose the default font that will be used in **Author** mode. The default font will be overridden by the fonts specified in any CSS file associated with the opened document.

Schema default font

This option allows you to choose the font to be used in:

- The **Design** mode of the [XML Schema editor](#).
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

Text antialiasing

This option allows you to set the text anti-aliasing behavior:

- **Default** - Allows the application to use the setting of the operating system, if available.
- **On** - Sets the text anti-aliasing to pixel level.
- **Off** - Disables text anti-aliasing.
- Sub-pixel anti-aliasing modes, such as GASP, LCD_HRGB, LCD_HBGR, LCD_VRGB, and LCD_VBGR.

Text components

This option allows you to choose the font to be used in text boxes within the interface.

GUI

This option allows you to choose the font to be used for user interface labels.

View titles font

This option allows you to choose the font to be used in the titles of the various views that are opened within the interface.

Note: You must restart the application for your changes to be applied.

Related information

[Changing the Font Size in the Editor](#) on page 285

Application Layout Preferences

Oxygen XML Editor offers various perspectives and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Application Layout**. The following options are available:

Select application layout

You can choose between the following three layouts:

- **Default** - Uses the default layout for all perspectives. Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.
- **Predefined** - Allows you to choose one of the predefined layouts:
 - **Advanced** - All views are displayed.
 - **Author** - An authoring-oriented layout that displays views such as **Project**, **Archive Browser**, **DITA Maps Manager**, **Outline**, **Attributes**, **Model**, and **Elements**.
 - **Basic** - Only the **Project** view and the **Outline** view are visible. Recommended when you edit XML content and you need maximum screen space.
 - **Schema development** - The **Project**, **Component Dependencies**, **Resource Hierarchy/Dependencies**, **Outline**, **Palette**, and **Attributes** views are displayed.
 - **XQuery development** - The **Project**, **Outline**, **Transformation Scenarios**, **XSLT/XQuery input** views are displayed.
 - **XSLT development** - The **Project**, **Component Dependencies**, **Resource Hierarchy/Dependencies**, **Outline**, **Attributes**, **Model**, **XSLT/XQuery input**, **XPath Builder**, and **Transformation Scenarios** views are displayed.
- **Custom** - Allows you to specify a custom layout to be used. You can save your preferred layout using **Window > Export Layout**, then enter the location of the saved layout file in this setting.

Reset layout at startup

When this option is enabled, Oxygen XML Editor forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

Remember layout changes for each project

When this options is enabled, Oxygen XML Editor saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

Allow detaching of editors from main window

When this options is enabled, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

Note: If the main screen is maximized, you cannot drag and drop an editor outside of it.

View tab placement

Specifies whether the *View* tabs are located at the top or bottom of the window.

Editor tab placement

Specifies whether the *Editor* tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined *layout* files are saved in the preferences directory of Oxygen XML Editor.

To watch our video demonstration about configuring the user interface of Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Dockable_VIEWS.html.

Add-ons Preferences

You can use add-ons to enhance the functionality of Oxygen XML Editor. To configure the **Add-ons** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Add-ons**.

The following options are available in this preferences page:

Enable automatic updates checking

When this option is selected, Oxygen XML Editor will automatically search for available updates.

Add-on Sites URLs

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.

Document Type Association Preferences

Oxygen XML Editor uses document type associations to associate a *document type* with a set of functionality provided by a framework. To configure the **Document Type Association** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for framework add-on update sites.

Document Type Table

This table presents the currently defined document type associations (frameworks), sorted by priority and alphabetically. Each edited document type has a set of association rules (used by the application to detect the proper document type association to use for an opened XML document). A rule is described by:

- **Namespace** - Specifies the namespace of the root element from the association rules set (* *(any)* by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).
- **Root local name** - Specifies the local name of the root element (* *(any)* by default).
- **File name** - Specifies the name of the file (* *(any)* by default).
- **Public ID** - Represents the Public ID of the matched document.

- **Java class** - Presents the name of the Java class, which is used to determine if a document matches the rule. This Java class should implement the `ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.

New

Opens a [Document type configuration dialog box](#) that allows you to add a new association.

Edit

Opens a [Document type configuration dialog box](#) that allows you to edit an existing association.

Note: If you try to edit an existing association type when you do not have write permissions to its store location, a dialog box will be shown asking if you want to extend the document type.

Duplicate

Opens a [Document type configuration dialog box](#) that allows you to duplicate the configuration of an existing document type association. This will create a snapshot of the framework in its current form. It is merely a copy of the document type and will not evolve along with the base document type like the **Extend** action does.

Extend

Opens a [Document type configuration dialog box](#) that allows you to extend an existing document type. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

Delete

Deletes the selected document type associations.

Enable DTD/XML Schema processing in document type detection

When this option is enabled (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the `DITAArchVersion` attribute of the root element. This attribute is specified as `default` in the DTD and it is detected in the root element, helping Oxygen XML Editor to correctly match the DITA customization.

Only for local DTDs/XML Schemas

When this option is enabled (default value), only the local DTDs / XML Schemas will be processed.

Enable DTD/XML Schema caching

When this option is enabled (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Locations Preferences

Oxygen XML Editor allows you to change the location where [document types \(frameworks\)](#) are stored, and to specify additional framework directories. The **Locations** preferences page allows you to specify the main frameworks folder location. You can choose between the **Default** directory (`[OXYGEN_INSTALL_DIR]/frameworks`) or a **Custom** specified directory. You can also change the current frameworks folder location value using the `com.oxygenxml.editor.frameworks.url` system property set in either the [.vmoptions configuration files](#) or in the [startup scripts](#).

A list of additional frameworks directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type (configuration) can be loaded from the following locations:

- Internal preferences - The document type configuration is stored in the application [Internal preferences](#).
- Additional frameworks directories - The document type configuration is loaded from one of the specified **Additional frameworks directories** list.
- Add-ons - An add-on can contribute a framework. You can manage the add-ons locations in the [Add-ons preferences page](#).
- The frameworks folder - The main folder containing framework configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

Document Type Configuration Dialog Box

The **Document type** configuration dialog box allows you to create or edit a *Document Type Association* (framework). It is displayed when you use the **New**, **Edit**, **Duplicate**, or **Extend** buttons in the **Document Type Association** preferences page ([open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**).

The configuration dialog box includes the following fields and sections:

- **Name** - The name of the *Document Type Association*.
- **Priority** - Depending on the priority level, Oxygen XML Editor establishes the order in which the existing document type associations are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority to *Document Type Associations* you want to be evaluated first.
- **Description** - A detailed description of the framework.
- **Storage** - Displays the type of location where the framework configuration file is stored. Can be one of: **External** (framework configuration is saved in a file) or **Internal** (framework configuration is stored in the application's internal options).

Note: If you set the **Storage** to **Internal** and the document type association settings are already stored in a framework file, the file content is saved in the application's internal options and the file is removed.

- **Initial edit mode** - Sets the default edit mode when you open a document for the first time.
- **Configuration Tabs** - The bottom section of the dialog box includes various tabs where you can configure numerous options for the *framework*.

Related information

[Document Type Sharing](#) on page 1205

Association Rules Tab

By combining multiple association rules you can instruct Oxygen XML Editor to identify the type of a document. An Oxygen XML Editor *association rule* holds information about *Namespace*, *Root local name*, *File name*, *Public ID*, *Attribute*, and *Java class*. Oxygen XML Editor identifies the type of a document when the document matches at least one of the *association rules*. This tab give you access to a **Document type rule** dialog box that you can use to create *association rules* that activate on any document matching all the criteria defined in the dialog box.

To open the **Association Rules** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button, and click on the **Association Rules** tab.

In the **Association rules** tab you can perform the following actions:

New

Opens the **Document type rule** dialog box allowing you to create *association rules*.

Edit

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected *association rule*.

Delete

Deletes the currently selected *association rules* from the list.

Move Up

Moves the selected *association rule* up one spot in the list.

Move Down

Moves the selected *association rule* down one spot in the list.

Schema Tab

In the **Schema** tab, you can specify a schema that Oxygen XML Editor uses if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

Schema type

Use this drop-down list to select the type of schema.

Schema URI

You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the [Insert Editor Variables](#) button, or the browsing tools in the [Browse](#) drop-down list.

Tip: It is a good practice to store all resources in the framework directory and use the \${framework} editor variable to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The **Classpath** tab displays a list of folders and JAR libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and framework translation files. Oxygen XML Editor loads the resources looking in the folders in the order they appear in the list.

To open the **Classpath** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Classpath** tab.

The **Classpath** tab includes the following actions:

New

Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the [Insert Editor Variables](#) button, or the browsing tools in the [Browse](#) drop-down list.

Tip: The path can also contain wildcards (for example, \${framework}/lib/*.jar).

Edit

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the [Insert Editor Variables](#) button, or the browsing tools in the [Browse](#) drop-down list.

Tip: The path can also contain wildcards (for example, \${framework}/lib/*.jar).

Delete

Deletes the currently selected resource from the list.

Move Up

Moves the selected resource up one spot in the list.

Move Down

Moves the selected resource down one spot in the list.

[Use parent classloader from plugin with ID](#)

Use this option to specify the ID of a plugin. The current framework has access to the classes loaded for the plugin.

Related information

[Extensions Tab](#) on page 71

[Author Tab](#) on page 58

[Localizing Frameworks](#) on page 1165

Author Tab

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding framework-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.

CSS Subtab

The **CSS** subtab contains the CSS files that Oxygen XML Editor uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

To open the **CSS** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **CSS** subtab.

The following actions are available in the **CSS** subtab:

New

Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list.

Edit

Opens a dialog box that allows you to edit the current selection.

Delete

Deletes the currently selected CSS file.

Move Up

Moves the selected CSS file up in the list.

Move Down

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is enabled by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

Actions Subtab

The **Actions** subtab contains a sortable table that includes all the framework-specific actions. Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Actions** subtab.

The following actions are available in this subtab:

 **New**

Opens the **Action dialog box** that allows you to add an action.

 **Duplicate**

Duplicates the currently selected action.

 **Edit**

Opens the **Action dialog box** that allows you to edit the existing action.

 **Delete**

Deletes the currently selected action.

Action Dialog Box

To edit an existing document type action or create a new one, open the **Preferences dialog box (Options > Preferences)**, go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend button**, click on the **Author** tab, and then the **Actions** subtab. At the bottom of this subtab, click  **New** to create a new action, or  **Edit** to modify an existing one.

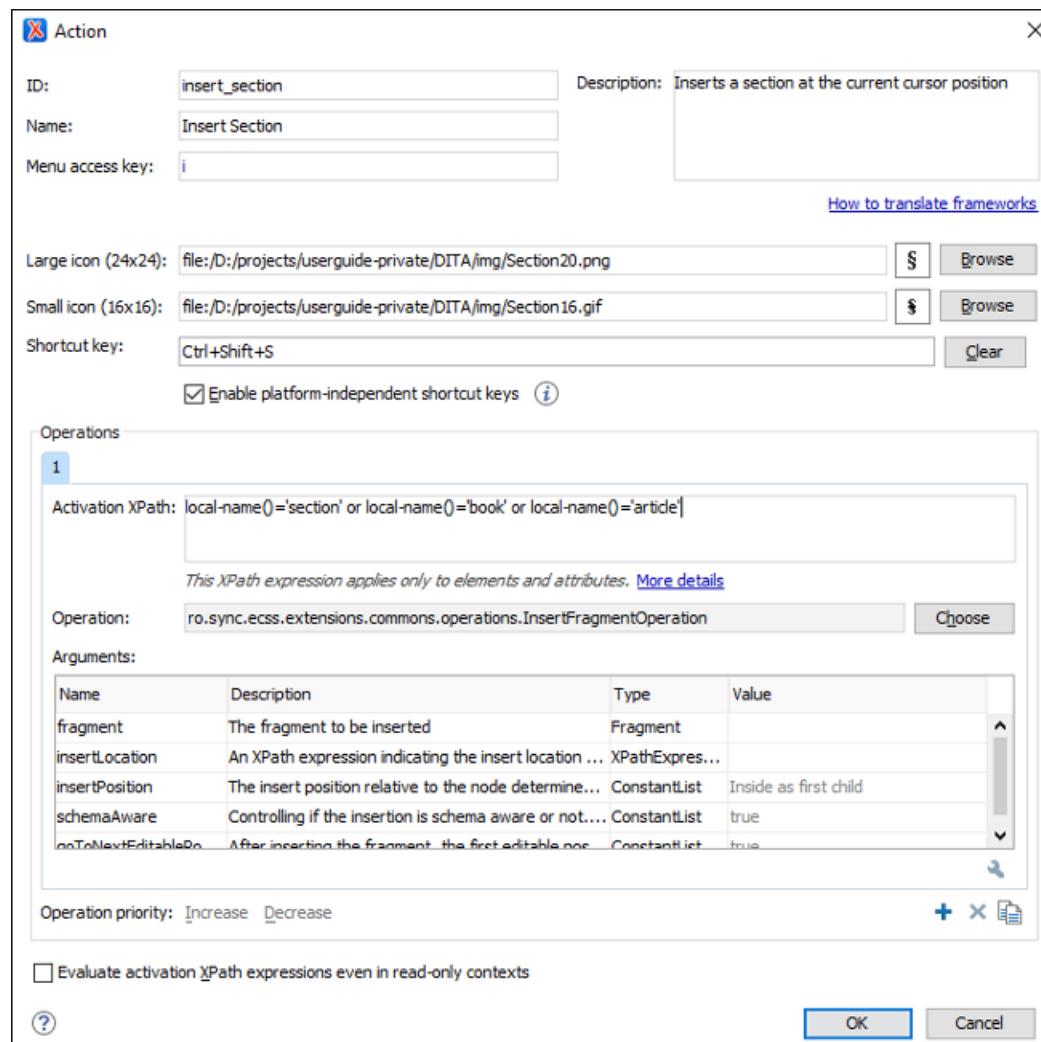

Figure 17: Action Dialog Box

The following options are available in the **Action** dialog box:

ID

Specifies a unique action identifier.

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip: You can use the `$(i18n('key'))` editor variable to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *Letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *Letter* in the name of the action that can be used to access the action.

Description

A description of the action. This description is displayed as a tooltip when hovering over the action.

Tip: You can use the `$(i18n('key'))` editor variable to allow for multiple translations of the description.

How to translate frameworks link

Use this link to see more information about [Localizing Frameworks](#) on page 1165.

Large icon

Allows you to select an image for the icon that Oxygen XML Editor uses for the toolbar action.

Tip: A good practice is to store the image files inside the framework directory and use the `${frameworks}` editor variable to make the image relative to the framework location. If the images are bundled in a *jar* archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the *class-path*.

Small icon

Allows you to select an image for the icon that Oxygen XML Editor uses for the contextual menu action.

Note: If you are using a Retina or HiDPI display, Oxygen XML Editor automatically searches for higher resolution icons in the path specified in both the **Large icon** and **Small icon** options. For more information, see [Adding Retina/HiDPI Icons in a Framework](#) on page 1158.

Shortcut key

This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.

Enable platform-independent shortcut keys

If this checkbox is enabled, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
- M2 represents the **Shift** key.
- M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
- M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first enabled operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: [Activate Multiple Functions for Actions using XPath Expressions](#) on page 61.

The following options are available in this section:

Activation XPath

An XPath 2.0 expression that applies to elements and attributes. For more details see: [Activate Multiple Functions for Actions using XPath Expressions](#) on page 61.

Operation

Specifies the invoked operation.

Arguments

Specifies the arguments of the invoked operation. The  Edit at the bottom of the table allows you to edit the arguments of the operation.

Operation priority

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

-  **Add** - Adds an operation.
-  **Remove** - Removes an operation.
-  **Duplicate** -Duplicates an operation.

Evaluate activation XPath expressions even in read-only contexts

If this checkbox is enabled, the action can be invoked even when the cursor is placed in a read-only location.

Activate Multiple Functions for Actions using XPath Expressions

An **Author** mode action can have multiple functions, each function invoking an **Author** mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a *true* result). If it is fulfilled, the operation defined in the function will be executed.

Three special XPath extension functions are provided:

- `oxy:allows-child-element()` - You can use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- `oxy:allows-global-element()` - You can use this function to check whether or not an element is a valid global element for the current framework, according to the associated schema.
- `oxy:current-selected-element()` - You can use this function to get the currently selected element.

`oxy:allows-child-element()` Function

The `oxy:allows-child-element()` function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

`oxy:allows-child-element($childName, ($attributeName, $defaultValue, $contains?)?)`

The following parameters are supported:

`childName`

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the para element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

```
oxy:allows-child-element("*:para")
```

The above example verifies if the para element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

```
oxy:allows-child-element("prefix:para")
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of false.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element("{namespaceURI}para")
```

The namespaceURI is the namespace of the element. The above example verifies if the para element (of the specified namespace) is allowed in the current context.

- Any element.

```
oxy:allows-child-element("*")
```

The above function verifies if any element is allowed in the current context.

Note: A common use case of `oxy:allows-child-element("*)` is in combination with the `attributeName` parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-child-element("*", "class", "topic/topic")
```

The above example verifies if an element with the class attribute and the default value of this attribute (that contains the topic/topic string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

```
oxy:allows-child-element("*", "*:localname", "topic/topic")
```

- A qualified name of an attribute.

```
oxy:allows-child-element("*", "prefix:localname", "topic/topic")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of false.

defaultValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

contains

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultValue parameter. If the value is false, the two values must be the same.

oxy:allows-global-element() Function

The `oxy:allows-global-element()` function allows you to check whether or not an element that matches the arguments of the function is valid for the current framework, according to the associated schema. It has the following signature:

```
oxy:allows-global-element($elementName, ($attributeName, $defaultValue, $contains?)?)
```

The following parameters are supported:

elementName

The name of the element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.

```
oxy:allows-global-element("para")
```

The above example verifies if the para element (of the default namespace) is allowed in the current framework.

- The element with the local name specified by any namespace.

```
oxy:allows-global-element("*:para")
```

The above example verifies if the para element (of any namespace) is allowed in the current framework.

- A prefix-qualified name of an element.

```
oxy:allows-global-element("prefix:para")
```

The prefix is resolved in the context of the framework. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of false.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-global-element("{namespaceURI}para")
```

The namespaceURI is the namespace of the element. The above example verifies if the para element (of the specified namespace) is allowed in the current framework.

- Any element.

```
oxy:allows-global-element("*")
```

The above function verifies if any element is allowed in the current framework.

attributeName

The attribute of an element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-global-element("*", "class", "topic/topic")
```

The above example verifies if an element with the class attribute and the default value of this attribute (that contains the topic/topic string) is allowed in the current framework.

- The attribute with the local name specified by any namespace.

```
oxy:allows-global-element("*", "*:localname", "topic/topic")
```

- A qualified name of an attribute.

```
oxy:allows-global-element("*", "prefix:localname", "topic/topic")
```

The prefix is resolved in the context of the framework. If the prefix is not resolved to a namespace, the function returns a value of false.

defaultValue

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

contains

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultValue parameter. If the value is false, the two values must be the same.

oxy:current-selected-element() Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

```
oxy:current-selected-element()[self::p]/b
```

This example returns the b elements that are children of the currently selected p element.

Localizing Frameworks

Oxygen XML Editor supports framework localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without

changing the distributed framework. Changing the language used in Oxygen XML Editor in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```
<translation>
    <languagelist>
        <language description="English" lang="en_US"/>
        <language description="German" lang="de_DE"/>
        <language description="French" lang="fr_FR"/>
    </languagelist>
    <key value="list">
        <comment>List menu item name.</comment>
        <val lang="en_US">List</val>
        <val lang="de_DE">Liste</val>
        <val lang="fr_FR">Liste</val>
    </key>
    .....
</translation>
```

Oxygen XML Editor matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `languagelist` tag for the corresponding framework is used.

Add the directory where this file is located to the **Classpath** list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Framework actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Use the **New** or **Edit** button to open the [Document type configuration dialog box](#), go to **Author > Actions**, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. `Translation_key` corresponds to the key from the `translation.xml` file.

Now open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the `translation.xml` file:

```
<key value="translation_key">
    <comment>Bold action name.</comment>
    <val lang="en_US">Bold</val>
    <val lang="de_DE">Bold</val>
    <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the `translation.xml` file in the Java code used by your custom framework, use the new [ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle\(\)](#) API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```
title:before{
    content: ${i18n(title.key)} : ;
```

Note: You can enter any language you want in the `languagelist` tag and any number of keys.

The `translation.xml` file for the DocBook framework is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the **Classpath** list corresponding to the DocBook document type the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association > Author > Actions**. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the [Oxygen SDK](#) Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Menu Subtab

In the **Menu** subtab, you can configure which actions will appear in the framework-specific menu. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Menu** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Menu** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor menu. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an image in this section as a child of the currently selected action use the **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Contextual Menu Subtab

In the **Contextual menu** subtab you configure what framework-specific action the **Content Completion Assistant** proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Contextual Menu** subtab.

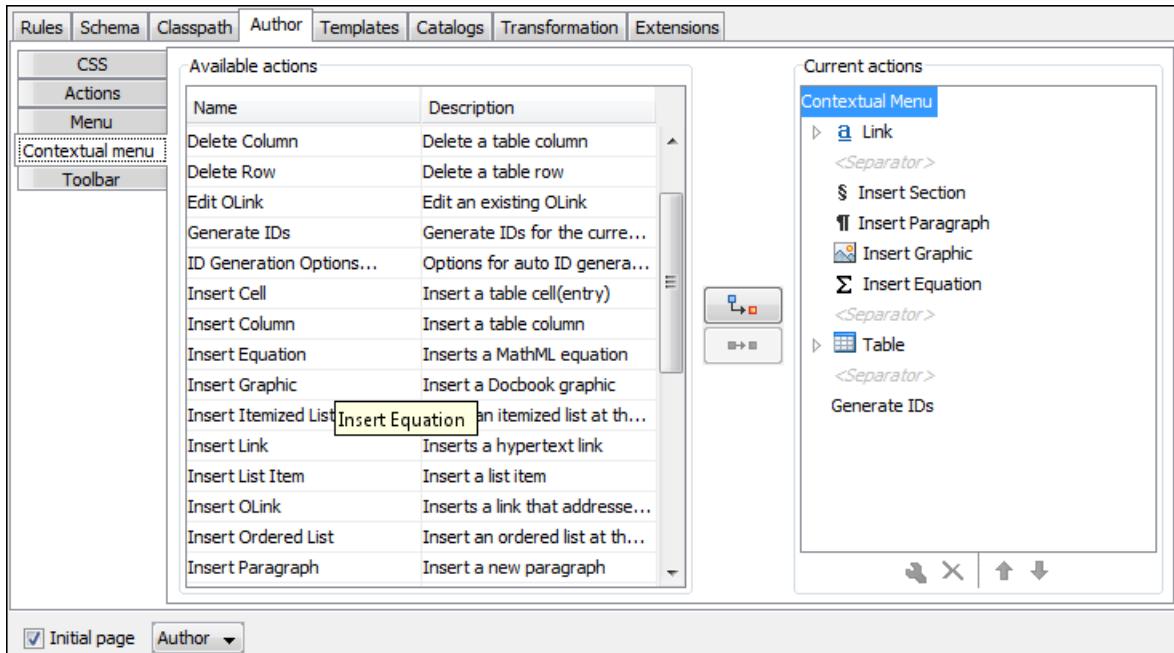

Figure 18: Contextual Menu Subtab

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited framework.

The following actions are available in this subtab:

Add as sibling

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

Add as child

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

Edit

This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

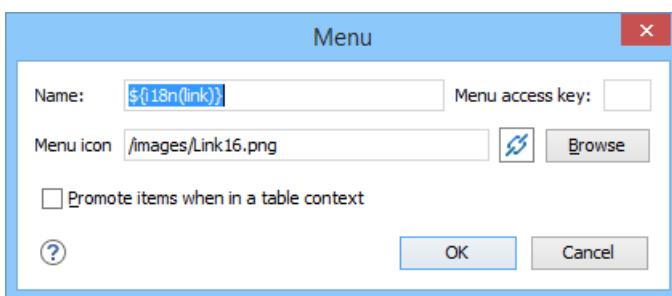

Figure 19: Menu Action Configuration Dialog Box

The following options are available in this dialog box:

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip: You can use the `$(i18n('key'))` editor variable to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *Letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *Letter* in the name of the action that can be used to access the action.

Menu icon

Allows you to select an image for the icon that Oxygen XML Editor uses for the container (submenu).

Promote items when in a table context

If this option is enabled, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

✖ Remove

Removes the selected action or submenu from the **Current actions** section.

⬆ Move Up

Moves the selected item up in the list.

⬇ Move Down

Moves the selected item down in the list.

Toolbar Subtab

In the **Toolbar** subtab you configure what framework-specific action the Oxygen XML Editor toolbar holds. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Toolbar** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Toolbar** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor toolbar when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action use the **Add as child** button.

The following actions are available in the **Current actions** section:

✎ Edit

Edits an item.

✖ Remove

Removes an item.

⬆ Move Up

Moves an item up.

⬇ Move Down

Moves an item down.

Content Completion Subtab

In the **Content Completion** subtab you configure what framework-specific the **Content Completion Assistant** proposes. The subtab is divided in two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), click on the **Author** tab, and then the **Content Completion** subtab.

Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the **Content Completion Assistant** proposes when you work with a document belonging to the edited framework. To add an action in this section as a sibling of the currently selected action, use the **Add as sibling** button. To add an action in this section as a child of the currently selected action use the **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the **Content Completion Assistant** or from some specific helper views or menus. Use the **Add** button to add more filters to the table, the **Edit** button to modify an existing item in the table, or the **Remove** button to remove a filtered item. The **Add** and **Edit** buttons open a **Remove item** dialog box.

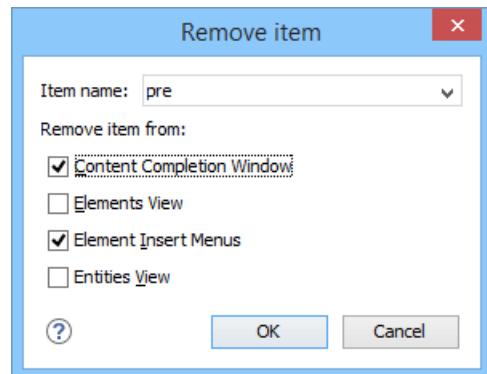

Figure 20: Remove Item Dialog Box

Use this dialog box to add or configure the elements that will be filtered:

Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered (<SPLIT> and <ENTER>).

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the **Content Completion Assistant**.
- **Elements View** - The element will not appear in the **Elements** view.
- **Element Insert Menus** - The element will not appear in the **Append Child**, **Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).
- **Entities View** - The element will not appear in the **Entities** view.

Related information

[Customizing the Content Completion Assistant](#) on page 1207

Templates Tab

The **Templates** tab specifies a list of directories where new file templates are located. These file templates are gathered from all the document types and presented in the various folders inside the **Framework templates** folder in the [New document wizard](#).

To open the **Templates** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Templates** tab.

The **Templates** tab includes the following actions:

New

Opens a dialog box that allows you to specify the path to the directory of the template. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list.

Tip: The path can also contain wildcards. For example, using \${frameworkDir}/templates/* would add all the template folders found inside the templates directory.

Edit

Opens a dialog box that allows you to edit the path of the selected template. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list.

Tip: The path can also contain wildcards. For example, using \${frameworkDir}/templates/* would add all the template folders found inside the templates directory.

Delete

Deletes the currently selected template from the list.

Move Up

Moves the selected template up one spot in the list.

Move Down

Moves the selected template down one spot in the list.

Catalogs Tab

The **Catalogs** tab specifies a list of [XML catalogs](#), specifically for the edited framework, that are added to list of catalogs that Oxygen XML Editor uses to resolve resources.

To open the **Catalogs** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Catalogs** tab.

You can perform the following actions:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables](#) button, or the browsing tools in the  [Browse](#) drop-down list.

Edit

Opens a dialog box that allows you to edit the path of an existing catalog.

Delete

Deletes the currently selected catalog from the list.

Move Up

Moves the selected catalog up one spot in the list.

Move Down

Moves the selected catalog down one spot in the list.

Transformation Tab

In the **Transformation** tab, you can configure the transformation scenarios associated with the particular framework you are editing. These transformation scenarios are presented in the **Configure Transformation Scenarios** dialog box when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the **Transformation** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Transformation** tab.

The **Transformation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the **Configure Transformation Scenarios** dialog box.

New

Opens the **New scenario** dialog box allowing you to [create a new transformation scenario for the particular document type](#).

Duplicate

Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can [configure the properties of the duplicated scenario](#).

Edit

Opens the **Edit scenario** dialog box allowing you to [edit the properties of the currently selected transformation scenario](#).

Delete

Deletes the currently selected transformation scenario.

Import scenarios

Imports transformation scenarios.

Export selected scenarios

Exports transformation scenarios.

Move Up

Moves the selection to the previous scenario.

Move Down

Moves the selection to the next scenario.

Validation Tab

In the **Validation** tab, you can configure the validation scenarios associated with the particular framework you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Master Files Support](#) on page 279 or [Working with Modular XML Files in the Master Files Context](#) on page 472.

To open the **Validation** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Document Type Association**, use the [New, Edit, Duplicate, or Extend button](#), and click on the **Validation** tab.

The **Validation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the **Configure Validation Scenarios** dialog box.

New

Opens the **New scenario** dialog box allowing you to *create a new validation scenario*.

Duplicate

Allows you to duplicate the configuration of an existing validation scenario. It opens the **Edit scenario** dialog box where you can *configure the properties of the duplicated scenario*.

Edit

Opens the **Edit scenario** dialog box allowing you to *edit the properties of the currently selected validation scenario*.

Delete

Deletes the currently selected validation scenario.

Import scenarios

Imports validation scenarios.

Export selected scenarios

Exports validation scenarios.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Extensions Tab

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, *open the Preferences dialog box (Options > Preferences)*, go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend button**, and click on the **Extensions** tab.

Libraries containing the implementations must be present in the **classpath** of your document type. The Javadoc available at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/> contains details about how each API implementation functions.

Encoding Preferences

Oxygen XML Editor lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, *open the Preferences dialog box (Options > Preferences)* and go to **Encoding**.

The following encoding options are available:

Fallback character encoding

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

Note: For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Editor tries to collect the character encoding from the document. If no such encoding is found, then *UTF-8* is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the *UTF-8* encoding is used.

UTF-8 BOM handling

This setting specifies how to handle the *Byte Order Mark* (BOM) when Oxygen XML Editor saves a UTF-8 XML document:

- **Keep** (default) - Do not alter the BOM declaration of the currently open file.
- **Write** - Save the BOM bytes.
- **Don't Write** - Do not save the BOM bytes. Loaded BOM bytes are ignored.

Note: The UTF-16 BOM is always preserved. UTF-32 documents have a *big-endian* byte order.

Encoding errors handling

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- **REPORT** (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.
- **REPLACE** - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code FFFD, and if the encoding is ASCII, the replacement character code is 63.
- **IGNORE** - The error is ignored and the character is not included in the document displayed in the editor.

Attention: If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the **Encode Selection** or **Decode Selection** actions for [Base64](#), [Base32](#), or [Hex conversions](#). The default setting is **UTF8**.

Editor Preferences

Oxygen XML Editor lets you configure the appearance of various components and features of the main editor. To access these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor**.

The following options are available:

Selection background color

Allows you to set the background color of selected text.

Selection foreground color

Allows you to set the color of selected text.

Completion proposal background

Allows you to set the background color of the **Content Completion Assistant**.

Completion proposal foreground

Allows you to set the color of the text in the **Content Completion Assistant**.

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the **Content Completion Assistant**.

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the **Content Completion Assistant**.

Find highlight color

Allows you to set the color of the highlights generated by the **Find** and **Find all** actions.

XPath highlight color

Allows you to set the color of the highlights generated when you run an XPath expression.

Declaration highlight color

Allows you to set the color of the highlights generated by the **Find declaration** action.

Reference highlight color

Allows you to set the color of the highlights generated by the **Find reference** action.

Maximum number of highlights

Allows you to set the maximum number of highlights that Oxygen XML Editor displays.

Show TAB/NBSP/EOL/EOF marks

Makes the *TAB/NBSP/EOL/EOF* characters visible in the editor. You can use the color picker to choose the color of the marks.

Show SPACE marks

Makes the space character visible in the editor.

Can edit read-only files

If this option is selected, Oxygen XML Editor will let you edit read-only files. When you try to save them, a **Save As** dialog box will be displayed to avoid overwriting the initial resource. If the option is not selected, a warning message is displayed when you try to edit a read-only file.

Display quick-assist and quick-fix side hints

Displays the *Quick Assist* icon (💡) and *Quick Fix* icon (💡) in the line number stripe on the left side of the editor.

Undo history size

Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (**Text**, **Author**, **Design**, **Grid**).

Enable mouse-wheel zooming

If enabled, you can use **Ctrl + MouseWheelForward** (**Command + MouseWheelForward** on OS X) to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards** (**Command + MouseWheelBackwards** on OS X) to decrease the editor font (zoom out). This option is enabled by default on Windows and Linux, while it is disabled by default on Mac OS X, due to the way inertia affects the mouse wheel on this operating system.

Print Preferences

Oxygen XML Editor lets you configure how files are printed out of the editor. Note that these setting cover how files are printed directly from Oxygen XML Editor itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the **Print** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Print**.

This page allows you to customize the headers and footers added to a printed page when you print from the **Text mode** or **Author mode** editors. These settings do not apply to the **Grid** and **schema Design** mode.

You can specify what is printed on the **Left**, **Middle**, and **Right** of the header and footer using plain text of any of the following variables:

- \${currentFileURL} - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- \${cfne} - Current file name with extension. The current file is the one currently opened and selected.
- \${cp} - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- \${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- \${env(VAR_NAME)} - Value of the *VAR_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \${system(var.name)} editor variable.
- \${system(var.name)} - Value of the *var . name* Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as *-Dvar . name=var . value*. If you are looking for operating system environment variables, use the \${env(VAR_NAME)} editor variable instead.
- \${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** yyyy-MM-dd;

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about xs:datetime, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the **Right** text area of the **Header** section: \${cp} of \${tp}.

You can also set the **Color** and **Font** used in the header and footer. Default font is SansSerif.

You can place a line below the header or above the footer by selecting **Underline/Overline**.

Edit Modes Preferences

Oxygen XML Editor lets you configure which **edit mode** a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes**.

Allow Document Type specific edit mode setting to override the general mode setting

If selected, the initial edit mode setting set in the [Document Type configuration dialog box](#) overrides the general edit mode setting from the table below.

Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the **Allow Document Type specific edit mode setting to override the general mode setting** option is not selected. Use the **Edit** button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- [Text](#)
- [Author](#)
- [Grid](#)
- [Design](#) (available only for the XSD editor).

Editor / Edit modes	
<input checked="" type="checkbox"/> Allow Document Type specific edit mode setting to override the general edit mode settings	
Select the initial edit mode (page) for each editor	
Editor	Edit Mode
XML Editor	Text
XSD Editor	Design
HTML Editor	Text
WSDL Editor	Text
XSL Editor	Text
NVDL Editor	Text
XProc Editor	Text
RNG Editor	Text
Schematron Editor	Text
<input type="button" value="Edit"/>	

Figure 21: Edit Modes Preferences Page

Text Preferences

Oxygen XML Editor lets you configure how the **Text mode editor** appears. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Text**.

The following options are available:

Editor background color

Sets the background color for the **Text** editing mode, **Outline** view, and some external tool editors (**Large File Viewer**, **Compare Files**, **Compare Directories**).

Editor cursor color

Sets the color for the cursor in **Text** mode.

Highlight current line

If enabled, the current line is highlighted with the foreground color specified with the color chooser.

Show line numbers

If enabled (default value), line numbers are shown in the editor panels and in the **Results** view of the debugger perspectives. You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.

Show print margin

If enabled, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.

Print margin column

Allows you to specify a limit for the print width, measured in the number of characters.

Line wrap

If enabled, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use *newline* characters to break long lines.

Cut / Copy whole line when nothing is selected

If enabled, *Cut* and *Copy* actions operate on the entire current line when nothing is selected in the editor.

Enable folding

If enabled (default value), the vertical stripe that holds the *folding markers* is displayed in **Text** mode.

Highlight matching tag

If enabled, when you place the cursor on a start or end tag, Oxygen XML Editor highlights the corresponding member of the pair. You can also customize the highlight color.

Lock the XML tags

If enabled, XML are locked and cannot be edited in **Text** mode.

Diagram Preferences

For certain XML languages, Oxygen XML Editor provides a diagram view as part of the text mode editor. To configure the **Diagram** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Text > Diagram**.

The following options are available in this preference page:

Show Full Model XML Schema diagram

When this option is selected, the **Text** mode editor for XML Schemas includes a split screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a the schema using a diagram instead of text, use the [schema Design view](#).

Note: When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

Enable Relax NG diagram and related views

Enables the Relax NG schema diagram and synchronization with the related views (**Attributes**, **Model**, **Elements**, **Outline**).

Show Relax NG diagram

Displays the Relax NG schema diagram in the split screen views (**Full Model View** and **Logical Model View**).

Enable NVDL diagram and related views

Enables the NVDL schema diagram and synchronization with the related views (**Attributes**, **Model**, **Elements**, **Outline**).

Show NVDL diagram

Displays the NVDL schema diagram in the split screen views (**Full Model View** and **Logical Model View**).

Location relative to editor

Allows you to specify the location of the schema diagram panel relative to the diagram **Text** editor.

Show/Hide Annotations link

Use this link to navigate to the [Schema Design preferences page](#) where you can choose to show or hide annotations in schema diagrams.

Zoom link

Use this link to navigate to the [Schema Design preferences page](#) where you can adjust the default zoom level of schema diagrams.

Grid Preferences

Oxygen XML Editor provides a [Grid view](#) of an XML document. To configure the **Grid** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Grid**.

The following options are available:

Compact representation

If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is *formatted and indented* each time you switch from the **Grid** view to the **Text** view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Active cell color

Allows you to set the background color for the active cell of the grid. There is only one active cell at a time.

The keyboard input always goes to the active cell and the selection always contains it.

Selection color

Allows you to set the background color for the selected cells of the grid except the active cell.

Border color

Allows you to set the color used for the lines that separate the grid cells.

Background color

Allows you to set the background color of grid cells that are not selected.

Foreground color

Allows you to set the text color of the information displayed in the grid cells.

Row header colors

Background color

Allows you to set the background color of row headers that are not selected.

Active cell color

Allows you to set the background color of the row header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Background color

Allows you to set the background color of column headers that are not selected.

Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

Author Preferences

Oxygen XML Editor provides an [**Author editing mode**](#) that provides a configurable graphical interface for editing XML documents. To configure the options for the **Author** mode, [open the **Preferences** dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author**.

The following options are available:

Author default background color

Sets the default background color of the **Author** editing mode. The `background-color` property set in the CSS file associated with the currently edited document overwrites this option.

Author default foreground color

Sets the default foreground color of the **Author** editing mode. The `color` property set in the CSS file associated with the current edited document overwrites this option.

Show XML comments

When this option is selected, XML comments are displayed in **Author** mode. Otherwise, they are hidden.

Show processing instructions

When this option is selected, XML processing instructions are displayed in **Author** mode. Otherwise they are hidden.

Show doctype

When this option is selected, the `doctype` declaration is displayed in **Author** mode. Otherwise it is hidden.

Show placeholders for empty elements

When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

Show Author layout messages

When this option is selected, all errors reported while rendering the document in **Author** mode are presented in the **Errors** view at the bottom of the editor.

Show block range

When this option is selected, a *block range indicator* is displayed in a stripe located in the left side of the editor. It is displayed as a heavy line that spans from the first line to the last line of the block.

Display referenced content (entities, XInclude, DITA conref, etc.)

When enabled, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Images Section

The following options in regards to images in **Author** mode are available in this section:

Auto-scale images wider than (pixels)

Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

Show very large images

When this option is selected, images larger than 6 megapixels are displayed in **Author** mode. Otherwise, they are not displayed.

Important: If you enable this option and your document contains many such images, Oxygen XML Editor may consume all available memory, throwing an *OutOfMemory* error. To resolve this, increase the [available memory limit](#), and restart the application.

Tags Section

In this section you can configure the following options in regards to tags that are displayed in **Author** mode:

Tags display mode

Sets the default display mode for element tags presented in **Author** mode. You can choose between the following:

- **Full Tags with Attributes** - All XML tags are displayed, with attribute names and values, making it easier to transition from a Text-based editing to **Author** mode editing.
- **Full Tags** - All XML tags are displayed, but without attributes.
- **Block Tags** - The XML tags that enclose block elements are displayed in full. Compact tags (no element names) are displayed for inline elements.
- **Inline Tags** - The XML tags that enclose inline elements are displayed in full. Block tags are not displayed.
- **Partial Tags** - Partial tags (no names) are displayed for all elements.
- **No Tags** - No tags are displayed. This representation is as close as possible to a word-processor view.

Tags background color

Sets the **Author** mode tags background color.

Tags foreground color

Sets the **Author** mode tags foreground color.

Tags font

Allows you to change the font used to display tags text in the **Author** visual editing mode. The *[Default]* font is computed based on the setting of the [Author default font option](#).

Compact tag layout

When you deselect this option, the **Author** mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

Serialization Section

In this section you can configure options in regards to the formatting and indenting that is applied when a document is saved in **Author** mode, or when switching the editing mode from **Author** to **Text**. The following options are available:

Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from **Author** to **Text** mode). You can choose between the following two options:

Only the modified content

The **Save** operation only formats the nodes that were modified in the **Author** mode. The rest of the document preserves its original formatting.

Note: This option also applies to the DITA maps opened in the **DITA Maps Manager**.

The entire document

The **Save** operation applies the formatting to the entire document regardless of the nodes that were modified in **Author** mode.

Also apply 'Format and Indent' action as in 'Text' edit mode

If this option is enabled, the content of the document is formatted by applying the **Format and Indent** rules from the [Editor/Format/XML](#) option page. In this case, the result of the **Format and indent** operation will be the same as when it is applied in **Text** editing mode.

Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

Note: New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the [Also apply 'Format and Indent' action as in 'Text' edit mode option](#), since the formatting from **Text** mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Editor to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

Note: New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the [Also apply 'Format and Indent' action as in 'Text' edit mode option](#), since the formatting from **Text** mode does not take the CSS styles into account.

For advanced Author configuration see the Document Type Association settings

Click this link to open the [Document Type Association preferences page](#).

Cursor Navigation Preferences

Oxygen XML Editor allows you to configure the appearance and behavior of the cursor in the [Author mode editor](#). To set cursor navigation preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Author > Cursor Navigation**.

The following options are available:

Highlight elements near cursor

When this option is enabled, the element containing the cursor is highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Editor uses [tool tips in Author mode to indicate the position of the cursor in the element structure](#) of the underlying document. Depending on context, the tool tips may show the current element name or the names of the elements before and after the current cursor position.

Show location tooltip on mouse move

When this option is enabled, Oxygen XML Editor displays [Location Tooltips](#) when you are editing the document in certain tags display modes (**Inline Tags**, **Partial Tags**, **No Tags**) or when the mouse pointer is moved between block elements.

Quick up/down navigation

This option is disabled by default and this means that when you navigate using the up and down arrow keys in **Author** mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is enabled, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is enabled by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is disabled, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in **Author** mode for bidirectional (BIDI) text. When this option is enabled (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is disabled, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Schema Aware Preferences

Oxygen XML Editor can use the schema of your XML language to improve the way the **Author** mode editor handles your content. To configure the **Schema Aware** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Schema Aware**.

The following options are available:

Schema aware normalization, format, and indent

When you open or save a document in **Author** mode, white space is normalized using the display property of the current CSS stylesheet and the values of the [settings](#) for **Preserve space elements**, **Default space elements**, and **Mixed content elements**. When this option is selected, the schema will also be used to normalize white space, based on the content model (*element-only*, *simple-content*, or *mixed*) . Note that the schema information takes precedence.

Indent blocks-only content

To avoid accidentally introducing inappropriate white space around inline elements, Oxygen XML Editor does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Editor will apply indenting to the source of mixed content elements that only contain block elements.

Schema Aware Editing

The options in this section determine how Oxygen XML Editor will use the schema of a document to control the behavior of the **Author** mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

Schema Aware Actions section

Delete element tags with backspace and delete

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Editor will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list items.
- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Editor tries to find an appropriate insert position. The possibilities include:
 - Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).

- Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below an existing list).
- Inserting the content into an ancestor element where it would be valid.
- **Reject action when its result is invalid** - If enabled, Oxygen XML Editor will not let you paste content into a position where it would be invalid.

Typing

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.
- **Reject action when its result is invalid** - If checked, and the result of the typing action is invalid, the action will not be performed.

Content Completion

Controls the behavior that takes place when inserting elements using content completion. Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing **Enter** will open the [Content Completion Assistant in Author mode](#). If deselected, there are three possibilities:
 - The current element will be split (if possible).
 - A new element with the same name will be inserted (if possible).
 - Otherwise, a new paragraph will be inserted.
- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Editor will attempt to find a valid location to insert it and may present you with several options.
- **Allow only insertion of valid elements and attributes** - If selected, the content completion list shows only the elements that can be inserted at the current position and will not allow you to enter any other element.
- **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the [Attributes view](#) or [In-place Attributes Editor](#). If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

Warn on invalid content when performing action

A warning message will be displayed when performing an action that will result in invalid content.

Available options are:

- **Delete Element Tags** - If selected, a warning message will be displayed if the [Delete Element Tags](#) action will result in an invalid document. You will be asked to confirm the deletion.
- **Join Elements** - If selected, a warning message will be displayed if the [Join Elements](#) action will result in an invalid document. You will be asked to confirm the join.

Automatically apply the best schema-aware insertion operation

If enabled, Oxygen XML Editor automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If disabled, Oxygen XML Editor will ask the user to choose from a list of proposed solutions.

Convert external content on paste

If selected, the [smart paste](#) feature is enabled when external content is pasted in **Author** mode.

Convert even when pasting inside space-preserve elements

If enabled, the [smart paste](#) feature will be used even when external content is pasted inside a space-preserve element (such as a codeblock).

Convert pasted URLs to links

If selected, when a URL is pasted into **Author** mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an `xref` is inserted.

[Customizing Smart Paste Support](#) on page 1179

Review Preferences

Oxygen XML Editor lets you [enter review comments and track changes](#) in your documents. The **Review** preferences page allows you to control how the Oxygen XML Editor review features work. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

Author

Specifies the name to be attached to all comments and to changes made while **Track Changes** is active. By default, Oxygen XML Editor uses the system user name.

Track Changes section (applies for all authors)

Initial State

Specifies whether or not **Track Changes** is enabled when you open a document. You may have the **Track Changes** feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of track changed is stored in the document itself, meaning that track changes are on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.
- **Always On** - The **Track Changes** feature is always on when you open a document. You can turn it off for an opened document, but it will be turned on for the next document you open.
- **Always Off** - The **Track Changes** feature is always off when you open a document. You can turn it on for an opened document, but it will be turned off for the next document you open.

Display changed lines marker

A changed line marker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, disable this option.

Inserted content color

When **Track Changes** option is on, the newly inserted content is highlighted with an *insertion marker* that uses a color to adjust the following display properties of the inserted content: *foreground*, *background*, and *underline*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who inserted content in the current document. The colors are picked from the [Colors for automatic assignment list](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If enabled, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the inserted content.
- **Use same color for background** - If enabled, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

Deleted content color

When **Track Changes** option is on, the deleted content is highlighted with a *deletion marker* that uses a color to adjust the following display properties of the deleted content: *foreground*, *background*, and *strikethrough*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who deleted content in the current document. The colors are picked from the [Colors for automatic](#)

[assignment list](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.

- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all deletion markers, regardless of who the author is.
- **Use same color for text foreground** - If enabled, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the deleted content.
- **Use same color for background** - If enabled, Oxygen XML Editor uses the color defined above (**Automatic** or **Fixed**) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

Comments color section (applies for all authors)

Sets the background color of the text that is commented on. The options are:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the [Colors for automatic assignment list](#), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

Colors for automatic assignment list

These are the colors that will be automatically assigned for tracked insertion changes, tracked deletion changes, and comments if the **Automatic** option is selected in any of the sections in this preferences page.

The colors are assigned in the order that you see in this list. You can use the **Add**, **Edit**, or  **Remove** buttons to modify the list of colors.

[Reviewing Documents](#) on page 349

Callouts Preferences

Oxygen XML Editor can display callouts for [review items such as comments and tracked changes](#). To customize options for review callouts, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Review > Callouts**.

The available options are as follows:

Show review callouts for:

Comments

If enabled, callouts are displayed for comments, including comments that are added to tracked changes.
This option is enabled by default.

Track Changes deletions

If enabled, callouts are displayed for tracked change deletions and the following additional option becomes available:

Show deleted content in callout

If enabled, the deleted content is also displayed in the callout.

Track Changes insertions

If enabled, callouts are displayed for tracked change insertions and the following additional option becomes available:

Show inserted content in callout

If enabled, the inserted content is also displayed in the callout.

Rendering section

Show review time

When enabled, timestamp information is displayed in callouts.

Show all connecting lines

When enabled, lines are shown that connect the callout to the location of the change.

Initial width (px)

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

Text lines count limit

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select  **Edit Comment** or  **Show Comment**.

Profiling/Conditional Text Preferences

Oxygen XML Editor lets you configure how *profiling and conditional text* is displayed in **Author** mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure **Profiling/Conditional Text** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.

Note: Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in **Author** mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA Subject Scheme Map is defined in the root map of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

Import from DITAVAL

This button allows you to import profiling attributes from .ditaval files. You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Editor displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

Note: When importing profiling attributes from DITAVAL files, Oxygen XML Editor automatically creates condition sets based on these files.

Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the **New** button at the bottom of the table [to add profiling attributes](#), the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

Report invalid profiling attribute values

If selected, it means the following:

- In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
- In the DITA  **Validate and Check for Completeness** dialog box, the [Report attributes and values that conflict with profiling preferences option](#) is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the **Edit Profiling**

Attributes action from the contextual menu in **Author** mode (or for DITA topics, the  **Edit Properties** action in the **DITA Maps Manager**), the **Profiling Values Conflict dialog box** will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Editor behaves as if the **Preserve the configuration** option has been chose in the **Profiling Values Conflict dialog box** and that dialog box will never appear.

Configure profiling colors and styles link

Use this link to open the [profiling Colors and Styles preference page](#).

Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the **New** button at the bottom of the table [to add condition sets](#), the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

Colors and Styles Preferences

Oxygen XML Editor lets you set the colors and styles used to display *profiling / conditional text* in the **Author mode editor**. To set Colors and Styles preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.

The preference page includes the following options and sections:

Import from DITAVAL

Allows you to import profiling styles from .ditaval files. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Editor displays a dialog box containing two tables: the first one previews the imported styles and the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones.

Profiling Colors and Styles Table

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the [Profiling / Conditional Text](#) preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the **Defined attributes values** category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name and value). This is the reason why a style from this category can only be [reset](#), not deleted.
- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the [Profiling / Conditional Text](#) preferences page. In this category are listed:
 - All the styles that were defined in other projects (with other profiling attribute value sets).
 - All the styles set for the profiling attributes defined in a [subject scheme map](#).

Automatic styling button

If you click this button, Oxygen XML Editor will apply automatic styling to the profiling attribute values that do not have a style defined.

New button

Opens the **Add Profiling Style** dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

Note: You can define a default style for a specific attribute by setting the **Attribute value** field to **<ANY>**. This style is applied for attribute values that do not have a specific style associated with it.

Edit button

Open the **Edit Profiling Style** dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

Clear style button

Resets the style for the selected value to its default setting (no color or decoration).

Delete button

Delete the selected style from the **Other** category.

[Styling the Rendering of Profiled Content Using a DITAVAL File](#) on page 1642

Attributes Rendering Preferences

Oxygen XML Editor lets you [display the profiling attributes applied to your content](#) in the **Author** mode editor. To configure how the profiling attributes appear, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes Rendering**. When the [Show Profiling Attributes option](#) is enabled, the **Author** mode displays conditional text markers at the end of conditional text blocks. Use the options in this page to customize the rendering of these text markers.

The following options are available:

Show profiling attribute name

If checked, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

Background color

Sets the background color used to display the profiling attributes.

Attribute name foreground color

Sets the foreground color used to display the names of the profiling attributes.

Attribute values foreground color

Sets the foreground color used to display values of the profiling attributes.

Border color

Sets the color of the border of the block that displays the profiling attributes.

MathML Preferences

Oxygen XML Editor allows you to [edit MathML](#) equations and displays the results in a preview window. For a more specialized *MathML* editor, you can [install Design Science MathFlow](#), which is a commercial product that requires a separate license.

To configure the *MathML* editor or to enter your *MathFlow* license information, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > MathML**.

You can configure the following options:

Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the **Author** mode.

MathFlow installation directory

The installation folder for the *MathFlow* components product (*MathFlow SDK*).

MathFlow license file

The license file for the *MathFlow* components product (*MathFlow SDK*).

MathFlow preferred editor

A *MathML* formula can be edited in one of three editors of *MathFlow* components product (*MathFlow SDK*).

- **Structure Editor** (default selection) - Targets professional XML workflow users.
- **Style Editor** - Tailored to the needs of content authors.
- **Simple Editor** - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

Save special characters

Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in &name ; format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek Omega character is saved as &Omega ;.

- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the &#xNNN format. For example, the Greek *Omega* character is saved as Ω.
- **As character values** - Saves the characters as the actual symbol. For example, the Greek *Omega* character is saved as Ω.

More documentation is available on the [Design Science MathFlow](#) website.

AutoCorrect Preferences

Oxygen XML Editor includes an option to automatically correct misspelled words as you type in **Author** mode. To enable and configure this feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The following options are available:

Enable AutoCorrect

This option is enabled by default. When enabled, while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Editor will automatically replace it with the value listed in the **With** column.

Use additional suggestions from the spell checker

If enabled, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Editor will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

Note: The AutoCorrect feature shares the same options configured in the [Language options](#) and [Ignore elements](#) sections in the [Spell Check](#) preferences page.

Spell Check options link

Use this link to navigate to the [Spell Check Preferences page](#).

Replacements Table section

The AutoCorrect feature uses the Replacements table to automatically replace anything that is listed in the **Replace** column with the value listed in the **With** column for each language.

Replacements for language drop-down menu

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the AutoCorrect feature. It is simply the language for the Replacements table.

Replacements Table

You can double-click on cells in either column to edit the listed items. Use the **Add** button to insert new items and the **Remove** button to delete rows from the table.

Note: Any changes, additions, or deletions you make to this table are saved to a path that is specified in the [AutoCorrect Dictionaries preferences page](#).

Smart quotes section

You can also choose to automatically convert double and single quotes to a quotation characters of your choice by using the following options in the **Smart quotes** section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

Global Options

If this option is selected, the options are stored on your local computer, in a folder that is not accessible to other users.

Project Options

If this option is selected, the options are stored in the project file and can be shared with other users.

Selecting **Project Options** will only save your selections in [Enable AutoCorrect](#), [Use additional suggestions from the spell checker](#), and the options in the [Smart quotes section](#). Changes to the Replacements table are

not saved in this page. To save changes to the Replacements table at project level you need to specify a custom location in [the User-defined replacements section of the AutoCorrect Dictionaries preferences page](#) and select **Project Options** from that preferences page instead.

Restore Defaults

Restores the options in this preferences page to their default values and **also deletes any changes you have made to the Replacements table**.

AutoCorrect Dictionaries Preferences

To set the Dictionaries preferences for the AutoCorrect feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Editor uses for the AutoCorrect feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Editor uses for the AutoCorrect feature are stored.

Include dictionaries from

Selecting this option allows you to specify a location where you have stored AutoCorrect dictionaries that you want to include, along with the default ones.

Important: Consider the following notes in regards to this option:

- The AutoCorrect mechanism takes into account AutoCorrect dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, en_UK.dat from the default location is merged with en_US.dat from a custom location).
- If you have a generic AutoCorrect dictionary file (one that just has a two letter language code for its file name, such as en.dat) saved in either the default or custom location, the other more specific dictionaries (for example, en_UK.dat and en_US.dat) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to [add dictionaries for the AutoCorrect feature](#).

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Tip: To save changes to [the Replacement table \(in the AutoCorrect preferences page\)](#) at project level, select a custom location for the **User-defined replacements** and select **Project Options** at the bottom of the page.

Related tasks

[Add Dictionaries for the AutoCorrect Feature](#) on page 706

Schema Design Preferences

Oxygen XML Editor provides a [graphical schema design editor](#) to make editing XML Schema easier. To configure the **Schema Design** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Schema Design**.

The following options are available in the **Schema Design** preferences page:

Show annotation in the diagram

When selected, Oxygen XML Editor displays the content of xs:documentation elements in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:

- **Always go to its definition** - Oxygen XML Editor opens the imported schema file so that you can edit it.
- **Never go to its definition** - The imported schema file is not opened and the component cannot be edited in place.
- **Always ask** - Oxygen XML Editor asks if you want to open the imported schema file.

Zoom

Allows you to set the default zoom level of the schema diagram.

Properties Preferences

Oxygen XML Editor lets you control which properties to display for XML Schema components in the *XML Schema Design view*. To configure the schema design properties displayed, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Schema Design > Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the XML Schema **Design mode**. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the XML Schema **Design mode**.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

Spell Check Preferences

Oxygen XML Editor provides support for spell checking in the **Text** and **Author** editing modes. To configure the **Spell Check** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Spell Check**.

The following options are available:

Automatic spell check

This option is disabled by default. When enabled, Oxygen XML Editor automatically checks the spelling as you type and highlights misspelled words in the document.

- **Select editors** - You can select which editors (and therefore which file types) will be automatically spelled checked. File types (such as CSS and DTD), in which automatic spell checking is not usually helpful, are excluded by default.

Spell check highlight color

Use this option to set the color used by the spell check engine to highlight spelling errors.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can [add additional dictionaries to the spell check engines](#).

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the lang or xml:lang attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the lang and xml:lang attributes are missing, the selection in the [Default language list](#) is used.

- **Do not check** - If the lang and xml:lang attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- **Comments**
- **Attribute values**
- **Text**
- **CDATA**

Options section

This section includes the following other options:

Check capitalization

When selected, the spell checker reports capitalization errors (for example, a word that starts with lowercase after etc. or i.e.).

Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, SpellChecker).

Ignore acronyms

Available only for the Hunspell spell checker. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, b2b).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, www.oxygenxml.com or c:\boot.ini).

Allow compounds words

When selected, all words formed by concatenating two legal words with a hyphen (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen (closed compounds) are also accepted.

Allow file extensions

When selected, the spell checker accepts any word ending with recognized file extensions (for example, myfile.txt or index.html).

Ignore elements section

You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '//' separators
- '*' wildcard

An example of an allowed XPath expression is: /a/*/b.

AutoCorrect options link

Use this link to navigate to the [AutoCorrect preferences page](#).

Spell Check Dictionaries Preferences

To set the Dictionaries preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries (.dic files) and term lists (.tdi files) that Oxygen XML Editor uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Editor uses the Hunspell spell checking engine:

Dictionaries and term lists default folder

Displays the default location where the dictionaries and term lists that Oxygen XML Editor uses are stored.

Include dictionaries and term list from

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

Important: Consider the following notes in regards to this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, en_UK.dic from the default location is merged with en_US.dic from a custom location).
- If you have a generic dictionary file (one that just has a two letter language code for its file name, such as en.dic) saved in either the default or custom location, the other more specific dictionaries (for example, en_UK.dic and en_US.dic) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to [add more dictionaries and term lists](#).

Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

[Adding Spell Check Term Lists](#) on page 701

Document Checking Preferences

To configure the **Document Checking** (validation) options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Document Checking**. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both [automatic validation](#) and [manual validation](#).

Validation error highlight color

The color used to highlight validation errors in the document.

Validation warning highlight color

The color used to highlight validation warnings in the document.

Validation info highlight color

The color used to highlight validation info messages in the document.

Validation success color

The color used to highlight the success indicator of the validation operation in the vertical ruler bar.

Always show validation status

If this option is enabled, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when **Automatic validation** is enabled and the vertical scroll bar changes position due to an error message being displayed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Editor.

Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

At the bottom of the preferences page you can *choose whether or not the saved options will be shared with other users by selecting Global or Project storage options*.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the **Text** and **Author** editing modes. To control additional options specifically for the **Author** mode editor, see *Whitespace Handling in Author Mode* on page 232.

Note: These settings apply to the formatting of source documents. The formatting of output documents is determined by the *transformation scenarios that create them*.

To configure the **Format** options, open the **Preferences** dialog box (**Options > Preferences**) and go to **Editor > Format**.

The following options are available:

Detect indent on open

If selected, Oxygen XML Editor detects how a document is indented when it is opened. Oxygen XML Editor uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Editor detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip: If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and **Detect line width on open** options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all your document have no indentation and you want to keep them that way.

Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the **Detect indent on open** option.

Indent size

The meaning of this setting depends on the following:

- If the **Detect indent on open option** is selected and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Editor uses the number of detected SPACE characters.
- If the **Indent with tabs option** is selected, the *indent size* is the width of a TAB character.
- If neither of these options are selected, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see *Setting an Indent Size to Zero* on page 308.

For information about when this setting is used, see *Where Indent Size and Line Width Settings are Used in Oxygen XML Editor* on page 93.

Indent on enter

If selected, when you press Enter to insert a line break in the **Text** editing mode, an indentation will be added to the new line.

Enable smart enter

If selected, when you press the Enter key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Format and indent the document on open

If selected, an XML document is formatted and indented before opening it in Oxygen XML Editor.

Note: Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

Detect line width on open

If selected, Oxygen XML Editor automatically detects the line width when the document is opened.

Hard line wrap (Limit to "Line width - Format and Indent")

If selected, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

Line width - Format and Indent

Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters. This setting is also used when saving XML content edited in the **Author** editing mode.

Note: To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Editor](#).

Clear undo buffer before Format and Indent

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Editor will be used for storing the undo states. If this option is selected, Oxygen XML Editor empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

Where Indent Size and Line Width Settings are Used in Oxygen XML Editor

The values set in the **Indent Size and Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press ENTER to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

To watch our video demonstration about the formatting options offered by Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Autodetect_Formatting.html.

XML Preferences

To configure the **XML** Formatting options, open the **Preferences** dialog box (**Options > Preferences**) and go to **Editor > Format > XML**.

The following options are available:

Format Section

This section includes the following drop-down boxes:

Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

Note: When this option is enabled, the **Break long attributes** option is automatically disabled.

Break long attributes

The **Format and Indent** operation breaks long attribute values.

Indent inline elements

The *inline elements* are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></child> </parent>
</root>
```

Indent inline elements enabled:

```
<root> text <parent>
  <child/>
</parent>
</root>
```

Indent inline elements disabled:

```
<root> text <parent> <child/> </parent> </root>
```

Expand empty elements

The **Format and Indent** operation outputs empty elements with a separate closing tag (for example, `<a attr1="v1">`). When not enabled, the same operation represents an empty element in a more compact form (`<a attr1="v1" />`).

Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

Break line before an attribute name

The **Format and Indent** operation breaks the line before the attribute name.

Element Spacing Section

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use **AND**/**OR** boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]  
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName` Note: The namespace prefixes (such as xs) are treated as part of the element name without taking its binding to a namespace into account.
- `//xs:documentation[@lang="en"]`

The tabs are as follows:

Preserve space

List of elements for which the **Format and Indent** operation preserves the whitespaces (such as blanks, tabs, and newlines).

Default space

List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

Mixed content

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

Line break

List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line *before* the element, *after*, or both.

Schema aware format and indent

The **Format and Indent** operation takes the schema information into account with regards to the *space preserve*, *mixed*, or *element only* properties of an element.

Indent Section

Includes the following options:

Indent (when typing) in preserve space elements

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to *preserve* or by their presence in the [Preserve space tab of the Element Spacing list](#)) are ignored by the **Format and Indent** operation. When this option is enabled and you edit one of these elements, its content is formatted.

Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, disable this option.

Whitespaces Preferences

When Oxygen XML Editor formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Editor allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XML > Whitespaces**.

This table lists the Unicode whitespace characters. Check any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The **Format and Indent** action is applied on an XML document.
- You switch from **Text** mode to **Author** mode.
- You switch from **Author** mode to **Text** mode.

Note: The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

Important: The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

XQuery Preferences

To configure the **XQuery** Formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XQuery**.

The following options are available:

- **Preserve line breaks** - All initial line breaks are preserved.
- **Break line before an attribute name** - Each attribute of an XML element is written on a new line and properly indented.

XPath Preferences

To configure the **XPath** Formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > XPath**.

The following option is available:

- **Format XPath code embedded in XSLT, XSD and Schematron files** - If enabled, the **Format and Indent** action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.

Note: For XSLT documents, the formatting is not applied to *attribute value templates*.

CSS Preferences

Oxygen XML Editor can format and indent your CSS files. To configure the **CSS** formatting options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

Class body on new line

If enabled, the *class* body (including the curly brackets) is placed on a new line. Disabled by default.

Indent class content

When enabled, the *class* content is indented. Enabled by default.

Add space before the value of a CSS property

When enabled, whitespaces are added between the : (colon) and the value of a style property. Enabled by default.

Add new line between classes

If enabled, an empty line is added between two classes. Disabled by default.

Preserve empty lines

When enabled, the empty lines from the CSS content are preserved. Enabled by default.

Allow formatting embedded CSS

When enabled, CSS content that is embedded in XML is also formatted when the XML content is formatted. Enabled by default.

JavaScript Preferences

To configure the **JavaScript** format options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Format > JavaScript**.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is enabled by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Editor to format embedded JavaScript code, taking precedence over the [Schema aware format and indent](#) option. This option is enabled by default.

Content Completion Preferences

Oxygen XML Editor provides a **Content Completion Assistant** that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the **Content Completion** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion**. These options control how the **Content Completion Assistant** works.

The following options are available:

Auto close the last opened tag

When enabled, Oxygen XML Editor automatically closes the last open tag when you type `</`.

Automatically rename/delete/comment matching tags

If you rename, delete, or comment out a start tag, Oxygen XML Editor automatically renames, deletes, or comments out the matching end tag.

Note: If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

Enable content completion

Toggles the content completion feature on or off.

Close the inserted element

When you choose an entry from the **Content Completion Assistant** list of proposals, Oxygen XML Editor inserts both start and end tags. The following additional options are available in regards to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Editor inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is [associated with the edited XML document](#).
 - **Add optional content** - If enabled, Oxygen XML Editor inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
 - **Add first Choice particle** - If enabled, Oxygen XML Editor inserts the first **choice** particle specified in the DTD, XML Schema, or RELAX NG schema.

Case sensitive search

When enabled, the search in the **Content Completion Assistant** is case-sensitive when you type a character ('a' and 'A' are different characters).

Note: This option is ignored when the current language itself is not case sensitive. For example, the case is ignored in the CSS language.

Position cursor between tags

When enabled, Oxygen XML Editor automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the [Insert the required attributes option](#) is disabled.

Show all entities

Oxygen XML Editor displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, &).

Insert the required attributes

Oxygen XML Editor inserts automatically the required attributes taken from the DTD or XML Schema.

Insert the fixed attributes

If enabled, Oxygen XML Editor automatically inserts any FIXED attributes from the DTD or XML Schema for an element inserted with the help of the **Content Completion Assistant**.

Show recently used items

When enabled, Oxygen XML Editor remembers the last inserted items from the **Content Completion Assistant** window. The number of items to be remembered is limited by the **Maximum number of recent items shown**

list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line .

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the **Content Completion Assistant** window.

Learn attributes values

When enabled, Oxygen XML Editor learns the attribute values used in a document.

Learn on open document

Oxygen XML Editor automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on CTRL-SPACE (COMMAND-SPACE on OS X))

When enabled, Oxygen XML Editor learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space (Command + Space on OS X)** on your keyboard;

Note: In order to be learned, the words need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from last key press until the **Content Completion Assistant** is displayed.

Related information

[Configuring the Proposals for Attribute and Element Values](#) on page 1208

Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Editor can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > Annotations**.

The following options are available:

Show annotations in Content Completion Assistant

Oxygen XML Editor displays the schema annotations of an element, attribute, or attribute value currently selected in the **Content Completion Assistant** proposals list.

Show annotations in tooltip

Oxygen XML Editor displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the **Elements** view.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. When this option is disabled the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Editor recommends prefixing with the doc : particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

When this option is enabled, Oxygen XML Editor uses the following mechanism to collect annotations:

- If at least one doc : comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc : comment is found in the entire DTD, all comments are considered annotations and displayed as such.

When the option is disabled, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

When this option is selected, any element outside the Relax NG namespace, that is `http://relaxng.org/ns/structure/1.0`, is considered annotation and is displayed in the annotation window next to the **Content Completion Assistant** window and in the **Model** view. When this option is not selected, only elements

from the Relax NG annotations namespace, that is `http://relaxng.org/ns/compatibility/annotations/1.0` are considered annotations.

Related information

[Schema Annotations in Text Mode](#) on page 295

XSLT Preferences

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Editor can suggest elements from these vocabularies. To configure the XSLT content completion options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > XSLT**.

The following options are available:

Include elements declared in the schema section

This section includes options in regards to detecting elements from the declared schema.

Automatically detect HTML or Formatting Objects

Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Editor analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Editor uses one of the following options:

- **None** - The **Content Completion Assistant** suggests only XSLT elements.
- **HTML** - The **Content Completion Assistant** includes HTML elements, including HTML5 elements (such as video, canvas, etc.).
- **Formatting objects** - The **Content Completion Assistant** includes Formatting Objects (XSL-FO) elements as substitutes for `xsl:element`.
- **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

Documentation schema section

This section specifies an additional schema that will be used for documenting XSL stylesheets. You can choose between the following:

- **Build-in schema** - Uses the built-in schema for documentation.
- **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

XPath Preferences

Oxygen XML Editor provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > XPath**.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the [Content Completion Assistant in XPath expressions](#) that you enter in the match, select, and test XSL attributes and also in the [XPath toolbar](#).
- **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
- **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
- **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the [XPath Tooltip Helper](#) section for more information.
- **Function signature window background** - Specifies the background color of the tooltip window.
- **Function signature window foreground** - Specifies the foreground color of the tooltip window.

XSD Preferences

Oxygen XML Editor provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > XSD**. The option in this preferences page allows you to define additional elements to be suggested by the **Content Completion Assistant** in xs:appinfo elements (in addition to the elements defined in the XML Schema).

The following option is available:

When in "xs:appinfo" context, also include elements declared in the schema

You can choose between the following:

- **None** - The **Content Completion Assistant** offers only the XML Schema schema information.
- **ISO Schematron** - The **Content Completion Assistant** also includes ISO Schematron elements in xs:appinfo.
- **Schematron 1.5** - The **Content Completion Assistant** also includes Schematron 1.5 elements in xs:appinfo.
- **Other** - The **Content Completion Assistant** also includes elements from an XML Schema identified by a URL in xs:appinfo elements.

JavaScript Preferences

Oxygen XML Editor can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Content Completion > JavaScript**. You can configure the following options:

Enable content completion

Enables the content completion support for JavaScript files.

Use built-in libraries

Allows Oxygen XML Editor to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.

Use defined libraries

Oxygen XML Editor can also use JavaScript libraries to when making suggestions. List the paths (URLs) of any JavaScript files you want Oxygen XML Editor to use when making suggestions.

Note: The paths can contain editor variables such as \${pdu}, or \${oxygenHome}. You can make these paths relative to the project directory or installation directory.

Syntax Highlight Preferences

Oxygen XML Editor supports syntax highlighting in the **Text** mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, Ant, and more.

To configure syntax highlighting, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the **Preview** panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

Note: All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the **Preview** area has a separate tab for each of them when **XML** is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

Elements/Attributes by Prefix Preferences

Oxygen XML Editor allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

Note: Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix, and not the whole element or attribute name, to be styled with a particular color, enable the **Draw only the prefix with a separate color** option.

Open/Save Preferences

Oxygen XML Editor lets you control how files are opened and saved. To configure the options for opening and saving documents, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save**.

The following options are available:

Open section

Lock local resources

When this option is selected and you open a file from the local file system or a shared network drive, Oxygen XML Editor locks the file for the current user and the file becomes read-only for other users while the lock exists. Locked and read-only files have a lock icon (displayed on their editor tabs. Newly created files are *locked* when you first save them. If you select this option with files already opened in Oxygen XML Editor, it will *lock* all the currently opened files. If you deselect this option with files already opened, it will unlock them by deleting the corresponding .lock files. When you try to save locked (read-only) files, a **Save As** dialog box will be displayed to avoid overwriting the initial resource.

Support for Special Characters section

When bidirectional text, Asian languages, or other special characters are detected

You can choose how you want Oxygen XML Editor to handle bidirectional text, Asian languages, or other special characters when they are detected. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled.
- **Disable support for special characters** - The support for special characters will always be disabled.
- **Prompt for each document** - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document.

Disable special characters support for documents larger than (characters)

Enabling bidirectional text editing support can affect performance on large files. When this option is enabled, bidirectional editing is disabled for files exceeding the specified size, even if the [Enable support for special characters](#) option is selected.

Save section

Safe save (only for local files)

In the unlikely event of a failure when attempting a **Save** action, this option provides increased protection from corruption of the original file. When this option is enabled, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

On Save, make backup copy with extension (only for local files)

If enabled, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is .bak, but that can be changed in the text field.

Automatically save the document every

If enabled, your documents are automatically saved after a preset time interval that is specified in the drop-down list.

Save all files before transformation or validation

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Check errors on save

If enabled, Oxygen XML Editor runs a validation that checks your document for errors before saving it.

Save all files before calling external tools

If enabled, all files are saved before executing an [external tool](#).

Performance section

Optimize loading in the Text edit mode for files over (MB)

File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are [several restrictions](#) for memory-intensive operations.

Show warning when loading large documents

Oxygen XML Editor will warn you if you open a file that is bigger than the specified size.

Optimize loading for documents with lines longer than (Characters)

Line wrap is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see [Editing Documents with Long Lines](#).

Show warning when loading documents with long lines

When selected, Oxygen XML Editor will warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, [format and indent the document](#) after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see [Editing Documents with Long Lines](#) on page 708.

Clear undo buffer on save

If selected, Oxygen XML Editor clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter *out of memory* errors when editing large documents.

Consider application bundles to be directories when browsing (OS X only)

This option is available only on the Mac OS X platform. When selected, the file browser dialog box allows you to browse inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on Mac OS X).

Note: The same effect can be obtained by setting the `apple.awt.use-file-dialog-packages` property to `true` or `false` in the `Info.plist` descriptor file of the Oxygen XML Editor application:

```
<key>apple.awt.use-file-dialog-packages</key>
<string>false</string>
```

Save Hooks Preferences

Oxygen XML Editor includes an option for automatically compiling LESS stylesheets. To set this option, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save > Save Hooks**.

The following option can be enabled or disabled:

Automatically compile LESS to CSS when saving

If enabled, when you save a LESS file it will automatically be compiled to CSS (disabled by default).

Important: If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Templates Preferences

This page simply allows you to navigate to the preference pages for code templates or document templates.

Code Templates Preferences

Code templates are code fragments that can be inserted at the current editing position. Oxygen XML Editor includes a set of built-in templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also define your own code templates and share them with your colleagues using the template export and import functions.

To configure **Code Templates**, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Templates > Code Templates**.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant**. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on Mac OS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on Mac OS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on Mac OS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant**. HTML markup can be used for better rendering.
- **Shortcut key** - Allows you to configure a shortcut key that can be used to insert the code template. The + character separates keys. If the **Enable platform-independent shortcut keys** checkbox is enabled, the shortcut is platform-independent and the following modifiers are used:
 - M1 represents the **Command** key on Mac OS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on Mac OS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on Mac OS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

Duplicate

Creates a duplicate of the currently selected code template.

Delete

Deletes the currently selected code template. This action is disabled for the built-in code templates.

Export

Exports a file with code templates.

Import

Imports a file with code templates that was created by the **Export** action.

You can use the following *editor variables* when you define a code template in the **Content** text box:

- `${caret}` - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${selection}` - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}`
- To prompt for values at runtime, use the `ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')` editor variable. You can set the following parameters:
 - 'message' - The displayed message. Note the quotes that enclose the message.
 - type - Optional parameter, with one of the following values:

Note: The title of the dialog box will be determined by the type of parameter and as follows:

- For `url` and `url_relative` parameters, the title will be the name of the parameter and the value of the 'message'.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Parameter	
<code>url</code>	<p>Format: <code> \${ask('message', url, 'default_value')}</code></p> <p>Description: Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Input URL', url)}</code> - The displayed dialog box has the name Input URL. The expected input type is URL. • <code> \${ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value <code>http://www.example.com</code>.
<code>password</code>	<p>Format: <code> \${ask('message', password, 'default')}</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Input password', password)}</code> - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. • <code> \${ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
<code>generic</code>	<p>Format: <code> \${ask('message', generic, 'default')}</code></p> <p>Description: The input is considered to be generic text that requires no special handling.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Hello world!')}</code> - The dialog box has a Hello world! message displayed. • <code> \${ask('Hello world!', generic, 'Hello again!')}</code> - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
<code>relative_url</code>	Format: <code> \${ask('message', relative_url, 'default')}</code>

Parameter	
	<p>Description: Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.</p> <p>Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • \${ask('File location', relative_url, 'C:/example.txt')} - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.
combobox	<p>Format: \${ask('message' , combobox , ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))}</p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. • \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')} • \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}
editable_combobox	<p>Format: \${ask('message' , editable_combobox , ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'))}</p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p>

Parameter	
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx') }</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
radio	<p>Format: <code> \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated <code>real_value</code>.</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx') }</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems. <p>Note: In this example Mac OS X is the default selected value and if selected it would return osx for the output.</p>

- 'default-value' - optional parameter. Provides a default value.
- `${timeStamp}` - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- `${uuid}` - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java [UUID](#) class.
- `${id}` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `${cfn}` - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- `${cfne}` - Current file name with extension. The current file is the one currently opened and selected.
- `${cf}` - Current file as file path, that is the absolute file path of the current edited document.
- `${cfdf}` - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- `${frameworksDir}` - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `${pd}` - The file path for the parent folder of the current project selected in the **Project** view.
- `${oxygenInstallDir}` - Oxygen XML Editor installation folder as file path.
- `${homeDir}` - The path (as file path) of the user home folder.
- `${pn}` - Current project name.
- `${env(VAR_NAME)}` - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `${system(var.name)}` editor variable.
- `${system(var.name)}` - Value of the `var.name` Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the `${env(VAR_NAME)}` editor variable instead.
- `${date(pattern)}` - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd;`

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about xs:datetime, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.

[Code Templates](#) on page 300

Document Templates Preferences

Oxygen XML Editor provides a selection of document templates that make it easier to create new documents in a variety of formats. The list of available templates is presented when you create a new document. You can also [create your own templates](#) and share them with others. You can store your custom file templates in the existing templates folder in the Oxygen XML Editor installation directory or store them in a custom directory. If you store them in a custom direction, you need to add that directory to the list of template directories that Oxygen XML Editor uses.

To add a template directory, follow these steps:

1. [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Templates > Document Templates**.
2. Use the **New** button to select a location of the new document template folder.

This will add the folder to the list in this preferences page and it will now appear in the [New document wizard](#).

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you create a [corresponding properties file](#), you need to set the type property to dita.

You can also use the **Edit** or **Delete** buttons to manage folders in the list, and you can alter the order in which Oxygen XML Editor looks in these directories by using the **Up** and **Down** buttons.

Mark Occurrences Preferences

This preferences page specifies which types of files will have the [Highlight IDs Occurrences](#) feature activated. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Mark Occurrences**:

The following options are available in this preferences page:

Highlight component occurrences in the current file for:

- **XML files** - Activates the [Highlight IDs Occurrences](#) feature in XML files.
- **XSLT files** - Activates the [Highlight Component Occurrences](#) feature in XSLT files.
- **XML Schema files** - Activates the [Highlight Component Occurrences](#) feature in XSD files.
- **WSDL files** - Activates the [Highlight Component Occurrences](#) feature in WSDL files.
- **RNG files** - Activates the highlight component occurrences feature in RNG files.
- **Schematron files** - Activates the [Highlight Component Occurrences](#) feature in Schematron files.
- **Ant files** - Activates the [Highlight Component Occurrences](#) feature in Ant files.

Declaration highlight color

Allows you to choose the color to be used for highlighting component declarations.

Reference highlight color

Allows you to choose the color to be used for highlighting component references.

Custom Validation Engines Preferences

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines than can be associated to a particular editor and used for validating documents. To access this page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Custom Validation Engines**.

If you want to add a new custom validation tool or edit the properties of an exiting one, you can use the **Custom Validator** dialog box displayed by pressing the **New** or **Edit** button.

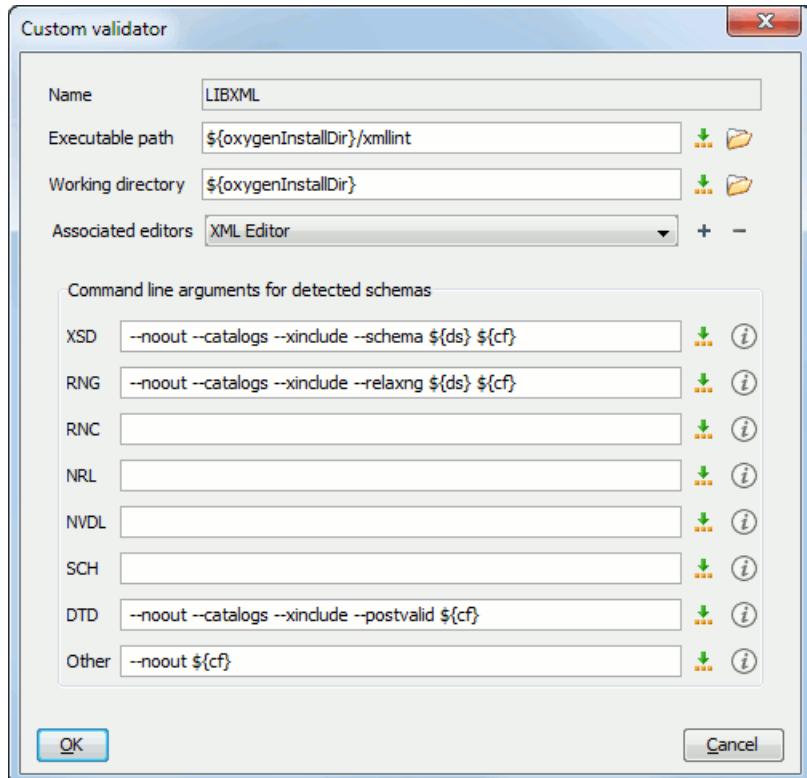

Figure 22: Custom Validator Dialog Box

The **Custom Validator** dialog box allows you to configure the following parameters:

Name

Name of the custom validation engine that will be displayed in the **Validation** toolbar drop-down menu.

Executable path

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

Working directory

The working directory of the custom validation tool. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

Associated editors

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

Command line arguments for detected schemas

Command line arguments used in the commands that validate the currently edited file against various types of schema (W3C XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables:

- \${cf} - Current file as file path, that is the absolute file path of the current edited document.
- \${currentFileURL} - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- \${ds} - The path of the detected schema as a local file path for the current validated XML document.
- \${dsu} - The path of the detected schema as a URL for the current validated XML document.

Related information

[Editor Variables](#) on page 164

Increasing the Stack Size for Validation Engines

To prevent the appearance of a *StackOverflowException* error, use one of the following methods:

- Use the **com.oxygenxml.stack.size.validation.threads** property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify $1x1024x1024=1048576$.
- Increase the value of the **-Xss** parameter.

Note: Increasing the value of the **-Xss** parameter affects all the threads of the application.

Related information

[Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor](#) on page 173

CSS Validator Preferences

To configure the **CSS Validator** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **CSS Validator**.

You can configure the following options for the built-in **CSS Validator** of Oxygen XML Editor:

- **Profile** - Selects one of the available validation profiles: **CSS 1**, **CSS 2**, **CSS 2.1**, **CSS 3**, **CSS 3 with Oxygen extensions**, **SVG**, **SVG Basic**, **SVG Tiny**, **Mobile**, **TV Profile**, **ATSC TV Profile**. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen](#) that can be used in [Author mode](#). That means all Oxygen specific extensions are accepted in a CSS stylesheet by [the built-in CSS validator](#) when this profile is selected.
- **Media type** - Selects one of the available mediums: **all**, **aural**, **braille**, **embossed**, **handheld**, **print**, **projection**, **screen**, **tty**, **tv**, **presentation**, **oxygen**.
- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: **All**, **Normal**, **Most Important**, **No Warnings**.
- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. As wildcards you can use:
 - * to match any string.
 - ? to match any character.
- **Recognize browser CSS extensions (also applies to content completion)** - If checked, Oxygen XML Editor recognizes (no validation is performed) browser-specific CSS properties. The **Content Completion Assistant** lists these properties at the end of its list, prefixed with the following particles:
 - -moz- for Mozilla.
 - -ms- for Internet Explorer or Edge.
 - -o- for Opera.
 - -webkit- for Safari/Webkit.

XML Preferences

This section describes the panels that contain the user preferences related with XML.

XML Catalog Preferences

To configure the **XML Catalog** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Catalog**.

The following options are available:

Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used. Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

Note: If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs it is sometimes useful to see what catalog files are parsed, if they are valid or not, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the XML catalog resolver that will be displayed in the **Catalogs** table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

Resolve schema locations also through system mappings

If enabled, Oxygen XML Editor analyzes both *uri* and *system* mappings to resolve the location of schema.

Note: This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the *uri* mappings. The namespace is taken into account only when the schema specified in the *schemaLocation* attribute was not resolved successfully. If disabled, the system IDs are used to resolve the schema location.

Use default catalog

If this option is enabled and Oxygen XML Editor cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see [How Oxygen XML Editor Determines which Catalog to Use](#) on page 476.

Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Delete

Deletes the currently selected catalog from the list.

Up

Moves the selection to the previous resource.

Down

Moves the selection to the following resource.

Note: When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a [manual Validate action](#) so that the XML catalog changes take full effect.

You can also add or configure catalogs at framework level from the **Catalogs tab** in the [Document Type configuration dialog box](#).

Related information

[Controlling the Catalog Resolver](#)

[Working with XML Catalogs](#) on page 475

XML Parser Preferences

To configure the **XML Parser** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser**.

The configurable options of the built-in XML parser are as follows:

Enable parser caching (validation and content completion)

Enables re-use of internal models when validating and provides content completion in opened XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

Ignore the DTD for validation if a schema is specified

Forces validation against a referenced schema (W3C XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against a W3C XML Schema or a Relax NG schema.

Note: Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

Enable XInclude processing

Enables XInclude processing. If checked, the XInclude support in Oxygen XML Editor is turned on for validation, rendering in **Author** mode and transformation of XML documents.

Base URI fix-up

According to the specification for XInclude, processors must add an `xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `xml:base` and / or `xml:lang` is not desired by your application, you can disable this option.

Language fix-up

The processor will preserve language information on a top-level included element by adding an `xml:lang` attribute if its include parent has a different [language] property. If the addition of `xml:lang` is undesired by your application, you can disable the language fix-up.

DTD post-validation

Enable this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you disable this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.

XML Schema Preferences

To configure options in regards to XML Schema, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema**.

This preferences page allows you to configure the following options:

Default XML Schema version

Allows you to select the version of W3C XML Schema to be used as the default. You can choose **XML Schema 1.0** or **XML Schema 1.1**.

Note: You are also able to set the XML Schema version using the **Customize** option in the [New document wizard](#).

Default XML Schema validation engine

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

Xerces validation features section

Enable full schema constraint checking

Sets the *schema-full-checking* feature to `true`. This enables a validation of the parsed XML document against a schema (W3C XML Schema or DTD) while the document is parsed.

Enable honour all schema location feature

Sets the *honour-all-schema-location* feature to `true`. All the files that declare W3C XML Schema components from the same namespace are used to compose the validation model. In case this option is disabled, only the first W3C XML Schema file that is encountered in the XML Schema import tree is taken into account.

Enable full XPath 2.0 in assertions and alternative types

When enabled (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

Saxon EE validation features section

Multiple schema imports

Forces `xs:import` to fetch the referenced schema document. By default, the `xs:import` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

Relax NG Preferences

To configure options in regards to Relax NG, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Relax NG**.

The following options are available in this page:

Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

Note: Enabling this option disables the **Check ID/IDREF** option.

Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Schematron Preferences

To configure options in regards to Schematron, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Schematron**.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should check this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When enabled, Saxon EE is used for xslt2/xslt3 query binding. If this option is disabled, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for quick fixes in Schematron files. This option is enabled by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: **xslt1**, **xslt2**, or **xslt3**.

Note: To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a queryBinding attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in [the Global Preferences page](#) will be used and only the validation messages that match that language will be presented. You can use the **Change application language** link to navigate to the preferences page where you can specify the language to be used in the application.
- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the xml:lang attribute from the Schematron root will be used and only the validation message that match that language will be presented.
- **Ignore the language and show all message** - All messages are displayed in whatever language they are defined within the Schematron schema.
- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

Note: In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language they are defined with in the Schematron schema.

Schematron 1.5 Section

XPath Version

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: **1.0**, **2.0**, or **3.0**. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

Sample XML Files Generator Preferences

The [Generate Sample XML Files tool](#) (available on the **Tools** menu) allows you to generate XML instance documents based on a W3C XML Schema. There are various options that can be configured within the tool and these options are also available in the **Sample XML Files Generator** preferences page. This allows you to set default values for these options. To configure the options for generating the XML files, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Sample XML Files Generator**.

The following options are available:

Generate optional elements

When checked, all elements are generated, including the optional ones (having the minOccurs attribute set to 0 in the schema).

Generate optional attributes

When checked, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **XML Instances Generator** preferences page). Note that type restrictions are ignored when this option is enabled. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.

Important: If all of the following are true, the **XML Instances Generator** outputs invalid values:

- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

Generate the other options as comments

If enabled, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Use incremental attribute / element names as default

If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an `a` element the generated values are: `a1`, `a2`, `a3`, and so on. If not checked, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

[Generating Sample XML Files](#) on page 585

XProc Preferences

Oxygen XML Editor includes a built-in XProc engine called *Calabash*. You can add or configure external XProc engines by using the **XProc** preferences page. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XProc**.

When **Show XProc messages** is selected all messages emitted by the XProc processor during a transformation will be presented in the results view.

To add an external engine click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

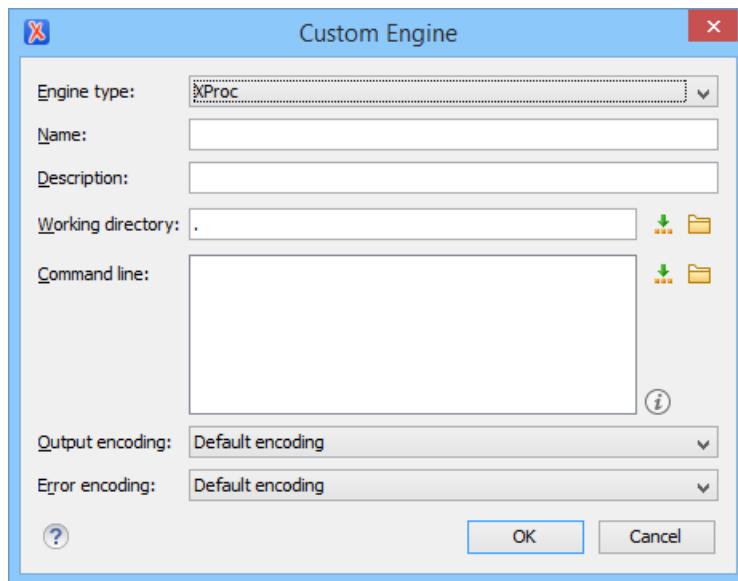

Figure 23: Creating an XProc external engine

The following options can be configured in this dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

Note: You can configure the built-in Saxon processor using the `saxon.config` file. For further details about configuring this file go to <http://www.saxonica.com/documentation9.5/index.html#!configuration/configuration-file>. You can configure the built-in Calabash processor by using the `calabash.config` file. These files are located in `[OXYGEN_INSTALL_DIR]\lib\xproc\calabash\lib`. If they do not exist, you have to create them.

XSLT-FO-XQuery Preferences

To configure options in regards to XSLT, XQuery, and FO processors, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery**. This panel contains only the most generic options for working with XSLT/XSL-FO/XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

Create transformation temporary files in system temporary directory

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

XSLT Preferences

To configure the **XSLT** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT**.

Oxygen XML Editor offers the possibility of using an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Editor). To use another XSLT transformer, specify the name of the transformer factory class. Oxygen XML Editor sets this transformer factory class as the value of the Java property: `javax.xml.transform.TransformerFactory`.

The XSLT preferences page allows you to customize the following options:

JAXP XSLT Transformer - Value

Allows you to set the value of the `TransformerFactory` Java class.

Validation engine - XSLT 1.0

Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

Validation engine - XSLT 2.0

Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

Validation engine - XSLT 3.0

Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.

Note: Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.0) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to <http://www.saxonica.com/documentation/index.html#!conformance/xslt30>.

XSLT Editor Content Completion Options link

Use this link to switch to the [XSLT Content Completion preferences page](#), where you can configure the XSLT content completion options.

Saxon6 Preferences

To configure the **Saxon 6** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon6**.

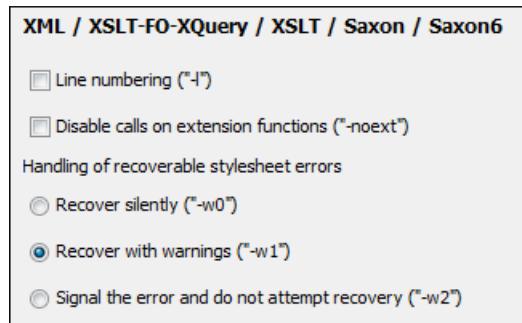

Figure 24: Saxon 6 XSLT Preferences Panel

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.

- **Disable calls on extension functions** - If enabled, external function calls are not allowed. Checking this is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
 - **recover silently** - Continue processing without reporting the error.
 - **recover with warnings** - Issue a warning but continue processing.
 - **signal the error and do not attempt recovery** - Issue an error and stop processing.

Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE**.

Oxygen XML Editor allows you to configure the following XSLT options for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file (" -config")

Sets a Saxon 9.6.0.7 configuration file that is executed for XSLT transformation and validation processes.

Version warnings (" -versmsg")

Warns you when the transformation is applied to an XSLT 1.0 stylesheet.

Line numbering (" -l")

Line numbers where errors occur are included in the output messages.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the [XSLT Debugger](#) to step into XPath expressions.

Expand attributes defaults (" -expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source (" -dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors (" -warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces (" -strip")

Allows you to choose how the `strip whitespace` operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Optimization level (" -opt ")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

The following options are available for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions (" -ext ")

If checked, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Register Saxon-CE extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.6.0.7 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

The options available specifically for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file (" -val ")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings (" -outval ")

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode (" --generateByteCode:(on|off) ")

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#javavadoc>.

Saxon-HE/PE/EE Advanced Preferences

To configure the **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced**.

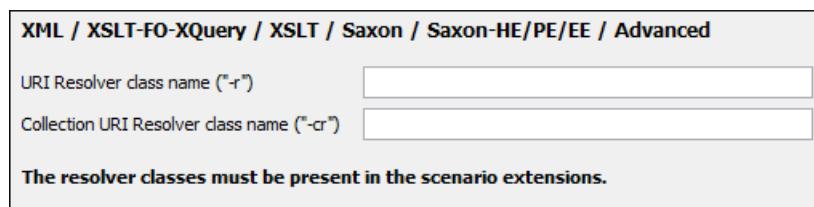

Figure 25: Saxon HE/PE/EE XSLT Advanced Preferences Panel

You can configure the following advanced XSLT options for the Saxon 9.6.0.7 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- **URI Resolver class name (" -r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from [the dialog box for configuring the XSLT extension](#) for the particular transformation scenario.
- **Collection URI Resolver class name (" -cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.6.0.7 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from [the dialog box for configuring the XSLT extension](#) for the particular transformation scenario.

XSLTProc Preferences

To configure XSLTProc options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If checked, XInclude references will be resolved when XSLTProc is used as transformer in [XSLT transformation scenarios](#).
- **Skip loading the document's DTD** - If checked, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** - If checked, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If checked, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If checked, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If checked, Oxygen XML Editor will display in the **Warnings** view the version of the **libxml** and **libxslt** libraries invoked by XSLTProc.
- **Show time information** - If checked, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If checked, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If checked, Oxygen XML Editor will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If checked, Oxygen XML Editor will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If checked, Oxygen XML Editor will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If checked, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If checked, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

MSXML Preferences

To configure the MSXML options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > MSXML**.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

Validate documents during parse phase

If checked, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is checked, the resolution is disabled.

Strip non-significant whitespaces

If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If checked, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Start transformation in this mode

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

MSXML.NET Preferences

To configure the **MSXML.NET** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XSLT > MSXML.NET**.

The options in this preferences page for the MSXML.NET processor are as follows:

Enable XInclude processing

If checked, XInclude references will be resolved when MSXML.NET is used as the transformer in the [XSLT transformation scenario](#).

Validate documents during parse phase

If checked, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is checked, the resolution is disabled.

Strip non-significant whitespaces

If checked, strips non-significant white space from the input XML document during the load phase. Enabling this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If checked, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (`System.Xml.Xsl.XslTransform` class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as ' ? '. Usually this happens when output encoding is set to ASCII. If this option checked, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (&#nnnn ; form).

Allow multiple output documents

This option allows you to create multiple result documents using the [exsl:document extension element](#).

Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in `xsl:import` and `xsl:include` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The [Use named URI resolver class option](#) specifies a partially or fully qualified URI resolver class name (for example, `Acme.Resolvers.CacheResolver`). Such a name requires additional assembly specification using this option or the [Assembly GAC name for URI resolver class option](#), but fully qualified class name (which always includes an assembly specifier) is *all-sufficient*. See MSDN for more info about [fully qualified class names](#).

Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the [global assembly cache](#) (GAC) where the specified resolver class can be found. See MSDN for more info about [partial assembly names](#).

List of extension object class names

This option allows to specify [extension object](#) classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly

MSXML.NET supports a rich library of the [EXSLT](#) and [EXSLT.NET extension functions](#) embedded or in a *plugged-in* EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

XQuery Preferences

To configure the **XQuery** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XQuery**.

The following generic XQuery preferences are available:

Validation engine

Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Editor uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

Size limit of Sequence view (MB)

When the result of an XQuery transformation is set as a sequence ([Present as a sequence option](#)) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the [Sequence view](#) and click **More results available** to extract more data from the database.

Format transformer output

Specifies whether or not the output of the transformer is formatted and indented (pretty print).

Note: This option is ignored if you choose [Present as a sequence](#) (lazy extract data from a database) from the associated transformation scenario.

Create structure indicating the type nodes

If enabled, Oxygen XML Editor takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

Note: This option is ignored if you choose **Present as a sequence** (lazy extract data from a database) from the associated transformation scenario.

Saxon-HE/PE/EE Preferences

To configure global options for XQuery transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XQuery > Saxon-HE/PE/EE**.

Oxygen XML Editor allows you to configure the following XQuery options for the Saxon 9.6.0.7 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file (" -config")

Sets a Saxon 9.6.0.7 configuration file that is used for XQuery transformation and validation scenarios.

Recoverable errors (" -warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces (" -strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Optimization level (" -opt")

Allows you to set the optimization level. It is the value is an integer in the range of 0 (no optimization) to 10 (full optimization). This option allows optimization to be suppressed when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model (" -tree:linked")

This option activates the linked tree model.

Enable XQuery 3.0 support (" -qversion:(1.0|3.0)")

If enabled (default value), Saxon runs the XQuery transformation with the XQuery 3.0 support.

The following option is available for Saxon 9.6.0.7 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions (" -ext")

If checked, calls on external functions are allowed. Checking this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 9.6.0.7 Enterprise Edition (EE) are as follows:

Validation of the source file (" -val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and enables parsing the source documents with strict schema-validation enabled.

- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode enables parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Enabling this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Generate bytecode ("--generateByteCode:(on|off)")

If you enable this option, Saxon-EE attempts to generate Java bytecode for evaluation of parts of a query or stylesheet that are amenable to such an action. For further details regarding this option, go to <http://www.saxonica.com/documentation9.5/index.html#javavadoc>.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If checked, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is enabled.

Saxon HE/PE/EE Advanced Preferences

To configure **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XQuery > Saxon-HE/PE/EE > Advanced**.

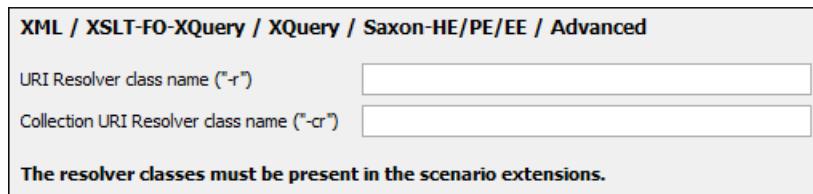

Figure 26: Saxon HE/PE/EE XQuery Advanced Preferences Panel

The advanced XQuery options that can be configured for the Saxon 9.6.0.7 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

- **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 9.6.0.7 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from [the dialog box for configuring the XQuery extension](#) for the particular transformation scenario.

Note: If your URISolver implementation does not recognize the given resource, the resolve(String href, String base) method should return a null value. Otherwise, the given resource will not be resolved through the [XML catalog](#).
- **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 9.6.0.7 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from [the dialog box for configuring the XQuery extension](#) for the particular transformation scenario.

Debugger Preferences

To configure the **Debugger** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > Debugger**.

The following options are available:

Show xsl:result-document output

If checked, the debugger presents the output of `xsl:result-document` instructions into the debugger output view.

Infinite loop detection

Enable this option to receive notifications when an infinite loop occurs during transformation.

Enable Saxon optimizations

This option is disabled by default and this means that the optimization level for the debugging process is set to zero. If it is enabled, the debugging process will use the optimization level from one of the following:

- The value specified in the [Optimization level option in an associated XSLT transformation](#) (or the same [option in an associated XQuery transformation](#)), if a transformation scenario is used in the debugging process.
- Otherwise, the value specified in the [Optimization level option in the XSLT Saxon-HE/PE/EE preferences page](#) (or the same [option in the XQuery Saxon HE/PE/EE preferences page](#)).

Maximum depth in templates stack

Allows you to set how many `xsl:template` instructions can appear on the current stack. This setting is used by the infinite loop detection.

Debugger layout

If you select the **Horizontal** layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the **Vertical** layout, the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

Debugger current instruction pointer

Allows you to set the background color of the current execution node, both in the document (XML) and XSLT/XQuery views.

XWatch evaluation timeout (seconds)

Allows you to specify the maximum time that Oxygen XML Editor allocates to the evaluation of XPath expressions while debugging.

Messages

Allows you to specify how to handle the debugging process when the source document involved in a debugging session is edited. You can choose one of the following:

- **Ask me what to do**
- **Always stop the debugging session**
- **Never stop the debugging session**

Profiler Preferences

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > Profiler** (see [Debugger Preferences](#) on page 123).

The following profiler settings are available:

Show time

Shows the total time that was spent in the call.

Show inherent time

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

Show invocation count

Shows how many times the call was called in this particular call sequence.

Time scale

Determines the unit of time measurement. You can choose between milliseconds or microseconds.

Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see [Hotspots View](#) on page 1040.

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see [Invocation Tree View](#) on page 1039.

Percentage calculation

The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- **Absolute** - Percentage values show the contribution to the total time.
- **Relative** - Percentage values show the contribution to the calling call.

FO Processors Preferences

Oxygen XML Editor includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Editor provides an easy way to add two of the most commonly used commercial FO processors: *RenderX XEP* and *Antenna House Formatter*. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Editor uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for [DITA OT transformations scenarios](#) and [XML with XSLT transformation scenarios](#).

To configure the options for the FO Processors, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > FO Processors**. The **FO Processors** preferences page is displayed.

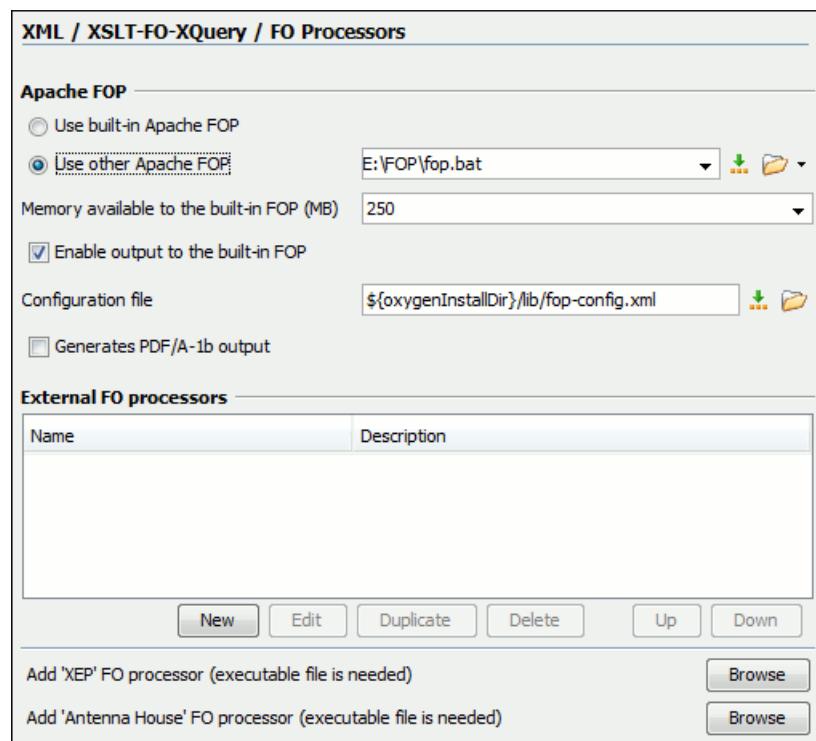

Figure 27: FO Processors Preferences Page

Apache FOP Section

In this section you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Editor to use the built-in Apache FO processor.

Use other Apache FOP

Instructs Oxygen XML Editor to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Editor window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font). You can specify the path by using the text field, the  **Insert Editor Variables** button, or the  **Browse** button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Note: All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in [Add a font to the built-in FOP](#).

Note: You cannot use the `<filterList>` key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active.*

External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the *RenderX XEP* or *Antenna House Formatter* commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If *RenderX XEP* is already installed on your computer, you can use this button to choose the XEP executable script (xep .bat for Windows, xep for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If *Antenna House Formatter* is already installed on your computer, you can use this button to choose the Antenna House executable script (AHFCmd .exe or XSLCmd .exe for Windows, and run .sh for Linux/Mac OS).

Note: The built-in **Antenna House Formatter GUI** transformation scenario requires that you configure an external FO processor that runs AHFormatter .exe (Windows only). In the [external FO Processor configuration dialog box](#), you could use " `${env(AHF63_64_HOME)}\AHFormatter.exe`" `-d ${fo}` `-s` for the value in the **Command line** field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see <https://github.com/AntennaHouse/focheck/wiki/focheck>.

You can also add external processors or configure existing ones. Press the **New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**, **Duplicate**, **Delete**, **Up**, **Down**) to configure existing external processors.

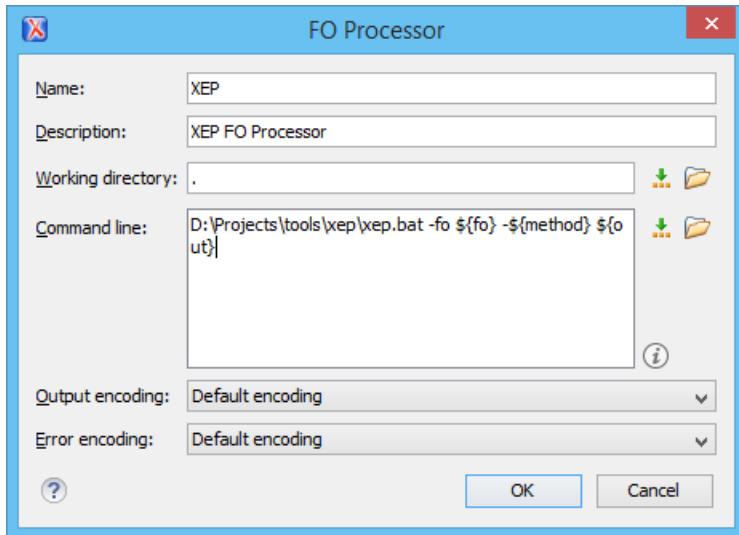

Figure 28: External FO Processor Configuration Dialog Box

The external **FO Processor** configuration dialog box includes the following options:

Name

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory

The directory where the intermediate and final results of the processing is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following editor variables:

- **`\${homeDir}`** - The path to the user home directory.
- **`\${cfd}`** - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- **`\${pd}`** - The project directory.
- **`\${oxygenInstallDir}`** - The Oxygen XML Editor installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following editor variables:

- **`\${method}`** - The FOP transformation method: **pdf**, **ps**, or **txt**.
- **`\${fo}`** - The input FO file.
- **`\${out}`** - The output file.
- **`\${pd}`** - The project directory.
- **`\${frameworksDir}`** - The path of the frameworks subdirectory of the Oxygen XML Editor installation directory.
- **`\${oxygenInstallDir}`** - The Oxygen XML Editor installation directory.
- **`\${ps}`** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a results panel at the bottom of the Oxygen XML Editor window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a results panel at the bottom of the Oxygen XML Editor window.

XPath Preferences

To configure XPath options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > XPath**.

Oxygen XML Editor allows you to customize the following options:

Unescape XPath expression

When enabled, the entities of an XPath expressions that you type in the XPath/XQuery Builder and the [XPath toolbar](#) are unescaped during their execution. For example the expression

```
//varlistentry[starts-with(@os, 's')]
```

is equivalent with:

```
//varlistentry[starts-with(@os, 's')]
```

Multiple XPath results

Enable this option to display the results of an XPath expression in separate tabs in the [Results view](#).

XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

Custom Engines Preferences

Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

Note: You can not use these custom engines in [the Debugger perspective](#).

To configure the **Custom Engines** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT-FO-XQuery > Custom Engines**.

The table in this preferences page displays the custom engines that have been defined. Use the **New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

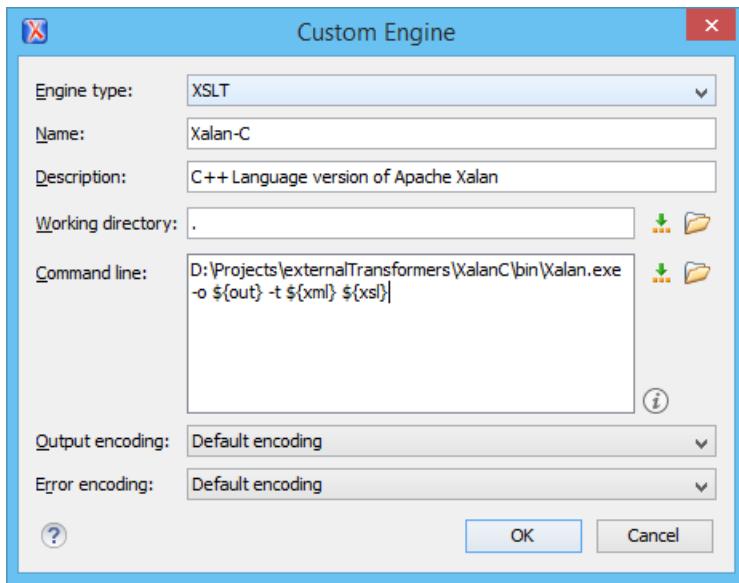

Figure 29: Parameters of a Custom Engine

The following parameters can be configured for a custom engine:

Engine type

Specifies the transformer type. You can choose between XSLT and XQuery engines.

Name

The name of the transformer displayed in the dialog box for editing transformation scenarios.

Description

A textual description of the transformer.

Working directory

The start directory of the executable program for the transformer. The following editor variables are available for making the path to the working directory independent of the location of the input files:

- **`\${homeDir}`** - The user home directory in the operating system.
- **`\${cfd}`** - The path to the directory of the current file.
- **`\${pd}`** - The path to the directory of the current project.
- **`\${oxygenInstallDir}`** - The Oxygen XML Editor install directory.

Command line

The command line that must be executed by Oxygen XML Editor to perform a transformation with the engine. The following editor variables are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **`\${xml}`** - The XML input document as a file path.
- **`\${xmlu}`** - The XML input document as a URL.
- **`\${xsl}`** - The XSL / XQuery input document as a file path.
- **`\${xslu}`** - The XSL / XQuery input document as a URL.
- **`\${out}`** - The output document as a file path.
- **`\${outu}`** - The output document as a URL.
- **`\${ps}`** - The platform separator that is used between library file names specified in the class path.

Output Encoding

The encoding of the transformer output stream.

Error Encoding

The encoding of the transformer error stream.

Ant Preferences

To set Ant preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Ant**. This panel allows you to choose the directory containing the Apache Ant libraries (the so-called *Ant Home*) that Oxygen XML Editor uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Editor installation kit.
- **Custom** - the path to an Ant distribution of your choice.

Import Preferences

To configure importing options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > Import**. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

Create empty elements for empty values

If checked, an empty value from a database column or from a text file is imported as an empty element.

Create empty elements for null values

If checked, null values from a database column are imported as empty elements.

Escape XML content

Enabled by default, this option instructs Oxygen XML Editor to escape the imported content to an XML-safe form.

Add annotations for generated XML Schema

If checked, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd'T'HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and `HH:mm:ss` for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.
- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

Table 3: Pattern Letters

Letter	Date or Time Component	Presentation	Examples
G	Era designator	Text	AD
y	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10

Letter	Date or Time Component	Presentation	Examples
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
H	Hour in day (0-23)	Number	0
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30
s	Second in minute	Number	55
S	Millisecond	Number	978
z	Time zone	General time zone	Pacific Standard Time; PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- *Text* - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- *Number* - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- *Year* - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- *Month* - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- *General time zone* - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
 - *GMTOffsetTimeZone* - GMT Sign Hours : Minutes
 - *Sign* - one of + or -
 - *Hours* - one or two digits
 - *Minutes* - two digits
 - *Digit* - one of 0 1 2 3 4 5 6 7 8 9

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- *RFC 822 time zone*: The RFC 822 4-digit time zone format is used:
 - *RFC822TimeZone*
 - *TwoDigitHours* (must be between 00 and 23)

XML Signing Certificates Preferences

Oxygen XML Editor provides two types of *keystores* for certificates that are used for digital signatures of XML documents: Java KeyStore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A keystore file is protected by a password. To configure a certificate keystore, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Signing Certificates**. You can customize the following parameters of a keystore:

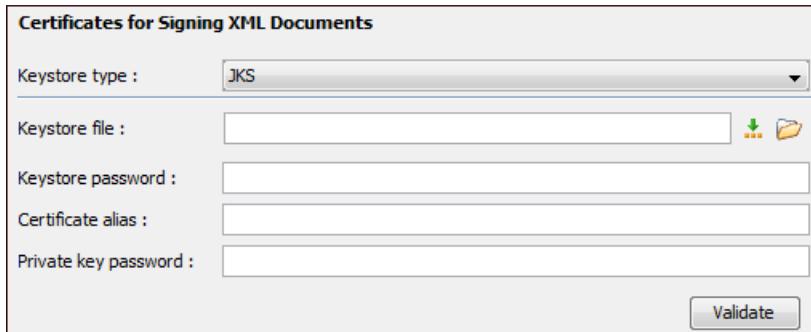

Figure 30: Certificates Preferences Panel

- **Keystore type** - The type of keystore that Oxygen XML Editor uses (**JKS** or **PKCS-12**).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the keystore.
- **Private key password** - The private key password of the certificate (required only for JKS keystores).
- **Validate** - Press this button to verify the configured keystore and the validity of the certificate.

XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**. The following option is available in this preferences page:

Load additional refactoring operations from

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

DITA Preferences

To access the DITA Preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **DITA**. This preferences page includes the following sections and options:

DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Editor installation) to be used for validating and publishing DITA content. You can select from the following:

Built-in DITA-OT 1.8

If this is set, all defined DITA transformation scenarios will run with DITA-OT 1.8.5. The built-in DITA OT 1.8.5 directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`.

Built-in DITA-OT 2.x (with support for DITA 1.3 and Lightweight DITA)

Starting with Oxygen 18.0, this is the default setting. All defined DITA transformation scenarios will run with DITA-OT 2.3.3. This also gives you access to DITA 1.3 file templates when you [create new documents from templates](#). The default DITA OT 2.3.3 directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x`.

Custom

Allows you to specify a custom directory for your DITA OT distribution.

Location

You can either provide a new file path for the specific DITA OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the [Insert Editor Variables](#) button, or the [Browse](#) button.

DITA Maps file patterns

Allows you to specify the extension types that will be handled as DITA maps when opened in Oxygen XML Editor.

When opening a map

Oxygen XML Editor can open a DITA map in the regular editor view or in the [DITA Maps Manager](#). This option allows you to specify how a map will be opened. You can choose one of the following options:

- **Always open in the DITA Maps Manager** - A DITA map file is always opened in the **DITA Maps Manager** view.
- **Always open as XML** - A DITA map file is always opened in the XML editor.
- **Always ask** - When opening a DITA map, you are prompted to choose between opening it in the XML editor panel or in the **DITA Maps Manager** view.

Prefer navigation title for topicref rendering

If enabled and there is a navtitle attribute set on a topicref, then the navtitle is used to render the title of the topic in the **DITA Maps Manager**.

Insert topic reference section

Allows you to specify that when inserting a topic reference (using the [Insert Reference dialog box](#) and [Edit Properties dialog box](#)), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If enabled, the attribute will always be automatically populated with a detected value.
- **Scope** - If enabled, the sformatcope attribute will always be automatically populated with a detected value.
- **Type** - If enabled, the type attribute will always be automatically populated with a detected value.
- **Navigation title** - If enabled, the navtitle attribute will always be automatically populated with a detected value.

Insert link section

Allows you to specify that when a link reference is inserted (using actions in the drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If enabled, the format attribute will always be automatically populated with a detected value.
- **Scope** - If enabled, the scope attribute will always be automatically populated with a detected value.
- **Type** - If enabled, the type attribute will always be automatically populated with a detected value.

Use '.' instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with ". " (#./elementId).

For more information, see <https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html>.

File name generation rules for new topics section

The options in this section pertain to the rules that will be used to generate file names in the [New DITA File dialog box](#) if the **Use the title to generate the file name** option is selected.

Replace spaces with

If selected, the file name generation mechanism will replace spaces in the title with the character entered in this option.

Lower case only

Select this option if you want the file name generation mechanism to only use lower case letters.

Use camel case

If selected, the file name generation mechanism will convert the title to a *camel* case file name.

Upper case first letter

Select this option if you want the file name generation mechanism to convert the title to a *camel* case file name but use an upper case letter for the first word.

Show console output

Allows you to specify when to display the console output log. The following options are available:

- **When build fails** - displays the console output log if the build fails.
- **Always** - displays the console output log, regardless of whether or not the build fails.

Profiling Attributes link

Link to the [Profiling Attributes preferences page](#), where you can configure how profiling and conditional text is displayed in **Author** mode.

Data Sources Preferences

To configure the **Data Sources** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see [Download Links for Database Drivers](#) on page 137.

Connection Wizards Section

Create eXist-db XML connection

Click this link to open the dedicated [Create eXist-db XML connection dialog box](#) that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Data Sources	
Name	Type
JDBC-ODBC Bridge	Generic JDBC
WebDAV FTP	WebDAV FTP
xDB DS	Documentum xDB
DocumentumDS	Documentum (CMS)

+

Figure 31: Data Sources Preferences Panel

The following buttons are available at the bottom of the **Data Sources** panel:

New

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

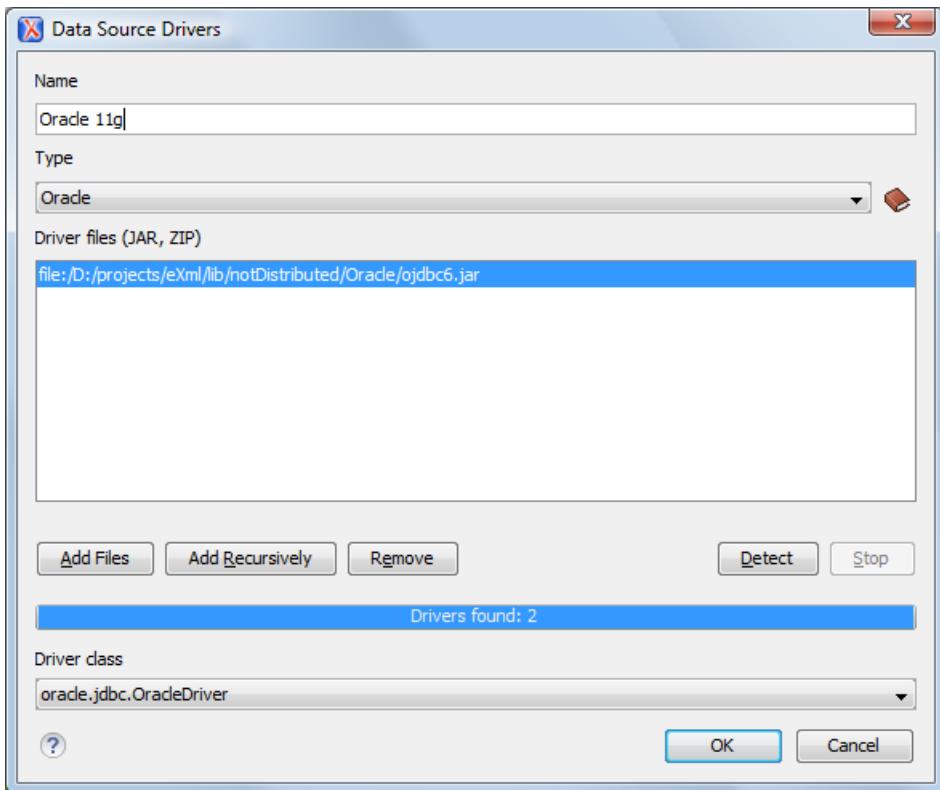

Figure 32: Data Sources Drivers Dialog Box

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
 -  **Help button** - Opens the User Manual at [the list of the sections](#) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
 - **Driver files (JAR, ZIP)** - Lists [download links for database drivers](#) that are necessary for accessing databases in Oxygen XML Editor.
 - **Add Files** - Adds the driver class library.
 - **Add Recursively** - Adds driver files recursively.
 - **Remove** - Removes the selected driver class library from the list.
 - **Detect** - Detects driver file candidates.
 - **Stop** - Stops the detection of the driver candidates.
 - **Driver class** - Specifies the driver class for the data source driver.

Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

Duplicate

Creates a copy of the selected data source.

Delete

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

Connections		
Browsable	Name	URL
<input checked="" type="checkbox"/>	MySQL Connection	jdbc:mysql://10.0.0.16:3306/test
<input checked="" type="checkbox"/>	DocumentumConnection	http://10.0.0.150:9080
+ - X ↑ ↓		
Limit the number of cells <input type="text" value="2000"/>		
Maximum number of children for container nodes <input type="text" value="200"/>		

Figure 33: Connections Preferences Panel

The following buttons and options are available at the bottom of the **Connections** panel:

+ New

Opens the **Connection** dialog box that allows you to configure a new database connection.

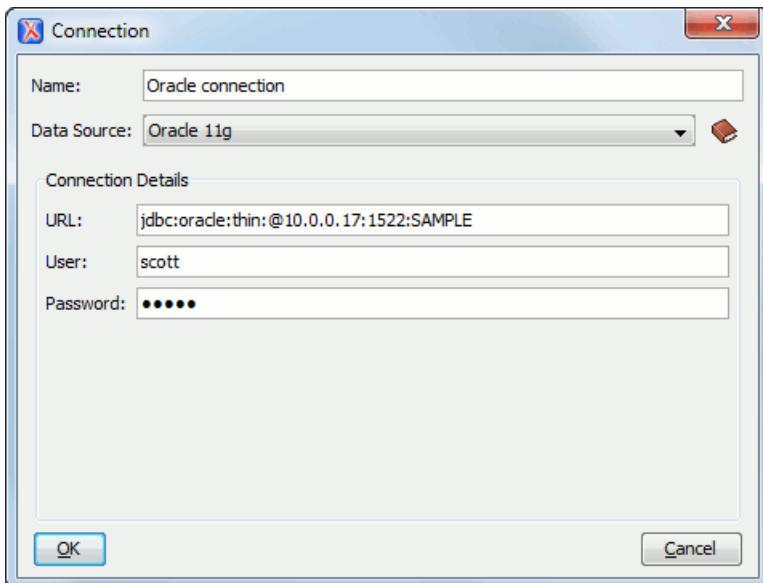

Figure 34: Connection Dialog Box

The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Environment home directory** - Specifies the home directory (only for a Berkeley database).
- **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).

- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

Edit

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

Duplicate

Creates a copy of the selected connection.

Delete

Deletes the selected connection.

Move Up

Moves the selected connection up one row in the list.

Move Down

Moves the selected connection down one row in the list.

Limit the number of cells

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer** view for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer** view, a warning dialog box will inform you that the table is only partially shown.

Maximum number of children for container nodes

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer** view would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. Navigation to other contained resources from the same container is enabled by the *Up* and *Down* buttons in the **Data Source Explorer** view. This limited number is set in the field. The default value is 200 nodes.

Table Filters Preferences

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer** view. To open this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**
- **Synonym**
- **System Table**
- **Table**
- **View**

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Editor:

- **Berkeley DB XML database** - Copy the *.jar* files from the Berkeley database install directory into the Oxygen XML Editor install directory as described in [the procedure for configuring a Berkeley DB data source](#).
- **IBM DB2 Pure XML database** - Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the *db2jcc.jar* and *db2jcc_license_cu.jar* files in Oxygen XML Editor for [configuring a DB2 data source](#).

- **eXist database** - Copy the jar files from the eXist database install directory to the Oxygen XML Editor install directory as described in [the procedure for configuring an eXist data source](#).
- **MarkLogic database** - Download the MarkLogic driver from [MarkLogic Community site](#).
- **Microsoft SQL Server 2005 / 2008 database** - Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to <http://www.microsoft.com/en-us/download/details.aspx?id=21599>. For SQL Server 2012 and 2014 go to <http://www.microsoft.com/en-us/download/details.aspx?id=11774>.
- **Oracle 11g database** - Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called ojdbc6.jar.
- **PostgreSQL 8.3 database** - Go to <http://jdbc.postgresql.org/download.html> and download the PostgreSQL 8.3 JDBC3 driver.
- **Documentum xDB (X-Hive/DB) 10 XML database** - Copy the jar files from the Documentum xDB (X-Hive/DB) 10 database install directory to the Oxygen XML Editor install directory as described in [the procedure](#) for configuring a Documentum xDB (X-Hive/DB) 10 data source.

SVN Preferences

To configure the options for the SVN client tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN**. Some other preferences for the embedded SVN client tool can be set in the global files called config and servers. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool (**Tools > SVN Client**) and select **Global Runtime Configuration > Edit 'config' file** or **Global Runtime Configuration > Edit 'servers' file** from the SVN client Options menu.

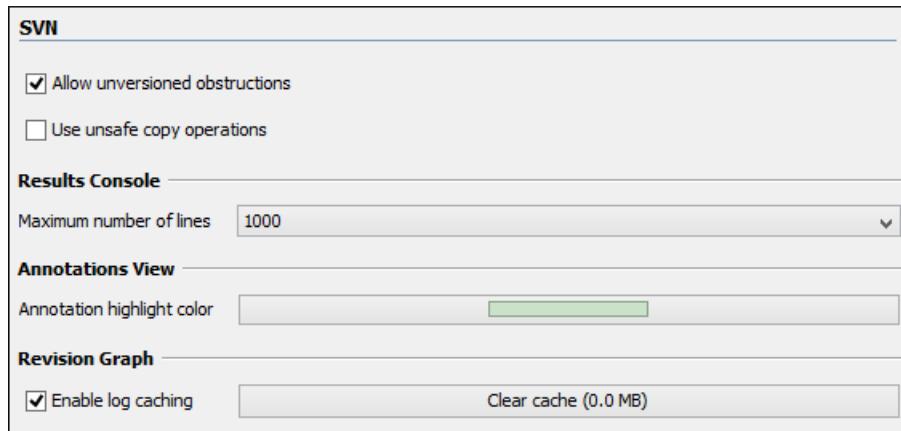

Figure 35: SVN Preferences Panel

The following SVN options can be configured in this preferences page:

Enable symbolic link support (available only on Mac OS X and Linux)

Apache Subversion™ has the ability to put a symbolic link under version control, via the usual SVN add command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a svn:special property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

Note: Windows file systems have no symbolic links, so a Windows client will not do any such translation and the object appears as a normal file.

Important: It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

Allow unversioned obstructions

Controls how to handle a situation where working copy resources are ignored / unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with

those being ignored / unversioned. If the option is enabled, the incoming items will become BASE revisions of the ones already present in the working copy, and those present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is disabled, the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is enabled.

Use unsafe copy operations

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

HTTPS encryption protocols (*available if you are using Java version 1.6 or older*)

Sets a specific encryption protocol to be used when the [application accesses a repository through HTTPS protocol](#). You can choose one of the following values:

- SSLv3, TLSv1 (default value)
- SSLv3 only
- TLSv1 only

Results Console

Specifies the maximum number of lines displayed in the **Console** view. The default value is 1000.

Annotations View

Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in [the Annotations view](#).

Revision Graph

Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

Working Copy Preferences

To configure the **Working Copy** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN > Working Copy**. The options in this preferences page are specific to SVN working copies and they include the following:

Working copies location

Allows you to define a location where you keep your working copies. This location is automatically suggested when you checkout a new working copy.

Working copy administrative directory

Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

When loading an old format working copy

You can instruct the SVN client to do one of the following:

- **Always ask** - You are notified when such a working copy is used and you are allowed to choose what action to be taken - to upgrade or not the format of the current working copy.
- **Never upgrade** - Older format working copies are left untouched. No attempt to upgrade the format is made.

Note: SVN 1.6 and older working copies still need to be upgraded before loading them.

Enable working copy caching

If checked, the content of the working copies is cached for refresh operations.

Automatically refresh the working copy

If checked, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows the last refresh operation) are refreshed from disk. Disabled by default.

Allow moving/renaming mixed revision directories

If enabled, Oxygen XML Editor will allow you to move or rename a directory even if its child items have a different revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is recommended to leave this option disabled and to **Update** the subtree to a single revision before moving or renaming it.

When synchronizing with repository

The action that will be executed automatically after the **Synchronize** action. The possible actions are:

- **Always switch to 'Modified' mode** - The **Synchronize** action is followed automatically by a switch to **Modified** mode of **Working Copy** view, if **All Files** mode is currently selected.
- **Never switch to 'Modified' mode** - Keeps the currently selected view mode unchanged.
- **Always ask** - The user is always asked if they want to switch to **Modified** mode.

Application global ignores

Allows you to set file patterns that may include the * and ? wildcards for unversioned files and folders that must be ignored when displaying the working copy resources in *the Working Copy view*. These patterns are case-sensitive. For example, *.txt matches file.txt, but does not match file.TXT.

Diff Preferences

To configure the SVN Diff options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff**.

The following option is available:

Compare With External Application

Specifies an external application to be launched for compare operations in the following cases:

- When two history revisions are compared.
- When the working copy file is compared with a history revision.
- When a conflict is edited.

The parameters \${firstFile} and \${secondFile} specify the positions of the two compared files in the command line for the external diff application. The parameter \${ancestorFile} specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

Important: If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or tokens must be double-quoted for the Oxygen XML Editor to correctly parse and identify them. For example, C:\Program Files\compareDir\app name.exe must be written as "C:\Program Files\compareDir\app name.exe".

Messages Preferences

The **Messages** preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **SVN > Messages**.

This preferences page allows you to disable the following warning messages:

Show confirmation dialog when using the "Update All" action

Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

Show confirmation dialog for drag and drop actions in Working Copy

This option avoids doing a drag and drop when you just want to select multiple files in the **Working Copy** view.

Show warning dialog when editing conflicts

When the **Edit Conflicts** action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then [proceeds with the visual editing of the conflicting file](#).

Show warning dialog when "svn:externals" definitions are ignored

A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as *Update* and *Override and Update*).

Diff Preferences

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

Files Comparison Preferences

To configure the **Files Comparison** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Files Comparison**.

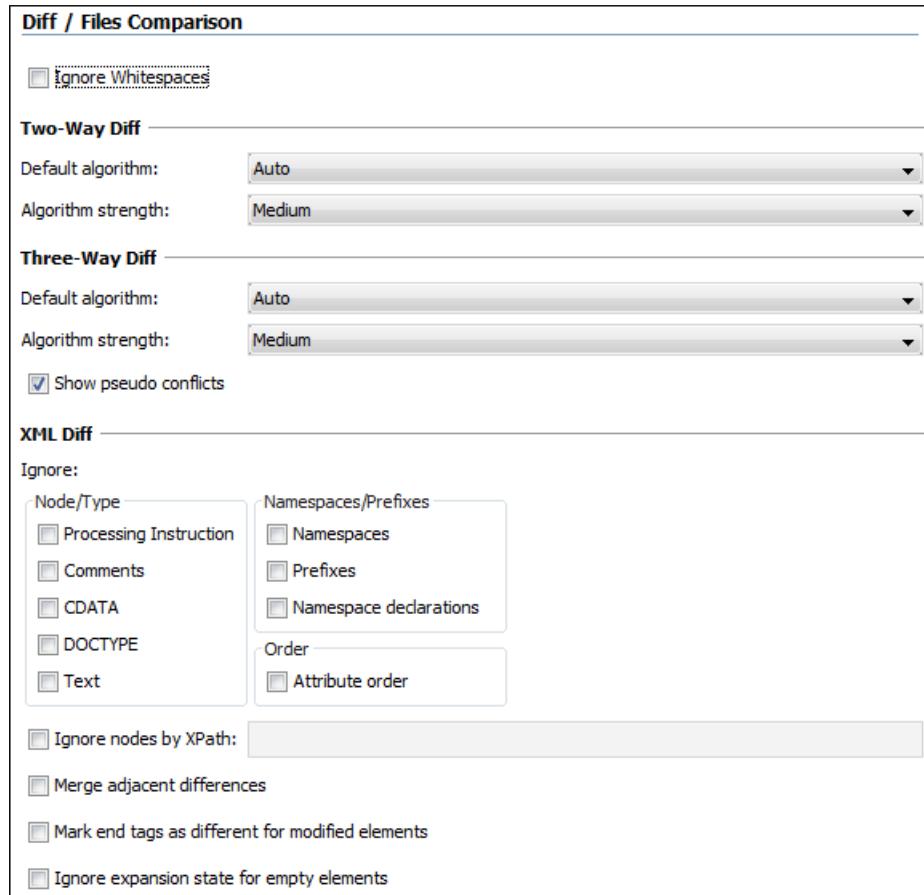

Figure 36: Files Comparison Preferences Page

This preferences page allows you to configure the following options:

Ignore Whitespace

If enabled, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

Note: If the **Ignore Whitespace** checkbox is selected, comparing the a b sequence with a b, Oxygen XML Editor finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing a b with ab (no whitespace between a and b), Oxygen XML Editor signals a difference.

Two-Way Diff section

Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).

- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Three-Way Diff section

Default algorithm

The default algorithm used for performing a three-way comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Show pseudo conflicts

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

XML Diff section

Ignore

Allows you to specify the types of XML nodes that will be ignored in the file comparison for the **XML Fast** and **XML Accurate** algorithms.

Ignore nodes by XPath

If enabled, you can enter an *XPath expression* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. The XPath expression specified in this option is used as the default ignore instructions **only** when the application is started. If you enter an XPath expression in the similar option on the **Diff Files** toolbar, that expression will be used instead.

Merge adjacent differences

If enabled, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If disabled, every difference is represented separately.

Mark end tags as different for modified elements

If enabled, end tags of modified elements are also presented as differences. Otherwise, only the start tags are presented as differences.

Ignore expansion state for empty elements

If enabled, empty elements in both expansion states are considered matched (that is <element /> and <element></element> are considered equal).

Appearance Preferences

To configure the appearance options for the Files Comparison tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Files Comparison > Appearance**. This preferences page offers the following options:

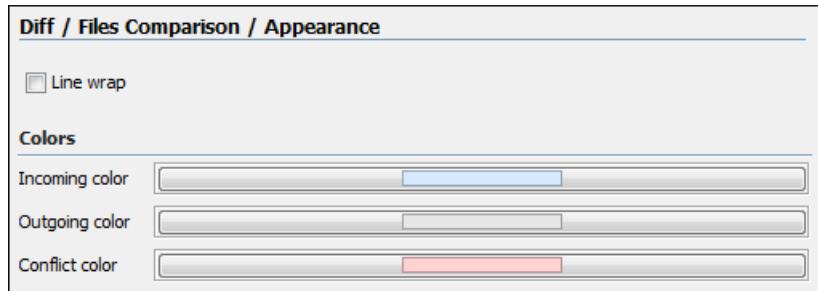

Figure 37: Files Comparison Appearance Preferences Panel

Line wrap

Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

Incoming color

Specifies the color used on the vertical bar for incoming changes.

Outgoing color

Specifies the color used on the vertical bar for outgoing changes.

Conflict color

Specifies the color used on the vertical bar for conflicts between the compared files.

Directories Comparison Preferences

To configure the **Directories Comparison** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Directories Comparison**.

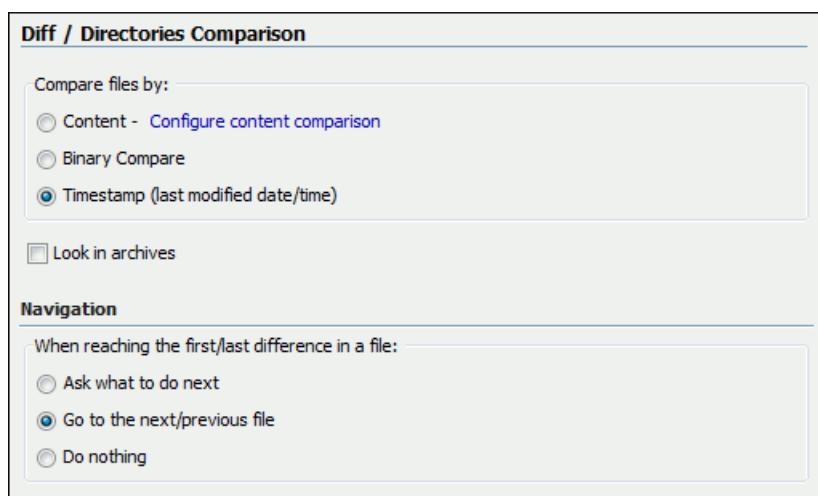

Figure 38: Diff Preferences Page

For the directories comparison, you can specify the following options:

Compare files by

Controls the method used for comparing two files:

- **Content** - The file content is compared using the current *diff algorithm*. This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).
- You can use the **Configure content comparison** link to open the [Files Comparison preferences page](#) where you can configure options for comparing files. However, the **Ignore nodes by XPath** option is ignored when using the **Compare Directories** tool.
- **Binary Compare** - The files are compared at byte level.
- **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.

Look in archives

If checked, [known archive types](#) are considered directories and their content is compared just like regular files.

Navigation

This options control the behavior of the differences traversal actions ([Go to previous modification](#), [Go to next modification](#)) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

Appearance Preferences

To configure the appearance options for the Directories Comparison tool, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Diff > Directories Comparison > Appearance**.

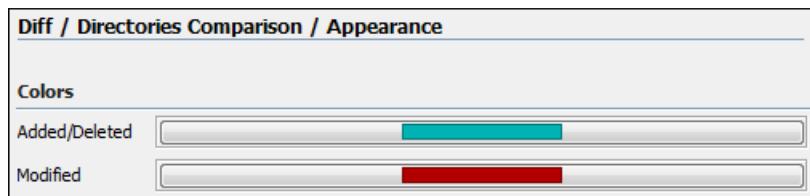

Figure 39: Diff Appearance Preferences Panel

- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

Archive Preferences

To configure Archive preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Archive**.

The following options are available in the **Archive** preferences page:

Archive backup options

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

Note: Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Editor. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

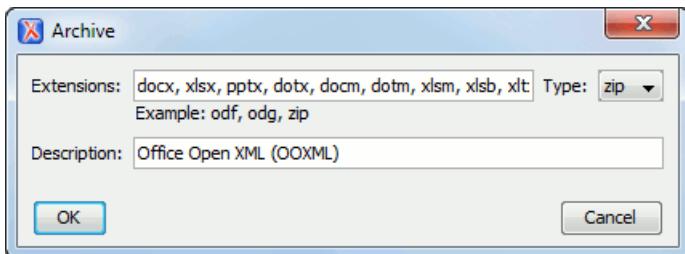

Figure 40: Edit Archive Extension Mappings

Important: You have to restart Oxygen XML Editor after removing an extension from the table for that extension to not be recognized as an archive extension.

Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

Plugins Preferences

You can add plugins that extend the functionality of Oxygen XML Editor. The plugins are shipped as separate packages. To check for new plugins, go to http://www.oxygenxml.com/oxygen_sdk.html.

A plugin consists of a separate sub-folder in the Plugins folder of the Oxygen XML Editor installation folder. This sub-folder must contain a valid plugin.xml file in accordance with the plugin.dtd file located in the Plugins folder.

Oxygen XML Editor automatically detects and loads plugins installed correctly in the Plugins folder and displays them in the **Plugins** preferences page. To configure plugins, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Plugins**.

You can use the check-boxes in front of each plugin to enable or disable them. To display the properties of a plugin in the second section of the **Plugins** preferences page, click the name of the plugin.

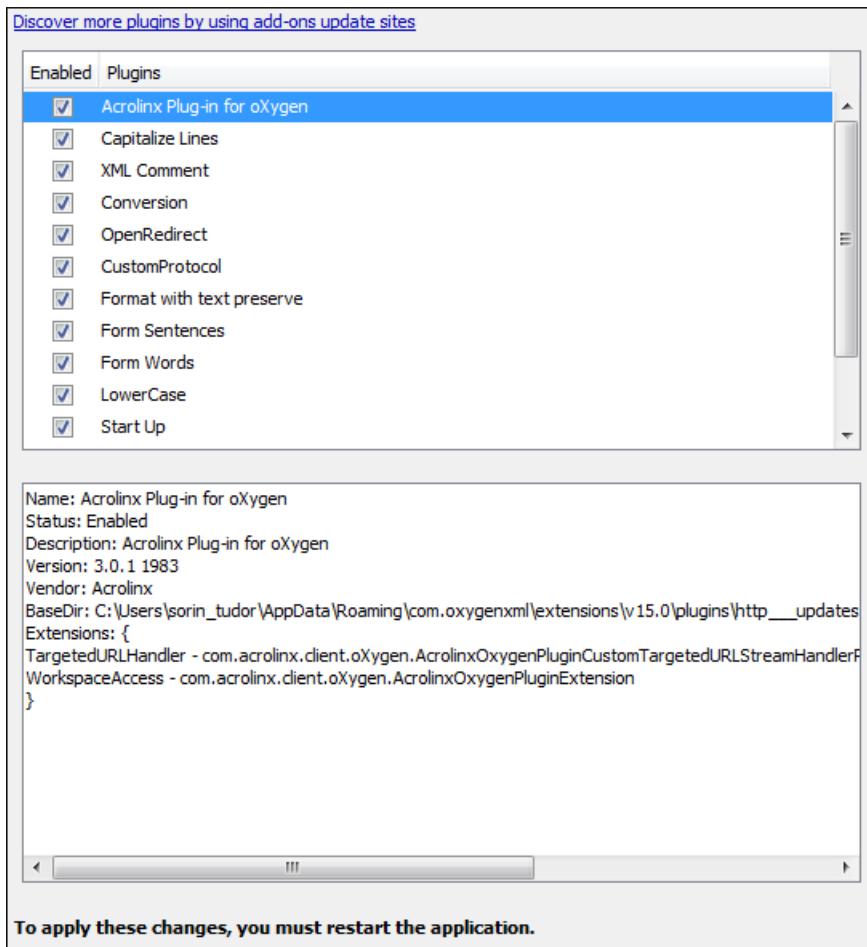

Figure 41: Plugins Preferences Panel

Also, you can install a plugin as an add-on. For further details about this, go to [Deploying Add-ons](#)

External Tools Preferences

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. The **External Tools** preferences page allows you to add and configure these external tools that could be used while working with Oxygen XML Editor. To access this preferences page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **External Tools** (or select **Configure** from the **Tools > External Tools** menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by

selecting it from the **Tools > External Tools** menu or from the **External Tools** drop-down menu on the toolbar (the **Tools** toolbar needs to be enabled in the [Configure Toolbars dialog box](#)).

How to Configure an External Tool

To configure an external tool in the **External Tools** preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** - Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the **External Tools** configuration dialog box.

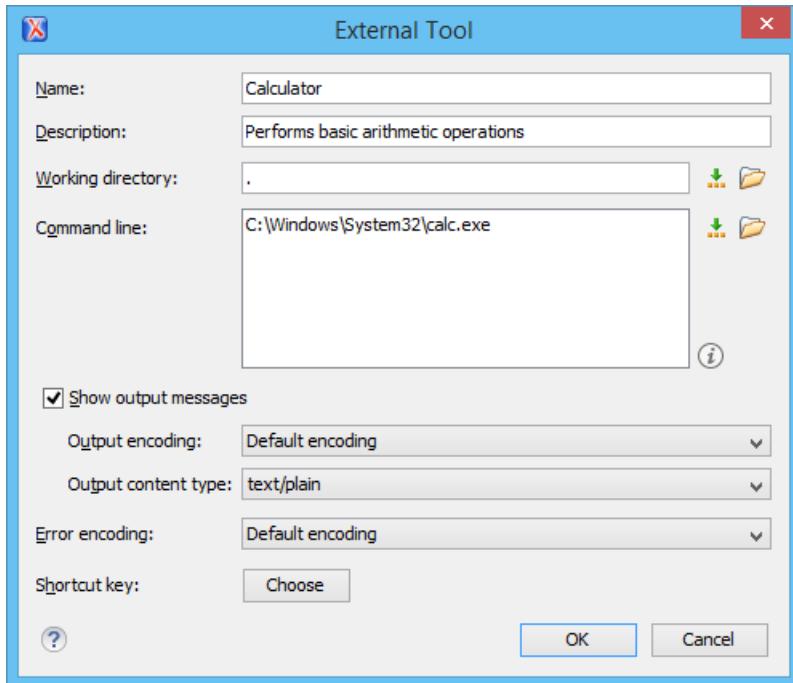

Figure 42: External Tools Configuration Dialog Box

This configuration dialog box includes the following options:

Name

The name of tool that will be displayed in the **Tools > External Tools** menu and in the **External Tools** drop-down menu on toolbar.

Description

A description of the tool displayed as a tooltip where the tool name is used.

Working directory

The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following editor variables: `$(cfid)`, `$(pd)`, `$(oxygenInstallDir)`, `$(homeDir)`, `$(system(var.name))`, `$(date(pattern))`, `$(xpath_eval(expression))`. You can also use the browsing tools to select the directory.

Command line

The command line that will start the external tool. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button. You can use one of the following editor variables: `$(homeDir)`, `$(home)`, `$(cfn)`, `$(cfne)`, `$(cf)`, `$(currentFileURL)`, `$(cfid)`, `$(cfdu)`, `$(tsf)`, `$(pd)`, `$(pdu)`, `$(oxygenInstallDir)`, `$(oxygenHome)`, `$(frameworksDir)`, `$(frameworks)`, `$(ps)`, `$(timeStamp)`, `$(uuid)`, `$(id)`, `$(afn)`, `$(afne)`, `$(af)`, `$(afu)`, `$(afd)`, `$(afdu)`, `$(ask('message', type, 'default_value'))`, `$(dbgXML)`, `$(dbgXSL)`, `$(env(VAR_NAME))`, `$(system(var.name))`, `$(date(pattern))`, and `$(xpath_eval(expression))`. You can also use the browsing tools to select a file path.

Show output messages

When this option is enabled, all the messages emitted by the external tool are displayed in the **Results** view. When this option is disabled, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used by Oxygen XML Editor to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instruct Oxygen XML Editor how to display the generated output. For example, setting the **Output content type** to `text/xml` enables the syntax coloring of XML output.

Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Editor to read the error stream.

Shortcut key

You can choose a keyboard shortcut that can be used to launch the external tool.

Menu Shortcut Keys Preferences

You can use the **Menu Shortcut Keys** preferences page to configure shortcut keys for the actions available in Oxygen XML Editor. The shortcuts assigned to actions are displayed in a table in this preference page. To access the full list of shortcut keys, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Menu Shortcut Keys** (or simply go to **Options > Menu Shortcut Keys**).

For a list of the most commonly used shortcuts, see [Frequently Used Shortcut Keys](#) on page 17.

Menu Shortcut Keys		
Name	Category	Shortcut key
Remove all	Bookmarks	Ctrl+F7
Remove all	Breakpoints	Ctrl+Shift+F7
Remove all	Highlights	
Remove all	Results	
Remove comment(s)	Edit	
Remove from Disk	Project	Shift+Delete
Remove from Project	Project	Delete
Remove from version control	Working copy	
Remove highlight(s)	Edit	
Remove selected	Results	Delete
Rename	Archive Browser	F2
Rename	File	F2
Rename	Markup	
Rename	Project	F2
Rename	SharePoint	F2
Repositories	Perspective	

Figure 43: Menu Shortcut Keys Preferences Page

The **Menu Shortcut Keys** preferences page also contains the [shortcuts that you define at document type level](#).

Note: A shortcut defined at *document type level* overwrites a default shortcut.

To find a specific action, you can use the filter to search through any of the columns in the table. You can also click on a column header to sort that column.

The table includes the following columns:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action. For example, by default, the *Remove all* action has one shortcut key assigned for *bookmarks* and another one assigned for *breakpoints*.
- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and press the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on Mac OS X only) - Controls the way the HOME and END keys are interpreted. If enabled, the default behavior of these keys is overridden and the cursor only moves on the current line.

How to Assign a Shortcut Key or Edit an Existing Shortcut

To assign a shortcut key to an action or edit an existing shortcut configuration, follow these steps:

1. Select the action in the table.
2. Click the **Edit** button.

Step Result: The **Shortcut key** configuration dialog box is displayed.

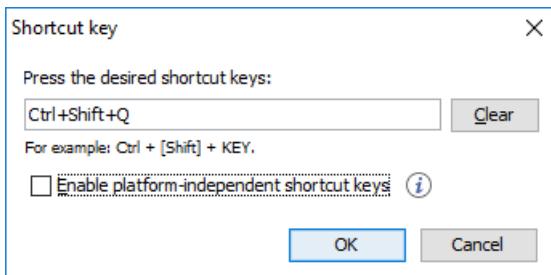

Figure 44: Shortcut Key Configuration Dialog Box

3. Press the desired shortcut keys on your keyboard.
4. If you need the shortcut to work on multiple platforms, check the **Enable platform-independent shortcut keys** option. In this case, the following modifiers are used:
 - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
 - M2 represents the **Shift** key.
 - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
 - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
5. Click **OK** to save your configuration.

[Frequently Used Shortcut Keys](#) on page 17

File Types Preferences

Oxygen XML Editor offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **File Types**.

File Types	
Extension	Editor
ant	ANT Editor
aspx	XML Editor
atom	XML Editor
bat	Batch Editor
bookmap	XML Editor
c	C Editor
c++	C++ Editor
cc	C++ Editor
cmd	Batch Editor
cpp	C++ Editor
css	CSS Editor
jsp	XML Editor

New Edit Delete

Ant build patterns:

Binary file patterns:

Figure 45: File Types Preferences Page

The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor, etc.).

If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in the [Encoding for non XML files option](#) is used for opening and saving a file of this type.

The files that match the **Ant build patterns** will be associated with the Ant editor.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the [Project view: File/Replace in Files, Check Spelling in Files, Validate](#).

Open/Find Resource Preferences Page

You can configure various options that pertain to the [Open/Find Resource dialog box](#) and [Open/Find Resource view](#). To access these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to [Open/Find Resource](#).

The following options are available in this **Open/Find Resource** preferences page:

Limit search results to

Specifies the maximum number of results that are displayed in the **Open/Find Resource** dialog box/view.

Enable searching in content

This option is enabled by default and it allows you to use the **Open/Find Resource** dialog box/view to search in content or reviews, as well as in file paths. If this option is disabled, you can only use the **Open/Find Resource** feature to search in file paths.

Content search scope section

Ignore content of these files

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, *.txt ignores all the .txt files, */topics/* ignores all the files from the topics directory, regardless of their depth, and file:/C:/tmp/* ignores everything from the tmp directory.

Note: The specified pattern must begin with the desired protocol (in our case *file*) and also contain forward slash (/).

Index the content of remote resources

Controls the indexing of resources that are not local. For example, the resources referenced in a DITA map opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, enable this option.

Note: Enabling this option may lead to delays when the indexing is computed.

Content search options section

Content language

Use this option to specify a language for the search engine to use for the current document. This is helpful if you have multiple languages within the content of a document. The search engine will use a set of stop words and analyzers tuned specifically for that specific language. By default, it is mapped to the [UI language specified in the Global preferences page](#). Therefore, you need to change this option only if the language of the text you want to perform the search in differs from the UI language.

Tip: If you select <Generic language (no stemming)> from the drop-down list, no word stemming is performed when creating the index. This might be useful if your content has many technical terms that should be indexed as they are.

Stop words

A list of stop words that will be filtered out of the search processing. The list is automatically populated based upon the specified Content language, but you can add or remove words from the list.

When searching in content, return

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- **Exact matches** - The search results match the exact whole words that you enter in the search field of the Open/Find Resource dialog box/view.
- **Prefix matches** (default) - The search results match documents that contain words starting with the search terms. For instance, searching for "pref page" will also find documents containing "preference page".

Automatically join search terms using:

Allows you to select the default boolean operator that Oxygen XML Editor applies when you perform a search. For example, if the AND operator is selected and you search for "car assembly", the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

Enable XML-aware searching

When enabled, you can perform [XML-specific searches](#) for XML elements and attributes.

Note: Enabling this option may slow down the indexing of your documents and increase the index size on the disk.

Index files with size less than (KB)

Since indexing can be slowed down when the [Enable XML-aware searching option](#) is active, you can use this option to set a maximum file size to be indexed.

Stop Words

A list of comma separated stop words, meaning that the words added in this list are filtered out prior to processing a search query.

Custom Editor Variables Preferences

An editor variable is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the [built-in editor variables](#).

Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. To create a new variable, click the **New** button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the **Edit** button and configure the variable in the subsequent dialog box. You can also use the **Delete** button to remove custom editor variables that are no longer needed.

Custom Editor Variables		
Name	Value	Description
`\${startDir}`/bin	Start directory of command line validator
`\${standardParams}`	-c config.xml -v -level 5 -list	List of command line standard parameters

New **Edit** **Delete**

Figure 46: Custom Editor Variables Table

Network Connection Settings Preferences

This section presents the options available in the **Network Connection Settings** preferences pages.

Proxy Preferences

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the **Proxy** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > Proxy**. The following options are available:

Proxy section

Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

- **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
- **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.

Attention: The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome based Linux systems, but it does not work on KDE based ones as the Java virtual machine does not offer the necessary support yet.

- **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the **Web Proxy (HTTP/HTTPS)** section.

Web Proxy (HTTP/HTTPS) section

Address

The address of the proxy server used for manual configurations.

Port

The port of the proxy server used for manual configurations.

No proxy for

Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, myhost.example.com) or as a domain name (for example, example.com). Use a comma to separate multiple hosts.

User

The user name for authentication with the proxy server.

Password

The password for authentication with the proxy server.

SOCKS Proxy section

Address

The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

Port

The port of a SOCKS proxy that all connections will pass through.

Using a Proxy Auto-Configuration Script (PAC)

If you have set up the path to a Proxy auto-configuration script in your system, Oxygen XML Editor cannot detect this setting out of the box.

You can create a new folder (`[OXYGEN_INSTALL_DIR]\lib\endorsed`) in which you should copy two additional Java libraries: `deploy.jar` and `plugin.jar`. These libraries can be found in the `[OXYGEN_INSTALL_DIR]\jre\lib` folder if the application came with a bundled Java VM (otherwise, in the Java VM installation used to run the application).

HTTP(S)/WebDAV Preferences

To set the **HTTP(S)/WebDAV** preferences, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > HTTP(S)/WebDAV**. The following options are available:

Internal Apache HttpClient Version

Oxygen XML Editor uses the Apache HttpClient to establish connections to HTTP servers. For Oxygen XML Editor to benefit from particular sets of features provided by different versions, you may choose between v3 and v4.

Note: For a full list of features, go to <http://hc.apache.org/httpclient-3.x/> and <http://hc.apache.org/httpcomponents-client-ga/>.

Maximum number of simultaneous connections per host

Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a **Denial of Service** attack. You can avoid that by lowering the value of this option.

Note: The minimum value that can be set in this option is 5.

Read Timeout (seconds)

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

Enable HTTP 'Expect: 100-continue' handshake (for HTTP/1.1 protocol)

Activates *Expect: 100-Continue* handshake. The purpose of the *Expect: 100-Continue* handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the *Expect: 100-continue* handshake can result in noticeable performance improvement when working with databases. The *Expect: 100-continue* handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.

Use the 'Content-Type' header field to determine the content type

When checked, Oxygen XML Editor tries to determine a resource type using the **Content-Type** header field. This header indicates the *Internet media type* of the message content, consisting of a type and subtype. For example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in `.xml` is considered to be an XML file.

Automatic retry on recoverable error

When enabled, if an HTTP error occurs when Oxygen XML Editor communicates with a server via HTTP (for example, sending or receiving a SOAP request to or from a Web services server) and the error is recoverable, Oxygen XML Editor tries to re-send the request to the server.

Automatically accept a security certificate, even if invalid

When enabled, the HTTPS connections that Oxygen XML Editor attempts to establish will accept all security certificates, even if they are invalid.

Important: By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

Lock WebDAV files on open

If checked, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

(S)FTP Preferences

To configure the (S)FTP options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > (S)FTP**. You can customize the following options:

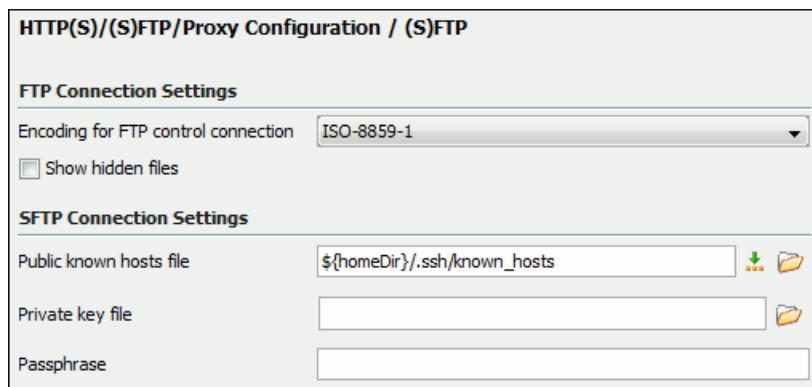

Figure 47: (S)FTP Configuration Preferences Panel

- **Encoding for FTP control connection** - The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Editor will use it for communication. Otherwise, it will use ISO-8859-1.
- **Public known hosts file** - File containing the list of all SSH server host keys that you have determined are accurate. The default value is `${homeDir}/.ssh/known_hosts`.
- **Private key file** - The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in [the Open URL dialog box](#).

- **Passphrase** - The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in [the Open URL dialog box](#).

Trusted Hosts Preferences

This preferences page contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Editor will allow connections to the listed hosts without requesting user confirmation.

To configure the **Trusted Hosts** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

- **New** - Allows you to manually add a new entry to the list of trusted hosts.

Tip: You can specify a specific port at the end of the URL (for instance, www.example.com:8080). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

- **Delete** - Allows you to remove an entry from the list of trusted hosts.

SSH Preferences

To configure the **SSH** options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Connection settings > SSH**. The following options are available:

- **SSH** - Specifies the command line for an external SSH client that will be used when connecting to a SVN +SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the **Default SVN user** (the same user name as the SSH client user) or **Prompt for a SVN user** for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the plink.exe tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

```
C:\plink-install-folder\plink.exe -l username -pw password -ssh -batch
host_name_or_IP_address_of_SVN_server
```

XML Structure Outline Preferences

To configure options in regards to the **Outline** view, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML Structure Outline**. It contains the following options:

Preferred attribute names for display

The preferred attribute names when displaying the attributes of an element in the **Outline** view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

Enable outline drag and drop

Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

Views Preferences

The **Views** preferences page allows you to configure some options in regards to certain views. To edit these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Views**.

The following options are available:

Project view section

Enable drag-and-drop in Project view

Enables drag and drop support in the [Project view](#). It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.

Information view section

Maximum number of lines

Specifies the maximum number of lines that can be written in the [Information view](#).

Elements view section

Show only items allowed at cursor position

If enabled, when editing in **Author** mode, only the elements that are allowed at the current cursor position will be listed in the [Elements view](#). If disabled, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view (in **Author** mode only). These tabs list the elements that are allowed before or after the element at the current cursor position.

Messages Preferences

The **Messages** preference page allows you to specify whether or not certain messages are displayed. To configure these options, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Messages**.

The following warning messages can be enabled or disabled:

Show confirmation dialog when moving resources

Specifies whether or not to display a confirmation dialog box when you move a resource in the **Project** view, **Data Source Explorer**, and **Archive Browser**. In the confirmation dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

Show warning when adding resources already included in the project

Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.

Show warning for document size limit for bidirectional text, Asian languages, and other special characters

Specifies whether or not to display a warning message when an opened file that contains bidirectional characters is too large and bidirectional support is disabled.

Show warning message when changing the text orientation in the editor

Specifies whether or not to display a warning message when you change the text orientation in the editor.

Show warning when editing long expressions in the XPath toolbar

Specifies whether or not to display an information dialog box that allows you to specify if you want to use the [XPath/XQuery Builder](#) view when editing long XPath expressions.

Show MathFlow recommendation

Specifies whether or not to display an information dialog box that recommends using the [MathFlow Editor](#) to edit MathML equations.

Show SFTP certificate warning dialog

Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.

Show Enterprise license related message when trying to connect to a Microsoft SharePoint server

Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.

Convert DB Structure to XML Schema

When tables from a database schema are selected in the **Select database table** section of the [Convert DB Structure to XML Schema dialog box](#) and another database schema is expanded, a confirmation is needed since the previous selection will be discarded. This option specifies whether or not you are always asked if you want the other database schema to always be expanded without asking you, or it is never expanded.

Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions

Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the **Encode Selection** or **Decode Selection** actions for [Base64](#), [Base32](#), or [Hex conversions](#). In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select **Restore Defaults** at the bottom of this preferences page.

Configuring Options

A set of options controls the behavior of Oxygen XML Editor, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Editor includes several distinct layers of option values.

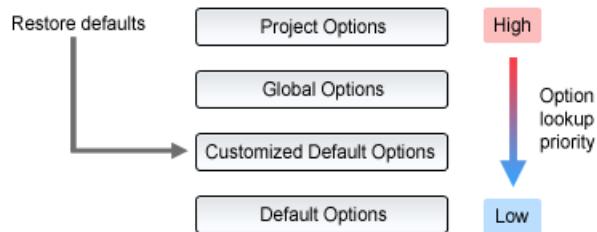

Figure 48: Option Lookup Priority

The option layers are as follows (sorted from high priority to low):

- *Project Options*

Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a common set of formatting rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- *Global Options*

Allows individual users to personalize Oxygen XML Editor according to their specific needs.

- *Customized Default Options*

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

Note: Once this layer is set, it represents the initial state of Oxygen XML Editor when an end-user uses the **Restore defaults** or **Reset Global Options** actions.

- *Default Options*

The predefined default or built-in values, tuned so that Oxygen XML Editor behaves optimally in most working environments.

Important: If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Customizing Default Options

Oxygen XML Editor has an extensive set of options that you can configure. When Oxygen XML Editor is installed, these options are set to default values. You can provide a different set of default values for an installation using an *XML options file*.

Creating an XML Options File

To create an *options file*, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Editor and [open the Preferences dialog box \(Options > Preferences\)](#).
3. Go through the options and set them to the desired defaults. Make sure that **Global Options** is selected in each page.

4. Click **OK** and close the **Preferences** dialog box.
5. Go to **Options > Export Global Options** to create an XML options file.

Using Customized Default Options

There are two methods that you can use to configure an Oxygen XML Editor installation to use the customized default options from the created XML options file:

- **Copy the XML Options File to the Installation Directory**

In the `[OXYGEN_INSTALL_DIR]`, create a folder called `preferences` and copy the created XML options file into it (for example, `[OXYGEN_INSTALL_DIR]/preferences/default.xml`).

- **Specify a Path to the XML Options File in a Startup Parameter**

Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the [startup parameters](#). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

```
-Dcom.oxygenxml.default.options=options/default.xml
```

- A system variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${system(CONFIG)}/default.xml
```

- An environmental variable that specifies the file path. For example:

```
com.oxygenxml.default.options=${env(CONFIG)}/default.xml
```

Note: If you are using the [Java Webstart distribution](#), use the [optionsDir property](#) to specify the path of the options file (in this case, the file must be named `default.xml`), or you can edit the [.jnlp file](#) that launches the application and set the `com.oxygenxml.default.options` parameter using a `property` element, as in the following example:

```
<property name="oxy:com.oxygenxml.default.options"
  value="http://host/path/to/default.xml"/>
```

Storing Global and Project Level Options

When you configure the Oxygen XML Editor options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be [shared with others by exporting the global options](#) or by [sharing the stored project-level files](#). The same is true with transformation and validation scenarios.

Figure 49: Controlling the Storage of the Preferences

Global Options

By default, **Global Options** is selected in the preferences pages, meaning that the options are stored on your computer and are not accessible to other users (unless you [export them into an XML options file that can then be shared](#)).

Global options are stored locally in option files (for example, `oxyOptionsSa18.1.xml` for a standalone distribution of Oxygen XML Editor version 18.1) located in the following directories:

- **Windows (Vista, 7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml`
- **Windows XP** - `[user_home_directory]\Application Data\com.oxygenxml`
- **Mac OS X** - `[user_home_directory]/Library/Preferences/com.oxygenxml`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml`

Project Options

If you select **Project Options**, the preferences are stored in the project file and can be [shared with other users](#).

Notice: Some pages do not have the **Project Options** switch, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

Note: If changes have been made to the options in a preferences page and you switch between **Project Options** and **Global Options**, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

[Sharing Application Settings](#) on page 159

[Customizing Default Options](#) on page 157

[Importing/Exporting/Resetting Global Options](#) on page 160

Sharing Application Settings

There are a variety of ways that you can share the settings in Oxygen XML Editor with other members of your team so that you all use a common set of options. This topic describes various possibilities.

Share Settings Through a Project File

Most of the preference pages in Oxygen XML Editor include a **Project Options** button that allows you to pass changes to the settings to the current project file that is opened in the **Project** view. That project file can then be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have access to the same option configuration that you stored in the project file.

For more information about sharing projects, see [Sharing a Project - Team Collaboration](#) on page 277.

Share Settings by Exporting/Importing Global Options

Oxygen XML Editor includes actions in the **Options** menu that allow you to export and import the global settings. The **Export Global Options** action will save the global settings as an XML properties file. You can then share those settings with others by using the **Import Global Options** action to import that properties file on their computer.

For more information about global options, see [Importing/Exporting/Resetting Global Options](#) on page 160.

Share Settings with a Custom Options File During Installation

When Oxygen XML Editor is installed, all the settings are set to default values. You can customize the set of default values by creating an XML *options file* that you will use when installing Oxygen XML Editor on each computer. You can then copy the XML options file to the installation directory or specify its path in a startup parameter.

For more information about creating and referencing a custom options file, see [Customizing Default Options](#) on page 157.

Share Settings by Imposing Fixed Options with an API

The Maven-based [Oxygen XML SDK](#) includes a sample plugin called **ImposeOptions** that imposes a fixed set of options when the application starts. This can be achieved by using the `PluginWorkspaceProvider.getPluginWorkspace().setGlobalObjectProperty(key, value)` API method.

For more information about this API, see [PluginWorkspaceProvider Class](#).

Related information

[Sharing a Project - Team Collaboration](#) on page 277

[Sharing Transformation Scenarios](#) on page 809

[Sharing Validation Scenarios](#) on page 453

[Customizing Default Options](#) on page 157

[Importing/Exporting/Resetting Global Options](#) on page 160

Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the **Options** menu. The export operation allow you to save global preferences as an XML properties file and the import operation allows you to load the property file. You can use this file to reload saved options on your computer or to [share with others](#).

The following actions are available in the **Options** menu:

Reset Global Options

Restores the preference to the factory defaults or to [customized defaults](#). This action also resets the transformation and validation scenarios to the default scenarios and clears recently used file templates.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a [project-level options file](#) (.xpr) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can enable the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Oxygen XML Editor automatically stores your global options in an XML properties file. Depending on the platform you are using, this file is located in the following directories:

- [user-home-folder]\AppData\Roaming\com.oxygenxml for Windows Vista/7/8/10
- [user-home-folder]\Application Data\com.oxygenxml for Windows XP
- [user-home-folder]/Library/Preferences/com.oxygenxml for OS X
- [user-home-folder]/.com.oxygenxml for Linux

The name of the options file of Oxygen XML Editor 18.1 is oxyOptionsSa18.1.xml.

Associating a File Extension with Oxygen XML Editor

To associate a file extension with Oxygen XML Editor on Windows:

1. Go to the Windows **Start** menu and open **Control Panel**.
2. Go to **Default Programs**.
3. Click **Associate a file type or protocol with a program**.
4. Click the file extension you want to associate with Oxygen XML Editor, then click the **Change program** button.
5. In the subsequent dialog box, browse for and choose Oxygen XML Editor.

To associate a file extension with Oxygen XML Editor on Mac OS:

1. In **Finder**, select a file and from the contextual menu select **Get Info**.
2. In the **Open With** subsection, select **Other** from the application combo box.
3. Browse to and select Oxygen XML Editor.
4. Select the **Always Open With** option, then click **Add**.

Configuring the Layout of the Views and Editors

All the Oxygen XML Editor views available in the [Editor Perspective](#), [XSLT Debugger Perspective](#), and [XQuery Debugger Perspective](#) are dockable. To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the **X** button at the top-right corner of the view, or with the **Window > Hide current view** action.

Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Editor window. Once you create a layout that suites your needs, you can save it from **Window > Export Layout**. Oxygen XML Editor creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

Note: The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the *preferences directory* of Oxygen XML Editor.

To gain more editing space in the Oxygen XML Editor window, click **Toggle auto-hide** in any view. This button sets the view in the *auto-hide* state, making it visible only as a vertical tab, at the margins of the Oxygen XML Editor window. To display a view in the *auto-hide* state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Editor window.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the *personal.xml* file was dragged over the *personal-schema.xml* file. When doing this, a dark gray rectangle marks the rearranged layout.

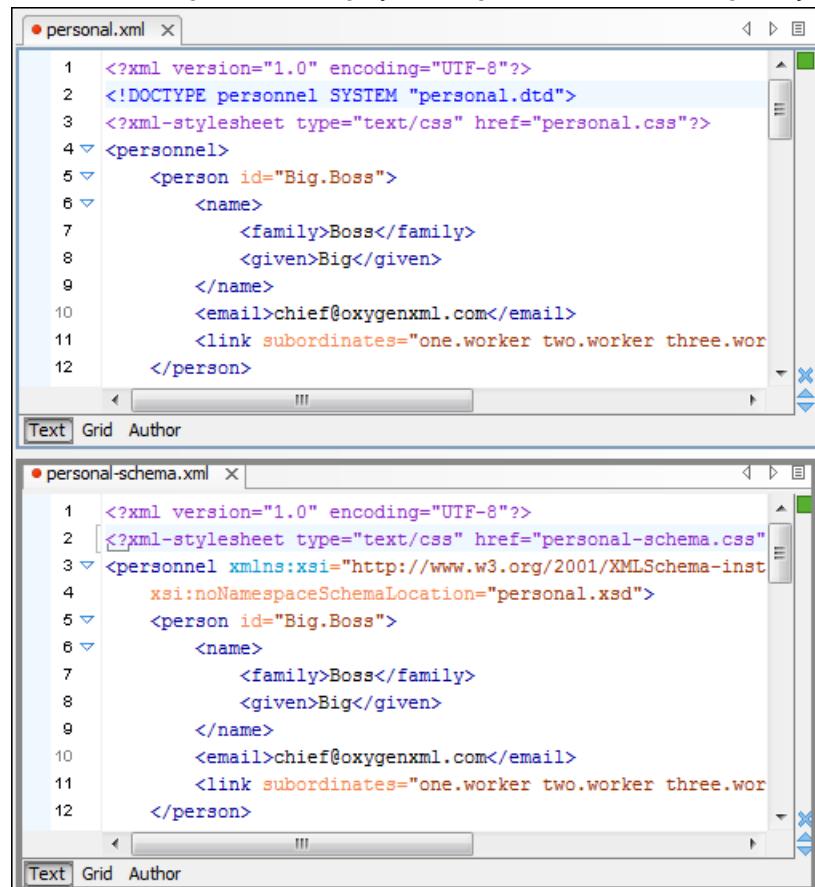

Figure 50: Drag and Drop Editors

Tile/Stack Editor Actions

You can also tile or stack all open editors, both in the *Editor Perspective* or in the *Database Perspective*, using the following actions from the **Editor** toolbar or **Window** menu:

Tile Editors Horizontally

Splits the editing area into horizontal tiles, one for each open file.

Tile Editors Vertically

Splits the editing area into vertical tiles, one for each open file.

Stack Editors

The reverse of the **Tile Editors Horizontally/Vertically** actions. Stacks all open editors.

Synchronous Scrolling

Select this action to scroll through the tiled editors at the same time.

Note: When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the **Editor** toolbar and **Window** menu:

-  **Split Editor Horizontally** - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
-  **Split Editor Vertically** - Splits the editor vertically. This is useful for comparing and merging content between two documents.
-  **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize/Restore Editor Area**.

Scroll Wheel Actions

When the opened documents titles do not fit in the tab strip, the scroll wheel can be used to scroll the editor title tabs to the left or right, the same as the two arrows on the top-right. You can also switch between edited files by using the **Next editor** and **Previous editor** actions from the **Window** menu, or by using their respective keyboard shortcuts (**Ctrl + F6 (Command + F6 on OS X)** and **Ctrl + Shift + F6 (Command + Shift + F6 on OS X)**). These two actions display a small pop-up window that allows you to cycle through all opened files.

To watch our video demonstration about dockable and floating views and editors in Oxygen XML Editor, go to https://www.oxygenxml.com/demo/Dockable_Views.html.

Configure Toolbars

You can configure the toolbars in Oxygen XML Editor to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (**Text**, **Author**, **Design**, or **Grid**) and in the current perspective (**Editor**, **XSLT Debugger**, **XQuery Debugger**, or **Database**). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

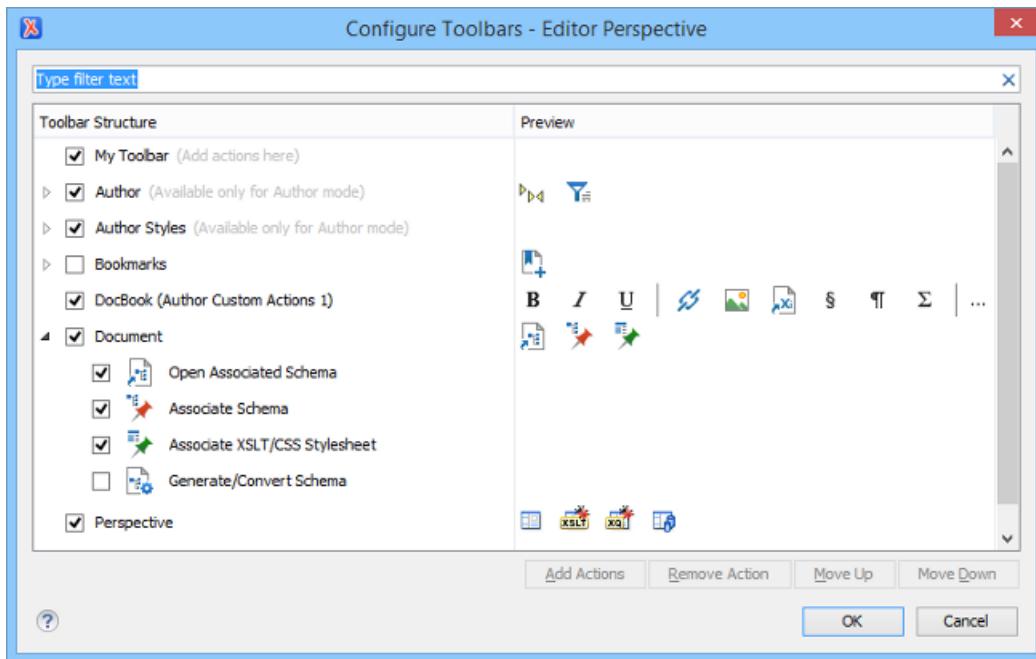

Figure 51: Configure Toolbars Dialog Box

The **Configure Toolbars** dialog box provides the following features:

Filter Text Box

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

Show or Hide Toolbars

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current perspective and editing mode.

Show or Hide Actions in a Toolbar

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

Add Actions to a Toolbar

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from frameworks (document type associations) or 3rd party plugins.

Remove Actions from a Toolbar

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

Move Actions in a Toolbar

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Editor.

Customize My Toolbar

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar"** **Toolbar** action that is available when you right-click anywhere in the toolbar area.

Drop-down Menu Actions

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

Configure External Tools Action

There is a  **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

Note: If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

Reset Toolbars

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

Reset Layout

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

Export Layout

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

Hide Toolbars

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

Scenarios Management

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, framework option files, or exported scenario files). The import and export scenario actions are available in the **Options** menu. The following actions are available:

Import Transformation Scenarios

Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Transformation Scenarios

Stores a set of global (not project-level) transformation scenarios in a specialized *scenarios* file.

Import Validation Scenarios

Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Validation Scenarios

Stores a set of global (not project-level) Validation scenarios in a specialized *scenarios* file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Transformation Scenarios** and **Import Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a timestamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Editor includes a variety of built-in editor variables. You can also create your own [custom editor variables](#) by using the [Custom Editor Variables preferences page](#).

You can use the following editor variables in Oxygen XML Editor commands of external engines or other external tools, in transformation scenarios, **Author** mode operations, and in validation scenarios:

- \${af} - The local file path of the ZIP archive that includes the current edited document.
- \${afd} - The local directory path of the ZIP archive that includes the current edited document.
- \${afdu} - The URL path of the directory of the ZIP archive that includes the current edited document.
- \${afn} - The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
- \${afne} - The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the current edited file.
- \${afu} - The URL path of the ZIP archive that includes the current edited document.
- \${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}
 - To prompt for values at runtime, use the \${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value')} editor variable. You can set the following parameters:
 - 'message' - The displayed message. Note the quotes that enclose the message.
 - type - Optional parameter, with one of the following values:

Note: The title of the dialog box will be determined by the type of parameter and as follows:

- For url and url_relative parameters, the title will be the name of the parameter and the value of the 'message'.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Parameter	
url	<p>Format: \${ask('message', url, 'default_value')}</p> <p>Description: Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • \${ask('Input URL', url)} - The displayed dialog box has the name Input URL. The expected input type is URL. • \${ask('Input URL', url, 'http://www.example.com')} - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value http://www.example.com.
password	<p>Format: \${ask('message', password, 'default')}</p> <p>Description: The input is hidden with bullet characters.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • \${ask('Input password', password)} - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols. • \${ask('Input password', password, 'abcd')} - The displayed dialog box has the name 'Input password' and the input hidden with bullet symbols. The input field already contains the default abcd value.
generic	<p>Format: \${ask('message', generic, 'default')}</p> <p>Description: The input is considered to be generic text that requires no special handling.</p>

Parameter	
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Hello world!')} </code> - The dialog box has a Hello world! message displayed. • <code> \${ask('Hello world!', generic, 'Hello again!')} </code> - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.
relative_url	<p>Format: <code> \${ask('message', relative_url, 'default')} </code></p> <p>Description: Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.</p> <p>Note: If the \$ask editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('File location', relative_url, 'C:/example.txt')} </code> - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.
combobox	<p>Format: <code> \${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')} </code></p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p>
	<p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} </code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <p>Note: In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: <code> \${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')} </code></p> <ul style="list-style-type: none"> • <code> \${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')} </code>
editable_combobox	<p>Format: <code> \${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')} </code></p>

Parameter	
	<p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated <code>real_value</code> (<code>real_value</code>) or the value inserted when you edit a list entry.</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p>
radio	<p>Format: <code> \${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'); 'default')}</code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated <code>real_value</code>.</p> <p>Note: The 'default' parameter specifies the default selected value and can match either a key or a value.</p> <p>Example:</p> <ul style="list-style-type: none"> • <code> \${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

- '`default-value`' - optional parameter. Provides a default value.
- `${caret}` - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- `${cf}` - Current file as file path, that is the absolute file path of the current edited document.
- `${cfdf}` - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- `${cfdu}` - Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
- `${cfn}` - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- `${cfne}` - Current file name with extension. The current file is the one currently opened and selected.
- `${configured.ditaot.dir}` - The default directory of the DITA Open Toolkit distribution, as configured in the [DITA preferences page](#).
- `${cp}` - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- `${currentFileURL}` - Current file as URL, that is the absolute file path of the current edited document represented as URL.

- `$(date(pattern))` - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** yyyy-MM-dd;

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to <http://www.w3.org/TR/xmlschema-2/#date>. For details about xs:datetime, go to <http://www.w3.org/TR/xmlschema-2/#dateTime>.
- `$(dbgXML)` - The local file path to the XML document that is currently selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- `$(dbgXSL)` - The local file path to the XSL/XQuery document that is currently selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- `$(dita.dir.url)` - A special local contextual editor variable that gets expanded only in the **Libraries** dialog box that is accessible from the **Advanced** tab of DITA transformation scenarios. The **Libraries** dialog box allows you to specify additional libraries (jar files or additional class paths) to be used by the transformer. This `$(dita.dir.url)` editor variable gets expanded to the value of the `dita.dir` parameter from the **Parameters** tab of the DITA transformation scenario.
- `$(ds)` - The path of the detected schema as a local file path for the current validated XML document.
- `$(dsu)` - The path of the detected schema as a URL for the current validated XML document.
- `$(env(VAR_NAME))` - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the `$(system(var.name))` editor variable.
- `$(framework(fr_name))` - The path (as URL) of the `fr_name` framework.
- `$(framework)` - The path (as URL) of the current framework, as part of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `$(frameworkDir(fr_name))` - The path (as file path) of the `fr_name` framework.

Note: Since multiple frameworks might have the same name (although it is not recommended), for both `$(framework(fr_name))` and `$(frameworkDir(fr_name))` editor variables Oxygen XML Editor employs the following algorithm when searching for a given framework name:

- All frameworks are sorted, from high to low, according to their [Priority](#) setting from the [Document Type configuration dialog box](#). Only frameworks that have the **Enabled** checkbox set are taken into account.
- Next, if the two or more frameworks have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
 - Frameworks stored in the internal Oxygen XML Editor options.
 - Additional frameworks added in the [Locations preferences page](#).
 - Frameworks installed using the add-ons support.
 - Frameworks found in the [main frameworks location](#) (**Default** or **Custom**).
- `$(frameworkDir)` - The path (as file path) of the current framework, as part of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `$(frameworks)` - The path (as URL) of the `[OXYGEN_INSTALL_DIR]` directory.
- `$(frameworksDir)` - The path (as file path) of the `[OXYGEN_INSTALL_DIR]/frameworks` directory.
- `$(home)` - The path (as URL) of the user home folder.
- `$(homeDir)` - The path (as file path) of the user home folder.
- `$(i18n(key))` - Editor variable used only at framework level to allow translating names and descriptions of **Author** mode actions in multiple actions. For more details, see [Localizing Frameworks](#) on page 1165.
- `$(id)` - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- `$(makeRelative(base,location))` - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

Example:

- ```
$(makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}
```
- `$(oxygenHome)` - Oxygen XML Editor installation folder as URL.
  - `$(oxygenInstallDir)` - Oxygen XML Editor installation folder as file path.
  - `$(pd)` - The file path for the parent folder of the current project selected in the **Project** view.

- \${pdu} - The URL for the parent folder of the current project selected in the **Project** view.
- \${pn} - Current project name.
- \${ps} - Path separator, which is the separator that can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.
- \${selection} - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
- \${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \${env(VAR\_NAME)} editor variable instead.
- \${timeStamp} - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- \${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- \${tsf} - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.
- \${uuid} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java **UUID** class.
- \${xpath\_eval(expression)} - Evaluates an XPath 3.0 expression. Depending on the context, the expression can be:
  - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

**Example:**

```
${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
```

- **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

**Example:**

```
${ask('Set new ID attribute', generic, '${xpath_eval(@id)})')}
```

## Related concepts

[Selection Plugin Extension](#) on page 1312

This type of plugin allows you to manage selections of text.

## Custom Editor Variables

An editor variable can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the [Custom Editor Variables preferences page](#). To create a custom editor variable, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Custom Editor Variables**.
2. Click the **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

## Custom System Properties

---

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see [Setting a system property](#) on page 173.

**Table 4: Custom System Properties**

| Property                                                        | Allowed values                                    | Default value        | Purpose                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------|---------------------------------------------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>com.oxygenxml.disable.http.protocol.handlers</code>       | true or false                                     | false                | By default, Oxygen XML Editor uses the open source Apache HTTP Client software for HTTP(S) connections. If set to True, the default Java Sun HTTP(S) will be used instead. You will also lose <b>WebDAV</b> support and possibly other related features. |
| <code>com.oxygenxml.default.options</code>                      | A URL-type relative or absolute path.             | N/A                  | Provides the path to an XML file containing default application options. For more details, see <a href="#">Customizing Default Options</a> on page 157.                                                                                                  |
| <code>com.oxygenxml.customOptionsDir</code>                     | A file system absolute path pointing to a folder. | N/A                  | Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. See <a href="#">Importing/Exporting/Resetting Global Options</a> on page 160.  |
| <code>com.oxygenxml.ApplicationDataFolder</code> (Windows only) | A file system absolute path pointing to a folder. | %APPDATA%            | When the application runs on Windows, you can set this property to change the location where the application considers that the APPDATA folder is located.                                                                                               |
| <code>com.oxygenxml.editor.frameworks.url</code>                | A URL-type absolute path.                         | OXYGEN_DIR\framework | Changes the folder where the application considers that the main frameworks are installed. It has the same effect as changing the custom frameworks directory value in the <a href="#">Location preferences page</a> .                                   |
| <code>com.oxygenxml.MultipleInstances</code>                    | true or false                                     | false                | If set to true, multiple instances of the application are allowed to be started.                                                                                                                                                                         |

| Property                                                             | Allowed values                                                   | Default value      | Purpose                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------|------------------------------------------------------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>com.oxygenxml.xep.location</code>                              | A file system absolute path pointing to a folder.                | N/A                | Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the <a href="#">FO Processors preferences page</a> .                                                                                                                                                                                          |
| <code>com.oxygenxml.additional.classpath</code>                      | A list of JAR-type resources separated by a classpath separator. | N/A                | An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the lib folder.                                                                                                                                                                                            |
| <code>com.oxygenxml.user.home</code> (Windows only)                  | A file system absolute path pointing to a folder.                | USERPROFILE Folder | Overwrites the user home directory that was implicitly detected for the application.                                                                                                                                                                                                                                                       |
| <code>com.oxygenxml.use.late.delegation.for.author.extensions</code> | <code>true</code> or <code>false</code>                          | true               | All Java extensions in a document type configuration are instantiated in a separate class loader. When <b>true</b> , the JAR libraries used in a certain document type configuration will have priority to resolve classes before delegating to the parent class loader. When <b>false</b> , the parent class loader will take precedence. |
| <code>com.oxygenxml.stack.size.validation.threads</code>             | The number of bytes used for validation threads.                 | 5*1024*1024        | Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger <i>Thread</i> stack size to parse complex schemas. The default value should be more than enough.                                                                                                                    |
| <code>com.oxygenxml.jing.skip.validation.xhtml.data.attrs</code>     | <code>true</code> or <code>false</code>                          | true               | By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.                                                                                                                                        |
| <code>com.oxygenxml.report.problems.url</code>                       | User defined URL                                                 | N/A                | The URL where a problem reported through the <b>Report Problem</b> dialog box is sent. The report is sent in XML format using the report parameter with the POST HTTP method.                                                                                                                                                              |

| Property                                                  | Allowed values | Default value | Purpose                                                                                                                                                                                               |
|-----------------------------------------------------------|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>com.oxygenxml.parallel.titlecomputingthreads</code> | Integers       | 4             | The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the DITA Maps Manager view. |

## Localizing the User Interface

You can select the language of the Oxygen XML Editor user interface. Oxygen XML Editor ships with the following languages: English, French, German, Japanese, and Dutch. To change the interface language, go to **Options > Preferences > Global** preferences page, then choose the appropriate language from the **Language** drop-down menu.

You can also localize the interface in another language by [creating an interface localization file](#).

### Creating an Interface Localization File

You can change the language of the Oxygen XML Editor user interface by creating an interface localization file. The example in this procedure is based on the Spanish language, and a standard Oxygen XML Editor Windows distribution.

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the [ISO 639 standard](#)), followed by an underscore character, and a region code (two or three uppercase letters that conform to the [ISO 3166 standard](#)).
2. Write an email to the Oxygen XML Editor support team and ask them to send you the *translation.xml* sample file.
3. Open *translation.xml* in Oxygen XML Editor. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a sample of its content:

```
<translation>
 <languageList>
 <language description="English" lang="en_US"/>
 </languageList>
 <key value="New">
 <comment>The File/New action. Creates a new document.</comment>
 <val lang="en_US">Nuevo</val>
 </key>
 <key value="New_folder">
 <comment>Creates a folder in the Project View.</comment>
 <val lang="en_US">New Folder</val>
 </key>
 ...
</translation>
```

4. Update the language element to reflect the new language. Set the *description* attribute to Spanish and the *lang* attribute to `es_ES`.
5. For each key element translate the *comment* (optional) and *val* elements. Set the *lang* attribute to `es_ES`.

**Note:** After you are finished, the file should look like this:

```
<translation>
 <languageList>
 <language description="Español" lang="es_ES"/>
 </languageList>
 <key value="New">
 <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
 <val lang="es_ES">Nuevo</val>
 </key>
 <key value="New_folder">
 <comment>Crea una carpeta en la vista del proyecto.</comment>
```

```
<val lang="es_ES">Nueva carpeta</val>
</key>
...
</translation>
```

6. Open the **Preferences** dialog box (**Options > Preferences**), go to **Global**, and enable the **Other language** option. Browse for the *translation.xml* file.
7. Restart the application.

## Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Editor *application launchers* or *command-line scripts*. You can also create a *custom startup parameters file*.

### Setting Parameters for the Application Launchers

#### Increasing the amount of memory that Oxygen XML Editor uses on Windows

To increase the memory available to Oxygen XML Editor on Windows:

- Browse to the installation directory of Oxygen XML Editor.
- Locate the `-Xmx` parameter in the `oxygen18.1.vmoptions` file.

**Note:** For 32-bit Windows modify the parameter to `-Xmx1024m` or larger, but not over `-Xmx1200m`. Make sure you do not exceed your physical RAM. For 64-bit Windows modify the parameter to a larger value (for example, `-Xmx2048m`). We recommended you to not use more than half of your existing physical RAM.

Restart Oxygen XML Editor. Go to **Help > About** and verify the amount of memory that is actually available (see the **JVM Memory Used** in the last row in the **Copyright** tab). If Oxygen XML Editor does not start and you receive an error message saying that it could not start the JVM, decrease the `-Xmx` parameter and try again.

For Windows Vista/7/8/10, copy the `oxygen18.1.vmoptions` to your desktop (or to any other folder with write access), modify it there, then copy it back to the Oxygen XML Editor installation folder.

**Note:** The parameters from the `.vmoptions` file are used when you start Oxygen XML Editor with the `oxygen` launcher (or with the desktop shortcut). In case you use the command line script `oxygen.bat/oxygen.sh`, modify the `-Xmx` parameter in the script file.

#### Increasing the amount of memory that Oxygen XML Editor uses on OS X

To increase the memory available to Oxygen XML Editor on OS X:

- **Ctrl + Single-Click (Command + Single-Click on OS X)** (or right-click) the Oxygen XML Editor icon in **Finder**.
- From the contextual menu, select **Show Package Contents**.
- Go to the contents directory and edit the `Info.plist` file.

**Note:** You can open this file either with the **Property List Editor**, or the **TextEdit**.

- Look for the **VMOptions** key and adjust the `-Xmx` parameter to a larger value (for example, `-Xmx1500m`)

**Note:** For a Mac kit bundled with Java 8, look for the **VMOptionArray** key and add the `-Xmx` parameter in a new string element from the `array` element. For example, for 1500 MB use the following:

```
<string>-Xmx1500m</string>
```

**Tip:** Try not to use more than half of your existing physical RAM if possible.

### Setting a system property

To set a system property, edit the application launcher and add a parameter after the `%OXYGEN_JAVA%` token, using the following form:

```
-Dproperty.name=value
```

You can also set a system property through a parameter prefixed with `-Doxy` in the command line used to start the application:

```
oxygen18.1.exe "-Doxyproperty.name=value"
```

All system properties are displayed in the **System properties** tab of the **About** dialog box.

To view the list of Oxygen XML Editor system properties, go to [Custom System Properties](#) on page 170.

### Disabling DPI Scaling

Some users may prefer the look of smaller icons in an HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, set the following property in `.vmoptions` (or in the `.bat` script):

```
sun.java2d.dpiaware=false
```

## Setting Parameters in the Command Line Scripts

If you start Oxygen XML Editor with the `oxygen.bat` command line script, you have to add or modify the `-Xmx` parameter to the java command at the end of the script.

For example, to set the maximum amount of Java memory to 600 MB in **Windows**, modify the `-Xmx` parameter like this:

```
java -Xmx600m -Dsun.java2d.noddraw=true ...
```

On **Mac OS X**, the java command should look like this:

```
java "-Xdock:name=Oxygen"\n-Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins"\n-Xmx600m\n...
```

On **Linux**, the Java command should look like this:

```
java -Xmx600m\n"-Dcom.oxygenxml.editor.plugins.dir=$OXYGEN_HOME/plugins"\n
```

## Creating Custom Startup Parameters File

The startup launchers for Oxygen XML Editor and its executable internal tools (**Tree Editor**, **XML Schema Regular Expressions Builder**, **Large File Viewer**, **SVN Client**, **Compare Directories**, and **Compare Files**) include a default `.vmoptions` file that contain some startup parameters (such the `-Xmx` parameter, which is used for allocating memory for that particular application). You can edit the parameters in these `.vmoptions` files so that the applications will launch with your desired values. However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values.

To avoid resetting user-defined startup parameters, you can create custom `.vmoptions` files and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- `custom_commons.vmoptions` - The parameters and their values of this file will be included in all the startup launchers.
- `custom_<app name>.vmoptions` - The `<app name>` is the name of the executable application or tool (for example, `custom_diffFiles.vmoptions` for the **Compare Files** tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Editor.

## Topics:

- [Editor Perspective](#)
- [XSLT Debugger Perspective](#)
- [XQuery Debugger Perspective](#)
- [Database Perspective](#)

An Oxygen XML Editor perspective is an interface layout geared towards a specific use. The Oxygen XML Editor interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Editor. You can change the perspective by selecting the respective icons in the top-right corner of Oxygen XML Editor or by selecting the perspective from the **Window > Open Perspective** menu.

## Editor Perspective

The **Editor** perspective is the most commonly used perspective and it is the default perspective when you start Oxygen XML Editor for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select the **Editor** button in the top-right corner of Oxygen XML Editor

(or select **Editor** from the **Window > Open perspective** menu)

The layout of this perspective is composed of the following components:

### Menus

Provides menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents. However, Oxygen XML Editor also includes some context-sensitive and framework-specific menus that are only available for a specific context or type of document.

### Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, **Author** mode also includes framework-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a *DITA Author Custom Actions* toolbar is available that includes operations that are specific to DITA documents). The [toolbars can be configured](#) to suit your specific needs.

### Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

### Views

Oxygen XML Editor includes a large variety of views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the **Window > Show View** menu. The [layout of the views can also be configured](#) according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the controls located on the top-right corner of the view (⊟).

Some of the most helpful views in the **Editor** perspective include the following:

- **Project view** - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager view** - For DITA frameworks, this view helps you organize, manage, and edit DITA topics and maps.
- **Open/Find Resource view** - Designed to offer advanced search capabilities in various scopes.
- **Outline view** - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** - Displays the messages generated as a result of user actions such as *validations*, *transformation scenarios*, *spell checking in multiple files*, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view** - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an *in-place attribute editor*.
- **Model view** - Presents the current edited element structure model and additional documentation as defined in the schema.
- **Elements view** - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author mode** this view includes tabs that present additional information relative to the cursor location.
- **Entities view** - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios view** - Displays a list with all currently configured transformation scenarios.
- **XPath/XQuery Builder view** - Displays the results from running an XPath expression.
- **WSDL SOAP Analyzer view** - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

#### Related information

[XSLT Debugger Perspective](#) on page 176

[XQuery Debugger Perspective](#) on page 177

[Database Perspective](#) on page 178

[Configuring the Layout of the Views and Editors](#) on page 160

## XSLT Debugger Perspective

---

The XSLT Debugger perspective allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this perspective, select the  **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can *split horizontally or vertically* in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in **Text mode** only.

The layout of this perspective is composed of the following components:

#### Menus

Provides menu driven access to all the features and functions available in the **XSLT Debugger**.

#### Toolbars

Contains all actions needed to configure and control the debugging process. The *toolbars can be configured* to suit your specific needs.

#### XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

#### XSL Source Pane

The editing pane where you can display and edit XSL stylesheets.

#### Output View

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML

view, and one text view for each `xsl:result-document` element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheet).

#### ***Debugging Information Views***

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the [Debugging Information Views](#) topic for a list of all the information views (and links to more details on each view).

**Note:** You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. In case you select an expression or a fragment of it and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Using **Watch expression** without selecting an expression displays the value of the attribute from the cursor position in the **XWatch** view. Variables detected at the cursor position are also displayed. Expressions displayed in the **XWatch** view are *normalized* (unnecessary white spaces are removed from the expression).

To watch our video demonstration about the XSLT debugging capabilities in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/XSLT\\_Debugger.html](https://www.oxygenxml.com/demo/XSLT_Debugger.html).

[XQuery Debugger Perspective](#) on page 177

[Database Perspective](#) on page 178

## **XQuery Debugger Perspective**

---

The XQuery Debugger perspective allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select the  **XQuery Debugger** button in the top-right corner of the interface or **Window > Open perspective > XQuery Debugger**.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can *split horizontally or vertically* in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in **Text mode** only.

The layout of this perspective is composed of the following components:

#### **Menus**

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

#### **Toolbars**

Contains all actions needed to configure and control the debugging process. The [toolbars can be configured](#) to suit your specific needs.

#### **XML Source Pane**

The editing pane where you can display and edit data or document-oriented XML documents.

#### **XQuery Source Pane**

The editing pane where you can display and edit XQuery files.

#### **Output View**

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

#### ***Debugging Information Views***

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the [Debugging Information Views](#) topic for a list of all the information views (and links to more details on each view).

**Note:** You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. If you select an expression, or a fragment of it, and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Expressions displayed in the **XWatch** view are normalized (unnecessary white spaces are removed from the expression).

To watch our video demonstration about the XQuery debugging capabilities in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/XQuery\\_Debugger.html](https://www.oxygenxml.com/demo/XQuery_Debugger.html).

[Database Perspective](#) on page 178

## Database Perspective

---

The **Database** perspective allows you to manage databases. To switch the focus to this perspective, select the

**Database Debugger** button in the top-right corner of Oxygen XML Editor  or select **Database** from the **Window > Open perspective** menu.

The **Database** perspective offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

### Supported Databases

Oxygen XML Editor supports numerous types of databases, including:

- Oracle Berkeley DB XML Database
- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL 8.3 (Enterprise edition only)
- Documentum xDB (X-Hive/DB) 10 XML Database (Enterprise edition only)
- Documentum (CMS) 6.5 (Enterprise edition only)
- SharePoint (CMS)

**Note:** For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Editor. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Editor [go to the Oxygen XML Editor website](#).

### Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.

- Opening a database table in the [Table Explorer view](#).
- Handling the values from **XML Type** columns as String values.

**Note:** The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Editor by registering the database driver as a Generic JDBC type driver when defining the data source for accessing the database. For more information, see [Database Connection Support](#) on page 953.

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Editor editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Editor editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

**Tip:** Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

## Layout of the Database Perspective

The layout of this perspective is composed of the following components:

### Menus

Provides menu driven access to all the features and functions available in the [XQuery Debugger](#).

### Toolbars

Contains all actions needed to configure and control the debugging process. The [toolbars can be configured](#) to suit your specific needs.

### Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

### Data Source Explorer View

Provides browsing support for the configured connections.

### Table Explorer View

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

## Topics:

- [Text Editing Mode](#)
- [Grid Editing Mode](#)
- [Author Editing Mode](#)
- [Design Editing Mode \(XML Schema Diagram Editor\)](#)

The main editing area in Oxygen XML Editor includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Editor offers the following editing modes:

- **Text** - This mode presents the source of an XML document.
- **Grid** - This mode displays an XML document as a structured grid of nested tables.
- **Author** - This mode enables you to edit in a WYSIWYG-like editor.
- **Design** - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the [Allow Document Type specific edit mode setting to override the general mode setting option](#) is selected in the **Edit Modes** preferences page, then the edit mode specified in the [Document Type configuration dialog box](#) is used when that particular type of document is initially opened.
- If the [Allow Document Type specific edit mode setting to override the general mode setting option](#) is not selected, then the edit mode specified in the [table in the Edit Modes preferences page](#) is used when that particular type of document is initially opened.

## Text Editing Mode

The **Text** mode **Author** editor in Oxygen XML Editor is designed to be a simple, yet powerful, XML editor. It provides support to help you edit, transform, and debug XML-based documents. It also includes a specialized [Content Completion Assistant](#), an [Outline view](#), and many other helpful features.

### Related information

[Changing the colors displayed in the Text Mode Editor](#) on page 100

## Navigating the Document Content in Text Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents in **Text** mode.

### Using the Keyboard

Oxygen XML Editor allows you to quickly navigate through a document using the [Ctrl + CloseBracket \(Command + CloseBracket on OS X\)](#) key to go to the next XML node and [Ctrl + OpenBracket \(Command + OpenBracket on OS X\)](#) to go to the previous one.

To navigate one word forward or backwards, use [Ctrl + RightArrow \(Command + RightArrow on OS X\)](#), and [Ctrl + LeftArrow \(Command + LeftArrow on OS X\)](#), respectively. To position the cursor at the beginning or end of the document you can use [Ctrl + Home \(Command + Home on OS X\)](#), and [Ctrl + End \(Command + End on OS X\)](#), respectively.

## Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

## Navigating with the Outline View

Oxygen XML Editor includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

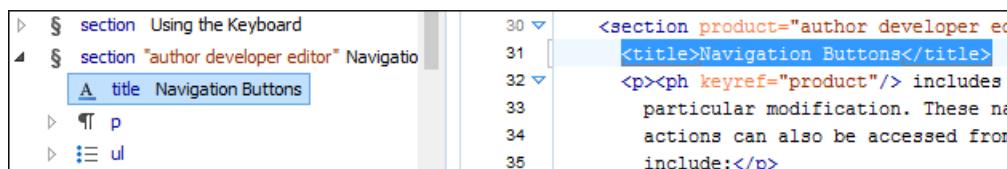

Figure 52: Outline View Navigation in Text Mode

## Using the Breadcrumb to Navigate

A **breadcrumb** on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 53: Breadcrumb in Text Mode

The last element listed in the **breadcrumb** is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the **breadcrumb** selects the entire element and navigates to it in the editor area.

## Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, go to **Find > Go to (Ctrl+L (Command+L on OS X))**.

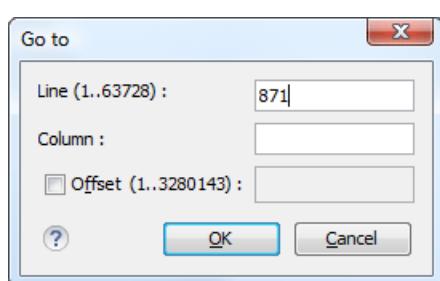

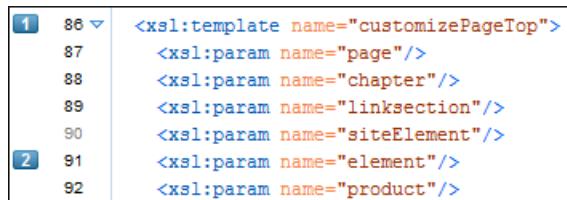

Figure 54: Go to Dialog Box

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

## Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the **Options > Menu Shortcut Keys** menu.

**Figure 55: Editor Bookmarks**

A bookmark can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

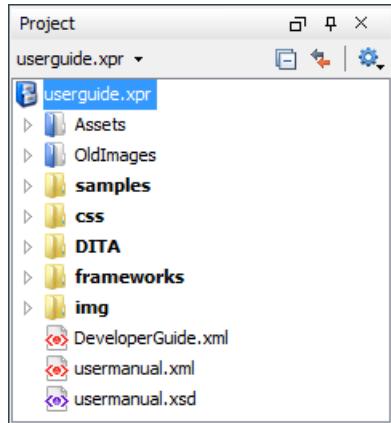

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

## Text Mode Views

There is a large selection of useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

### Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

**Figure 56: Project View**

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the **Outline view**. If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

## **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

## **New Project**

Creates a new, empty project.

The following actions are grouped in the upper right corner:

## **Collapse All**

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

## **Link with Editor**

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the **Debugger** perspective.

## **Settings**

A submenu that contains the following actions:

### **Filters**

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

### **Show Full Path**

When selected, linked files and folders are presented with a full file path.

### **Enable Master Files Support**

Select this option to enable the [Master Files support](#).

### **Change Search and Refactor operations scope**

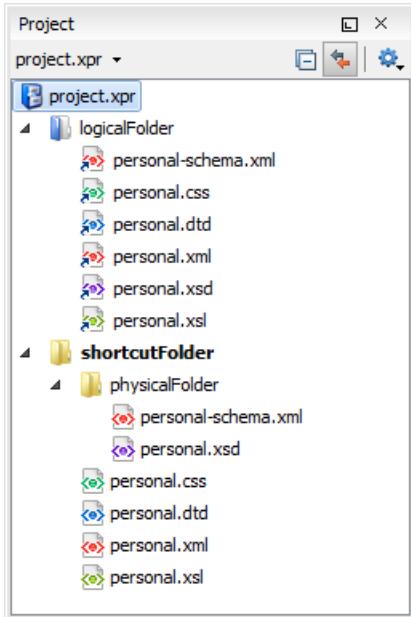

Allows you to change the collection of documents that define the context of the [search and refactor operations](#).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- *Logical folders* - marked with a blue icon on Windows and Unix/Linux () and a magenta icon on Mac OS X (). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action  **Remove from Project** can be used to remove them from the project.
- *Physical folders and files* - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action  **Remove from Disk (Shift +Delete)** can be used to remove them from the project and local file system.

- **Shortcut folders and files** - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

**Figure 57: Project View with Examples of all Three Types of Resources**

## Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

### **New Project**

Creates a new, empty project.

## Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

### **New > File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

### **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

### **New > Logical Folder**

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - .

### **New > Logical Folders from Web**

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

## Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

### Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

### Add Files

Adds links to files on the local file system.

### Add Edited File

Adds a link to the currently edited file in the project.

## Managing Project Content

### Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be enabled in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root. To create a file inside a linked folder, select the **New > File** action from the contextual menu.

**Note:** The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

### Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action **Remove from Disk (Shift+Delete)**. The **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Editor and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

### Moving Files and Folders

You can [move the resources of the project](#) with drag and drop operations on the files and folders of the tree (the **Enable oXygen consoles** option must be enabled in the [View preferences page](#)).

You can also use the usual **Cut**, **Copy**, and **Paste** actions to move resources in the **Project** view.

### Renaming Files and Folders

There are three ways you can [rename an item in the Project view](#). Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

**Note:** The **Rename** action is also available on *logical* files.

### Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

### Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

### Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

#### **Check Well-Formedness**

Checks if the selected file or files are well-formed.

#### **Validate**

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a **Validate and Check for Completeness** operation.

#### **Validate with Schema**

Validates the selected file or files against a specified schema.

#### **Configure Validation Scenario(s)**

Allows you to configure and run a *validation scenario*.

### Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

#### **Apply Transformation Scenario(s)**

Obtains the output with one of the built-in scenarios.

#### **Configure Transformation Scenario(s)**

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

#### **Transform with**

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

### Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL))

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

#### **Rename resource**

Allows you to change the name of a resource.

#### **Move resource**

Allows you to change the location on disk of a resource.

## XML Refactoring

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

## Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations](#) that are used will also appear in this submenu.

## Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

### Open

Opens the selected files in the corresponding editor.

### Open with submenu

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: [DITA Maps Manager](#), [Archive Browser](#), [MathML Editor](#), [Generate/Convert Schema](#), [WSDL/SOAP Analyzer](#), [Large File Viewer](#), [Hex Viewer](#), [SVG Viewer](#).

### Show in Explorer (or Show in Finder on OS X)

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

### Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

### Refresh

Refreshes the content and the dependencies between the resources in [the Master Files directory](#).

### Find/Replace in Files

Allows you to [find and replace text in multiple files](#).

### XPath in Files

Opens the [XPath/XQuery Builder view](#) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

### Open/Find Resource

Opens the [Open/Find Resource dialog box](#).

### Check Spelling in Files

Allows you to [check the spelling of multiple files](#).

### Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

### Open in SVN Client

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

### Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

### Generate Documentation > XML Schema Documentation

Opens [the XML Schema Documentation Dialog Box](#).

## Generate Documentation > XSLT Stylesheet Documentation

Opens [the XSLT Stylesheet Documentation Dialog Box](#).

## Generate Documentation > XQuery Documentation

Opens [the XQuery Documentation Dialog Box](#).

## Generate Documentation > WSDL Documentation

Opens [the WSDL Documentation Dialog Box](#).

## Properties

Displays the properties of the current file in a **Properties** dialog box.

## Menu Level Actions

The following actions are available in the **Project** menu:

### New Project

Creates a new, empty project.

### Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Save Project As

Allows you to save the current project under a different name.

### Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

### Filters

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

### Enable Master Files Support

Allows you to enable the [Master Files Support](#) for each project you are working on.

### Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

### Show Project View

Displays the **Project** view.

### Reopen Project

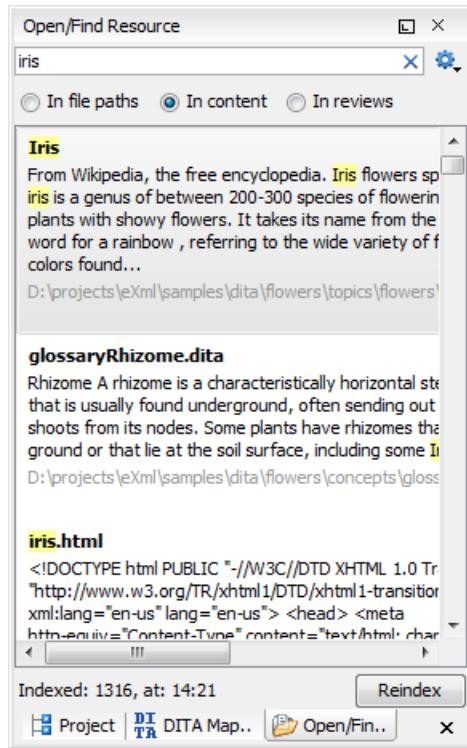

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

### Related information

[Working with EPUB](#)

## Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the **Project** and **DITA Maps Manager** views. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 58: Open/Find Resource View**

You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

## Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the [Results view](#) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *\*ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for *\*/samples/\*.gif* with the **in file paths** option selected, you will find all the *gif* images from the samples directory.

## Options Available in the View

The **Open/Find Resource** view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.

- **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

### Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

### Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the [Open/Find Resource preferences page](#).

### Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

### Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in [the editor associated with the type of the file](#).

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to [https://www.oxygenxml.com/demo/Open\\_Find\\_Resource.html](https://www.oxygenxml.com/demo/Open_Find_Resource.html).

## Outline View in Text Mode

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

## Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

## Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

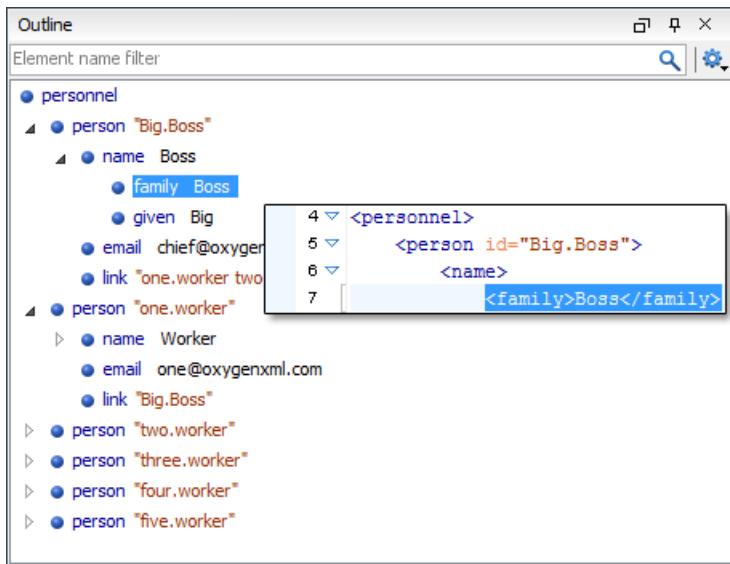

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

## Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be [disabled and enabled from a Preferences page](#).

**Figure 59: Outline View in Text Mode**

#### Related information

[Outline View in Author Mode](#) on page 217

#### Outline View Filters in Text Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view when editing in **Text mode**:

##### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

##### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

##### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

##### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

##### Show element name

Show/hide element name.

##### Show text

Show/hide additional text content for the displayed elements.

##### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

##### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

#### Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the **Outline** view in **Text mode**:

### **Append Child**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

### **Insert Before**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

### **Insert After**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

### **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

### **Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

### **Cut**

Cuts the currently selected component.

### **Copy**

Copies the currently selected component.

### **Delete**

Deletes the currently selected component.

### **Expand More**

Expands the structure of a component in the **Outline** view.

### **Collapse All**

Collapses the structure of all the component in the **Outline** view.

### **Attributes View in Text Mode**

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column . If the possible values of the attribute are specified as **list** in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attributes	
Attribute	Value
abstract	false
<b>block</b>	false
default	true
final	
fixed	
<b>id</b>	
<b>name</b>	email
nilable	false
substitutionGroup	
<b>type</b>	xs:string

**Figure 60: Attributes View**

### Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

#### Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the **Allow only insertion of valid elements and attributes** schema aware option is enabled.

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

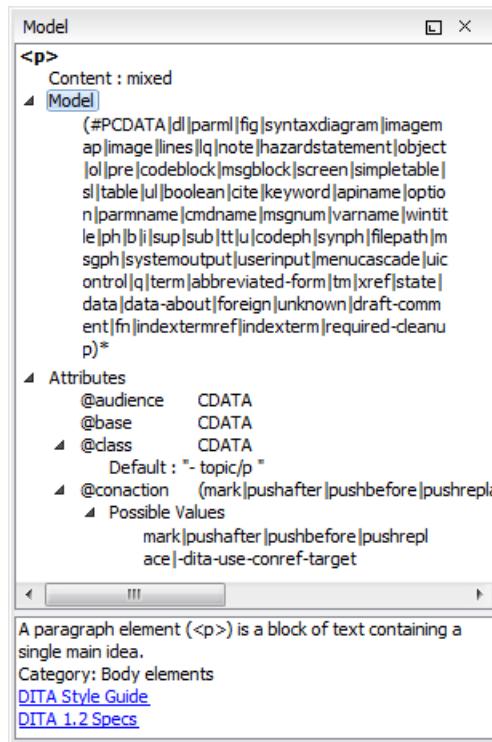

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.

- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

## Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

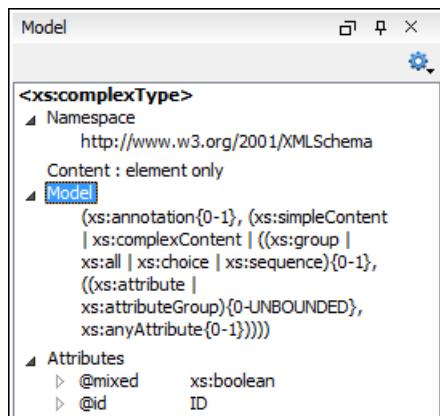

**Figure 61: Model View**

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

## Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

**Figure 62: Element Structure Panel**

## Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

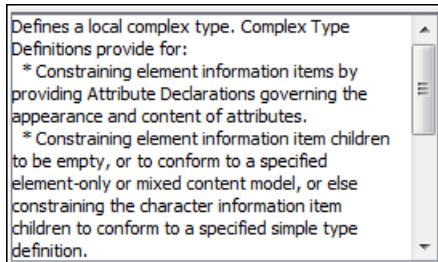

Figure 63: Annotation panel

## Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position.

Figure 64: Elements View in Text Mode

## Entities View

**Entities** provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (&lt;, &gt;, &amp;, &apos;, &quot;).
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Entities	
Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbsnbsp	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 65: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

### Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. Those actions include the following:

- [Validation actions](#)
- [Transformation actions](#)
- [Check Spelling in Files action](#)
- [Find All action from the \*Find/Replace dialog box\*](#)
- [Find/Replace in Files dialog box](#)
- [Search References action](#)
- [XPath expression results](#)
- [SQL results](#)

Description - 12 items	Resource	Location
▲ D:\Projects\UserGuide\DTI\topics\batch-transformation.dita (2 items)		
href="results-view.dita#results-view" format="dita">>Results View </xref>. All entries in the Results View point to the location of the code that triggered them. <p>	batch-transformation.dita	29:61
Results View	batch-transformation.dita	30:7

<title>The XPath Results View </title>	oxygen-xpath-view.dita	12:30
Find in Files - Result... X		

**Figure 66: Results View**

## Results View Toolbar Actions

The view includes a toolbar with the following actions:

### Grouping options drop-down menu

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

#### Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

#### Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

#### Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files](#) action.
- No grouping rule for the results of [applying an XPath expression](#).

### Highlight all results in editor

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

**Note:** To customize highlighting behavior, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

### Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

### Remove all

Removes all messages from the view.

## Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

### Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

### Previous message

Navigates to the message above the current selection.

### Next message

Navigates to the message below the current selection.

### Remove selected

Removes selected messages from the view.

## \*Remove all

Removes all messages from the view.

## Copy

Copies the information associated with the selected messages:

- The file path of the document that triggered the output message.
- The path of the main file (in the case of a *validation scenario*, it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of *validation scenario*.
- The line and column in the file that triggered the message.

## Select All

Extends the selection to all the messages from the view.

## Print Results

Sends the complete list of messages to a printer. For each message the included details are the same as the ones for the [Copy action](#).

## Save Results

Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for the [Copy action](#).

## Save Results as XML

Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for the [Copy action](#).

## Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

## Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

## Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

## Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).
- No grouping rule for the results of [applying an XPath expression](#).

## Expand All

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

## Collapse All

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

## Syntax Highlight Depending on Namespace Prefix

The [syntax highlight scheme of an XML file type](#) allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor

panel can become cluttered. [Marking tags with different colors based on the namespace prefix](#) allows easier identification of the tags.

```
3 <xsl:template match="name">
4 <fo:list-item>
5 <fo:list-item-label end-indent="label-end">
6 <fo:block text-align="end" font-weight="bold">Full Name</fo:block>
7 </fo:list-item-label>
8 <fo:list-item-body start-indent="body-start">
9 <xsl:apply-templates select="*"/>
10 </fo:list-item-body>
11 </fo:list-item>
12 </xsl:template>
```

**Figure 67: Example of Coloring XML Tags by Prefix**

#### Related information

[Changing the colors displayed in the Text Mode Editor](#) on page 100

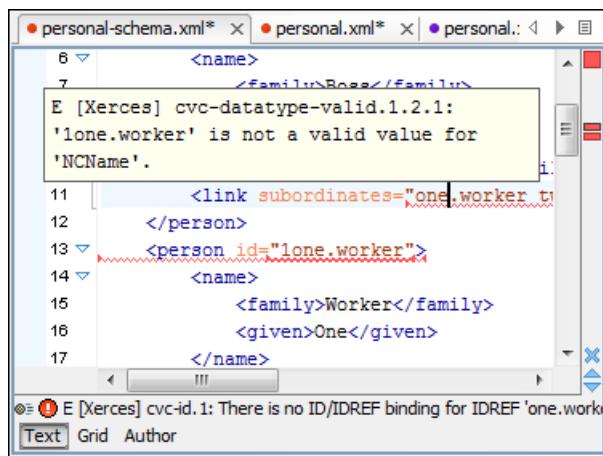

### Presenting Validation Errors in Text Mode

Oxygen XML Editor can be configured to [automatically validate documents](#) while editing in the **Text** mode, and actions are also available to [manually validate documents](#) on-request.

A line with a validation issue is marked in the editor panel by underlining the problem region with a colored line, according to the type of issue. The issues are also marked with a colored marker in the right vertical stripe. You can configure the color for each type in the [Document Checking preferences page](#).

- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes](#) (if available for that issue).

**Figure 68: Presenting Validation Errors in Text Mode**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

#### Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

## Middle Part of the Stripe

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights option**.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#)).

## Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the  button can be used to clear all the validation markers.

Status messages from every validation action are logged in the [Information view](#).

If you want to see all the validation messages grouped in the [Results panel](#), you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

[Presenting Schematron Validation Issues](#)

## Bidirectional Text Support in Text Mode

Bidirectional documents contain text in both directions, usually involving characters from unique types of alphabets.

If bidirectional text (such as Arabic or Hebrew languages), certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Editor displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters.

You can also configure the support for bidirectional text in the **Open/Save** preferences page. To enable or disable this support, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Open/Save**, and choose the appropriate setting in the **Support for Special Characters** section.

**Note:** Disabling this support may affect text rendering, cursor positioning and navigation, as well as text selection and management operations. If you need to open [very large documents](#), the bidirectional editing support can also be disabled to enhance performance while editing.

**Restriction:** Bidirectional content in the **Text** mode cannot be rendered using **Bold** or **Italic**.

### Related information

[Bidirectional Text Support in Grid Mode](#) on page 204

[Inserting Symbols](#) on page 245

## Grid Editing Mode

The Oxygen XML Editor **Grid** editor displays the XML document as a structured grid of nested tables. To activate this mode, select **Grid** at the bottom of the editing area.

### Modify Content Without Working with XML Tags

If you are a non-technical user, you can modify the text content of the edited document without working with the XML tags directly. You can expand and collapse the tables using the mouse cursor and also display or hide the

elements of the document as nested. The document structure can also be changed easily with drag and drop operations on the grid components.

### Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

#### Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the *Enable mouse-wheel zooming option* in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the *Enable mouse-wheel zooming option* in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### Normal editor font (Ctrl + 0 (Command + 0 on OS X))

Resets the font size to *the value of the editor font set in the Fonts preferences page*.

		5	four.worker	four@oxygengxml.com	
		6	five.worker	five@oxygengxml.com	

Figure 69: Grid Editing Mode

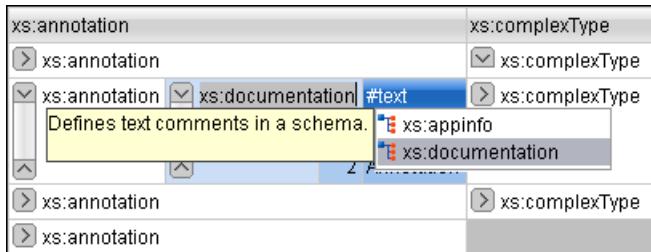

### Switch Editing Modes

To switch back from the **Grid** mode to the **Text** or **Author** mode, use the **Text** and **Grid** buttons from the bottom of the editor. You are also able to perform this switch from **Document > Edit Mode > Grid** and **Document > Edit Mode > Text**.

### Content Completion Assistant

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the editor offers a **Content Completion Assistant** for the elements and attributes names and values. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are automatically included.

To display the content completion pop-up menu, you have to start editing (for example, double-click a cell). Pressing **Ctrl + Space (Command + Space on OS X)** on your keyboard also displays the pop-up menu.

**Figure 70: Content Completion in Grid Editing Mode**

To watch our video demonstration about some of the features available in the **Grid** editor, go to [https://www.oxygenxml.com/demo/Grid\\_Editor.html](https://www.oxygenxml.com/demo/Grid_Editor.html).

## Layouts: Grid and Tree

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

<?xml version="1.0" encoding="UTF-8"			
test	table		
	tr (3 rows)		
	@id	first	last
	1	10001	Jhon
	2	10002	Mark
	3	10003	Dave
			Flint

**Figure 71: Grid Layout**

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

<?xml version="1.0" encoding="UTF-8"		
test	table	
	tr	
	@id	10001
	first	Jhon
	last	Doe
	tr	
	@id	10002
	first	Mark
	last	Ewing
	tr	
	@id	10003
	first	Dave
	last	Flint

**Figure 72: Tree Layout**

To switch between the two modes, go to **Document > Grid Layout > Grid mode/Tree mode**.

## Grid Mode Navigation

At first, the content of a document opened in the **Grid** mode is collapsed. Only the root element and its attributes are displayed. The grid disposition of the node names and values is similar to a web form or dialog box. The same set of key shortcuts used to select dialog box components is also available in the **Grid** mode:

**Table 5: Shortcuts in the Grid Mode**

Key	Action
<b>Tab</b>	Moves the cursor to the next editable value in a table row.
<b>Shift + Tab</b>	Moves the cursor to the previous editable value in a table row.

Key	Action
<u>Enter</u>	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.
<u>UpArrow/PageUp</u>	Navigates toward the beginning of the document.
<u>DownArrow/PageDown</u>	Navigates toward the end of the document.
<u>Shift</u>	Used in conjunction with the navigation keys to create a continuous selection area.
<u>Ctrl (Command on OS X) key</u>	Used in conjunction with the mouse cursor to create discontinuous selection areas.

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on OS X)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on OS X)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on OS X)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on OS X)** scrolls the grid to the right.

An arrow sign displayed at the left of the node name indicates that this node has child nodes. To display the children, click this sign. The expand/collapse actions can be invoked either with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu or from **Document > Grid Expand/Collapse**.

The following actions are available on the **Expand/Collapse** menu:

Expands the selection and all its children.

Collapses the selection and all its children.

#### **Expand Children**

Expands all the children of the selection but not the selection.

#### **Collapse Children**

Collapses all the children of the selection but not the selection.

#### **Collapse Others**

Collapses all the siblings of the current selection but not the selection.

## **Bidirectional Text Support in Grid Mode**

If you are editing documents with a bidirectional text orientation, you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation(Ctrl + Shift + O (Command + Shift + O on OS X))** action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

**Note:** This change applies only to the text from the cells, and not to the layout of the grid editor.

<?xml	version="1.0" encoding="UTF-8"

#### Related information

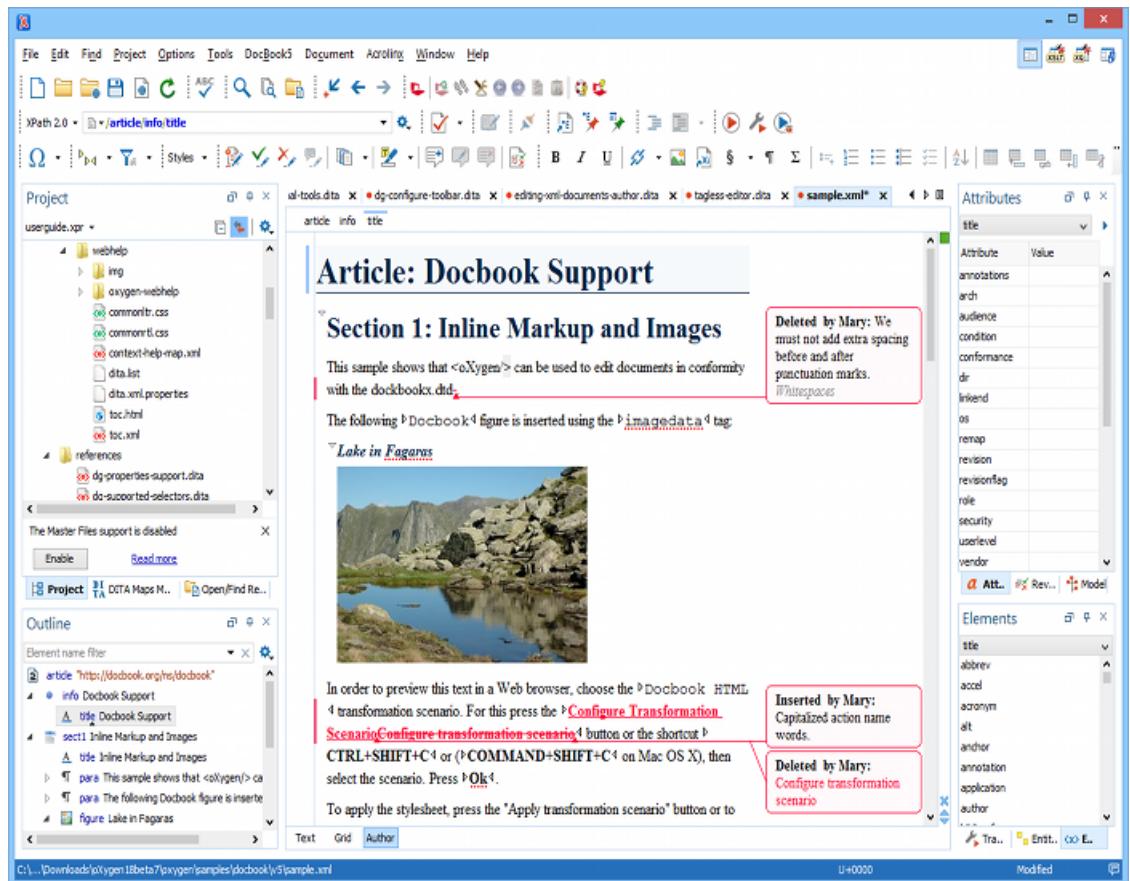

[Bidirectional Text Support in Text Mode](#) on page 201

[Bidirectional Text Support in Author Mode](#) on page 233

[Inserting Symbols](#)

## Author Editing Mode

The **Author** editing mode in Oxygen XML Editor allows you to visually edit XML documents in a visual interface that is similar to a WYSIWYG word processor.

**Figure 75: Author Editing Mode**

## Navigating the Document Content in Author Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents.

### Using the Keyboard

Oxygen XML Editor allows you to quickly navigate through a document using the **Tab** key to move the cursor to the next XML node and **Shift + Tab** to go to the previous one. If you encounter a space preserved element when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a space preserved element and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

### Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

## Navigating with the Outline View

Oxygen XML Editor includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

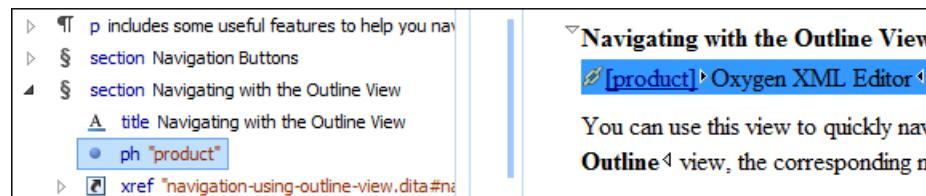

Figure 76: Outline View Navigation in Author Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 77: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the **linking support** is useful for navigating between the documents. In the predefined customizations that are bundled with Oxygen XML Editor, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.

## Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the **Options > Menu Shortcut Keys** menu.

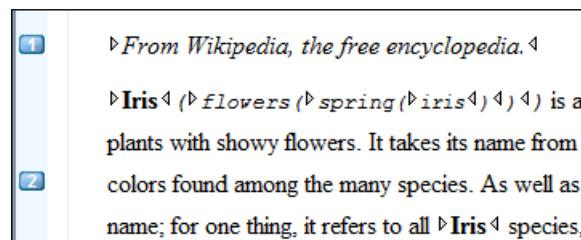

Figure 78: Editor Bookmarks

A bookmark can be inserted in **Author** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the  **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl +F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

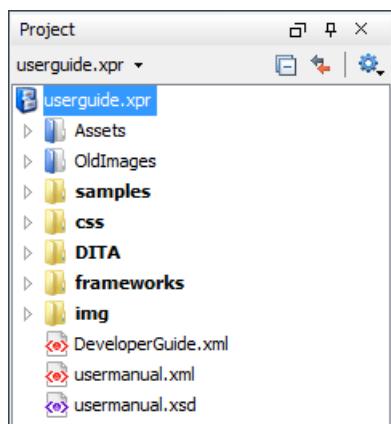

## Author Mode Views

The content author is supported by special views that are automatically synchronized with the current editing context of the editor panel. The views present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is a large selection of useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Author** mode.

### Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

**Figure 79: Project View**

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the **Outline view**. If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

#### **New Project**

Creates a new, empty project.

The following actions are grouped in the upper right corner:

## Collapse All

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

## Link with Editor

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the **Debugger** perspective.

## Settings

A submenu that contains the following actions:

### Filters

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

### Show Full Path

When selected, linked files and folders are presented with a full file path.

### Enable Master Files Support

Select this option to enable the [Master Files support](#).

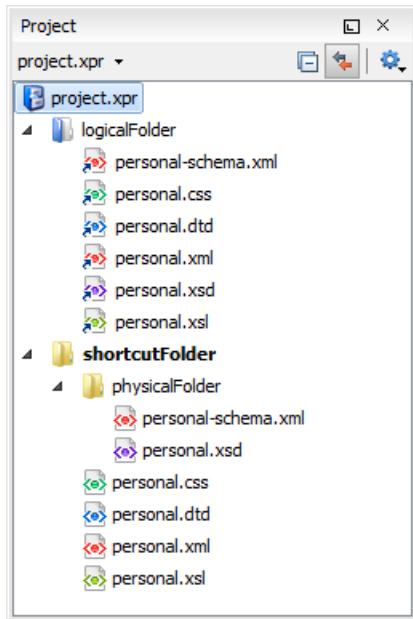

### Change Search and Refactor operations scope

Allows you to change the collection of documents that define the context of the [search and refactor operations](#).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- *Logical folders* - marked with a blue icon on Windows and Unix/Linux () and a magenta icon on Mac OS X (). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action **Remove from Project** can be used to remove them from the project.
- *Physical folders and files* - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- *Shortcut folders and files* - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **Remove from Project** and **Remove from Disk (Shift+Delete)** are available for shortcuts. **Remove from Project** just removes the shortcut from the project, while **Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

**Figure 80: Project View with Examples of all Three Types of Resources**

### Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

#### **New Project**

Creates a new, empty project.

### Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

#### **New > File**

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

#### **New > Folder**

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

#### **New > Logical Folder**

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

#### **New > Logical Folders from Web**

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

### Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

### **Add Folder**

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X .

### **Add Files**

Adds links to files on the local file system.

### **Add Edited File**

Adds a link to the currently edited file in the project.

## **Managing Project Content**

### *Creating/Adding Files and Folders*

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be enabled in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root. To create a file inside a linked folder, select the **New >  File** action from the contextual menu.

**Note:** The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

### *Removing Files and Folders*

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action **Remove from Disk (Shift+Delete)**. The **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Editor and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

### *Moving Files and Folders*

You can [move the resources of the project](#) with drag and drop operations on the files and folders of the tree (the **Enable oXygen consoles** option must be enabled in the [View preferences page](#)).

You can also use the usual **Cut**, **Copy**, and **Paste** actions to move resources in the **Project** view.

### *Renaming Files and Folders*

There are three ways you can [rename an item in the Project view](#). Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

**Note:** The **Rename** action is also available on *logical* files.

### *Locating and Opening Files*

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

#### Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

#### Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

##### **Check Well-Formedness**

Checks if the selected file or files are well-formed.

##### **Validate**

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a **Validate and Check for Completeness** operation.

#### Validate with Schema

Validates the selected file or files against a specified schema.

##### **Configure Validation Scenario(s)**

Allows you to configure and run a *validation scenario*.

#### Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

##### **Apply Transformation Scenario(s)**

Obtains the output with one of the built-in scenarios.

##### **Configure Transformation Scenario(s)**

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

##### **Transform with**

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

#### Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL))

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

##### **Rename resource**

Allows you to change the name of a resource.

##### **Move resource**

Allows you to change the location on disk of a resource.

##### **XML Refactoring**

Opens *the XML Refactoring tool wizard* that presents refactoring operations to assist you with managing the structure of your XML documents.

## Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations](#) that are used will also appear in this submenu.

## Other Contextual Menu Actions

Other actions that are available in the contextual menu from the project tree include:

### Open

Opens the selected files in the corresponding editor.

### Open with submenu

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: [DITA Maps Manager](#), [Archive Browser](#), [MathML Editor](#), [Generate/Convert Schema](#), [WSDL/SOAP Analyzer](#), [Large File Viewer](#), [Hex Viewer](#), [SVG Viewer](#).

### Show in Explorer (or Show in Finder on OS X)

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

### Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

### Refresh

Refreshes the content and the dependencies between the resources in [the Master Files directory](#).

### Find/Replace in Files

Allows you to [find and replace text in multiple files](#).

### XPath in Files

Opens the [XPath/XQuery Builder view](#) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

### Open/Find Resource

Opens the [Open/Find Resource dialog box](#).

### Check Spelling in Files

Allows you to [check the spelling of multiple files](#).

### Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

### Open in SVN Client

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

### Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

### Generate Documentation > XML Schema Documentation

Opens [the XML Schema Documentation Dialog Box](#).

### Generate Documentation > XSLT Stylesheet Documentation

Opens [the XSLT Stylesheet Documentation Dialog Box](#).

### Generate Documentation > XQuery Documentation

Opens [the XQuery Documentation Dialog Box](#).

## Generate Documentation > WSDL Documentation

Opens [the WSDL Documentation Dialog Box](#).

## Properties

Displays the properties of the current file in a **Properties** dialog box.

## Menu Level Actions

The following actions are available in the **Project** menu:

### New Project

Creates a new, empty project.

### Open Project ([Ctrl + F2 \(Command + F2 on OS X\)](#))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Save Project As

Allows you to save the current project under a different name.

### Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

### Filters

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

### Enable Master Files Support

Allows you to enable the [Master Files Support](#) for each project you are working on.

### Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

### Show Project View

Displays the **Project** view.

### Reopen Project

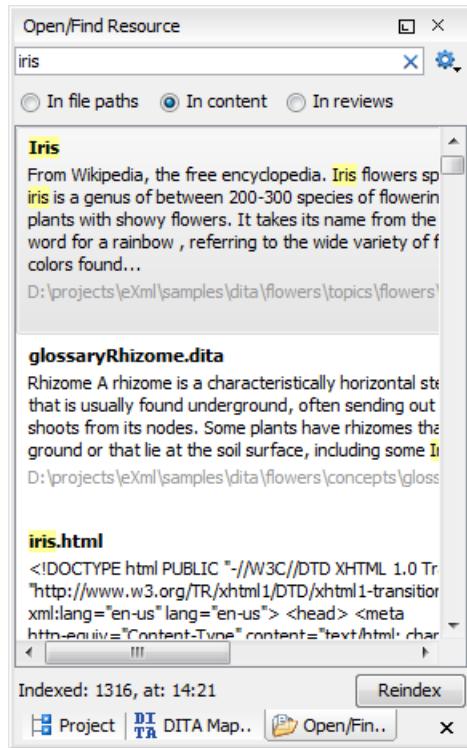

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

## Related information

[Working with EPUB](#)

## Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the **Project** and **DITA Maps Manager** views. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 81: Open/Find Resource View**

You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

## Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the [Results view](#) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *\*ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for *\*/samples/\*.gif* with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

## Options Available in the View

The **Open/Find Resource** view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.

- **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

### Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

### Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the [Open/Find Resource preferences page](#).

### Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

### Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in [the editor associated with the type of the file](#).

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to [https://www.oxygenxml.com/demo/Open\\_Find\\_Resource.html](https://www.oxygenxml.com/demo/Open_Find_Resource.html).

[Open/Find Resource Dialog Box](#) on page 262

## Outline View in Author Mode

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

## Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

## Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

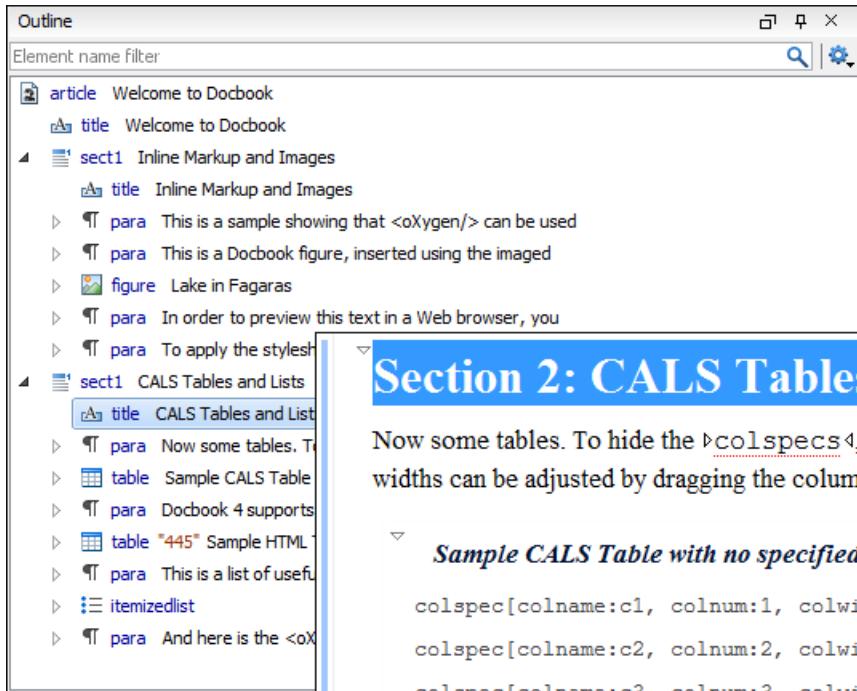

## Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be [disabled and enabled from a Preferences page](#).

**Tip:** You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.

**Figure 82: Outline View**

### Outline View Filters in Author Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the **Settings** menu of the **Outline** view when editing in **Author** mode:

#### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

#### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

#### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

#### Show element name

Show/hide element name.

#### Show text

Show/hide additional text content for the displayed elements.

#### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the [Outline preferences panel](#).

#### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

### Outline View Contextual Menu Actions in Author Mode

The contextual menu of the **Outline** view in **Author** mode contains the following actions:

#### Edit Attributes

Allows you to edit the attributes of a selected node. For more details about this action, see [Attributes View in Author Mode](#) on page 219.

## Edit Profiling Attributes

Allows you to change the [profiling attributes](#) defined on all selected elements.

## Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

## Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

## Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

## Cut, Copy, Paste, Delete editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content. The **Paste before** and **Paste after** actions allow you to insert a well-formed element before or after the currently selected element. The **Paste as XML** action pastes copied content that is considered to be valid XML, preserving its XML structure.

## Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Rename Element

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

## Expand More

Expands the structure tree of the currently selected element.

## Collapse All

Collapses all of the structure tree of the currently selected node.

**Tip:** You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

## Related information

[Attributes View in Author Mode](#) on page 219

## Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the [-oxy-editable](#) property associated with the element.
- The element is entirely included in a deleted [Track Changes](#) marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

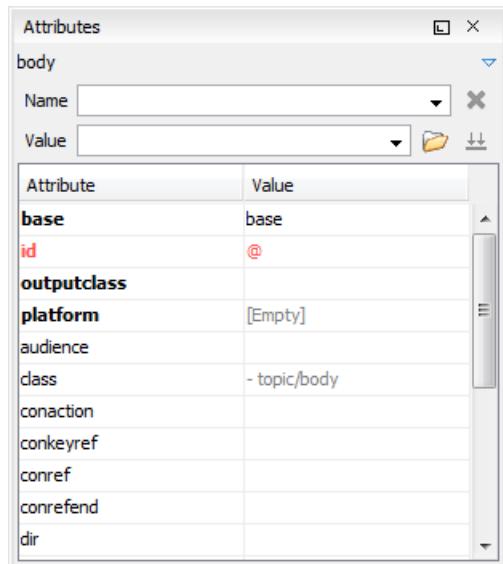

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column . If the possible values of the attribute are specified as list in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 83: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

#### Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

#### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

##### Set empty value

Specifies the current attribute value as empty.

### **Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

### **Copy**

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

### **Paste**

Depending on the content of the clipboard, the following cases are possible:

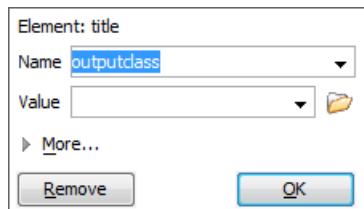

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

## **In-place Attributes Editor**

Oxygen XML Editor includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 84: In-place Attributes Editor**

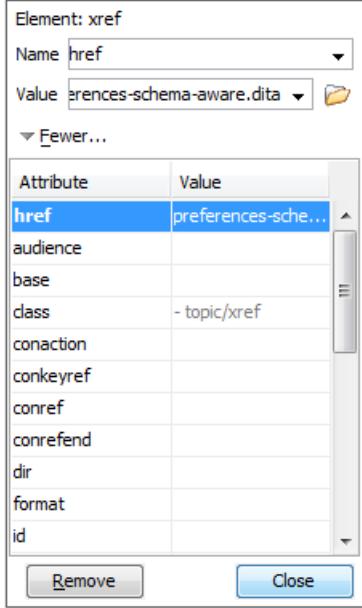

### **Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

### **Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 85: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

### Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Content : mixed**

- Model**
  - (#PCDATA | dl | parml | fig | syntaxdiagram | image | ap | image | lines | lq | note | hazardstatement | object | ol | pre | codeblock | msgblock | screen | simpletable | sl | table | ul | boolean | cite | keyword | apiname | option | parname | cmdname | msgnum | varname | wintitle | ph | b | i | sup | sub | tt | u | codeph | synph | filepath | msgph | systemoutput | userinput | menucascade | uicontrol | q | term | abbreviated-form | tm | xref | state | data | data-about | foreign | unknown | draft-comment | fn | indextermref | indexterm | required-clean-up)\*
- Attributes**
  - @audience CDATA
  - @base CDATA
  - @class CDATA
    - Default : "- topic/p "
  - @conaction (mark | pushafter | pushbefore | pushreplace | -dita-use-conref-target)
    - Possible Values
      - mark | pushafter | pushbefore | pushreplace | -dita-use-conref-target

A paragraph element (<p>) is a block of text containing a single main idea.  
Category: Body elements  
[DITA Style Guide](#)  
[DITA 1.2 Specs](#)

**Figure 86: Model View**

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

## Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

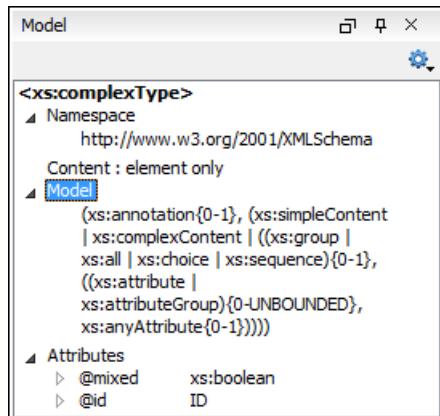

Figure 87: Element Structure Panel

## Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

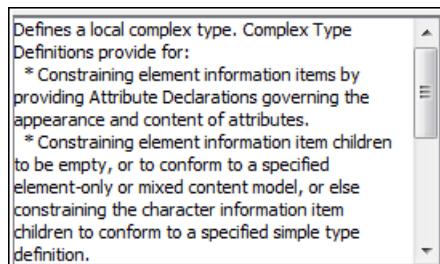

Figure 88: Annotation panel

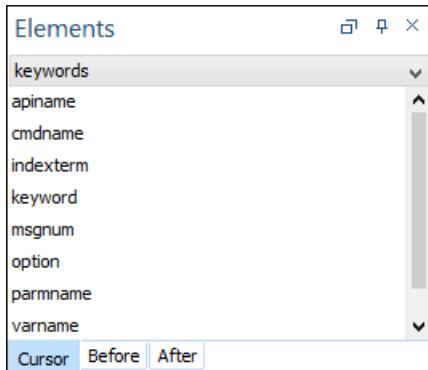

## Elements View in Author Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position option** is disabled in the **Views preferences page**, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

**Figure 89: Elements View in Author Mode**

### Entities View

**Entities** provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An **entity** is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in or Predefined* - Entities that are part of the predefined XML markup (&lt;, &gt;, &amp;, &apos;, &quot;).
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbsps	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 90: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

## Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. Those actions include the following:

- [Validation actions](#)
- [Transformation actions](#)
- [Check Spelling in Files action](#)
- [Find All](#) action from the [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [Search References](#) action
- [XPath expression results](#)
- [SQL results](#)

Description - 12 items	Resource	Location	Actions

<title>The XPath Results View</title>	oxygen-xpath-view.dita	12:30	

**Figure 91: Results View**

## Results View Toolbar Actions

The view includes a toolbar with the following actions:

### Grouping options drop-down menu

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

### Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

### Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

### Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).

- No grouping rule for the results of *applying an XPath expression*.

### **Highlight all results in editor**

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: **Find All**, **Find in Files**, **Search References**, and **Search Declarations**. Click **Highlight all results in editor** again to turn off highlighting.

**Note:** To customize highlighting behavior, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Highlights category**. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

### **Remove selected**

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages or remove those that have already been addressed or not relevant to your task.

### **Remove all**

Removes all messages from the view.

## **Results View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

### **Show message**

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

### **Previous message**

Navigates to the message above the current selection.

### **Next message**

Navigates to the message below the current selection.

### **Remove selected**

Removes selected messages from the view.

### **Remove all**

Removes all messages from the view.

### **Copy**

Copies the information associated with the selected messages:

- The file path of the document that triggered the output message.
- The path of the main file (in the case of a *validation scenario*, it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of *validation scenario*.
- The line and column in the file that triggered the message.

### **Select All**

Extends the selection to all the messages from the view.

### **Print Results**

Sends the complete list of messages to a printer. For each message the included details are the same as the ones for the [Copy action](#).

### **Save Results**

Saves the complete list of messages in a file in text format. For each message the included details are the same as the ones for the [Copy action](#).

## Save Results as XML

Saves the complete list of messages in a file in XML format. For each message the included details are the same as the ones for the [Copy action](#).

## Group by

A set of **Group by** toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

### Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

### Show group columns

If any of the **Group by** options are selected, you can use this option to show or hide grouping columns.

### Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the [Check Spelling in Files action](#).
- No grouping rule for the results of [applying an XPath expression](#).

### Expand All

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

### Collapse All

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

## CSS Inspector View

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

The screenshot shows the CSS Inspector view with the following content:

```

CSS Inspector
test.css:44
*[attr='val'] {
 text-decoration:underline;
}

test.css:35
job {
 display:block;
 color:blue;
 margin-top:2em;
 margin-right:2em;
 margin-left:2em;
 margin-bottom:2em;
 font-weight:bold;
 font-size:large;
 text-decoration:none;
}

Inherited from doc
test.css:1
doc {
 font-family:arial , helvetica , sans-serif;
}

```

Element :before :after Computed Path

**Figure 92: CSS Inspector View**

### Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

### Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Editor opens the associated CSS file at the line number where the properties of the rule are defined.

The screenshot shows the CSS Inspector view with the following content:

```

job {
 display:block;
 color:blue;
 font-size:large;
 text-decoration:none;
}

```

A red arrow points to the line 'text-decoration:none;' with the label 'Overridden Rule'. A red arrow points to the line 'test.css:33' with the label 'CSS Link'.

**Figure 93: CSS Inspector View - Displaying Rules**

The **CSS Inspector** view contains five tabs:

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:before** - Displays the rules matching the **:before** pseudo-element.
- **:after** - Displays the rules matching the **:after** pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.

- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane
- **Show empty rules** - forces the view to show all the matching rules, even if they do not declare any CSS properties (by default, the empty rules are not displayed)

## Displaying the XML Markup (Tags)

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the  **Tags Display Mode** drop-down menu (available on the toolbar):

### **Full Tags with Attributes**

Displays full tag names with attributes for both block and in-line elements.

### **Full Tags**

Displays full tag names without attributes for both block and in-line elements.

### **Block Tags**

Displays full tag names for block elements and simple tags without names for in-line elements.

### **Inline Tags**

Displays full tag names for in-line elements, while block elements are not displayed.

### **Partial Tags**

Displays simple tags without names for in-line elements, while block elements are not displayed.

### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

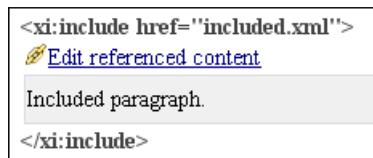

### **Configure Tags Display Mode**

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

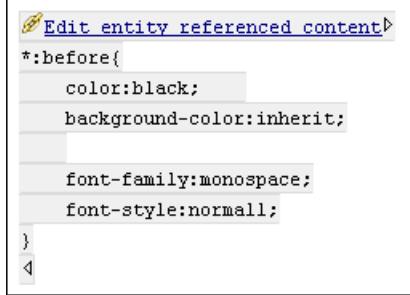

**Note:** The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

## Displaying Referenced Content

The references to entities, XInclude, and DITA conrefs are expanded by default in **Author** mode and the referenced content is displayed. You can control this behavior from the [Author preferences page](#). The referenced resources are loaded and displayed inside the element or entity that refers them, however the displayed content cannot be modified directly.

**Figure 94: XInclude reference**

**Figure 95: External entity reference**

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the referenced resource in an editor. The referenced resource can be opened quickly by clicking the link (marked with the icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case the cursor is placed at the precise location where the action was invoked in the main file). The referenced resource is resolved through the XML Catalog set in **Preferences**.

The referenced content is refreshed:

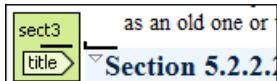

- Automatically, when it is modified and saved from Oxygen XML Editor.
- On demand, by using the *Refresh references action*. Useful when the referenced content is modified outside the Oxygen XML Editor scope.

## Visual Hints for the Cursor Position

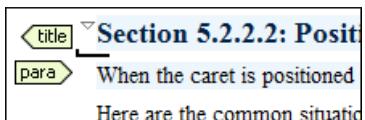

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

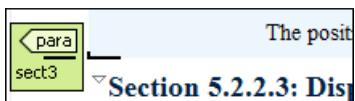

- **Before first block** - The cursor is positioned before the first block child of the current node.

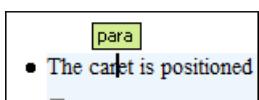

- **Between two block elements** - The cursor is positioned between two block elements.

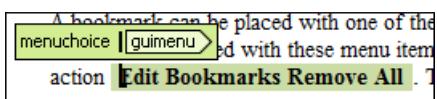

- **After last block** - The cursor is positioned after the last block element child of the current node.

- **Inside a node** - The cursor is positioned inside a node.

- **Before an inline element** - The cursor is positioned inside an element, before an inline child element.

- **Between two inline elements** - The cursor is positioned between two inline elements.

bookmark can be placed with one of the menu items associated with the current context. The cursor can be positioned on the **Edit Bookmarks** or **Remove All** buttons.

- **After an inline element** - The cursor is positioned inside an element, after an inline child element.

A bookmark can be placed with one of the menu items associated with the current context. The cursor can be positioned on the **Edit Bookmarks** or **Remove All** buttons.

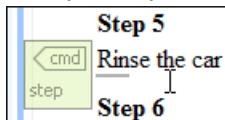

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Author > Cursor Navigation**, and disable the **Show cursor position tooltip** option. Even if this option is disabled, you can trigger the display of the position tooltip by pressing **Shift+F2**.

**Note:** The position information tooltip is not displayed if **Full Tags with Attributes or Full Tags is selected in the Tags display mode drop-down menu**.

### Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor displays a transparent preview of the position information, called the *Location Tooltip*:

**Figure 96: Location Tooltip**

Oxygen XML Editor displays a *Location Tooltip* when the following conditions are met:

- You are editing the document in one of the following *tags display modes*: **Inline Tags**, **Partial Tags**, **No Tags**.
- The mouse pointer is moved between block elements.

To activate or deactivate this feature, use the **Show location tooltip on mouse move** option in the [Cursor Navigation preferences page](#).

## Presenting Validation Errors in Author Mode

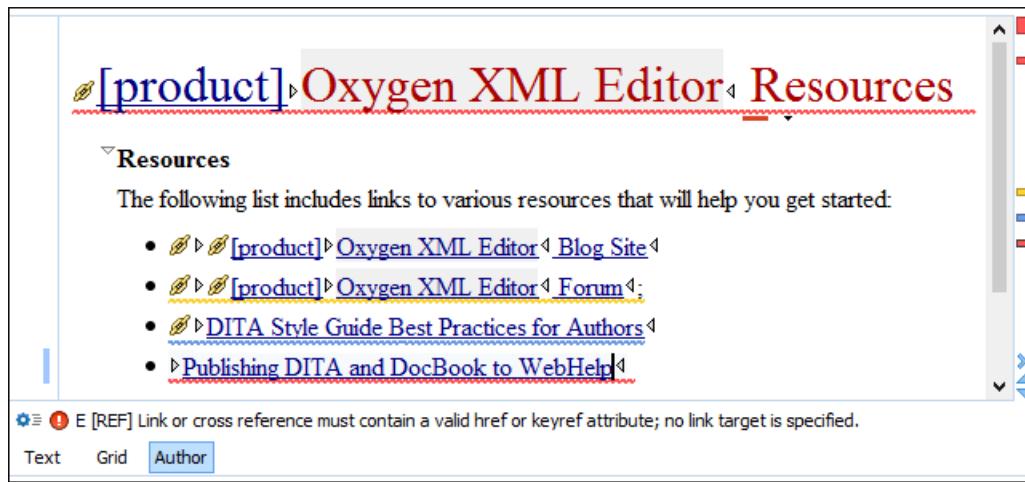

Oxygen XML Editor can be configured to [automatically validate documents](#) while editing in the **Author** mode, and actions are also available to [manually validate documents](#) on-request.

Validation issues are marked in **Author** mode with a colored underline in the editing pane and a colored marker in the right vertical stripe, according to the type of issue. You can configure the color for each type in the [Document Checking preferences page](#).

- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes](#) (if available for that issue).

Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [Document Checking preferences page](#) where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages include an icon () that provides a link to a style guide or specification.

**Figure 97: Presenting Validation Errors in Author Mode**

Also, the vertical stripe on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The stripe contains the following:

#### Upper Part of the Stripe

By default, a success indicator square will turn green if the validation is successful or if only validation info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous issues, only the first three are presented in the tool tip.

#### Middle Part of the Stripe

By default, errors are depicted with red markers, warnings with yellow markers, and info messages with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights option**.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [Document checking preferences page](#) where you can configure some validation options).

#### Bottom Part of the Stripe

Two navigation arrows ( ) allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**). Also, the button can be used to clear all the validation markers.

Status messages from every validation action are also logged in the [Information view](#).

If you want to see all the validation messages grouped in the [Results panel](#), you should use the **Validate** action from the toolbar or **Document > Validate** menu..

[Presenting Schematron Validation Issues](#)

## Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Editor must serialize the resulting document as XML. Oxygen XML Editor serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor [formats and indents the XML document](#) according to the current [format and indent settings](#).

## Minimizing whitespace differences between versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

### Entering whitespace in Author mode

Oxygen XML Editor controls the entry of whitespace characters in **Author** mode according the [XML whitespace rules](#), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its [predefined document types](#), Oxygen XML Editor is [correctly configured to recognize preserve space elements](#) and to allow you to enter additional spaces in them.

If you are using a predefined document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is [configured correctly](#) so that Oxygen XML Editor recognizes that the current element is a preserve-space element.

## Bidirectional Text Support in Author Mode

Oxygen XML Editor offers support for languages that require right to left scripts. This means that authors editing documents in the **Author** mode can create and edit XML content in Arabic, Hebrew, Persian and others. To achieve this, Oxygen XML Editor implements the [Unicode Bidirectional Algorithm](#), as specified by the Unicode consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in **Author** mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the [Arrow keys move the cursor in the writing direction option](#) in the **Cursor Navigation** preferences page is disabled, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

If bidirectional text (such as Arabic or Hebrew languages), certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer) or other special characters (such as combining characters), are detected in a document, Oxygen XML Editor displays a **Special Characters Detected** dialog box that prompts you to **Enable** or **Disable** support for these special characters.

To watch our video demonstration about the bidirectional text support in the **Author** mode, go to [https://www.oxygenxml.com/demo/BIDI\\_Support.html](https://www.oxygenxml.com/demo/BIDI_Support.html).

**Tip:** If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Editor is faster than the standalone version when working with bidirectional text.
- Changing the font. For example, you could try using the **David** font in Hebrew content. If it is not already installed in your operating system, this font is available at: <https://www.microsoft.com/typography/fonts/family.aspx?FID=234>. To change the font in Oxygen XML Editor, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Appearance > Fonts**, and change the font in the **Author default font** option.

## Controlling the Text Direction Using XML Markup

Oxygen XML Editor Supports the following CSS properties:

**Table 6: CSS Properties Controlling Text Direction**

direction	Specifies the writing direction of the text. The possible values are <code>ltr</code> (the text direction is left to right), <code>rtl</code> (the text direction is right to left, and <code>inherit</code> (the direction property is inherited from the parent element).
unicodeBidi	Used along with the <code>direction</code> property to create levels of embedded text with different text directions in the same document. The possible values of this property are <code>bidi-override</code> (creates an additional level of embedding and forces all strong characters to the direction specified in the <code>direction</code> ), <code>embed</code> (creates an additional level of embedding), <code>normal</code> (does not use an additional level of embedding), and <code>inherit</code> (the value of the <code>unicodeBidi</code> property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like the one below:

XML File:

```
<article>
 <myRTLpara>RIGHT TO LEFT TEXT</myRTLPara>
</article>
```

Associated CSS File:

```
myRTLpara{
 direction:rtl;
 unicode-bidi:embed;
}
```

Oxygen XML Editor recognizes the `dir` attribute on any XML document. The supported values are:

<code>ltr</code>	The text from the current element is Left to Right, embedded.
<code>rtl</code>	The text from the current element is Right to Left, embedded.
<code>lro</code>	The text from the current element is Left to Right, embedded.
<code>rlo</code>	The text from the current element is Right to Left, embedded.

The following XML document types make use of the `dir` attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the inline element tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the **No Tags** mode versus viewing it in the **Full Tags** mode.

## Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

**Table 7: Directional Formatting Codes**

U+202A (LRE)	LEFT-TO-RIGHT EMBEDDING	Treats the following text as embedded left-to-right.
U+202B (RLE)	RIGHT-TO-LEFT EMBEDDING	Treats the following text as embedded right to left.
U+202D (LRO)	LEFT-TO-RIGHT OVERRIDE	Forces the following characters to be treated as strong left-to-right characters.
U+202E (RLO)	RIGHT-TO-LEFT OVERRIDE	Forces the following characters to be treated as strong right-to-left characters.
U+202C (PDF)	POP DIRECTIONAL FORMATTING CODE	Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.
U+200E (LRM)	LEFT-TO-RIGHT MARK	Left-to-right strong zero-width character.
U+200F (RLM)	RIGHT-TO-LEFT MARK	Right-to-left strong zero-width character.

To insert Unicode Direction Formatting Codes, use the [Character Map](#) dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Editor offers the support for bi-directional text in all the side views (**Outline** view, **Attributes** view and so on) and text fields.

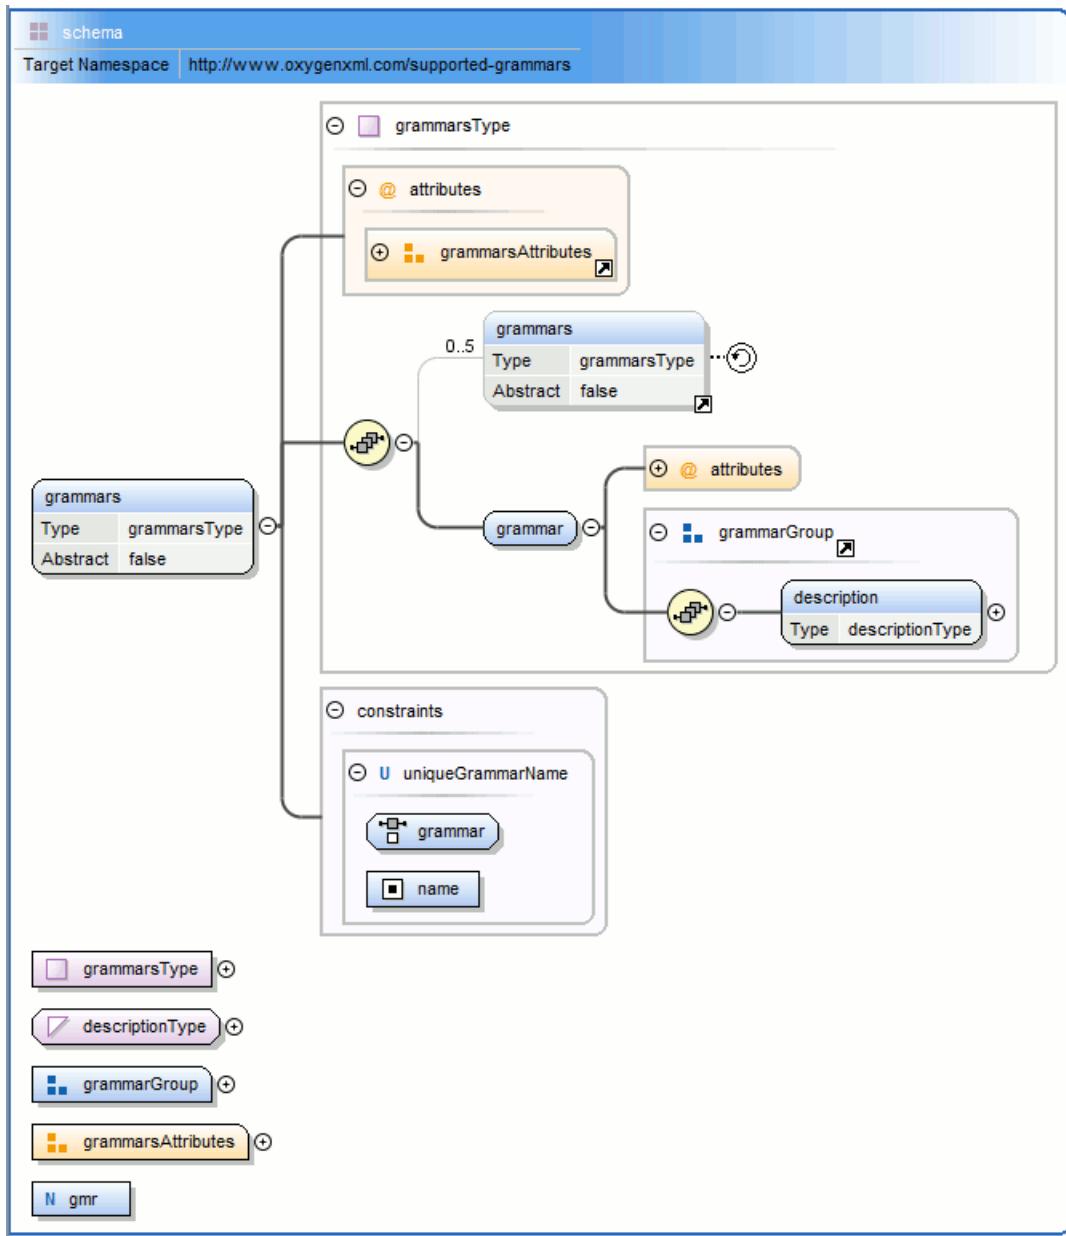

## Design Editing Mode (XML Schema Diagram Editor)

---

XML Schemas enable document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor provides a simple and expressive XML Schema diagram editor (**Design** mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The diagram font can be increased using the usual Oxygen XML Editor shortcuts: [\*\*\(Ctrl \(Meta on Mac OS\) + "+"\)\*\*](#), [\*\*\(Ctrl \(Meta on Mac OS\)+"-"\)\*\*](#), [\*\*\(Ctrl \(Meta on Mac OS\) + 0\)\*\*](#) or [\*\*\(Ctrl \(Meta on Mac OS\) - mouse wheel\)\*\*](#). The whole diagram can also be zoomed with one of the predefined factors [available in the Schema preferences panel](#). The same zoom factor is applied for the print and save actions.

**Figure 98: XML Schema Diagram**

To watch our video demonstration about the basic aspects of designing an XML Schema using the new Schema Editor, go to [https://www.oxygenxml.com/demo/XML\\_Schema\\_Editing.html](https://www.oxygenxml.com/demo/XML_Schema_Editing.html).

## Navigation in the XML Schema Design Mode

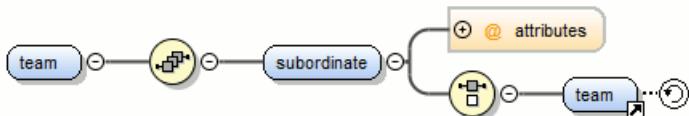

The following editing and navigation features work for all types of schema components in the XML Schema Design mode:

- Move/reference components in the diagram using drag-and-drop actions.
- Select consecutive components on the diagram (components from the same level) using the **Shift** key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on Mac OS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use **Home/End** keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on OS X)** key combination to go to the diagram root and **Ctrl + End (Command + End on OS X)** to go to the last child of the selected component.

- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline** view:
  - **Back** (go to previous schema component).
  - **Forward** (go to next schema component).
  - \* **Go to Last Modification** (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Show Definition** action.
- Search in the diagram using the *Find/Replace dialog box* or the *Quick find toolbar*. You can find/replace components only in the current file scope.
- You can expand and see the contents of the imports/includes/redefines in the diagram. In order to edit components from other schemas the schema for each component will be opened as a separate file in Oxygen XML Editor.

**Tip:** If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

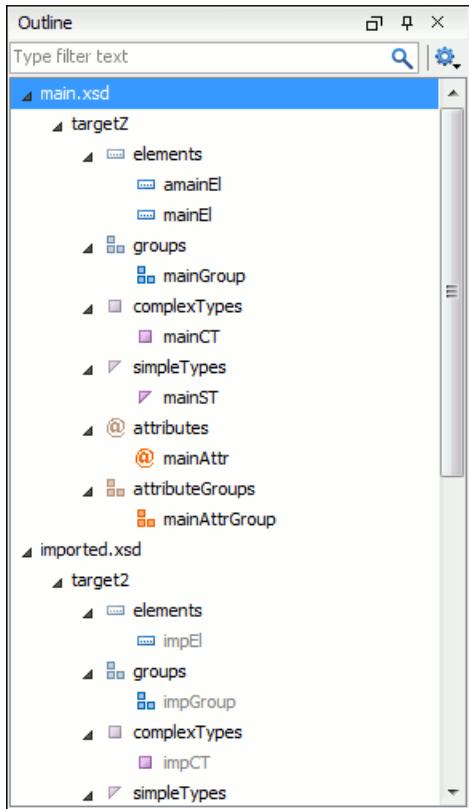

- Recursive references are marked with a *recurse symbol* (). Click this symbol to navigate between the element declaration and its reference.

**Figure 99: Recursive Reference**

## XML Schema Outline View

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 100: Outline View for XML Schema**

The **Outline** view provides the following options in the **Settings** menu on the **Outline** view toolbar:

#### **Filter returns exact matches**

The text filter of the **Outline** view returns only exact matches;

#### **Selection update on cursor move**

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

#### **Sort**

Allows you to sort alphabetically the schema components.

#### **Show all components**

Displays all components that were collected starting from the main files. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the componentNS namespace.

#### **Show referable components**

Displays all components (collected starting from the main files) that can be referenced from the current file. This option is set by default.

#### **Show only local components**

Displays the components defined in the current file only.

#### **Group by location/namespace/type**

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

#### **Remove (Delete)**

Removes the selected item from the diagram.

## **Search References (Ctrl (Meta on Mac OS)+Shift+R)**

Searches all references of the item found at current cursor position in the defined scope, if any.

## **Search References in**

Searches all references of the item found at current cursor position in the specified scope.

## **Component Dependencies (Ctrl (Meta on Mac OS)+Shift+F4)**

Allows you to see the dependencies for the current selected component.

## **Resource Hierarchy (F4)**

Allows you to see the hierarchy for the current selected resource.

## **Resource Dependencies (Shift + F4)**

Allows you to see the dependencies for the current selected resource.

## **Rename Component in**

Renames the selected component.

## **Generate Sample XML Files**

Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

[Editing Relax NG Schema in the Master Files Context](#) on page 631

## **XML Schema Attributes View**

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Attributes	
<span style="font-size: small;">+</span> <span style="font-size: small;">X</span> <span style="font-size: small;">↑</span> <span style="font-size: small;">↓</span> <span style="font-size: small;">✖</span>	
<b>Name</b>	family
<b>Type</b>	[ST - union]
<b>Member Types</b>	
<b>Member</b>	xs:string
Default	
Fixed	
Substitution Group	
Abstract	false
Nullable	false
Block	
Final	
ID	
Component	element
Namespace	
System ID	personal.xsd

**Figure 101: Attributes View**

The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the [Document checking user preferences](#).

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the [Edit Schema Namespaces](#) section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

 **Add**

Allows you to add a new member type to an union's member types category.

 **Remove**

Allows you to remove the value of a property.

 **Move Up**

Allows you to move up the current member to an union's member types category.

 **Move Down**

Allows you to move down the current member to an union's member types category.

 **Copy**

Copy the attribute value.

 **Show Definition** Ctrl (Meta on MAC OS) + Click

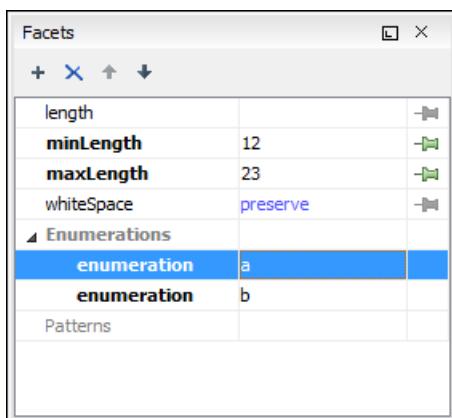

Shows the definition for the selected type.

**Show Facets**

Allows you to edit the facets for a simple type.

## XML Schema Facets View

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 102: Facets View**

The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

**Important:** Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the [Document Checking user preferences](#).

The **Facets** view provides the following actions in its toolbar and contextual menu:

**Add**

Allows you to add a new enumeration or a new pattern.

**Remove**

Allows you to remove the value of a facet.

**Edit Annotations**

Allows you to edit an annotation for the selected facet.

**Move Up**

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

**Move Down**

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

**Copy**

Copy the attribute value.

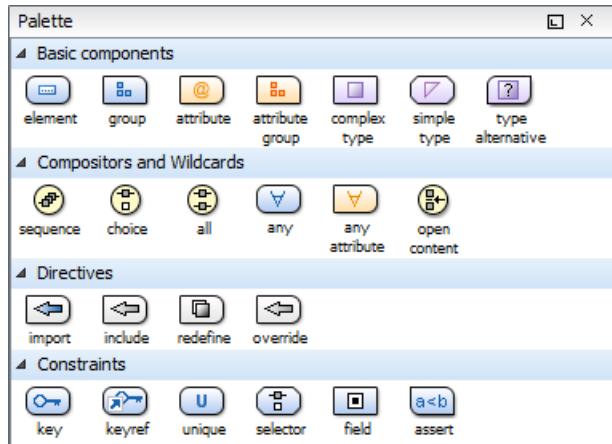

## Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the [XML Schema Regular Expressions Builder](#) that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the button.

## XML Schema Palette View

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the [XML Schema preferences page](#). If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 103: Palette View**

Components are organized functionally into 4 collapsible categories:

- Basic components: *elements, group, attribute, attribute group, complex type, simple type, type alternative*.
- Compositors and Wildcards: *sequence, choice, all, any, any attribute, open content*.
- Directives: *import, include, redefine, override*.
- Identity constraints: *key, keyref, unique, selector, field, assert*.

**Note:** The *type alternative, open content, override, and assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

**Note:** You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the [Validation error highlight color option](#) (default color is red).

To watch our video demonstration about the Schema palette and developing XML Schemas, go to [https://www.oxygenxml.com/demo/Schema\\_Palette.html](https://www.oxygenxml.com/demo/Schema_Palette.html) and [https://www.oxygenxml.com/demo/Developing\\_XML\\_Schemas.html](https://www.oxygenxml.com/demo/Developing_XML_Schemas.html) respectively.

# Editing Documents

---

## Topics:

- [\*Working with Unicode\*](#)
- [\*Creating and Working with Documents\*](#)
- [\*Using Projects to Group Documents\*](#)
- [\*Editing XML Documents\*](#)
- [\*Editing XSLT Stylesheets\*](#)

- [\*Handling Read-Only Files\*](#)
- [\*Editing Documents with Long Lines\*](#)
- [\*XML Digital Signatures\*](#)
- [\*Compare Files or Directories\*](#)

This chapter includes a large amount of information about editing numerous types of documents, how to create and work with documents, working with projects, and various editing features that are provided in Oxygen XML Editor. Each type of document has unique features and options when editing them in Oxygen XML Editor, while some editing features are available for all document types. This chapter also includes information about some of the special tools that are included in Oxygen XML Editor, such as the file and directory comparison tools.

## Working with Unicode

---

Unicode provides a unique number for every character, independent of the platform and language. Unicode is an internationally recognized standard, adopted by industry leaders. The Unicode is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.) and is the official way to implement ISO/IEC 10646.

It is supported in many operating systems, all modern browsers, and many other products. The emergence of the Unicode Standard, and the availability of tools supporting it, are among the most significant recent global software technology trends. Incorporating Unicode into client-server or multiple tiered applications and websites offers significant cost savings over the use of legacy character sets.

As a modern XML Editor, Oxygen XML Editor provides support for the Unicode standard enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Editor uses 16 bit characters covering the Unicode Character set.

As a Java application, Oxygen XML Editor includes a default Java input method for typing characters with Unicode codes. However, the default input method does not cover all the Unicode codes (for example, the codes for some accented characters or characters found in East Asian languages). Such characters can be inserted in the editor panel of Oxygen XML Editor either with [the Character Map dialog box](#) available from menu **Edit > Insert from Character Map** or by installing a Java input method that supports the insertion of the needed characters. The [installation of a Java input method](#) depends on the platform (Windows, Mac OS X, Linux, etc.) and is the same for any Java application.

**Note:** Oxygen XML Editor may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

**Tip:** On windows, you can enable the support for CJK (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages**.

## Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Editor reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Editor prompts and displays the **Available Java Encodings** dialog box that provides a list of all encodings supported by the Java platform.

If the opened document contains an unsupported character, Oxygen XML Editor applies [the policy specified for handling such errors](#). If the policy is set to REPORT, Oxygen XML Editor displays an error dialog box with a message about the character not allowed by the encoding. If the policy is set to IGNORE, the character is removed from the document displayed in the editor panel. If the policy is set to REPLACE, the character is replaced with a standard replacement character for that encoding.

While in most cases you are using UTF-8, simply changing the encoding name causes the application to save the file using the new encoding.

When saving a document edited in the **Text**, **Grid**, or **Design** modes, if it contains characters not included in the encoding declared in the document prolog, Oxygen XML Editor detects the problem and signals it to the user. The user is responsible to resolve the conflict before saving the document.

When saving a document edited in the **Author** mode, all characters that fall outside the detected encoding will be automatically converted to hexadecimal character entities.

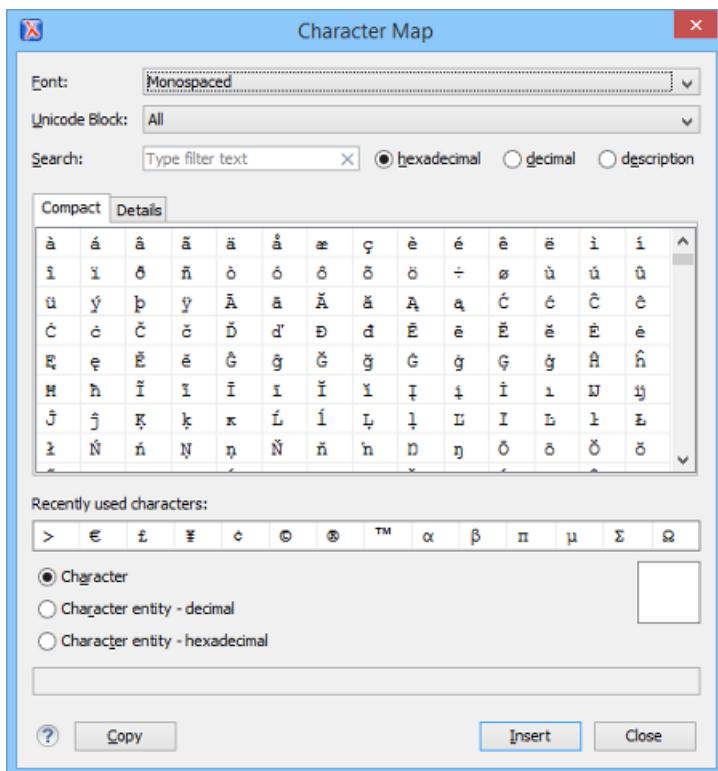

To edit documents written in Japanese or Chinese, change the font to one that supports the specific characters (a Unicode font). For the Windows platform, *Arial Unicode MS* or *MS Gothic* is recommended. Do not expect *WordPad* or *Notepad* to handle these encodings. Use applications such as *Internet Explorer* or *Word* to examine XML documents.

When a document with a UTF-16 encoding is edited and saved in Oxygen XML Editor, the saved document has a byte order mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*) has a different BOM than a UTF-16 document created on a Mac OS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved

when the document is edited and saved. This behavior can be changed in Oxygen XML Editor from the [Encoding preferences panel](#).

## Inserting Symbols

You can insert symbols by using the **Character Map** dialog box that can be opened with the **Edit > Insert from Character Map** action. If you have [enabled the Symbols toolbar](#), you can also use the **Symbols** drop-down menu to insert some of the most commonly used symbols and selecting **More symbols** from that menu will also open the **Character Map** dialog box.

**Figure 104: Character Map Dialog Box**

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

### Font

Use this drop-down list to choose the font for which you want to display characters.

### Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

### Search

Use this filter to search for a character by one of the following attributes:

- **hexadecimal**
- **decimal**
- **description**

**Note:** Selecting **description** opens the **Details tab**. If you enter a character description in the **Search** field, **tdescription** is selected automatically.

### Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.

- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

### Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

### Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in the **Text** editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in **Text** mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in **Author** mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the **Insert** button to insert the selected character in the current editor at cursor position. You will see the character in the editor if [the editor font](#) is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

**Note:** The **Character Map** dialog box cannot be used to insert Unicode characters in the [Grid editor](#). Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in **Grid** mode.

## Unicode Fallback Font Support

Oxygen XML Editor provides fonts for most common Unicode ranges. However, if you use special symbols or characters that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many Unicode characters as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Editor will try to find that symbol in a *fallback* font.

### Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (♿ - U+267F) into your content in a Windows operating system. By default, Oxygen XML Editor does not render this symbol correctly since it is not included in any of the default fonts. It is included in *Segoe UI Symbol*, but this font is not part of the default fonts that come with Oxygen XML Editor. To allow Oxygen XML Editor to recognize and render the symbol correctly, you can add *Segoe UI Symbol* as a *fallback* font.

### Add a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Editor installation, use the following procedure:

1. Start Windows Explorer and browse to the `[OXYGEN_INSTALL_DIR]/jre/lib/fonts` directory.
2. Create a directory called `fallback` (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

**Tip:** You could, for example, copy the *Segoe UI Symbol Regular* font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Editor for the changes to take full effect.

**Result:** Whenever Oxygen XML Editor finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the `fallback` folder.

### Alternate Solution for Other Platforms

For Mac OS X or other platforms, you could use the following approach:

1. Use a font editor (such as [FontForge](#)) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.

3. In Oxygen XML Editor, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Appearance > Fonts**.
4. Click the **Choose** button in the **Editor** option and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Editor for the font changes to take full effect.

## Creating and Working with Documents

---

Oxygen XML Editor includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

### Creating New Documents and Templates

Oxygen XML Editor includes a handy **New Document** wizard that allows you to customize and create new files from a large list of document types and predefined new file templates. You can also create your own templates and share them with others.

#### New Document Wizard

Oxygen XML Editor supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **File Types**.

The **New Document** wizard only creates a skeleton document. It may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type.

#### New Document Wizard

The **New Document** wizard allows you to create various types of documents and provides some options that help you to configure the new document. To use this wizard to create a new document in Oxygen XML Editor, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New**.

**Result:** The **New Document** wizard is displayed and it groups the supported document types in the following categories:

- **Recently Used** - Contains the list of the most recently used file types.
  - **New Document** - Contains the list of all supported document types. This list includes XML, XSL, XML Schema, Document Type Definition, Relax NG Schema, XQuery, web Services Definition Language, Schematron Schema, CSS, Text, PHP, JavaScript, Java, C, C++, Batch, Shell, Properties, SQL, XML Catalog, PERL, and more.
  - **Global Templates** - Contains the list of predefined templates as well as user-defined custom templates. You can [create your own custom file templates](#) and add them to the templates folder of the Oxygen XML Editor installation directory. You can also specify an additional directory to use for the templates in the [Document Templates preferences page](#).
  - **Framework Templates** - Contains the list of templates defined in the [Document Type configuration dialog box \(Templates tab\)](#) for each framework.
2. Select the type of document that you want to create.
  3. If you want to use the default settings in the creation process, select **Create** at the bottom of the dialog box.

**Result:** The document is created using the default settings and the new file is opened in the appropriate editor.
  4. If you want to configure properties before creating the file, select **Customize**. This action is available for XML, XML Schema, Schematron, and XSL documents.

**Result:** A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click **Create** to create the file and open it in the appropriate editor.

## XML Document File Type

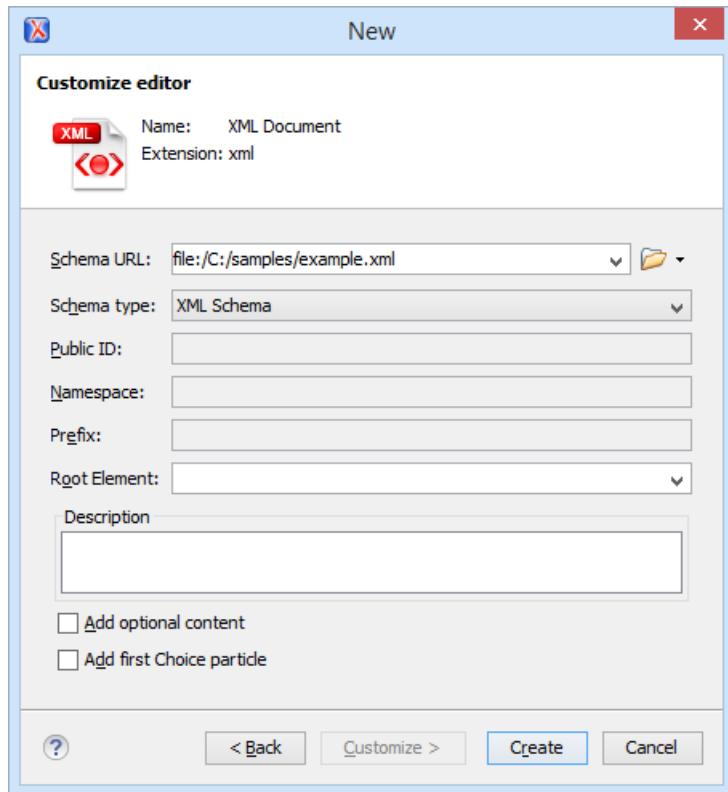

Figure 105: New XML Document Configuration Dialog Box

If you selected **XML Document** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Schema URL** - Specifies the path to the schema file. When you select a file, Oxygen XML Editor analyzes its content and tries to fill in the rest of the dialog box.
- **Schema Type** - Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.
- **Public ID** - Specifies the PUBLIC identifier declared in the document prolog.
- **Namespace** - Specifies the document namespace.
- **Prefix** - Specifies the prefix for the namespace of the document root.
- **Root Element** - Populated with elements defined in the specified schema, enables selection of the element used as document root.
- **Description** - A small description of the selected document root.
- **Add Optional Content** - If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.
- **Add First Choice Particle** - If you select this option, Oxygen XML Editor generates the first element of an xs:choice schema element in the skeleton XML document. Oxygen XML Editor creates this document in a new editor panel when you click **OK**.

## XSLT Stylesheet File Type

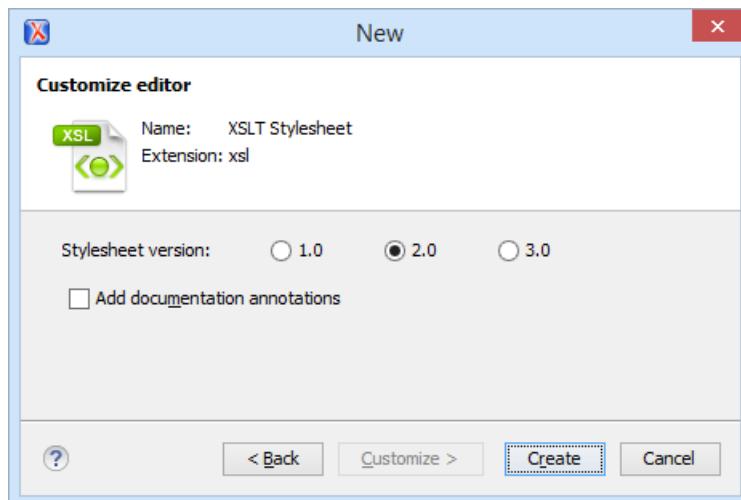

Figure 106: New XSLT Stylesheet Configuration Dialog Box

If you selected **XSLT Stylesheet** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Stylesheet version** - Allows you to select the Stylesheet version number. You can select from: 1 . 0, 2 . 0, and 3 . 0.
- **Add documentation annotations** - Enable this option to generate the stylesheet annotation documentation.

## XML Schema File Type

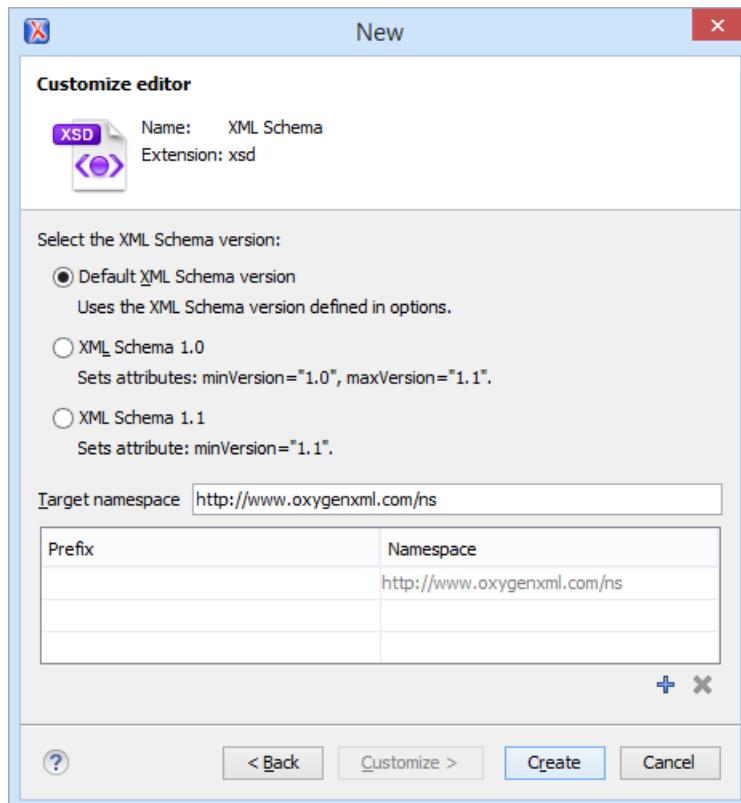

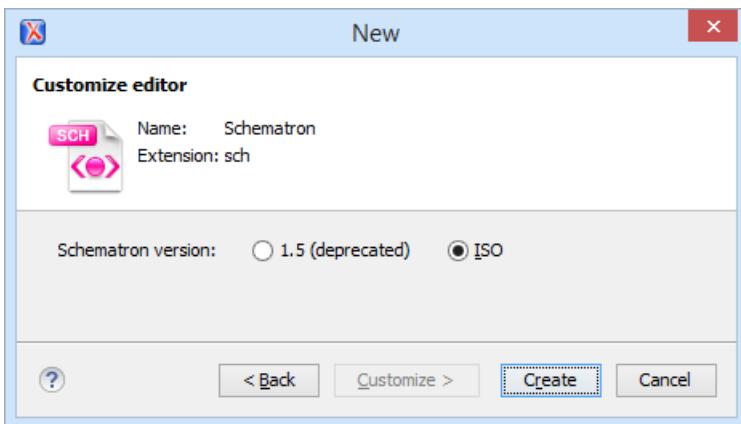

Figure 107: New XML Schema Configuration Dialog Box

If you selected **XML Schema** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

- **Default XML Schema version** - Uses the XML Schema version defined in the [XML Schema preferences page](#).
- **XML Schema 1.0** - Sets the `minVersion` attribute to `1.0` and the `maxVersion` attribute to `1.1`.
- **XML Schema 1.1** - Sets the `minVersion` attribute to `1.1`.
- **Target namespace** - Allows you to specify the schema target namespace.
- **Namespace prefix declaration table** - This table contains namespace prefix declarations. Table information can be managed using the **New** and **Delete** buttons.

**Tip:** For further details on how you can set the version of an XML Schema, go to [Setting the XML Schema Version](#).

## Schematron File Type

**Figure 108: New Schematron Configuration Dialog Box**

If you selected **Schematron** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

- **Schematron version** - Specifies the Schematron version. Possible options: `1.5 (deprecated)` and `ISO`.  
**Note:** Starting with version 16.0 of Oxygen XML Editor, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

## Creating New Document Templates

Oxygen XML Editor allows you to create your own custom document templates and they will appear in the **Global templates** folder (or another specified folder) within the [New document wizard](#).

### Creating a New Document Template

To create your own custom document template and have it appear in the new file wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.  
**Tip:** You can use [editor variables](#) in the template file content and they will be expanded when the files are opened.
2. Save the new file template in one of the following locations:
  - The `templates` directory of the Oxygen XML Editor installation directory (`[OXYGEN_INSTALL_DIR]/templates`). File templates saved in this directory will appear in the **Global templates** category in the [New document wizard](#).
  - You can also use any other directory of your choice, but you must add that directory to the list of templates in the [Document Templates preferences page](#). This user-defined directory will appear in the [New document wizard](#) with the new file templates that you save in it.

**Attention:** The name that you use to save the template will be the name that appears in the new file wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as `My Custom Template1`).

3. Open the new file wizard ( New toolbar button or **File > New**) and you should see your custom template in the appropriate folder. For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you create a corresponding properties file (see the procedure below), you need to set the type property to dita.

#### Related information

[Customizing Document Templates](#) on page 251

### Customizing Document Templates

Oxygen XML Editor allows you to customize certain aspects of predefined or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the [New document wizard](#).

#### Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one.

- If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file will specify the paths to the icons that will be used in the new file wizard. You can find some examples in the templates directory of the Oxygen XML Editor installation directory to help you get started.

When defining the icons, the properties file should look like this:

```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

**Important:** For DITA files, the type property needs to be set to dita. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**. For all other types of files, set it to general. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

**Note:** If you created a new template and chose to use a custom directory for the new template (in [step 2 of the new template procedure](#)), make sure the path to the icons is relative to that directory.

- If you edit an existing template, simply define the icon paths as specified [above](#).
2. Save the properties file in the same directory as the document template.
  3. Open the new file wizard (**File > New**) and you should see your custom icons next to the document template in the appropriate folder.

#### Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you select **New > File** from the contextual menu in the [Project view](#). The prefix or suffix is added to the name of the file in the **File name** field.
- For DITA files, it also applies to the new document dialog box that appears when you select **Append Child > New or Insert After > New** from the [DITA Maps Manager](#). The prefix or suffix is added to the name of the file in the **Save as** field.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.

- If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties). This properties file will specify the prefix/suffix that will be used to propose the file name in the new file wizards.

When defining the prefix/suffix, the properties file should look something like this:

```
type=general
filenamePrefix=prod_
filenameSuffix=_test
```

**Important:** For DITA files, the type property needs to be set to dita. For all other types of files, set it to general.

- If you edit an existing template, simply define the prefix/suffix as specified [above](#).
- 2. Save the properties file in the same directory as the document template.
- 3. Open the new document wizard ([using the methods described above](#)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

#### Related information

[Creating New Document Templates](#) on page 250

## Opening Documents

To open a document in Oxygen XML Editor, do one of the following:

- Go to **File > Open (Ctrl + O (Command + O on OS X))** or click the Open toolbar button to display the **Open File** dialog box. The start folder of the **Open** dialog box can be either the last folder visited by this dialog box or the folder of the currently edited file. This can be [configured in the user preferences](#).
- Go to **File > Open URL** or click the Open URL toolbar button to display a dialog box that allows you to access any resource identified through a URL (defined by a protocol, host, resource path, and an optional port). The following actions are available in the drop-down action list:
  - **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local DITA map.
  - **Browse for remote file** - Displays the [Open URL dialog box](#) that allows you to open a remotely stored DITA map.
  - **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to browse the content of an archive and choose a DITA map.
  - **Browse Data Source Explorer** - Opens the **Data Source Explorer** that allows you to browse the data sources defined in the [Data Sources preferences page](#).

**Tip:** You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.

- **Search for file** - Displays the [Open/Find Resource dialog box](#) that allows you to search for a DITA map.
- Click the Open/Find Resource toolbar button to search for a file to open.
- Go to **File > Reload** to load the last saved file content. All unsaved modifications are lost.
- Go to **File > Reopen** to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the **Clear history** action.
- Select the **Open** or **Open with** action from the contextual menu of the [Project view](#).

#### Related information

[Opening Local Files at Start-up](#) on page 253

## Opening the Current Document in System Application

To open the currently edited document in the associated system application, use the **View in Browser/System Application** action that is available in the **File** menu and on the **File** toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

## Opening Local Files at Start-up

To open a local file at start-up when you open Oxygen XML Editor from the command line, add the paths for one or more local files as parameters in the command line:

- `scriptName [pathToXMLFile1] [pathToXMLFile2]`
  - **scriptName** is the name of the startup script for your platform (oxygen.bat on Windows, oxygen.sh on Unix/Linux, oxygenMac.sh on Mac OS).
  - **pathToXMLFileN** is the name of a local XML file.
- An XML file and a schema file to be associated automatically to the file and used for validation and content completion:

```
scriptName -instance pathToXMLFile -schema pathToSchemaFile -schemaType
XML_SCHEMA|DTD_SCHEMA|RNG_SCHEMA|RNC_SCHEMA -dtName documentTypeName
```

- **scriptName** is the name of the startup script for your platform (oxygen.bat on Windows, oxygen.sh on Unix/Linux, oxygenMac.sh on Mac OS).
- **pathToXMLFile** is the name of a local XML file.
- **pathToSchemaFile** is the name of the schema that you want to associate to the XML file, the four constants (XML\_SCHEMA, DTD\_SCHEMA, RNG\_SCHEMA, RNC\_SCHEMA) are the possible schema types (W3C XML Schema, DTD, Relax NG schema in full syntax, Relax NG schema in compact syntax).
- **documentTypeName** specifies the name of the *Document Type* for which the schema is defined. If the Document Type is already set in preferences, its schema and type are updated.

The two possibilities of opening files at startup by specifying them in the command line are explained also if the startup script receives one of the `-h` or `--help` parameters.

### Related information

[Opening a File at a Specific Location Using the Command Line Interface](#) on page 253

## Opening a File at a Specific Location Using the Command Line Interface

Oxygen XML Editor offers support for opening a file at a specific position using the command line interface, by transmitting parameters to the Oxygen XML Editor batch script file. The following methods are available, depending on how you identify the position that is needed:

### 1. Specific position values (line and column number, or character offset)

Oxygen XML Editor supports the following position parameters:

- `line` - The line number.
- `column` - The column number (has meaning if the `line` parameter is also defined).
- `char` - The character offset.

#### Examples for Windows:

The following examples show how you can open an XML document in Oxygen XML Editor:

```
oxygen.bat file:samples/personal.xml#line=4
oxygen.bat file:samples/personal.xml#line=4;column=5
oxygen.bat file:samples/personal.xml#line=4;column=5
oxygen.bat file:samples/personal.xml#char=334
```

### 2. Simplified XPath index path

Oxygen XML Editor will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form 1/5/7 identifies the seventh child of the fifth child of the root element.

**Restriction:** Oxygen XML Editor will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

#### Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Editor and select the third child of the root element:

```
oxygen.bat file:samples/personal.xml#element(1/3)
```

### 3. Anchors identified by ID attribute values

Oxygen XML Editor will open an XML file and select the element whose `id` attribute value is an exact match of the anchor attached to a command line instruction.

#### Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Editor and select the element that has the `id` element set to `titleID`:

```
oxygen.bat file:samples/personal.xml#titleID
```

#### Related information

[Opening Local Files at Start-up](#) on page 253

## Saving Documents

You can save the document you are editing with one of the following actions:

- **File > Save**.
- **Save** toolbar button - If the document was not yet saved, it displays the **Save As** dialog box.
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save To URL** - Displays a **Save to URL** dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). Use the drop-down action list to choose one of the available save actions:
  - **Browse for local file** - Opens a local file browser dialog box allowing you to save the document locally.
  - **Browse for remote file** - Displays a **Save to URL** dialog box that allows you to save the document to a remote location (accessible through FTP, SFTP or WebDAV).
  - **Browse for archived file** - Displays the **Archive Browser** dialog box that allows you to save the document inside an archive.
  - **Browse Data Source Explorer** - Opens a **Data Source Explorer** that allows you to browse the data sources defined in the [Data Sources preferences page](#).

**Tip:** You can get to the **Data Sources** preferences page, using the **Configure Database Sources** shortcut from the **Save to URL** dialog box.

- **Search for file** - Displays the [Open/Find Resource dialog box](#).
- **File > Save All** - Saves all open documents. If any document does not have a file, displays the **Save As** dialog box.

## Opening and Saving Remote Documents

Oxygen XML Editor supports editing remote files, using the FTP, SFTP, WebDAV , SharePoint, and SharePoint Online for Office 365 protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files a project, or make them subject of XSL and FO transformations.

You can open one or more remote files in [the Open URL dialog box](#).

A WebDAV resource can be locked when it is opened in Oxygen XML Editor by checking the [Lock WebDAV files on open option](#) to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Editor displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Editor.

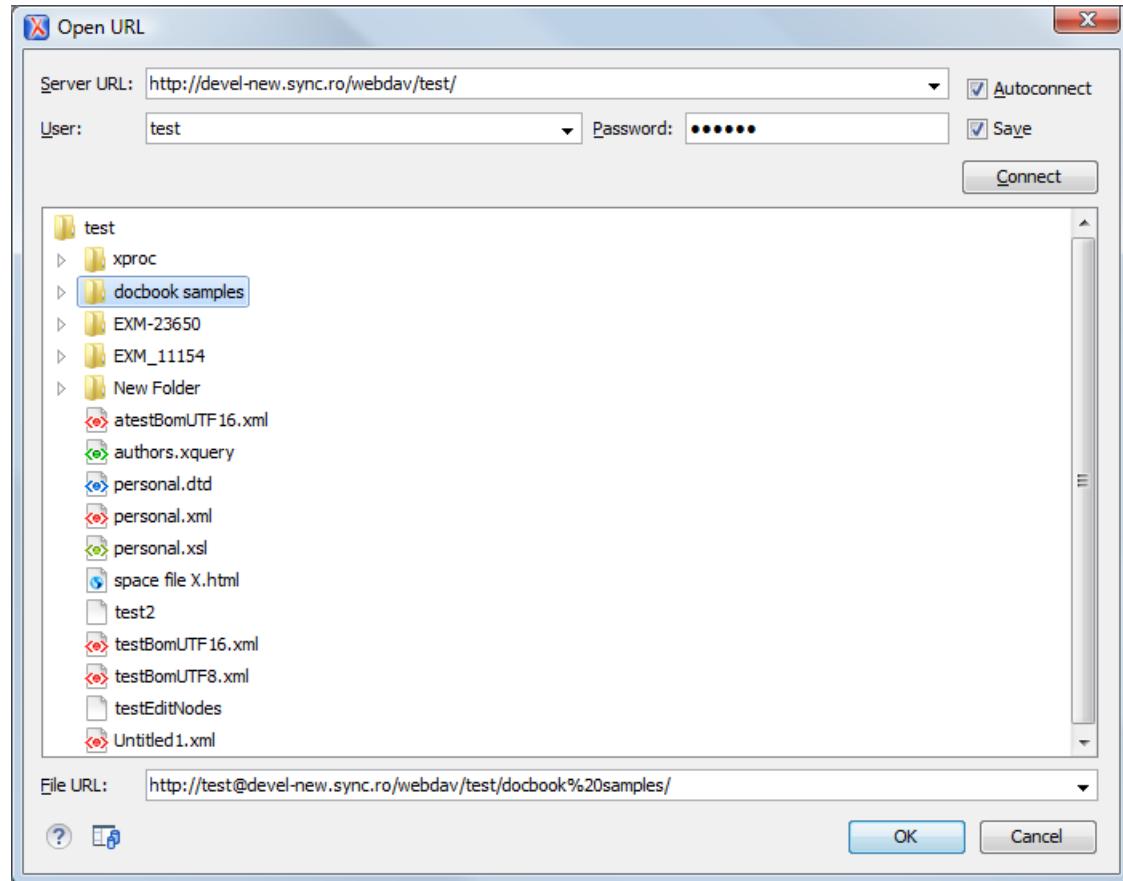

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Editor and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current **WebDAV Connection** details can be saved using the **Database Perspective** button and then used in the **Data Source Explorer** view.

### Open URL

To open this dialog box, go to **File > Open URL** (or click the **Open URL** toolbar button), then choose the **Browse for remote file** option from the drop-down action list.

**Figure 109: Open URL Dialog Box**

The displayed dialog box is composed of the following:

#### Server URL

Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

**Tip:** When specifying a URL, follow these rules:

- To access an FTP server, write the protocol, host, and port (if using a non-standard one). For example, `ftp://server.com` or `ftp://server.com:7800/`.
- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, `https://www.some-webdav-server.com:443/webdav-repository/`.

**Important:** Make sure that the repository directory ends in a slash "/". For example, `https://www.some-webdav-server.com:443/webdav-repository/`

#### Autoconnect

If selected, the browse action is performed every time when you open the dialog box.

## User and Password

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the **File URL** combo box, and used further in opening/saving the file. If the **Save** option is selected, then the user and password are saved between editing sessions. The password is kept encrypted in the options file.

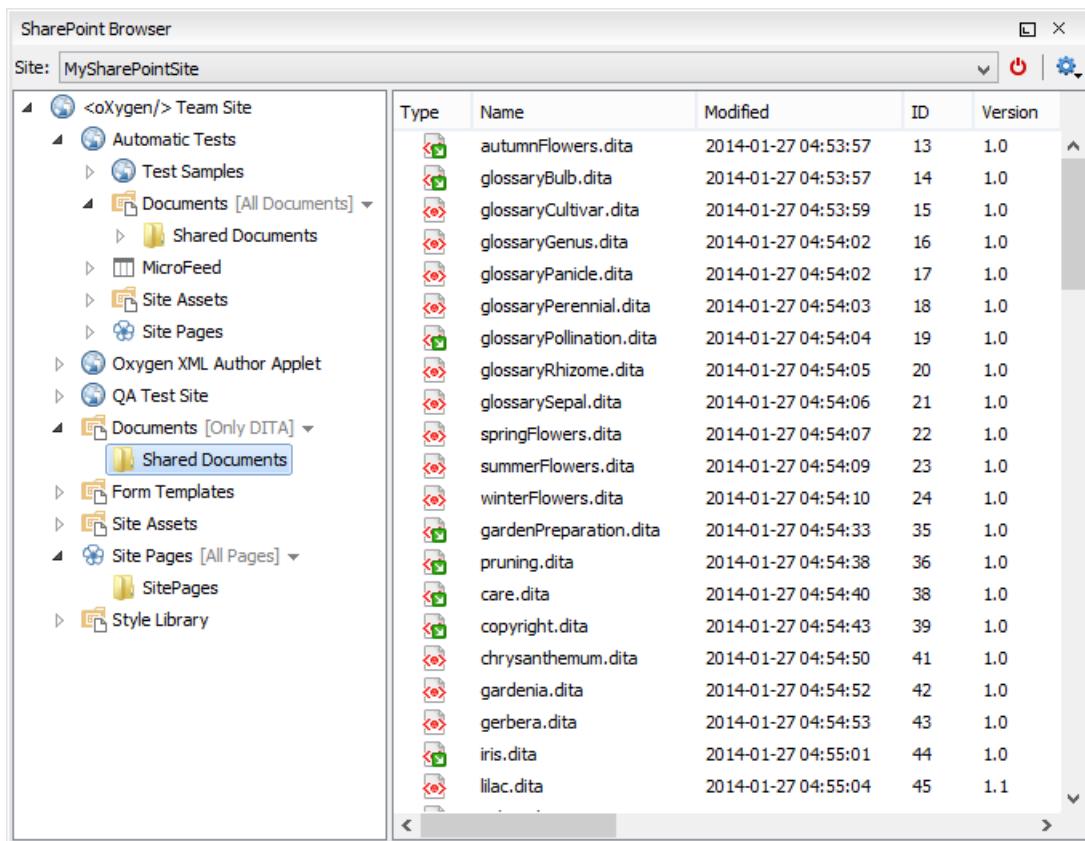

**Note:** Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

## Connect

When you press this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

## Browser view

- If you are browsing a WebDAV or FTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.
- **Note:** The file names are sorted in a case-insensitive way.
- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.

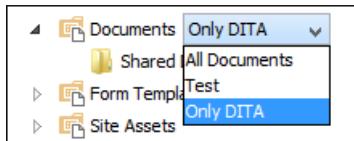

**Figure 110: Browsing a SharePoint Repository**

The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

**Note:** The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

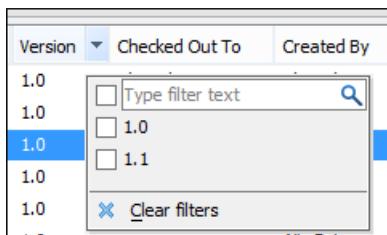

**Figure 111: Drop-Down Menu to Select Which Items to Display**

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

**Note:** A column can be filtered or sorted only if it was configured this way on the server side.

**Figure 112: Column Filter**

#### File URL

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as `http://some.site/test.xml` (if the file is accessible through normal HTTP protocol), or `ftp://anonymous@some.site/home/test.xml` (if the file is accessible through anonymous FTP).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

#### Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP/WebDAV file browser dialog box by right-clicking a tree node and selecting the *Change permissions* menu item.

In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the check boxes.

#### WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Editor allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Editor will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Editor. This means that Oxygen XML Editor can find the certificate in the key store of the Java Runtime Environment in which it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

#### Troubleshooting HTTPS

When Oxygen XML Editor cannot connect to an HTTPS-capable server, most likely there is no certificate set in the *Java Runtime Environment (JRE)* that Oxygen XML Editor runs into. The following procedure describes how to:

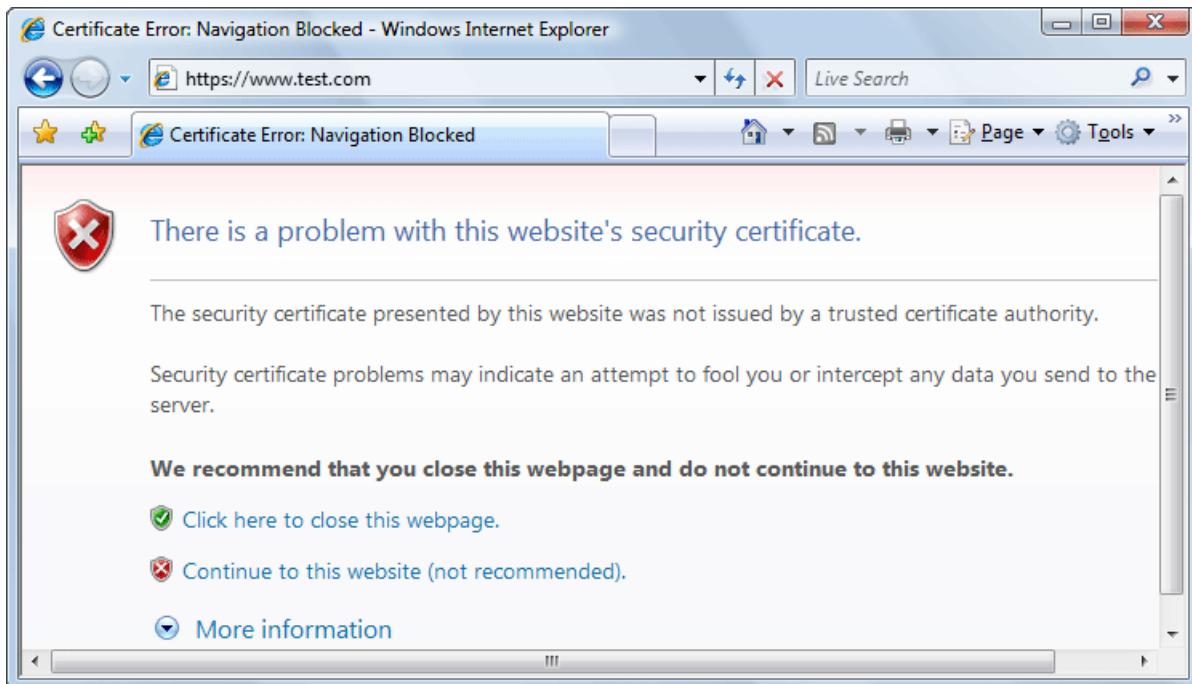

- Export a certificate to a local file using any HTTPS-capable Web browser (for example, Internet Explorer).
- Import the certificate file into the JRE using the keytool tool that comes bundled with Oxygen XML Editor.

**Note:** To make Oxygen XML Editor accept a certificate even if it is invalid, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Connection settings > HTTP(S)/WebDAV**, and enable the **Automatically accept a security certificate, even if invalid** option.

1. Export the certificate into a local file

- a) Point your HTTPS-aware Web browser to the repository URL.

If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

**Figure 113: Security alert - untrusted certificate**

- b) Go to menu **Tools > Internet Options**.  
**Internet Options** dialog box is opened.
  - c) Select **Security** tab.
  - d) Select **Trusted sites** icon.
  - e) Press **Sites** button.  
This will open **Trusted sites** dialog box.
  - f) Add repository URL to **Websites** list.
  - g) Close the **Trusted sites** and **Internet Options** dialog boxes.
  - h) Try again to connect to the same repository URL in Internet Explorer.  
The same error page as above will be displayed.
  - i) Select **Continue to this website** option.  
A clickable area with a red icon and text **Certificate Error** is added to Internet Explorer address bar.
  - j) Click the **Certificate Error** area.  
A dialog box containing a **View certificates** link is displayed.
  - k) Click the **View certificates** link.  
**Certificate** dialog box is displayed.
  - l) Select **Details** tab of **Certificate** dialog box.
  - m) Press **Copy to File** button.  
**Certificate Export Wizard** is started.
  - n) Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file `server.cer`.
2. Import the local file into the JRE running Oxygen XML Editor.

- a) Open a text-mode console with administrative rights.

If Oxygen XML Editor has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases administrative rights will be required.

- b) Go to the lib/security directory of the JRE running Oxygen XML Editor. You find the home directory of the JRE in the java.home property that is displayed in the **About** dialog box (**System properties** tab).

On Mac OS X systems, the lib/security directory is usually located in /System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home directory.

On OS X, if you have installed a distribution of Oxygen XML Editor that is not bundled with a JRE, a JRE from Apple is required. The Apple Java version 1.6 stores the certificates in /System/Library/Java/Support/CoreDeploy.bundle/Contents/Home/lib/security/cacerts with a symbolic link pointing to it from /System/Library/Java/JavaVirtualMachines/1.6.0.jdk/Contents/Home/lib/security/cacerts.

On OS X, if you have installed a distribution of Oxygen XML Editor that bundles the JRE from Oracle, the JRE uses the .install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts path within its installation directory.

- c) Run the following command:

```
...\\bin\\keytool -import -trustcacerts -file server.cer -keystore cacerts
```

The server.cer file contains the server certificate, created during the previous step. keytool requires a password before adding the certificate to the JRE keystore. The default password is changeit. If someone changed the default password, then that person is the only one who can perform the import.

**Tip:** If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the -alias command line argument, as in the following example:

```
...\\bin\\keytool -import -alias myalias1 -trustcacerts -file
server1.cer -keystore cacerts
...\\bin\\keytool -import -alias myalias2 -trustcacerts -file
server2.cer -keystore cacerts
```

### 3. Restart Oxygen XML Editor.

#### Related information

[HTTP\(S\)/WebDAV Preferences](#) on page 153

#### HTTP Authentication Schemes

Oxygen XML Editor supports the following HTTP authentication schemes:

- **Basic** - The basic authentication scheme defined in the [RFC2617 specifications](#).
- **Digest** - The digest authentication scheme defined in the [RFC2617 specifications](#).
- **NTLM** - The NTLM scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

**Note:** For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\\username
```

- **Kerberos** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

#### Single Sign-on

Oxygen XML Editor implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the Kerberos protocol and relies on a *ticket-granting ticket* (*TGT*) that Oxygen XML Editor obtains from the operating system.

To turn on the Kerberos-based authentication, you need to add the following system property in the .vmoptions configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

## Switching and Moving File Tabs

There are two keyboard shortcuts that can be used for cycling through the opened file tabs:

### **Ctrl + Tab (Command + Tab on OS X)**

Switches between the tabs with opened files in the order most recent ones first.

### **Ctrl + Shift + Tab (Command + Shift + Tab on OS X)**

Switches between the tabs with opened files in the reverse order.

There are also two shortcuts for moving the current tab:

### **Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

### **Ctrl + Alt + Period**

Moves the current file tab one position to the right.

## Searching Documents

Oxygen XML Editor includes advanced search capabilities to help you locate documents and resources.

### Open/Find Resource View

The **Open/Find Resource** view is designed to offer advanced search capabilities either by using a simple text search or by using the [Apache Lucene - Query Parser Syntax](#). By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the **Project** and **DITA Maps Manager** views. If the view is not displayed, it can be opened from the **Window > Show View** menu.

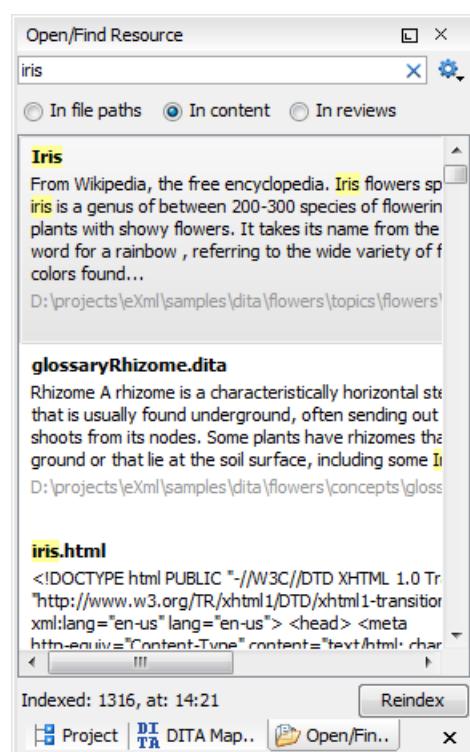

Figure 114: Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

## Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view** at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for car you get the same results as when you search for Car.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for \*ing with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for \*/samples/\*.gif with the **in file paths** option selected, you will find all the gif images from the samples directory.

## Options Available in the View

The **Open/Find Resource** view offers the following options:

-  **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
  - **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
  - **In content** - Select this option to search through the content of your resources.
  - **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
  - **Reindex** - Use this option to reindex your resources.

## Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

## Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the [Open/Find Resource preferences page](#).

## Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

## Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in *the editor associated with the type of the file*.

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to [https://www.oxygenxml.com/demo/Open\\_Find\\_Resource.html](https://www.oxygenxml.com/demo/Open_Find_Resource.html).

### Open/Find Resource Dialog Box

The **Open/Find Resource** dialog box offers advanced search capabilities. To open the dialog box, go to **Find >**

**Open/Find Resource (Ctrl + Shift + R (Command + Shift + R on OS X))**. You can also click the **Open/Find Resource** toolbar button or use the **Search for file** action that is available in some URL input fields.

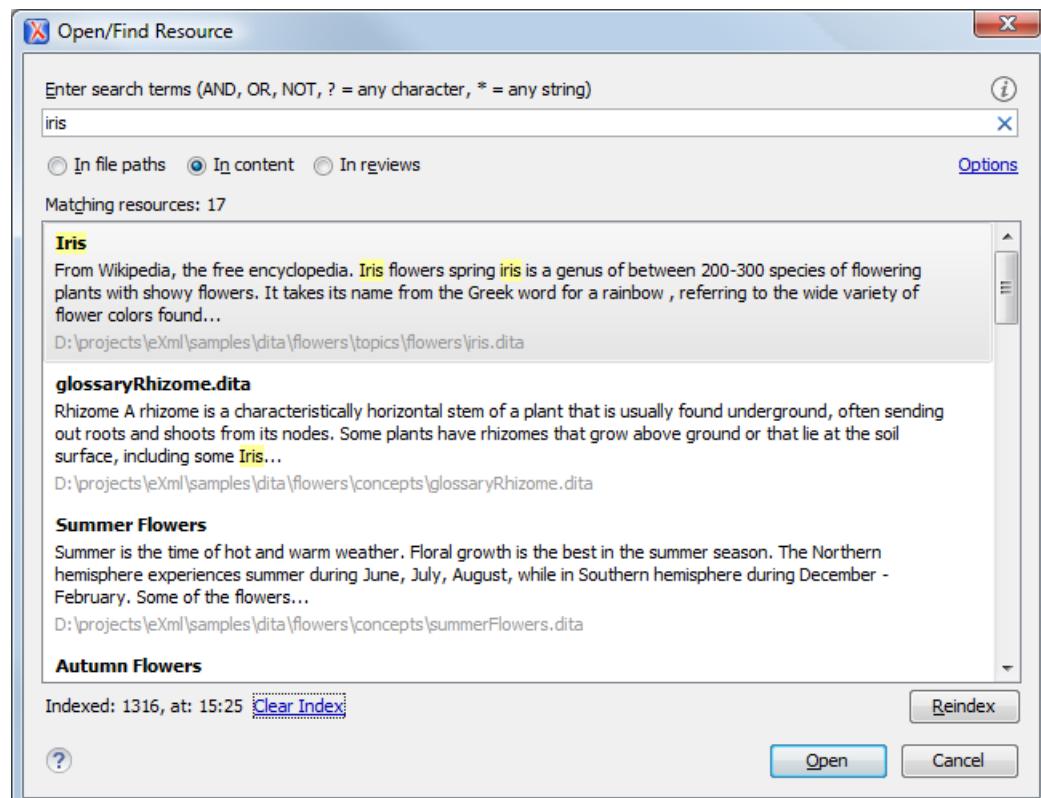

Figure 115: Open/Find Resource Dialog Box

You can use this dialog box to find a file in the current Oxygen XML Editor project or in one of the DITA maps opened in [the DITA Maps Manager view](#) by typing a few letters of the file name or a fragment of the content you are searching for. The **Open/Find Resource** dialog box also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

**Note:** Full support for searching in document edits is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers support to search through a maximum of 10 edits.

## Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view** at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *\*ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for *\*/samples/\*.gif* with the **in file paths** option selected, you will find all the *gif* images from the *samples* directory.

## Options Available in the Dialog Box

The **Open/Find Resource** dialog box includes the following options:

- **In file paths** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** - Select this option to search through the content of your resources.
- **In reviews** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Options** - Opens the [Open/Find Resource preferences page](#) where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **Clear Index** - Clears the index.
- **Reindex** - Use this option to reindex your resources.

## Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

## Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index is not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*. This means that if you are searching for any of these words, the indexing

process will not be able to match any of them. However, you can configure the list of stop words in the [Open/Find Resource preferences page](#).

## Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

**Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

## Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in [the editor associated with the type of the file](#).

To watch our video demonstration about the **Open/Find Resource** feature and its search capabilities, go to [https://www.oxygenxml.com/demo/Open\\_Find\\_Resource.html](https://www.oxygenxml.com/demo/Open_Find_Resource.html).

## Related information

[Open/Find Resource View](#) on page 188

[Open/Find Resource Preferences Page](#) on page 150

## Searching in Content

To perform a search through the content of your resources, open the **Open/Find Resource dialog box** (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the **Open/Find Resource view** (by default, located on the left side of the editor), select the **in content** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature is powered by [Apache Lucene](#). Apache Lucene is a free open source information retrieval software library.

You can use the **Open/Find Resource** feature to either perform a simple text search or a more complex search using the [Apache Lucene - Query Parser Syntax](#). Using the [Apache Lucene - Query Parser Syntax](#) means you can perform any of the following searches:

### Term Searches

Use the **Open/Find Resource** view or dialog box to search for plain text:

```
Garden Preparation
```

### Element-Specific Searches

Use the **Open/Find Resource** view or dialog box to search for content that belongs to a specific element:

```
title:"Garden Preparation"
```

## Wildcard Searches

Use wildcards to make your search more permissive:

```
Garden Prepar?tion
```

## Fuzzy Searches

If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to what you introduce in the **Open/Find Resource** view or dialog box. To perform a fuzzy search, use the ~ symbol after the word that you are not sure of:

```
Garden Preparing~
```

## Proximity Searches

Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the ~ symbol at the end of your search. For example, to search for the word *Garden* and the word *Preparation* within 6 words of each other use:

```
"Garden Preparation"~6
```

## Range Searches

Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between *Iris* and *Lilac*, use:

```
title:{Iris TO Lilac}
```

The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between *Iris* and *Lilac*, but not including *Iris* and *Lilac*. To create an inclusive query use square brackets:

```
title:[Iris to Lilac]
```

## Term Prioritising Searches

Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for *Autumn Flowers*, a good idea is to prioritise the word *Autumn* since the word *Flowers* occurs more often. To prioritise a word use the ^ symbol:

```
Autumn^6 Flowers
```

## Searches Using Boolean Operators

You can use the **AND**, **+**, **OR**, **-**, and **NOT** operators.

To search for documents that contain both the words *Garden* and *Preparation*, use:

```
Garden AND Preparation
```

To search for documents that must contain the word *Garden* and may contain the word *Preparation*, use:

```
+Garden Preparation
```

To search for documents that contain either the word *Garden* or the word *Preparation*, use:

```
Garden OR Preparation
```

To search for documents that contain *Garden Preparation* but not *Preparation of the Flowers*, use:

```
"Garden Preparation" - "Preparation of the Flowers"
```

### Searches Using Grouping

To search either for the word *Garden* or *Preparation*, and the word *Flowers*, use:

```
(Garden OR Preparation) AND Flowers
```

### Searches Using Element Grouping

To search for a title that contains both the word *Flowers* and the phrase *Garden Preparation*, use:

```
title:(+Flowers +"Garden Preparation")
```

### Searching for Special Characters

Sometimes you might need to search your content for special character, such as:

```
+ - && || ! () { } [] ^ ~ * ? : \
```

In this case, you should surround your search query with quotes. For example, to search for *(Hydrogen + Oxygen)=Water*, use:

```
"(Hydrogen + Oxygen)=Water"
```

## Searching in File Paths

To perform a search in the file paths of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located on the left side of the editor), select the **In file paths** option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:

- Use "\*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for *\*-preferences-page* you will find all the resources that contain the *-preferences-page* fragment in their name. If you search for *\*/samples/\*.gif*, you will find all the .gif images from the samples directory.

## Searching in Reviews

To perform a search in the edits of your resources, open the [Open/Find Resource dialog box](#) (from the **Find** menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the [Open/Find Resource view](#) (by default, located on the left side of the editor), select the **In reviews** option, and in the search field enter the terms that you want to search for.

The following options are available:

- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.

- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time**- Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to **Settings** and disable the **Show Description** option.

## Technical Aspects

When Oxygen XML Editor performs the indexing of your resources, the refereed content from your documents is not taken into account. For example, when DITA documents are indexed, the content from the `conref` elements is not parsed. The files that make up the index are stored on disk in the `[user_home_directory]\AppData\Roaming\com.oxygenxml\lucene` folder.

## Closing Documents

To close open documents, use one of the following actions that are available in the contextual menu of the current editor tab (or from the **File** menu):

### **Close (Ctrl + W (Command + W on OS X))**

Closes the currently selected editor.

### **Close Other Files**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs except for the current one.

### **Close Files to the Right**

Available only from the contextual menu of the current editor tab and it closes all opened editors to the right of the currently selected editor.

### **Close All**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs.

## Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

### **Close (Ctrl + W (Command + W on OS X))**

Closes the currently selected editor.

### **Close Other Files**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

### **Close Files to the Right**

Closes all opened editors to the right of the currently selected editor.

### **Close All**

If multiple files are opened, this action is available to close all opened editors.

### **Move editor tab to the left (Ctrl + Alt + Comma)**

Moves the current editor tab one position to the left.

### **Move editor tab to the right (Ctrl + Alt + Period)**

Moves the current editor tab one position to the right.

### **Reopen last closed editor Ctrl + Alt + T (Command + Alt + T on OS X))**

Reopens the last closed editor.

## **Maximize/Restore Editor Area**

Collapses all the side views and spans the editing area to cover the entire width of the main window.

## **Add to project**

Adds the file you are editing to the current project.

## **Add all to project**

If multiple files are opened, this action is available to add all the opened files in the current group/stack of tabs to the current project.

## **Copy Location**

Copies the disk location of the file.

## **Show in Explorer (Show in Finder on OS X)**

Opens the Explorer to the file path of the file.

## **Viewing File Properties**

The **Properties** view, you can quickly access information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Properties**.

To copy a value from the **Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

## **Using Projects to Group Documents**

---

This section explains how to create and work with Projects.

### **Creating a New Project**

Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also [share your project settings and transformation/validation scenarios](#) with other users. Use the [Project view](#) to manage projects, and the files and folders contained within.

#### **Creating a New Project**

To create a new project, select  **New Project** from the **Project** menu, the **New** menu in the contextual menu, or the drop-down menu at the top-left of the **Project** view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the [Project view](#).

#### **Adding Items to the Project**

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the **Project** view:

## New > File

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

## New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the *project root*:

## New > Logical Folder

Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

## New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

## Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

## Add Files

Adds links to files on the local file system.

## Add Edited File

Adds a link to the currently edited file in the project.

## Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the  **Refresh** (**F5**) action from the toolbar or contextual menu and the **Project** view will display the existing files and subdirectories. If your files are scattered amongst several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting  **Add Folder** in the contextual menu from the *project root*. Linked folders are displayed in the **Project** view with bold text. To create a file inside a linked folder, select the **New >  File** action from the contextual menu. The linked files presented in the **Project** view are marked with a special icon.

**Note:** Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project View](#) on page 182.

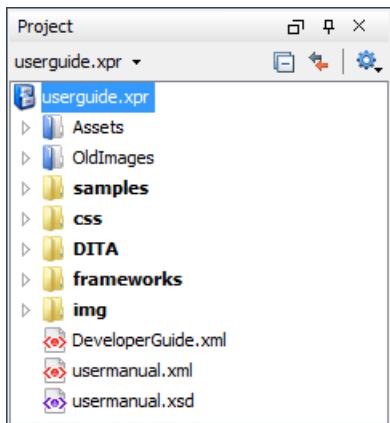

For more details about how you can share projects with other users, see [Sharing a Project - Team Collaboration](#) on page 277.

## Related information

[Using Projects to Group Documents](#) on page 268

## Project View

The **Project** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available on the contextual menu and toolbar associated to this panel enable the creation of XML projects and shortcuts to various operations on the project documents.

**Figure 116: Project View**

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the [Outline view](#). If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (or using the **Show Project View** action from the **Project** menu).

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects and project management actions:

#### **Open Project (Ctrl + F2 (Command + F2 on OS X))**

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

#### **New Project**

Creates a new, empty project.

The following actions are grouped in the upper right corner:

#### **Collapse All**

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

#### **Link with Editor**

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the **Debugger** perspective.

#### **Settings**

A submenu that contains the following actions:

#### **Filters**

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

#### **Show Full Path**

When selected, linked files and folders are presented with a full file path.

#### **Enable Master Files Support**

Select this option to enable the [Master Files support](#).

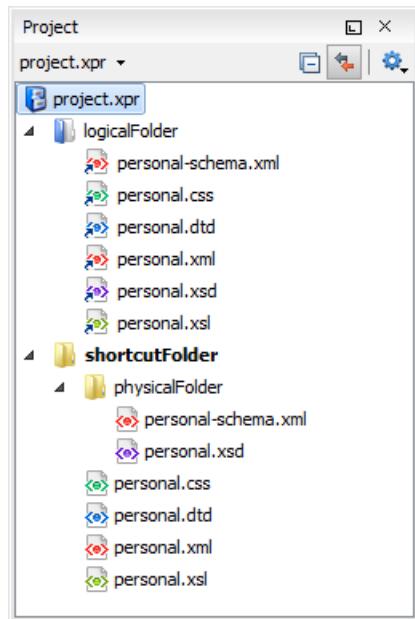

#### **Change Search and Refactor operations scope**

Allows you to change the collection of documents that define the context of the [search and refactor operations](#).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

The files are usually organized in an XML project as a collection of folders. There are three types of resources displayed in the **Project** view:

- *Logical folders* - marked with a blue icon on Windows and Unix/Linux (📁) and a magenta icon on Mac OS X (📁). They help you group files within the project. This folder type has no correspondent on the physical disk, since they are used as containers for related items. Creating and deleting them does not affect the file system on disk. They are created on the project root or inside other logical folders by using the contextual action **New > Logical Folder**. The contextual menu action **✖ Remove from Project** can be used to remove them from the project.
- *Physical folders and files* - marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Add Folder**, etc.) Also, the contextual menu action **>Delete Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.
- *Shortcut folders and files* - the icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. All files and folders that appear as direct descendants of a logical folder are considered shortcuts. They are created and added with the contextual actions **Add Files** and **Add Folder** from the project root. Both contextual menu actions **✖ Remove from Project** and **Delete Remove from Disk (Shift+Delete)** are available for shortcuts. **✖ Remove from Project** just removes the shortcut from the project, while **Delete Remove from Disk (Shift+Delete)** removes the shortcut and the physical resource from the local file system.

**Figure 117: Project View with Examples of all Three Types of Resources**

### Creating New Projects

The following action is available in the **Project** menu, the **New** menu in the contextual menu, or from the drop-down menu in the top-left of the **Project** view:

Creates a new, empty project.

## Creating New Project Items

The following actions are available by selecting **New** from the contextual menu, when invoked from the **Project** view:

### New > File

Opens a **New** file dialog box that helps you create a new file and adds it to the project structure.

### New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

### New > Logical Folder

Available when invoked from the *project root*, this action creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - ).

### New > Logical Folders from Web

Available when invoked from the *project root*, this action replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

## Add Content to a Logical Folder

The project itself is considered a logical folder. You can add content to a logical folder using one of the actions available in the contextual menu, when invoked from the *project root*:

### Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X ).

### Add Files

Adds links to files on the local file system.

### Add Edited File

Adds a link to the currently edited file in the project.

## Managing Project Content

### Creating/Adding Files and Folders

You can create linked folders (shortcuts) by dragging and dropping folders from a system explorer to the project tree (the **Enable drag-and-drop in Project view** option must be enabled in the [Views preferences page](#)), or by selecting **Add Folder** in the contextual menu from the project root. To create a file inside a linked folder, select the **New > File** action from the contextual menu.

**Note:** The linked files presented in the **Project** view are marked with a special icon. Linked folders are displayed in bold text.

You can create physical folders by selecting **New > Folder** from the contextual menu.

When adding files to a project, the default target is the project root. To change a target, select a new folder. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

### Removing Files and Folders

To remove one or more linked files or folders, select them in the project tree and press the **Delete** key, or select the contextual menu action  **Remove from Project**. To remove a linked file or folder from both project and local file system, select the contextual menu action  **Remove from Disk (Shift+Delete)**. The  **Remove from Disk (Shift+Delete)** action is also used to remove physical files or folders.

**CAUTION:** In most cases this action is irreversible, deleting the file permanently. Under particular circumstances (if you are running a Windows installation of Oxygen XML Editor and the *Recycle Bin* is active) the file is moved to *Recycle Bin*.

## Moving Files and Folders

You can [move the resources of the project](#) with drag and drop operations on the files and folders of the tree (the **Enable oXygen consoles** option must be enabled in the [View preferences page](#)).

You can also use the usual Cut, Copy, and Paste actions to move resources in the **Project** view.

## Renaming Files and Folders

There are three ways you can [rename an item in the Project view](#). Select the item in the **Project** view and do one of the following:

- Invoke the **Rename** action from the contextual menu.
- Press **F2** and type the new name.
- Click the selected item and type the new name.

To finish editing the item name, press **Enter**.

**Note:** The **Rename** action is also available on *logical* files.

## Locating and Opening Files

If a project folder contains a lot of documents, a certain document can be located quickly in the project tree by selecting the folder containing the desired document and typing the first few characters of the document name. The desired document is automatically selected as soon as the typed characters uniquely identify its name in the folder.

The selected document can be opened by pressing the **Enter** key, by double-clicking it, or with one of the **Open** actions from the contextual menu. The files with known document types are opened in the associated editor, while binary files are opened with the associated system application. To open a file with a known document type in an editor other than the default one, use the **Open with** action. Also, dragging and dropping files from the project tree to the editor area results in the files being opened.

## Saving the Project

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

## Validate Files

The currently selected files in the **Project** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

### Check Well-Formedness

Checks if the selected file or files are well-formed.

### Validate

Validates the selected file or files against their associated schema. EPUB files make an exception, because this action triggers a [Validate and Check for Completeness](#) operation.

### Validate with Schema

Validates the selected file or files against a specified schema.

### Configure Validation Scenario(s)

Allows you to configure and run a [validation scenario](#).

## Applying Transformation Scenarios

The currently selected files in the **Project** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

### Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

## **Configure Transformation Scenario(s)**

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

## **Transform with**

Allows you to select a transformation scenario to be applied to the currently selected files.

Along with the logical folder support, this allows you to group your files and transform them very easily.

## **Refactoring Actions (Available for certain document types (such as XML, XSD, and XSL))**

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

### **Rename resource**

Allows you to change the name of a resource.

### **Move resource**

Allows you to change the location on disk of a resource.

### **XML Refactoring**

Opens [the XML Refactoring tool wizard](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

### **Other XML Refactoring Actions**

For your convenience, the last 5 [XML Refactoring tool operations](#) that are used will also appear in this submenu.

## **Other Contextual Menu Actions**

Other actions that are available in the contextual menu from the project tree include:

### **Open**

Opens the selected files in the corresponding editor.

### **Open with submenu**

This submenu allows you to open the selected file with the internal editor, a system application, or other internal tools: [DITA Maps Manager](#), [Archive Browser](#), [MathML Editor](#), [Generate/Convert Schema](#), [WSDL/SOAP Analyzer](#), [Large File Viewer](#), [Hex Viewer](#), [SVG Viewer](#).

### **Show in Explorer (or Show in Finder on OS X)**

In Windows, the content of the selected folder or file is presented in a specific explorer window. On MAC OS X, the parent folder is opened and the selected folder is highlighted in a specific finder window.

### **Copy Location**

Copies an application-specific URL for the selected resource to the clipboard.

### **Refresh**

Refreshes the content and the dependencies between the resources in [the Master Files directory](#).

### **Find/Replace in Files**

Allows you to [find and replace text in multiple files](#).

### **XPath in Files**

Opens the [XPath/XQuery Builder view](#) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

### **Open/Find Resource**

Opens the [Open/Find Resource dialog box](#).

### **Check Spelling in Files**

Allows you to [check the spelling of multiple files](#).

## Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

## Open in SVN Client

[Syncro SVN Client](#) tool is opened and it highlights the selected resource in its corresponding working copy.

## Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the [Compare Files](#) or [Compare Directories](#) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the [three-way comparison mode](#). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

## Generate Documentation > XML Schema Documentation

Opens [the XML Schema Documentation Dialog Box](#).

## Generate Documentation > XSLT Stylesheet Documentation

Opens [the XSLT Stylesheet Documentation Dialog Box](#).

## Generate Documentation > XQuery Documentation

Opens [the XQuery Documentation Dialog Box](#).

## Generate Documentation > WSDL Documentation

Opens [the WSDL Documentation Dialog Box](#).

## Properties

Displays the properties of the current file in a **Properties** dialog box.

## Menu Level Actions

The following actions are available in the **Project** menu:

### New Project

Creates a new, empty project.

### Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the **Project** panel.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Save Project As

Allows you to save the current project under a different name.

### Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

### Filters

Opens the **Project filters** dialog box that allows you to decide which files and directories will be shown or hidden.

### Enable Master Files Support

Allows you to enable the [Master Files Support](#) for each project you are working on.

### Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

## Show Project View

Displays the **Project** view.

## Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the **Clear history** action.

## Related information

[Working with EPUB](#)

## Moving/Renaming Resources in the Project View

The **Project** view allows you to move or rename files in the current project.

### Moving Resources

To move a file or directory in the **Project** view, drag and drop it to the new location in the tree structure or use the **Cut** and **Paste** actions from the contextual menu or **Edit** menu (you can also use the **Copy** and **Paste** actions from the contextual menu or **Edit** menu to copy resources to a new location).

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, based upon the selected scope. You can *select or configure the scope* by using the button.

### Renaming Resources

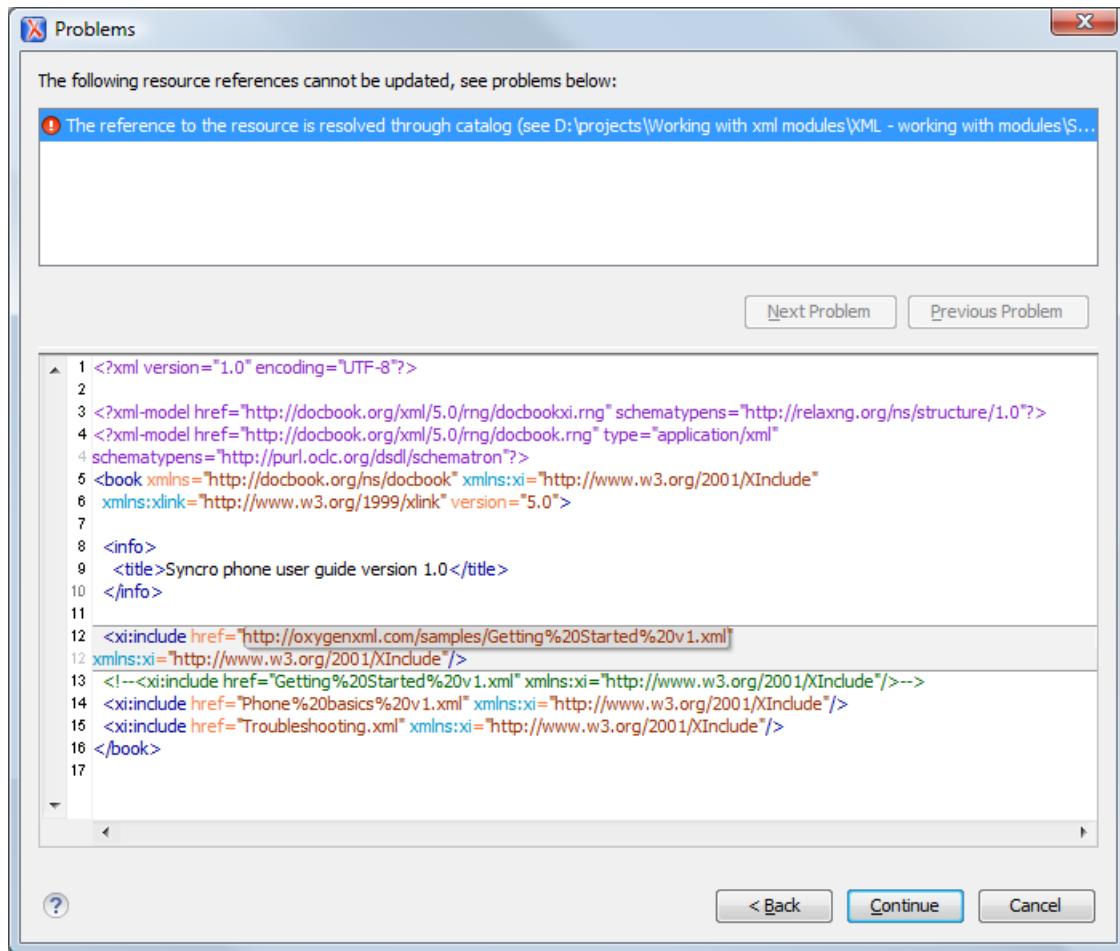

To quickly rename a file or a directory, use the in-place editing either by pressing **F2** or by selecting **Rename** from the contextual menu.

You can also rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Enable this option to update the references to the resource you are renaming. You can *select or configure the scope* by using the button.

### Problems Updating References of Moved/Renamed Resources

In some cases the references of a moved or a renamed resource can not be updated. For example, when a resource is resolved through an XML catalog or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Editor displays a warning dialog box.

**Figure 118: Problems Dialog Box**

### Image Preview from the Project View

Images and SVG files from the **Project** view can be previewed in a separate panel.

To preview an image, either double-click the image name or click the **Preview** action from the contextual menu of the **Project** view. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the **Preview** panel using the actions from the contextual menu, you can scale the image to its original size (1:1 action) or scale it down to fit in the view's available area (**Scale to fit** action).

To preview an **SVG file**, click the **Preview** action from the contextual menu of the **Project** view. Once the SVG is displayed in the **Preview** panel, the following actions are available on the contextual menu: **Zoom in**, **Zoom out**, **Rotate** and **Refresh**.

**Note:** You can drag an image from the **Image Preview** view and drop it in a DITA, DocBook, or TEI document.

### Sharing a Project - Team Collaboration

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Editor also allows you to store preferences, transformation scenarios, and validation scenarios in a *project file* (.xpr file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team will have access to the same resources stored in the project file.

### Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can create a project-level options file by storing them in a *project file* (.xpr file extension). To do so, follow these steps:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the **Project view**, create a project or open an existing one.
3. [Open the Preferences dialog box \(Options > Preferences\)](#).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to **Project Options** in each page.

**Note:** Some pages do not have the **Project Options** switch, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.

5. Click **OK** and close the **Preferences** dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

## Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a *project file* (.xpr file extension) by following these steps:

1. In the **Project view**, create a project or open an existing one.
2. When you create a new transformation scenario or edit an existing one, there is a **Storage** option. Switch the storage preference to **Project Options** in each transformation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

## Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a *project file* (.xpr file extension) by following these steps:

1. In the **Project view**, create a project or open an existing one.
2. When you create a new validation scenario or edit an existing one, there is a **Storage** option. Switch the storage preference to **Project Options** in each validation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Notice:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

## Syncro SVN Client (Apache Subversion™)

To assist you with team collaboration and sharing projects, Oxygen XML Editor includes an embedded [SVN \(Subversion\) Client](#). Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team.

It can be accessed from the **Tools** menu and can be used for synchronizing your working copy with a central repository.

It can also be started by selecting the  **Open in SVN Client** action from the contextual menu of the **Project** view. This action opens the Syncro SVN Client and shows the selected project file in the **Working Copy** view.

[Sharing Validation Scenarios](#) on page 453

### Minimize Differences Between Versions Saved on Multiple Computers

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:

1. Create an Oxygen XML Editor project file that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Format**, configure the appropriate options in this page, then go to **Editor > Format > XML** and configure the options there.
3. Save the configured options into your project file by selecting **Project Options** in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the **Project** view.
6. Open and save your XML files in the **Author** mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

## Master Files Support

This chapter details the *Master Files Support* available in Oxygen XML Editor. A *Master File* typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects.

Oxygen XML Editor allows you to define *master files* at project level. These *master files* are automatically used by Oxygen XML Editor to determine the context for operations such as validation, content completion, refactoring, or search for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Editor maintains the hierarchy of the *master files*, helping you to determine the editing context.

To watch our video demonstration about the **Master Files Support** for XML documents, XSL documents, and WSDL documents, go to [Working with Modular XML Files](#), [Master Files Support](#), and [Working with Modular WSDL Files](#), respectively.

### Master Files Benefits

Using the *Master Files* support in Oxygen XML Editor includes the following benefits:

- When the module is validated, Oxygen XML Editor automatically identifies the *master files* that include the module and validates all of them.
- The **Content Completion Assistant** presents all the components that are collected from the *master files* for the modules they include.
- The **Outline** view displays all the components that are defined in the *master files* hierarchy.
- The *master files* that are defined for the current module determines the [scope of the search and refactoring actions](#). Oxygen XML Editor performs the search and refactoring actions in the context that the *master files* determine, thus improving the speed of execution.

## Enabling the Master Files Support

Oxygen XML Editor stores the *master files* in a folder located in the **Project** view, as the first child of the project root. The **Master Files Support** is disabled by default. To enable it, select **Enable Master Files Support** from the  **Settings** menu in the top-right corner of the **Project** view. You can also select **Enable Master Files Support** from the contextual menu of the **Master Files** directory, or from the contextual menu of the project itself. Oxygen XML Editor allows you to enable or disable the **Master Files Support** for each project you are working on.

When the **Master Files Support** is disabled, Oxygen XML Editor displays a window tip located at the bottom of the project view. This window contains an **Enable** button and a **Read more** link. Clicking the **read more** link takes you to the user guide. Clicking the **Enable** button opens the **Enable Master Files** dialog box. This dialog box contains general information about the **Master Files Support** and allows you to enable it. You can also use the **Detect and Enable** option to detect the *master files* from the current project.

 **Warning:** Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by [resetting Oxygen XML Editor to its default settings](#). However, doing so will result in you losing your customized options.

## Detecting Master Files

Oxygen XML Editor allows you to detect the *master files* using the  **Detect Master Files** option. This action applies to the folders you select in the project. To detect *master files* over the entire project, do one of the following:

- Right-click the root of the project and select  **Detect Master Files**.
- Use the  **Detect Master Files from Project** option, available in the contextual menu of the **Master Files** folder.

Both of these options display the **Detect Master Files** wizard. In the first panel you can select the type of *master files* you want Oxygen XML Editor to detect. In the subsequent panel the detected *master files* are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible master files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *master files*.
- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any of the files presented on the first level of a cycle is a possible *master file*.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *master files*.

To set them as *master files*, simply enable their check-boxes. Oxygen XML Editor marks all the children of a *master file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *master files*. A module can be accessed from multiple *master files*.

The *master files* that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a *master file* is to delete it from the **Master Files** folder.

The next panel displays a list with the selected *master files*. Click the **Finish** button to add the *master files* in the **Master Files** folder.

You can use the **Select Master Files** option to automatically mark all *master files*. This action sets all the resources from the **Possible Master Files** category and the first resource of each **Cycle** as *master files*.

**Tip:** We recommend that you to only add top-level files (files that are at the root of the include/import graph) in the **Master Files** directory. Keep the file set to a minimum and only add files that import or include other files.

 **Attention:** If the **Master Files Support** is disabled, the **Master Files** directory is rendered only if it contains *master files*.

## Adding Files to the Master File Directory

The **Master Files** directory only contains logical folders and linked files. To add files in the **Master Files** directory, use one of the following methods:

- Right-click a file from your project and select  **Add to Master Files** from the contextual menu.

- Select **Add Files** or **Add Edited File** from the contextual menu of the Master Files directory.
- Drag and drop files into the Master Files directory.
- From the contextual menu of the **Resource Hierarchy Dependencies** view, use the **Add to Master Files** action.

You can view the *master files* for the current resource in the **Properties** dialog of the **Project** view and the *master files* for the current editor in the **Properties** and **Information** views.

### Project Validation and Transformation

The *Master Files Support* is also useful for project-level validation and transformation. When you hover the cursor over a file in the Master Files directory, Oxygen XML Editor displays the **Validate** and **Transform** buttons at the right of the file. Select one of these buttons to run a transformation or validation scenario. If the current node is selected, Oxygen XML Editor executes a batch transformation and validation. If the current node is not selected, Oxygen XML Editor executes the validation and transformation for the current node only. The behavior of these actions is the same as the behavior of the *corresponding actions that are available in the contextual menu*.

**Note:** The tooltip of the **Validate** and **Transform** buttons displays the associated scenarios that you can apply.

When you hover the cursor over the Master Files directory itself, Oxygen XML Editor also displays a **Help** button. Use this button (or press **F1** on your keyboard) to open the **Help** section regarding the *Master Files Support*.

### Contextual Menu of the Master Files

The contextual menu of the Master Files directory contains the following actions:

#### New

Allows you to create a **File**, **Logical Folder**, or **Project**.

Allows you to add *master files* to the Master Files directory.

Use this option to add the currently edited file to the Master Files directory.

#### Open

Opens all the files of the Master Files directory.

Pastes the files you copy in the Master Files directory.

#### Rename

Allows you to rename a file in the Master Files directory.

Refreshes the content of the Master Files directory.

Opens the *Find/Replace dialog box*.

Opens the *XPath/XQuery Builder view* that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Opens the *Open/Find Resource dialog box*.

Opens the *Check Spelling in Files dialog box*.

## Format and Indent Files

Opens the [Format and Indent Files dialog box](#) that allows you to configure the format and indent (pretty print) action that will be applied on the selected documents.

## Transform

Provides access to one of the following actions:

### Apply Transformations Scenario(s)

Applies the transformation scenarios associated with the Master Files directory.

### Configure Transformation Scenario(s)

Opens the [Configure Transformation Scenario dialog box](#).

### Transform with

Opens the **Transform with** dialog box that allows you to select the transformation scenario you want to execute.

## Validate

Provides access to one of the following actions:

### Check Well-Formedness

Allows you to check if a document is *Namespace Well-Formed XML*.

### Validate

Oxygen XML Editor performs the validation of the *master files*.

### Validate with Schema

Opens the **Validate with** dialog box. Oxygen XML Editor performs the validation of the *master files* using a schema.

### Configure Validation Scenario(s)

Opens the [Configure Validation Scenario dialog box](#).

### Detect Master Files from Project

Enables automatic detection of *master files*.

## Enable Master Files Support

Select this option to enable the **Master Files Support**.

# Editing XML Documents

---

This section explains the various features in Oxygen XML Editor for editing XML documents. It includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

## Related information

[Text Editing Mode](#) on page 180

[Author Editing Mode](#) on page 205

[Grid Editing Mode](#) on page 201

## Editing XML Documents in Text Mode

This section includes features and actions for editing XML documents in the **Text** mode of Oxygen XML Editor.

### Navigating the Document Content in Text Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents in **Text** mode.

## Using the Keyboard

Oxygen XML Editor allows you to quickly navigate through a document using the **Ctrl + CloseBracket (Command + CloseBracket on OS X)** key to go to the next XML node and **Ctrl + OpenBracket (Command + OpenBracket on OS X)** to go to the previous one.

To navigate one word forward or backwards, use **Ctrl + RightArrow (Command + RightArrow on OS X)**, and **Ctrl + LeftArrow (Command + LeftArrow on OS X)**, respectively. To position the cursor at the beginning or end of the document you can use **Ctrl + Home (Command + Home on OS X)**, and **Ctrl + End (Command + End on OS X)**, respectively.

## Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

## Navigating with the Outline View

Oxygen XML Editor includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

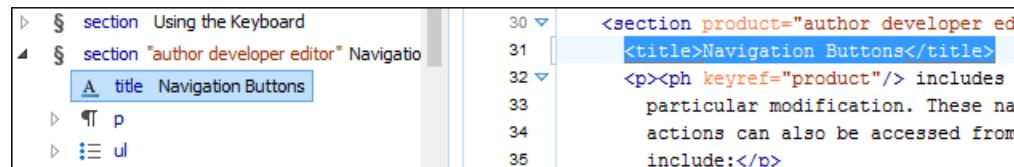

Figure 119: Outline View Navigation in Text Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

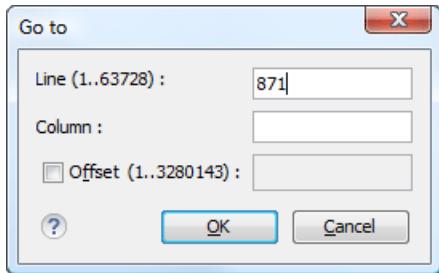

Figure 120: Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by using the **Go to** dialog box. To open this dialog box, go to **Find > Go to (Ctrl+L (Command+L on OS X))**.

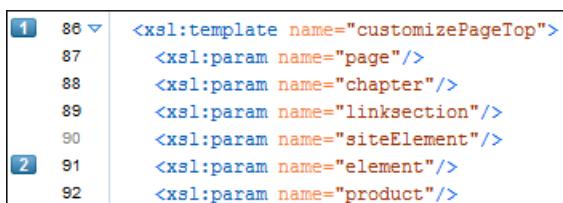

**Figure 121: Go to Dialog Box**

The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

### Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

**Figure 122: Editor Bookmarks**

A bookmark can be inserted in **Text** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Select the [Create Bookmark \(F9\)](#) action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and selecting **Remove** or **Remove all (Ctrl+F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

### Smart Editing in Text Mode

Oxygen XML Editor includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag>|</tag>`).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor will mirror-edit the name of the matching end tag. This feature can be controlled from the [Content Completion option page](#).
- **Auto-breaking the edited line** - The [Hard line wrap option](#) automatically breaks the edited line when its length exceeds the maximum line length [defined for the format and indent operation](#).
- **Indent on Enter** - The [Indent on Enter option](#) indents the new line inserted when you press **Enter**.
- **Smart Enter** - The [Smart Enter option](#) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.

- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is immediately before an attribute, then the entire attribute and its value is selected.
  - If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
  - Otherwise, it selects the entire current line of text.

## Shortcut Actions in Text Mode

Oxygen XML Editor includes numerous shortcut actions to help you edit content in the **Text** editing mode.

### Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

#### Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the [Enable mouse-wheel zooming option](#) in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

#### Normal editor font (Ctrl + 0 (Command + 0 on OS X))

Resets the font size to [the value of the editor font set in the Fonts preferences page](#).

## Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

#### Undo (Ctrl + Z (Command + Z on OS X))

Reverses a maximum of 200 editing actions (configurable with the [Undo history size option](#) in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

#### Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

## Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

### **Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

### **Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

### **Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

### **Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

## Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

### **Ctrl + Alt + UpArrow (Command + Alt + UpArrow on OS X)**

Moves the node up one line.

### **Ctrl + Alt + DownArrow (Command + Alt + DownArrow on OS X)**

Moves the node down one line.

**Note:** The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

## Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Editor also includes the following other miscellaneous shortcut actions in **Text** mode:

### **Ctrl + Delete (Command + Delete on OS X)**

Deletes the next word.

### **Ctrl + Backspace (Command + Backspace on OS X)**

Deletes the previous word.

### **Ctrl + W (Command + W on OS X)**

Cuts the previous word.

### **Ctrl + K (Command + K on OS X)**

Cuts to end of line.

### **Ctrl + Single-Click (Command + Single-Click on OS X)**

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: *schemaLocation*, *noNamespaceSchemaLocation*, *href* and others.
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

### **Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

## Related information

[Frequently Used Shortcut Keys](#) on page 17

## Editing XML Markup in Text Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

### Using the Breadcrumb

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 123: Breadcrumb in Text Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

#### Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

#### Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

#### Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

#### Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

#### Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

**Cut**  
Removes the selected element and copies it to the clipboard.

**Copy**  
Copies the selected element to the clipboard.

**Delete**  
Deletes the currently selected element.

### Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

#### Alt + UpArrow

Moves the current node or selected nodes in front of the previous node.

#### Alt + DownArrow

Moves the current node or selected nodes after the subsequent node.

### Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

## **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

## **Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

## **Surround Content with Tags (Wrap)**

You can surround a selection of content with tags (*wrap the content*) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

### **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

## **Unwrap the Content of Elements**

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

## **Join or Split Elements**

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

### **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

## **Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

#### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

#### **Delete attribute**

Allows you to remove one or more attributes.

#### **Rename attribute**

Allows you to rename an attribute.

#### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

### **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

#### **Delete comments**

Allows you to delete comments found inside one or more elements.

### **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

#### **Change topic ID to file name**

Changes the ID of a topic to be the same as its file name.

#### **Convert simple tables to CALS tables**

Converts all DITA simple tables to CALS tables in the specified scope.

### **Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

#### **Delete element**

Allows you to delete elements.

#### **Delete element content**

Allows you to delete the content of elements.

#### **Insert element**

Allows you to insert new elements.

#### **Rename element**

Allows you to rename elements.

#### **Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

#### **Wrap element**

Allows you to surround elements with element tags.

#### **Wrap element content**

Allows you to surround the content of elements with element tags.

### **Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### **Insert XML fragment**

Allows you to insert an XML fragment.

### **Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

### **Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

### **JATSKit submenu**

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

#### **Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

#### **Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

#### **Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

### **Related information**

[Refactoring XML Documents](#) on page 484

[Contextual Menu Actions in Text Mode](#) on page 310

[Frequently Used Shortcut Keys](#) on page 17

### **Folding XML Elements in Text Mode**

When working with a large document, the **folding support** in Oxygen XML Editor can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the folding feature is enabled in Oxygen XML Editor, but it can be disabled in the **Text** preferences page with the [Enable folding option](#).

**Figure 124: Folding of XML Elements in Text Mode**

The fact that the folds are persistent is a unique feature of Oxygen XML Editor. The next time you open the document the folds are restored to its last state.

### **Folding Actions in Text Mode**

Element folds are marked with a small triangle ( ▲ / ▶ ) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

#### **▶ Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

### **Collapse Child Folds (**Ctrl + NumPad**. (**Command + NumPad**. on OS X))**

Folds the child elements that are indented one level inside the current element.

### **Expand Child Folds**

Unfolds all child elements of the currently selected element.

### **Expand All (**Ctrl + NumPad\*** (**Command + NumPad\*** on OS X))**

Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Editor, go to <https://www.oxygenxml.com/demo/FoldingSupport.html>.

## **Drag and Drop in Text Mode**

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

## **Selecting Content in Text Mode**

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in **Text** mode.

### **Standard Continuous Selection Shortcuts**

#### **Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

#### **Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

#### **Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

#### **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

#### **Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

#### **Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

#### **Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

#### **Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

#### **Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

#### **Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

#### **Double-Click**

Selects certain text, depending on the position of the click in the document. See [Smart Editing Double-Click](#) for the specifics.

### **Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the [Smart Editing Triple-Click](#) for the specifics.

### **Right-Click > Select > Element**

Selects the entire element at the current cursor position.

### **Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### **Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

### **Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

## **Rectangular Selection Shortcuts**

Oxygen XML Editor also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

**Attention:** The rectangular selection shortcuts will not work if the [Line Wrap option](#) is enabled in the [Text](#) preferences page.

The following shortcuts can be used to create a rectangular selection:

### **Alt + Mouse Click + Mouse Movement (Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)**

Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt** (**Alt + Meta** on Mac OS X) to enter the [in-place editing mode](#).

### **Shift + Alt + Left/Right Arrow Keys (Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

### **Shift + Alt + Up/Down Arrow Keys (Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

### **Ctrl + Shift + Alt + Left/Right Arrow Keys (Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

### **Shift + Alt + Home (Shift + Alt + Meta + Home on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

### **Shift + Alt + End (Shift + Alt + Meta + End on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it to the end of the current line.

### **Shift + Alt + PageUp (Shift + Alt + Meta + PageUp on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it up one screen page.

### **Shift + Alt + PageDown (Shift + Alt + Meta + PageDown on Mac OS X)**

Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

## **In-Place Editing Mode**

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on Mac OS X, release both **Alt & Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.

## Content Completion Assistant in Text Mode

Oxygen XML Editor includes an intelligent **Content Completion Assistant** that offers rapid, in-line identification and insertion of structured language elements, attributes, and attribute values. Oxygen XML Editor shows the available entries that are valid in the current editing context.

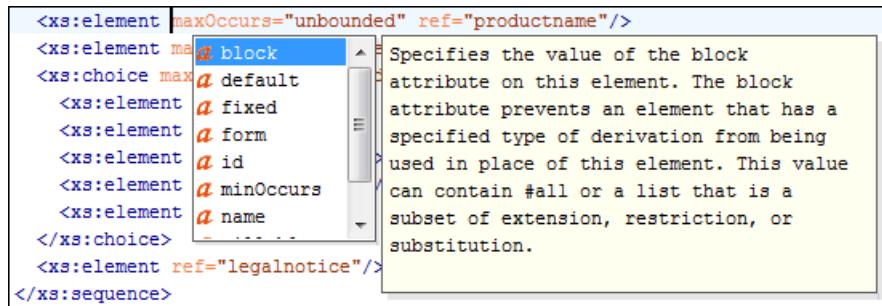

Figure 125: Content Completion Assistant

The **Content Completion Assistant** feature is schema-driven (XML Schema, DTD, and RELAX NG) and status information about the detected schema is logged in the [Information view](#).

The **Content Completion Assistant** is enabled by default. To disable it, open the [Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Content Completion**, and disable the [Enable content completion](#) option.

### Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the [Activation delay of the proposals window \(ms\) option](#) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:** When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the [Add Element Content option](#) (in the **Content Completion** preferences page) is enabled. The **Content Completion Assistant** can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the [Add optional content](#) and [Add first Choice particle](#) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the `>` character of the start tag, if the element allows attributes, to enable rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to enable manual insertion. The values of the attributes can be learned from the same elements in the current document
- After the `>` character of the start tag if the element has no attributes.

## Where the Content Completion Assistant is Displayed

The **Content Completion Assistant** is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

## Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

- The proposals that populate the **Content Completion Assistant** depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:** The **Content Completion Assistant** is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

- The number and type of elements displayed by the **Content Completion Assistant** is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.
- A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Editor checks the uniqueness and correctness of the *ID* attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.
- Values of all the *xml:id* attributes are handled as *ID* attributes. They are collected and displayed by the **Content Completion Assistant** as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.
- For documents that use an XML Schema or Relax NG schema, the content assistant offers proposals for attributes and elements values that have an enumeration of tokens as the type. Also, if a default value or fixed value is defined in the XML Schema used in validation for an attribute or element, then that value is offered in the **Content Completion Assistant** window.

## Related information

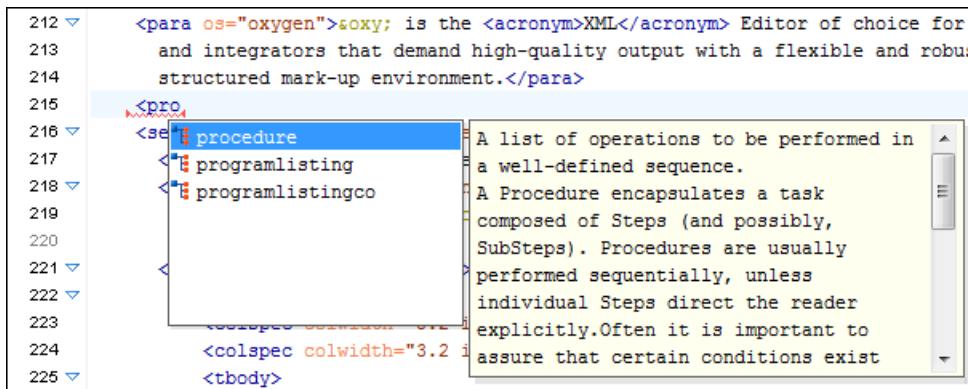

[Customizing the Content Completion Assistant](#) on page 1207

## Set Schema to be Used for Content Completion in Text Mode

The list of proposals in the **Content Completion Assistant** depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the **Content Completion Assistant** is specified in the following methods, in the order of their precedence:

- The *schema specified explicitly in the document*. In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The *default schema declared* in the [Document Type configuration dialog box](#) that matches the edited document type.
- For XSLT stylesheets, the schema specified in the Oxygen XML Editor [XSL preferences page](#). Oxygen XML Editor will read the content completion settings when the prolog fails to provide or resolve the location of a DTD, XML Schema, Relax NG, or NVDL schema.
- For XML Schemas, the schema specified in the Oxygen XML Editor [XSD preferences page](#). Oxygen XML Editor will read the content completion settings and the specified schema will enhance the content completion inside the *xs:annotation/xs:appinfo* elements of the XML Schema.

Oxygen XML Editor creates the content completion lists by analysing the detected schema and the current context (the position in the editor). If you change the schema, then the list of tags to be inserted is also updated.

**Figure 126: Example: Content Completion Driven by DocBook DTD**

### Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The **Content Completion Assistant**.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the **F2** shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** option in the **Annotations** preferences page.

### Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** option in the **Annotations** preferences page. When this option is disabled, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

### Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```

<xs:annotation>
 <xs:documentation>
 Description of the element.
 </xs:documentation>
</xs:annotation>

```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

### Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the <http://relaxng.org/ns/compatibility/annotations/1.0> namespace. However, any element outside the Relax NG namespace (<http://relaxng.org/ns/structure/1.0>) is handled as annotation

and the text content is displayed in the annotation window. To activate this behavior, enable the **[Use all Relax NG annotations as documentation](#)** option in the **Annotations** preferences page.

## Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled from the **[Prefer DTD comments that start with "doc:" as annotations](#)** option in the **Annotations** preferences page. The following is an example of a DTD annotation:

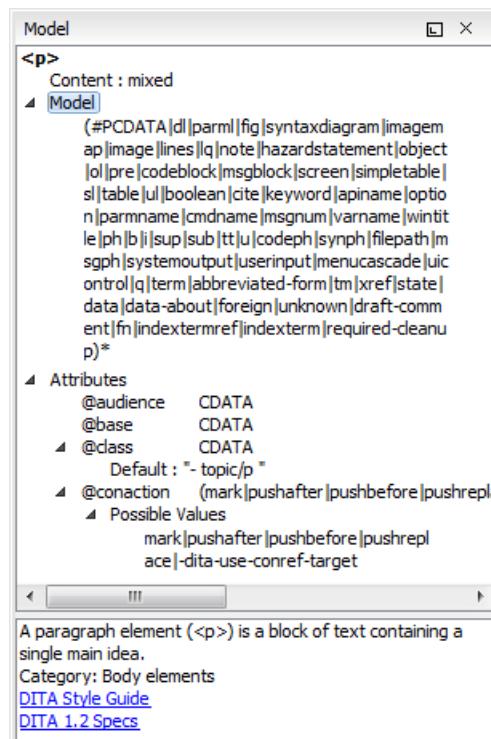

```
<!--doc:Description of the element. -->
```

## Content Completion Helper Views

Information about the current element being edited is also available in various views, such as the **Model** view, **Attributes** view, **Elements** view, and **Entities** view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view, provide spatial and insight information about the edited document and the current element.

### Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 127: Model View**

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

### Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

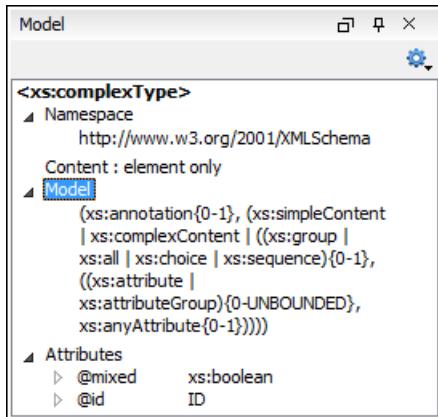

Figure 128: Element Structure Panel

### Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

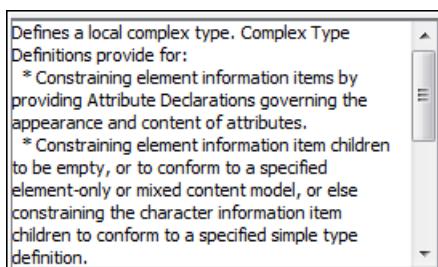

Figure 129: Annotation panel

### Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as list in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Attributes	
Attribute	Value
abstract	false
<b>block</b>	false
default	true
final	
fixed	
<b>id</b>	
<b>name</b>	email
nillable	false
substitutionGroup	
<b>type</b>	xs:string

**Figure 130: Attributes View**

### Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

#### Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the *Allow only insertion of valid elements and attributes* schema aware option is enabled.

#### Set empty value

Specifies the current attribute value as empty.

#### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

#### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

#### Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.

- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

#### *Elements View in Text Mode*

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position.

**Figure 131: Elements View in Text Mode**

#### *Entities View*

**Entities** provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An **entity** is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (&lt;, &gt;, &amp;, &apos;, &quot;).
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbsnbsp	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 132: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

### Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position . Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the **Content Completion Assistant** is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to [https://www.oxygenxml.com/demo/Code\\_Templates.html](https://www.oxygenxml.com/demo/Code_Templates.html).

### Outline View in Text Mode

The **Outline** view in **Text** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

### Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.

- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

## Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

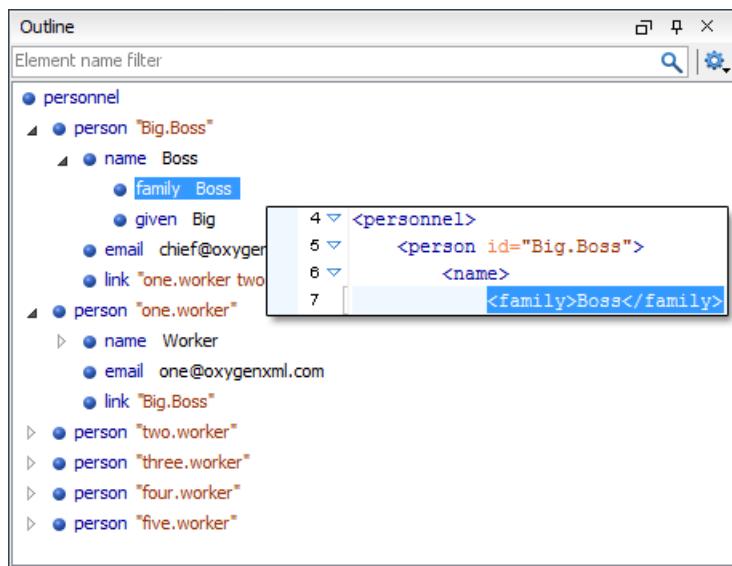

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

## Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (**Ctrl (Command on OS X)**) key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be [disabled and enabled from a Preferences page](#).

**Figure 133: Outline View in Text Mode**

## Related information

[Outline View in Author Mode](#) on page 217

## Outline View Filters in Text Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Text** mode:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

### Show element name

Show/hide element name.

### Show text

Show/hide additional text content for the displayed elements.

### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

## Outline View Contextual Menu Actions in Text Mode

The following actions are available from the contextual menu in the **Outline** view in **Text** mode:

### Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

### Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

### Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

### Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

### Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

### Cut

Cuts the currently selected component.

### Copy

Copies the currently selected component.

## **Delete**

Deletes the currently selected component.

## **Expand More**

Expands the structure of a component in the **Outline** view.

## **Collapse All**

Collapses the structure of all the component in the **Outline** view.

## **Quick Assist Support for IDs and IDREFS**

The Quick Assist support is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the quick assist menu from the contextual menu or by pressing **Alt 1 (Meta Alt 1 on Mac OS X)** on your keyboard.

The following actions are available:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation](#). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### **Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Change scope**

Opens the [Select the scope for the Search and Refactor operations](#) dialog box.

### **Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

### **Search Occurrences**

Searches for the declaration and references of the ID located at the cursor position in the current document.

## **Related information**

[Working with Modular XML Files in the Master Files Context](#) on page 472

## **Inserting or Opening a File at Cursor Location**

When editing content in **Text** mode, the following actions (in regards to inserting, opening, or comparing files) are available in the **Document > File** menu:

### **Insert File**

Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

### **Open File at Cursor**

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

## Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

## Compare

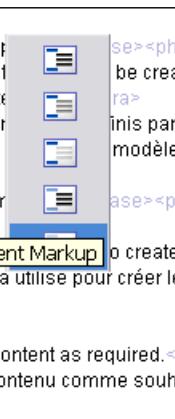

Opens the current file in [the Compare Files tool](#).

## Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Editor offers the option of reducing the visibility of the markup by increasing their transparency when displayed in **Text** mode. To change

the level of transparency, use the  [Tags Transparency Selector] drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using [the Configure Toolbars action](#). There are several levels of transparency that can be adjusted to make the content more or less visible:

-  **Normal Contrast** - Resets the transparency level back to normal.
-  **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
-  **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
-  **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
-  **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

```

Figure 134: Tags Transparency Selector

## Locking and Unlocking XML Markup

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be disabled/enabled with the  **Lock / Unlock the XML tags** action available in **Text** editing mode from:

- The **Document > Source** menu.
- The **Source** submenu from the contextual menu.

You can set the default lock state for all opened editors using the [Lock the XML tags option in the Text preferences page](#).

## Formatting and Indenting XML Documents

Oxygen XML Editor creates XML documents using several [edit modes](#). In **Text mode**, you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen

XML Editor must decide how to format and indent the XML. Oxygen XML Editor will also format and indent your XML for you in **Text** mode if you use one of the Format and Indent options:

- **Document > Source >  Format and Indent** - Formats and indents the whole document.
- **Document > Source >  Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source >  Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

A number of settings affect how Oxygen XML Editor formats and indents XML. Many of these settings have to do with how whitespace is handled.

### Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html"
scope="external">Law of the land</xref>.
We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
 public static void main(String args[])
 {
 System.out.println("Hello World");
 }
</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.

### How Oxygen XML Editor determines when whitespace is significant

When Oxygen XML Editor formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor assigns each element in the document to one of four categories:

#### Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

## Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

## Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello.
This is a big
<emphasis>deal</emphasis>.
</p>
```

In this example, whitespace should not be introduced around the *i* tags as it would introduce extra significant whitespace into the document. The space between the end *</strong>* tag and the beginning *<emphasis>* tag should be normalized to a single space, not zero spaces.

## Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor consults information from the following sources:

### **xml:space**

If the XML element contains the `xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

### **CSS whitespace property**

If the CSS stylesheet controlling the **Author** mode editor applies the `whitespace: pre` setting to an element, it is promoted to the preserve space category.

### **CSS display property**

If a text node contains only white-spaces:

- If the node has a parent element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS `display` property set to `table` then the node is assigned to the ignore space category.

## Schema aware formatting

If a schema is available for the XML document, Oxygen XML Editor can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type xs:string, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for **Author** mode, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Edit modes > Author > Schema aware**, and enable/disable the **Schema aware normalization, format and indent option**.
- To turn it on or off for the **Text** editing mode, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Format > XML**, and enable/disable the **Schema aware format and indent option**.

## Preserve space elements list

If an element is listed in the **Preserve space tab of the Element Spacing list** in the **XML formatting preferences**, it is promoted to the preserve space category.

## Default space elements list

If an element is listed in the **Default space tab of the Element Spacing list** in the **XML formatting preferences**, it is promoted to the default space category

## Mixed content elements list

If an element is listed in the **Mixed content tab of the Element Spacing list** in the **XML formatting preferences**, it is promoted to the mixed content category.

## Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

## Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

## Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements. In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the **Schema Aware Editing option** in the **Schema-Aware** preferences page.

## How Oxygen XML Editor formats and indents XML

You can control how Oxygen XML Editor formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- [Format preferences page](#)
- [XML Formatting preferences page](#)
- [Whitespaces preferences page](#)

## When Oxygen XML Editor formats and indents XML

Oxygen XML Editor formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Author** mode.
- When switching from **Author** mode to another mode.
- When saving documents in **Design** mode.
- When switching from **Design** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the **Format and indent when passing from grid to text or on save option** is selected in the **Grid** preferences page.

## Setting an Indent Size to Zero

Oxygen XML Editor will automatically *format and indent* documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:** Changing the indent size does not override the rules that Oxygen XML Editor uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

### Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Editor to maintain a zero indent when editing or formatting those documents:

1. *Open the Preferences dialog box (Options > Preferences)* and go to **Editor > Format**.
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Editor will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor will use the indent closest to what it detects in the document.

### Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. *Open the Preferences dialog box (Options > Preferences)* and go to **Editor > Format**.
2. Deselect **Detect indent on open**.
3. Set **Indent size** to 0.

All documents will be formatted and indented with an indent of zero.

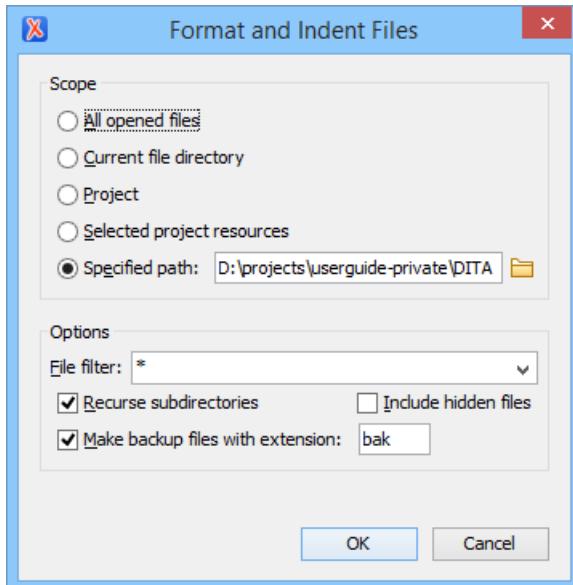

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.

## Format and Indent (Pretty Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (*pretty printing*) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project** view or from the **Tools** menu. This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

**Figure 135: Format and Indent Files Dialog Box**

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The *pretty print* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - *Pretty prints* the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the *pretty print* is also performed in the hidden files.
- **Make backup files with extension** - When enabled, Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

### Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Editor includes a feature, **Manage Highlighted Content**, that is designed to help you achieve this.

When you are in **Text** mode and you perform a search operation or apply an XPath that highlights multiple results, you can select the **Manage Highlighted Content** action from the contextual menu of any highlight in the document, and the following options are available in its submenu:

- **Modify All** - Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Note:** If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the **Find/Replace** operation, or continue the operation.

- **Surround All** - Use this option to surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.
- **Remove All** - Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

- **Modify All Matches** - Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

**Note:** Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Mark Occurrences](#).

### Contextual Menu Actions in Text Mode

When editing XML documents in **Text** mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

Executes the typical editing actions on the currently selected content.

#### Copy XPath

Copies the XPath expression of the current element or attribute from the current editor to the clipboard.

#### →! **Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

#### Go to submenu

This submenu includes the following actions:

##### ↳ Go to Matching Tag (Ctrl + Shift + G)

Moves the cursor to the end tag that matches the start tag, or vice versa.

##### Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))

Moves the cursor to the end of the next tag.

##### Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))

Moves the cursor to the end of the previous tag.

#### Select submenu

This submenu allows you to select the following:

##### Element

Selects the entire element at the current cursor position.

##### Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

##### Attributes

Selects all the attributes of the element at the current cursor position.

## **Parent**

Selects the parent element at the current cursor position.

## **Source submenu**

This submenu includes the following actions:

### **Shift Right (Tab)**

Shifts the currently selected block to the right.

### **Shift Left (Shift + Tab)**

Shifts the currently selected block to the left.

### **Indent selection (Ctrl + I (Command + I on OS X))**

Corrects the indentation of the selected block of lines if it does not follow the current *indenting preferences*.

### **Escape Selection**

Escapes a range of characters by replacing them with the corresponding character entities.

### **Unescape Selection**

Replaces the character entities with the corresponding characters.

### **Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))**

Pretty prints the element that surrounds the current cursor position.

## **To Upper Case**

Converts the content selection to upper case characters.

## **To Lower Case**

Converts the content selection to lower case characters.

## **Capitalize Lines**

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

## **Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

## **Base64 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding *base64* schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the *Encoding for Base64, Base32, Hex conversions* option in the *Encoding preferences page* will be used. Likewise, the same is true if the *Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions* option is disabled in the *Messages* preference page.

## **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Base32 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding base32 schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

### **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Hex Encode/Decode submenu**

This submenu include the following actions for encoding or decoding hex schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

## Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## Join and Normalize Lines ([Ctrl + J \(Command + J on OS X\)](#))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

## Insert new line after ([Ctrl + Alt + Enter \(Command + Alt + Enter on OS X\)](#))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

## [Insert XInclude](#)

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

**Note:** In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

## [Import entities list](#)

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files chapter1.xml and chapter2.xml inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

## [Lock / Unlock the XML Tags](#)

Disables or enables the ability to edit XML tags.

## [Canonicalize](#)

Opens the **Canonicalize** dialog box that allows you to select a canonicalization algorithm to standardize the format of the document.

## [Sign](#)

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

## [Verify Signature](#)

Allows you to specify the location of a file to verify its digital signature.

## Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

### Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

### Remove All

Removes all the highlighted content.

## Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### Show Definition (**Ctrl + Shift + Enter**)

Moves the cursor to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “<http://www.w3.org/2001/XMLSchema-instance>” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute.

## Refactoring submenu

This submenu includes the following actions:

### Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### Rename Prefix (**Alt + Shift + P (Command + Shift + P on OS X)**)

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, check the **Rename also attribute values that start with the same prefix** checkbox.

### Surround with submenu

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

### Surround with Tags (**Ctrl + E (Command + E on OS X)**)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

 **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

 **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

 **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

#### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

##### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

##### **Delete attribute**

Allows you to remove one or more attributes.

##### **Rename attribute**

Allows you to rename an attribute.

##### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

#### **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

##### **Delete comments**

Allows you to delete comments found inside one or more elements.

#### **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

##### **Change topic ID to file name**

Changes the ID of a topic to be the same as its file name.

##### **Convert simple tables to CALS tables**

Converts all DITA simple tables to CALS tables in the specified scope.

#### **Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

##### **Delete element**

Allows you to delete elements.

##### **Delete element content**

Allows you to delete the content of elements.

### **Insert element**

Allows you to insert new elements.

### **Rename element**

Allows you to rename elements.

### **Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

### **Wrap element**

Allows you to surround elements with element tags.

### **Wrap element content**

Allows you to surround the content of elements with element tags.

## **Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

### **Insert XML fragment**

Allows you to insert an XML fragment.

### **Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

### **Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

## **JATSKit submenu**

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

### **Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

### **Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### **Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

## **Manage IDs submenu**

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

### **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation](#). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### **Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

### **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### **Search References in**

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

## Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

## Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

## Quick Assist (**Alt + 1** (**Command + Alt + 1** on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the Quick Assist window that allows you to select some search and refactoring actions for the selected ID or IDREF.

## Open submenu

The following actions are available in this submenu:

### Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

### Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

## Compare

Opens the current file in [the Compare Files tool](#).

## Resource Hierarchy

Opens the **Resource Hierarchy/Dependencies** view that allows you to see the resource hierarchy for an XML document.

## Resource Dependencies

Opens the **Resource Hierarchy/Dependencies** view that allows you to see the resource dependencies for an XML document.

## Editing XML Documents in Grid Mode

This section includes features and actions for editing XML documents in the **Grid** mode of Oxygen XML Editor.

### Editing Actions in Grid Mode

A variety of editing actions are available in **Grid** mode from the contextual menu, the **Document** menu, the toolbar, and with shortcut keys. This section explains some of those useful editing actions.

### Sorting a Table Column

You can sort certain table columns by using the **Sort Ascending** or **Sort Descending** actions that are available on the toolbar or from the contextual menu.

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

### Inserting a Row in a Table

You can add a new row using the **Copy/Paste** actions, or by selecting **Insert row** from the contextual menu or the toolbar.

For a faster way to insert a new row, move the selection over the row header, and then press **Enter**. The row header is the zone in the left of the row that holds the row number. The new row is inserted below the selection.

### Inserting a Column in a Table

You can insert a column after the selected column by using the **Insert column** action from the contextual menu or the toolbar.

### Clearing the Content of a Column

You can clear all the cells from a column by using the **Clear content** action from the contextual menu.

### Adding Nodes

You can add nodes before, after, or as a child of the currently selected node by using the various actions in the following submenus of the contextual menu:

- **Insert before** - Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.
- **Insert after** - Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.
- **Append child** - Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

### Duplicating Nodes

You can quickly create new nodes by duplicating existing ones. The **Duplicate** action is available in the contextual menu and in the **Document > Grid Edit** menu.

### Refresh Layout

When using drag and drop to reorganize the document, the resulting layout can be different from the expected one. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the **Refresh selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

### Editing a Cell Value

To edit the value of a cell, simply select the grid cell and press **(Enter)** or you can use the **Start Editing** action found in the **Document > Grid Edit** menu.

To stop editing a cell value, press **(Enter)** again or use the **End Editing** action found in the **Document > Grid Edit** menu.

To cancel the editing without saving the current changes in the document, press the **(Esc)** key.

### Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**. For more information, see [Copy and Paste in the Grid Editor](#).

### Copy and Paste in the Grid Editing Mode

The selection in the **Grid** mode is a bit complex compared to the selection in a text component. It consists of a currently selected cell and additional selected cells. These additional cells are either selected with the cursor, or implied by the currently selected cell. To be more specific, consider that you click the name of the column (this

becomes the current selected cell), but the editor automatically extends the selection so that it contains all the cells from that column. The currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

### Pasting Content Within Grid Mode

You can paste the copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- **Paste (Ctrl + V (Command + V on OS X))** - Pastes the content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes the content as the last child of the current selection.

### Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into the **Text** editor or other applications. When copying from the **Grid** into the **Text** editor or other text based applications, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

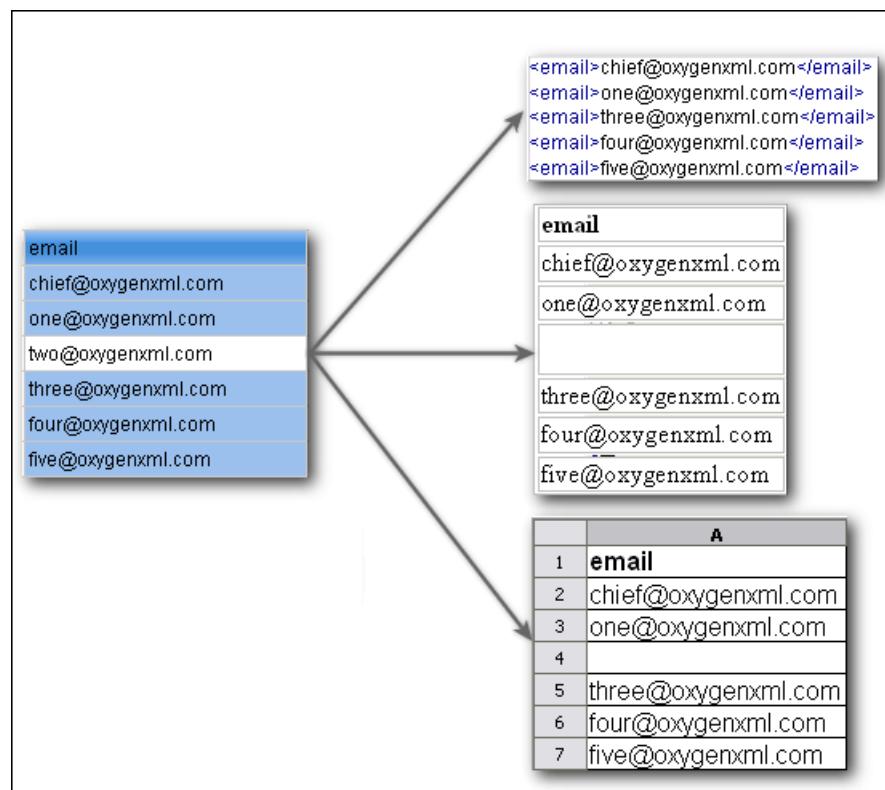

Figure 136: Copying from Grid to Other Editors

### Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

The diagram illustrates the mapping of XML data to a grid. On the left, an XML snippet is shown:

```

<person id="one.worker">
 <name>
 <family>Worker</family>
 <given>One</given>
 </name>
 <email>one@oxygenxml.com</email>
 <link manager="Big.Boss"/>
</person>

```

An arrow points from this XML to a grid editor on the right. The grid has columns labeled "person", "@id", and "one.worker". The data is mapped as follows:

person	@id	one.worker
	name	family Worker
	given	One
	email	one@oxygenxml.com
	link	@manager Big.Boss

**Figure 137: Pasting XML Data into Grid**

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

The diagram illustrates the mapping of tab-separated values to a grid. On the left, a table with three rows and two columns is shown:

Id1	Email1
Id2	Email2
Id3	Email3

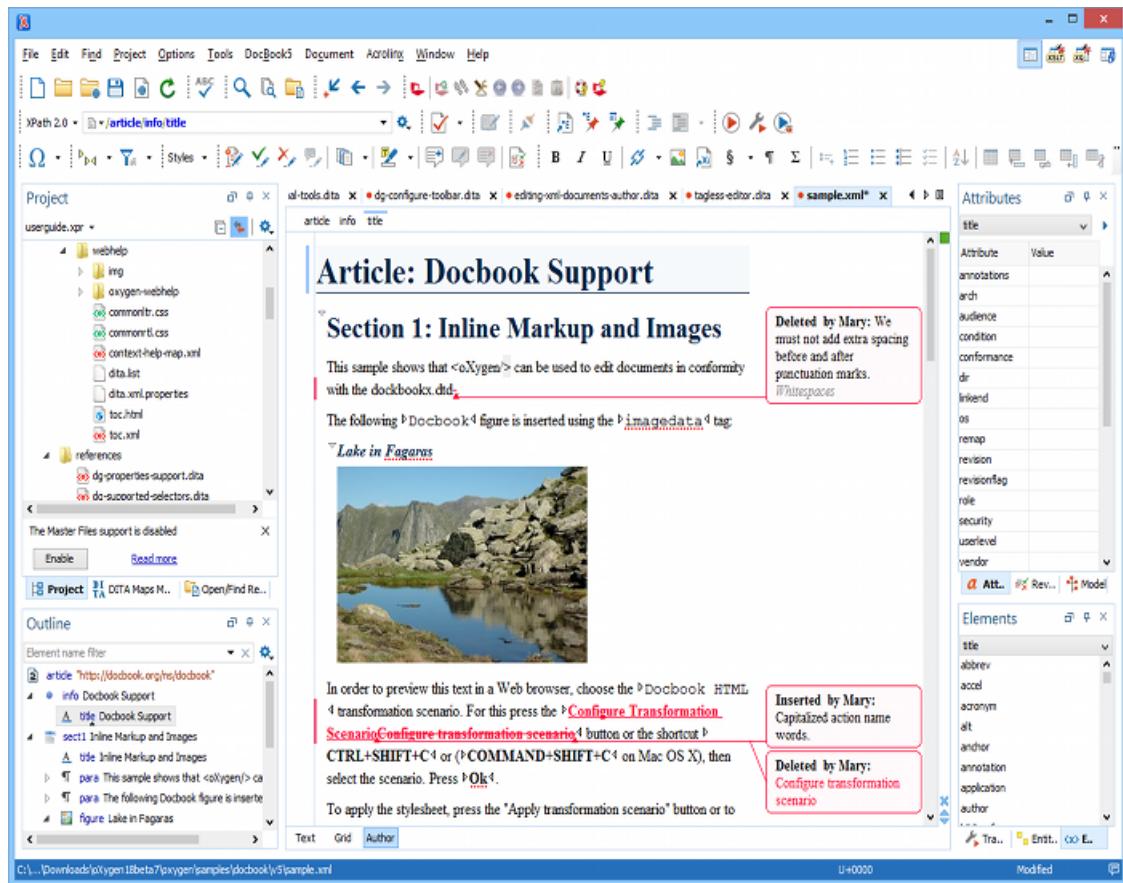

An arrow points from this table to a grid editor on the right. The grid has columns labeled "@id" and "email". The data is mapped as follows:

@id	email
1 Big.Boss	chief@oxygenxml.com
2 Id1	Email1
3 Id2	Email2
4 Id3	Email3

**Figure 138: Pasting Tab-Separated Values into Grid**

## Editing XML Documents in Author Mode

This section includes details about editing the text content and markup of XML documents in **Author** mode.

**Figure 139: Author Editing Mode**

### Author Mode User Roles

There are two main types of users for the **Author** mode: *framework developers* and *content authors*.

#### Framework Developers

A *framework developer* is a technical person with advanced XML knowledge who defines the framework for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

#### Content Authors

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

#### Document Type Association (Framework)

The framework that is set up by the developer is also called a *document type association* and defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- XML catalogs.

- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor includes some ready-to-use predefined document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

## Rendering XML Documents in Author Mode

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in a visual editor. For more information about schema association, see [Associating a Schema to XML Documents](#) on page 464. The **Author** mode renders the content of the XML documents visually, based on a CSS stylesheet associated with the document.

## Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `<?xml-stylesheet type="text/css" href="test.css"?>` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, [you should create a new document type \(framework\)](#).

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

LESS example:

```
<?xml-stylesheet type="text/css" href="test.less"?>
```

**Note:** XHTML documents need a `link` element, with the `href` and `type` attributes in the `head` child element, as specified in the [W3C CSS specification](#). XHTML example:

```
<link href="/style/screen.css" rel="stylesheet" type="text/css"/>
```

**Tip:** You can also insert the `<?xml-stylesheet` processing instruction by using the  [Associate XSLT/CSS Stylesheet](#) action that is available on the toolbar or in the **Document > XML Document** menu.

2. Configure a *Document Type Association* by adding a new CSS or LESS file in the settings. To do so, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**. Edit the appropriate framework, open the **Author** tab, then the **CSS** tab. Press the  **New** button to add a new CSS or LESS file.

**Note:** The Document Type Associations are read-only, so you need to extend an existing one.

You can read more about associating a CSS to a document in the section about [customizing the CSS of a document type](#).

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

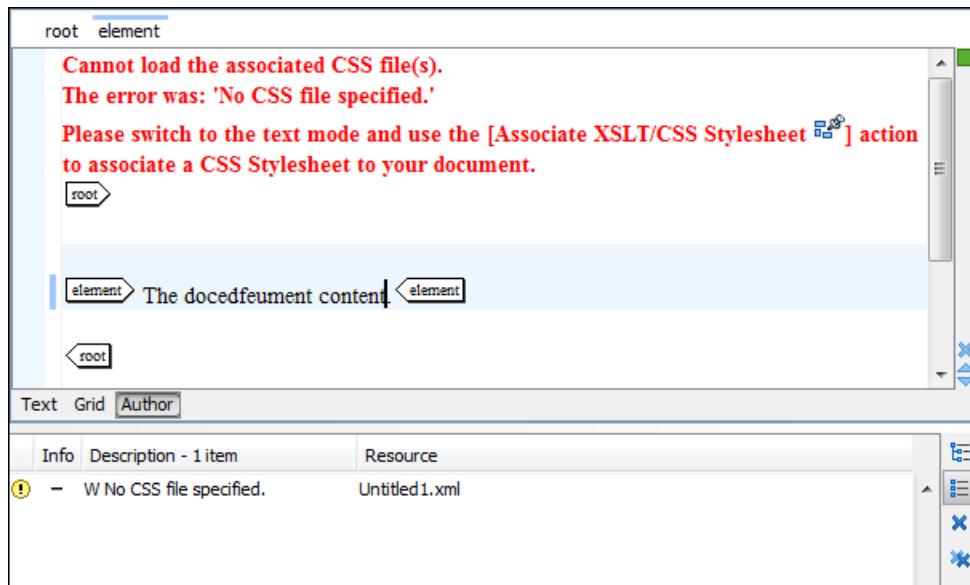

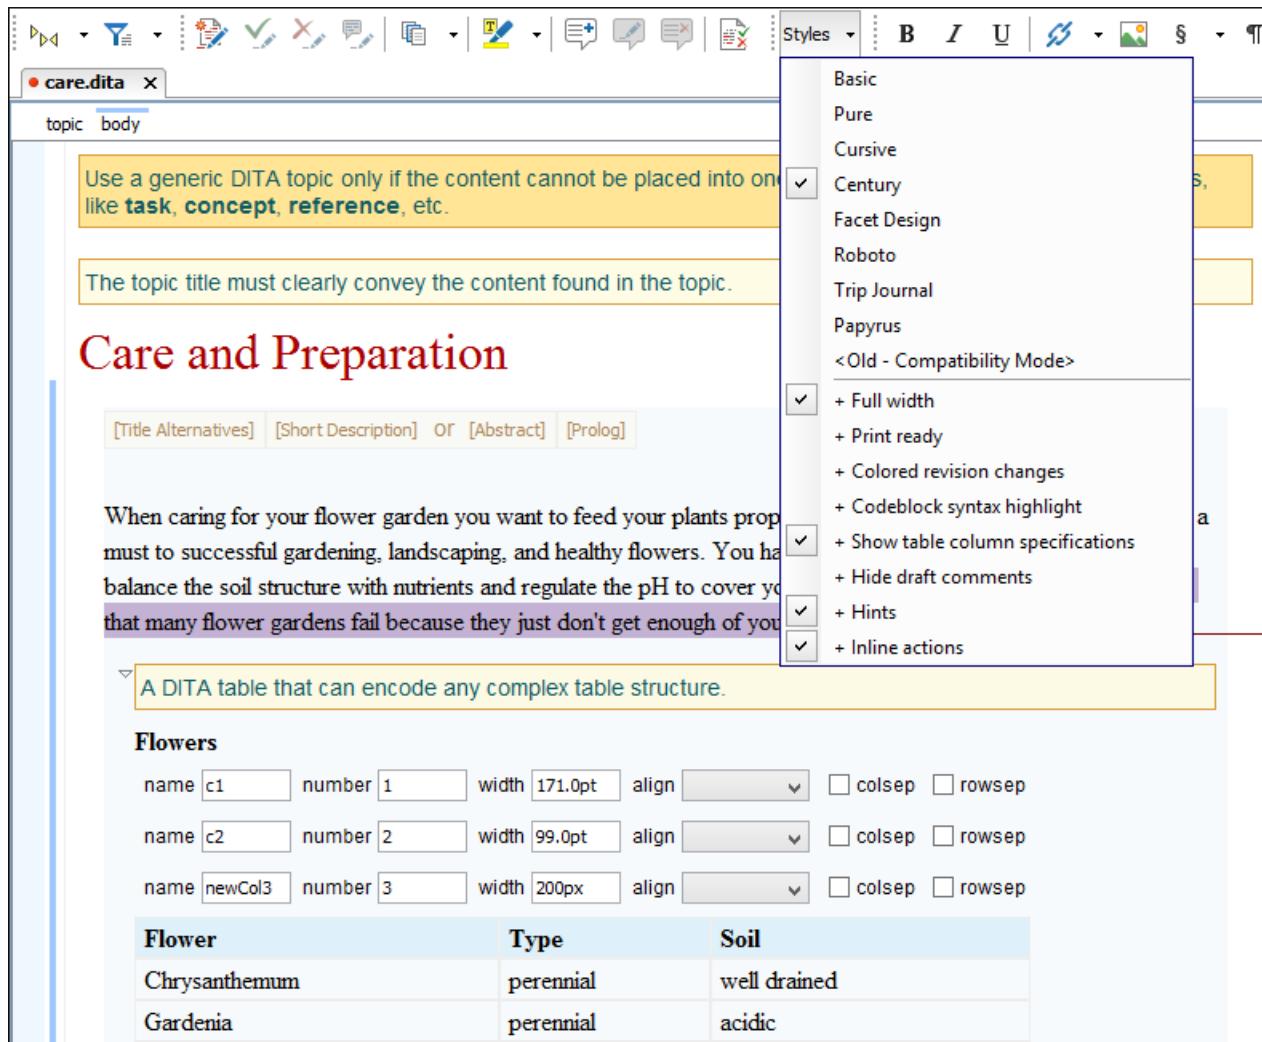

Figure 140: Document with no CSS association default rendering

### Selecting and Combining Multiple CSS Styles

Oxygen XML Editor provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate)* CSS style and multiple *alternate* CSS styles. This makes it easy to change the look of the document.

**Tip:** For information about configuring the **Styles** drop-down menu, see [Selecting and Combining Multiple CSS Styles](#) on page 1222.

You can select a *main* CSS stylesheet that styles the whole document and then apply *alternate* styles, as layers, to specific parts of the document. In the subsequent figure, a DITA document has the **Century** style selected for the *main* CSS and the *alternate* styles **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

**Figure 141: Styles Drop-down Menu in a DITA Document**

#### Related information

#### Navigating the Document Content in Author Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents.

#### Using the Keyboard

Oxygen XML Editor allows you to quickly navigate through a document using the **Tab** key to move the cursor to the next XML node and **Shift + Tab** to go to the previous one. If you encounter a space preserved element when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a space preserved element and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

To navigate one word forward or backwards, use **Ctrl + RightArrow** (**Command + RightArrow** on OS X), and **Ctrl + LeftArrow** (**Command + LeftArrow** on OS X), respectively. Entities and hidden elements are skipped. To position the cursor at the beginning or at the end of the document you can use **Ctrl + Home** (**Command + Home** on OS X), and **Ctrl + End** (**Command + End** on OS X), respectively.

## Navigation Buttons

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar and the actions can also be accessed from the **Find** menu. The three actions include:

-  **Last Modification** - Moves the cursor to the last modification in any opened document.
-  **Back** - Moves the cursor to the previous position.
-  **Forward** - Moves the cursor to the next position. Enabled after at least one press of the **Back** button.

## Navigating with the Outline View

Oxygen XML Editor includes a very useful **Outline view** that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

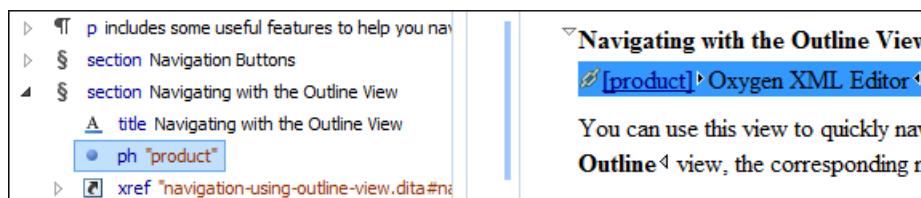

Figure 142: Outline View Navigation in Author Mode

## Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 143: Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

## Using the Linking Support

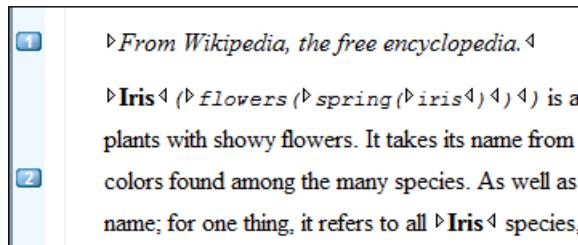

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc), the **linking support** is useful for navigating between the documents. In the predefined customizations that are bundled with Oxygen XML Editor, links are marked with an icon representing a chain link (). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.

## Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any

document. Shortcut keys are available to place the bookmarks or to return to any of the marked positions. You can configure these shortcut keys in the [Options > Menu Shortcut Keys](#) menu.

**Figure 144: Editor Bookmarks**

A bookmark can be inserted in **Author** mode by doing one of the following:

- Click in the vertical stripe on the left side of the editor.
- Select the **Create Bookmark (F9)** action from the **Edit > Bookmarks** menu.

A bookmark can be removed by right-clicking its icon on the vertical stripe and select **Remove** or **Remove all (Ctrl +F7 (Command+F7 on OS X))**.

You can navigate the bookmarks by using one of the actions available on the **Edit > Bookmarks > Go to** menu or by using the shortcut keys that are listed in that menu.

### Displaying the XML Markup (Tags)

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the **Tags Display Mode** drop-down menu (available on the toolbar):

#### **Full Tags with Attributes**

Displays full tag names with attributes for both block and in-line elements.

#### **Full Tags**

Displays full tag names without attributes for both block and in-line elements.

#### **Block Tags**

Displays full tag names for block elements and simple tags without names for in-line elements.

#### **Inline Tags**

Displays full tag names for in-line elements, while block elements are not displayed.

#### **Partial Tags**

Displays simple tags without names for in-line elements, while block elements are not displayed.

#### **No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

### Configure Tags Display Mode

Use this option to go to the [Author preferences page](#) where you can configure the **Tags Display Mode** options.

**Note:** The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

### Editing Content in Author Mode

The **Author** mode in Oxygen XML Editor allows you to create, review, and edit structured content in a visual editor that is similar to common word processors. To enter this mode, click the **Author** button at the bottom of the editing area. This mode includes a large variety of user-friendly authoring features to help even novice users work with XML content, including numerous toolbar, menu, and shortcut actions, drag and drop support, smart paste support, and some specialized content editing features.

## Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

### **Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))**

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the *Enable mouse-wheel zooming option* in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

### **Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))**

Decreases the font size (zooms out) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the *Enable mouse-wheel zooming option* in the **Editor** preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

### **Normal editor font (Ctrl + 0 (Command + 0 on OS X))**

Resets the font size to *the value of the editor font set in the Fonts preferences page*.

## Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

### **Undo (Ctrl + Z (Command + Z on OS X))**

Reverses a maximum of 200 editing actions (configurable with the *Undo history size option* in the **Editor** preferences page) to return to the preceding state.

**Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

### **Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

## Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

### **Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

### **Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

### **Paste (Ctrl + V (Command + V on OS X))**

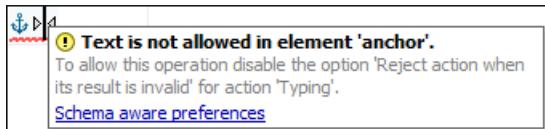

Inserts the current clipboard content into the document at the cursor position.

### **Select All (Ctrl + A (Command + A on OS X))**

Selects the entire content of the current document.

## Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

**Figure 145: Editing in empty element warning**

To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and disable the **Reject action when its result is invalid** option in the **Typing** actions section.

To watch our video demonstration about the basic functionality of the **Author** mode, go to [https://www.oxygenxml.com/demo/WYSIWYG\\_XML\\_Editing.html](https://www.oxygenxml.com/demo/WYSIWYG_XML_Editing.html).

[Editing XML Markup in Author Mode](#) on page 328

[Drag and Drop in Author Mode](#) on page 335

[Smart Paste Support](#) on page 335

[Content Completion Assistant in Author Mode](#) on page 337

[Contextual Menu Actions in Author Mode](#) on page 430

[Frequently Used Shortcut Keys](#) on page 17

### Editing XML Markup in Author Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

### Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the breadcrumb displayed at the top of the editing window.
- **Outline View** - Click the element name in the **Outline** view.
- **Full Tags Mode** - While editing in **Full Tags mode**, click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in **Full Tags mode**, click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in **Full Tags mode**, place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

**Note:** If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in [well-formed XML](#).

### Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 146: Breadcrumb in Author Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

#### **Edit Attributes**

Opens the [in-place attributes editor](#) that allows you to easily edit the attributes of an element.

#### **Edit Profiling Attributes**

Allows you to select the [profiling attributes](#) that apply to a certain element.

### **Append child**

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

### **Insert before**

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

### **Insert after**

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

### **Cut**

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

### **Copy**

Copies the selected element to the clipboard, while preserving the styles of the copied content.

### **Paste**

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

### **Paste before**

Insert a well-formed element (from the clipboard) before the currently selected element.

### **Paste after**

Insert a well-formed element (from the clipboard) after the currently selected element.

### **Paste as XML**

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

### **Delete**

Deletes the currently selected element.

### **Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

### **Rename Element**

Opens the **Rename** dialog box that allows you to rename the currently selected element and other elements with the same name.

**Tip:** The tag names displayed in the *breadcrumb* can be customized with an **Author** mode extension class that

implements the `AuthorBreadCrumbCustomizer` API. See the [Oxygen SDK](#) for more details.

You can move XML nodes in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### **Move Up (Alt + UpArrow)**

Moves the current node or selected nodes in front of the previous node.

### **Move Down (Alt + DownArrow)**

Moves the current node or selected nodes after the subsequent node.

**Tip:** The easiest way to move nodes is to use the **Alt + UpArrow** and **Alt + DownArrow** shortcut keys.

### **Promote/Demote List Item Nodes**

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

### Promote (Shift + Tab)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

### Demote (Tab)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

### Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Join Elements

Joins two adjacent *block* elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to join block elements in the following situations:

- The cursor is located before the end position of the first element and **(Delete)** key is pressed.
- The cursor is located after the end position of the first element and **(Backspace)** key is pressed.
- The cursor is located before the start position of the second element and **(Delete)** key is pressed.
- The cursor is located after the start position of the second element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

#### Split Element (**Alt + Shift + D (Ctrl + Alt + D on OS X)**)

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

### Rename Elements

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

#### Surround with Tags (**Ctrl + E (Command + E on OS X)**)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

#### Surround with '[tag]' (**Ctrl + ForwardSlash (Command + ForwardSlash on OS X)**)

Surround the selected content with the last tag used.

## Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Tip:** Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **(Delete)** key is pressed.
- The cursor is located after the start position of the element and **(Backspace)** key is pressed.
- The cursor is located before the end position of the element and **(Delete)** key is pressed.
- The cursor is located after the end position of the element and **(Backspace)** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

## Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:** You can use the **(Delete)** or **(Backspace)** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

## Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

### Remove Text

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

## Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

### Attributes submenu

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

#### Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

#### Delete attribute

Allows you to remove one or more attributes.

#### Rename attribute

Allows you to rename an attribute.

#### Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

### Comments submenu

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

### **Delete comments**

Allows you to delete comments found inside one or more elements.

### **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

#### **Change topic ID to file name**

Changes the ID of a topic to be the same as its file name.

#### **Convert simple tables to CALS tables**

Converts all DITA simple tables to CALS tables in the specified scope.

### **Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

#### **Delete element**

Allows you to delete elements.

#### **Delete element content**

Allows you to delete the content of elements.

#### **Insert element**

Allows you to insert new elements.

#### **Rename element**

Allows you to rename elements.

#### **Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

#### **Wrap element**

Allows you to surround elements with element tags.

#### **Wrap element content**

Allows you to surround the content of elements with element tags.

### **Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

#### **Insert XML fragment**

Allows you to insert an XML fragment.

#### **Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

#### **Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

### **JATSKit submenu**

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

#### **Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

#### **Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

#### **Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

[Frequently Used Shortcut Keys](#) on page 17

## Editing Attributes in Author Mode

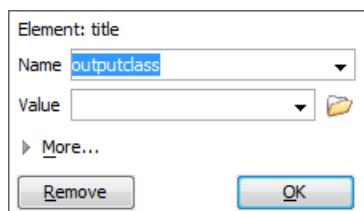

You can easily edit attributes in **Author** mode by using the [Attributes View](#) and Oxygen XML Editor also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

### In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 147: In-place Attributes Editor**

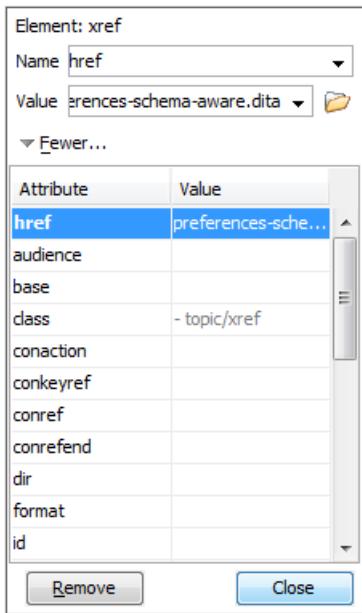

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 148: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

#### Related information

[Attributes View in Author Mode](#) on page 219

#### Folding XML Elements in Author Mode

When working with a large document, the **folding support** in Oxygen XML Editor can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

The screenshot shows the Oxygen XML Editor interface with several collapsed folds. One fold is expanded, showing the following content:

▶ Configuring [product] ▶ Oxygen XML Editor ↴

▼ Video Tutorials

The [product] ▶ Oxygen XML Editor ↴ website includes numerous video tutorials that demonstrate how to use the editor. These videos present many of the features that are available in [product]. You can use the video tutorials to learn how to complete specific tasks or how to use the various features.

**Figure 149: Folding of XML Elements in Author Mode**

The fact that the folds are persistent is a unique feature of Oxygen XML Editor, meaning the next time you open the document the folds are restored to its last state.

#### Folding Actions in Author Mode

Foldable elements are marked with a small triangle ( ▽ / ▷ ) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the **Folding** submenu of the contextual menu or from the **Document > Folding** menu:

##### ▶ Toggle Fold (or you can simply click on the ▽ / ▷ arrow)

Toggles the state of the current fold.

#### **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

#### **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the child elements that are indented one level inside the current element.

#### **Expand Child Folds**

Unfolds all child elements of the currently selected element.

#### **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

To watch our video demonstration about the folding support in Oxygen XML Editor, go to <https://www.oxygenxml.com/demo/FoldingSupport.html>.

## **Drag and Drop in Author Mode**

The Oxygen XML Editor **Author** mode includes support for dragging and dropping content in XML documents.

When editing content in **Author** mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

## **Related information**

[Smart Paste Support](#) on page 335

## **Smart Paste Support**

The **Author** editing mode includes a *Smart Paste* feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Editor, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

## **Smart Paste Options**

By default, the *Smart Paste* features are enabled in Oxygen XML Editor. There are several options in the [Schema Aware preferences page](#) that control the *Smart Paste* feature:

- **Smart paste and drag and drop** - This option determines whether or not Oxygen XML Editor will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is enabled by default.
- **Reject action when its result is invalid** - If you enable this option, Oxygen XML Editor will not let you paste content into a position where it would be invalid. This option is disabled by default.
- **Convert external content on paste** - This option determines whether or not Oxygen XML Editor will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is enabled by default.

- **Convert even when pasting inside space-preserve elements** - If you enable this option, the Smart Paste feature will also work when pasting external content into a space-preserve element (such as a codeblock). This option is disabled by default.

## Smart Paste Supported Document Types

The Smart Paste feature is supported for the following document types (frameworks):

- DITA
- DocBook 4
- DocBook 5
- TEI P4
- TEI P5
- XHTML
- JATS

To watch our video demonstration about the Smart Paste support, go to [https://www.oxygenxml.com/demo/Smart\\_Paste\\_Copy\\_Paste\\_from\\_Web\\_Office\\_Documents\\_to\\_DITA\\_DocBook\\_TEI\\_XHTML\\_Documents.html](https://www.oxygenxml.com/demo/Smart_Paste_Copy_Paste_from_Web_Office_Documents_to_DITA_DocBook_TEI_XHTML_Documents.html).

### Related information

[Customizing Smart Paste Support](#) on page 1179

## Selecting Content in Author Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to easily select content in **Author** mode.

### Selection Shortcuts in Author Mode

#### **Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

#### **Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

#### **Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

#### **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

#### **Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

#### **Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

#### **Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

#### **Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

#### **Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

#### **Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

## **Double-Click**

Selects the word at the cursor position.

## **Triple-Click**

Selects the node at the cursor position.

## **Right-Click > Select > Element**

Selects the entire element at the current cursor position.

## **Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag.

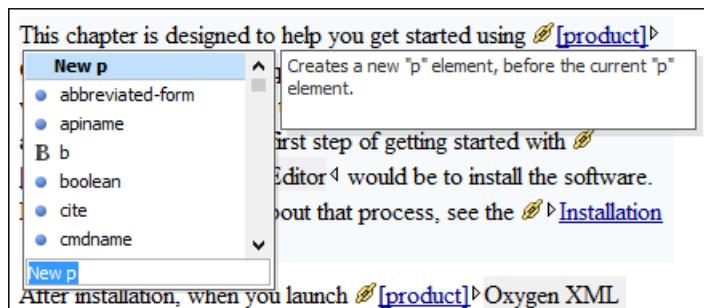

Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

## **Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

## **Content Completion Assistant in Author Mode**

One of the most useful features in **Author** mode is the content completion support. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

**Figure 150: Content Completion Assistant in Author Mode**

The **Content Completion Assistant** is enabled by default. To disable it, open the **Preferences dialog box (Options > Preferences)**, go to **Editor > Content Completion**, and disable the **Enable content completion** option.

## **Using the Content Completion Assistant in Author Mode**

To activate the feature in **Author** mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space (Command + Space on OS X)**
- **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Author** mode, simply press **Enter**.

## **Types of Proposals Listed in the Content Completion Assistant**

The **Content Completion Assistant** offers the following types of proposed actions:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert **code templates**.

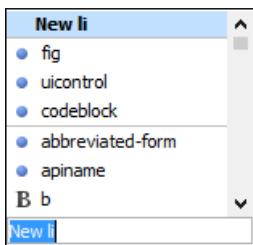

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in [Full Tags mode](#)), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If the [Show all possible elements in the content completion list option from the Schema-Aware preferences page](#) is enabled, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

**Note:** By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the [Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page](#).

### Examples of How the Content Completion Assistant Works

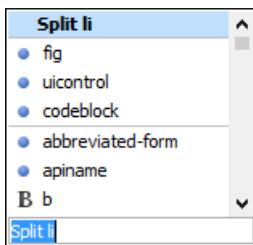

To illustrate how the feature works, consider the following examples of invoking the **Content Completion Assistant** in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the **Content Completion Assistant** is a **New <Element>** item. Selecting this item will insert an empty element.

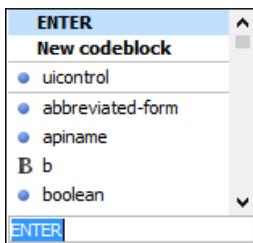

**Figure 151: Example (New [Element Name])**

- If the cursor is positioned somewhere inside the element, the first entry in the **Content Completion Assistant** is a **Split <Element>** item. In most cases, you can only split the closest block element to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

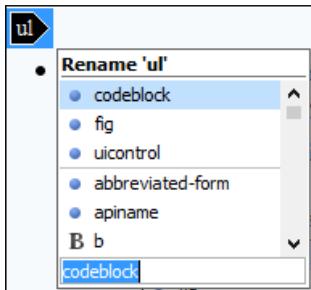

**Figure 152: Example (Split [Element Name])**

- If the cursor is positioned inside a space preserved element (for example, a `codeblock`), the first choice in the **Content Completion Assistant** is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

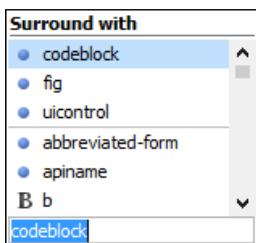

**Figure 153: Example ('ENTER' New Line)**

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in [Full Tags mode](#)), it will allow you to rename the element.

**Figure 154: Example (Rename)**

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

**Figure 155: Example (Surround)**

#### Related information

[Customizing the Content Completion Assistant](#) on page 1207

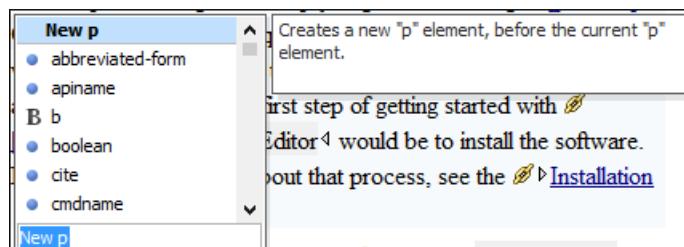

#### Set the Schema to be Used for Content Completion

The proposals that are presented in the **Content Completion Assistant** depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the **Content Completion Assistant** is specified in the following methods, in the order of their precedence:

- The *schema specified explicitly in the document*. In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The *default schema declared* in the [Schema tab of the Document Type configuration dialog box](#) for the particular document type.

#### Schema Annotations in Author Mode

A *schema annotation* is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the **Content Completion Assistant**.

Creates a new "p" element, before the current "p" element.  
first step of getting started with Editor would be to install the software.  
about that process, see the [Installation](#)

**Figure 156: Schema Annotation in the Content Completion Assistant**

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the [Show annotations in Content Completion Assistant](#) option in the **Annotations** preferences page.

## Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the [Show annotations using HTML format, if possible](#) option in the **Annotations** preferences page. When this option is disabled, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins a new paragraph, br breaks the current line, ul encloses a list of items, and li encloses an item of the list.

## Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an <xs:annotation> element like this:

```
<xs:annotation>
 <xs:documentation>
 Description of the element.
 </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

## Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the <documentation> element from the <http://relaxng.org/ns/compatibility/annotations/1.0> namespace. However, any element outside the Relax NG namespace (<http://relaxng.org/ns/structure/1.0>) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, enable the [Use all Relax NG annotations as documentation](#) option in the **Annotations** preferences page.

## Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled from the [Prefer DTD comments that start with "doc:" as annotations](#) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

### Related tasks

[Annotations for XML Elements and Attributes in Content Completion Assistant](#) on page 1216

### Related information

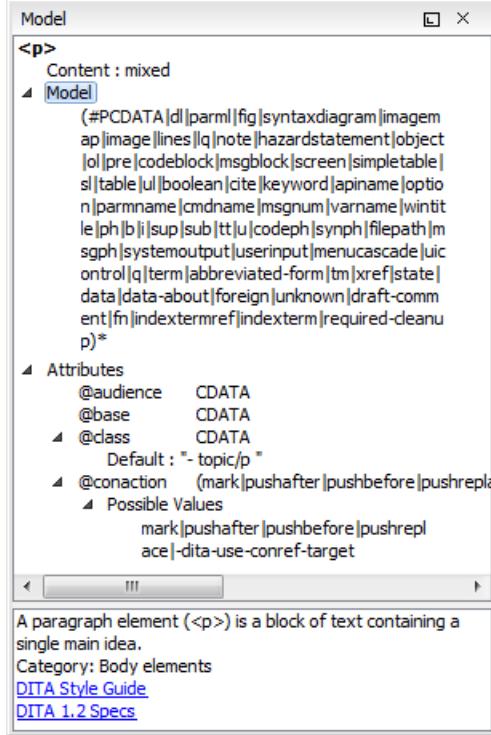

[Customizing the Rendering of Elements](#) on page 1214

## Content Completion Helper Views

Information about the current element being edited is also available in various views, such as the **Model** view, **Attributes** view, **Elements** view, and **Entities** view. By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view, provide spatial and insight information about the edited document and the current element.

### Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

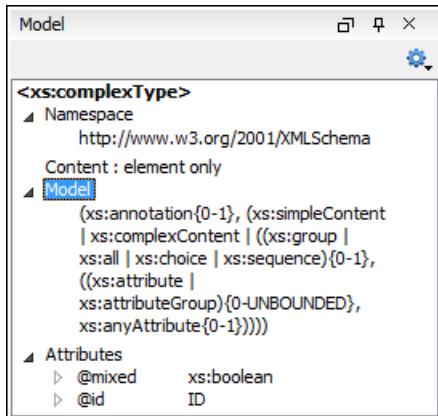

**Figure 157: Model View**

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

### Element Structure Panel

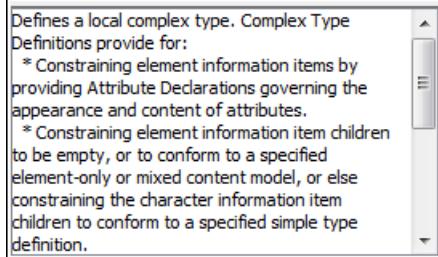

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

**Figure 158: Element Structure Panel**

### Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

**Figure 159: Annotation panel**

#### Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the *-oxy-editable* property associated with the element.
- The element is entirely included in a deleted *Track Changes* marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

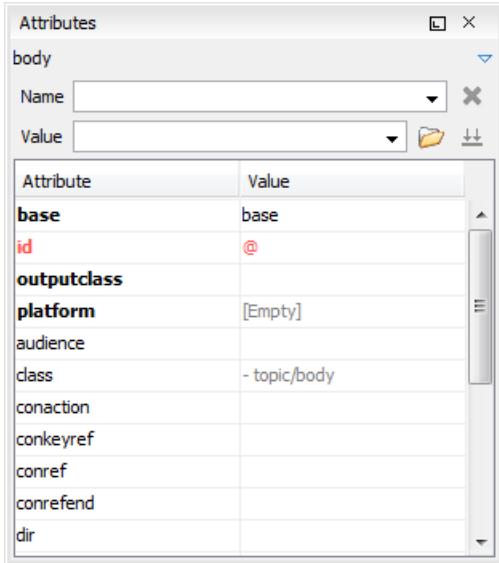

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column . If the possible values of the attribute are specified as *list* in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 160: Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

#### Expand/Collapse Button

There is an **Expand/ Collapse** button at the top-right of the view. When expanded, this presents the following additional combo boxes:

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view. You can use the **Remove** button to delete an attribute and its value from the selected element.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

#### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

##### Set empty value

Specifies the current attribute value as empty.

##### Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **(Delete)** or **(Backspace)** keys.

##### Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

##### Paste

Depending on the content of the clipboard, the following cases are possible:

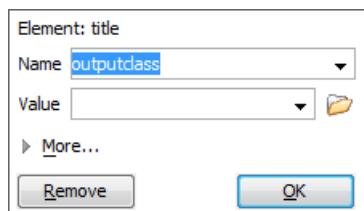

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

### In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following *display modes*: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, or **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

**Figure 161: In-place Attributes Editor**

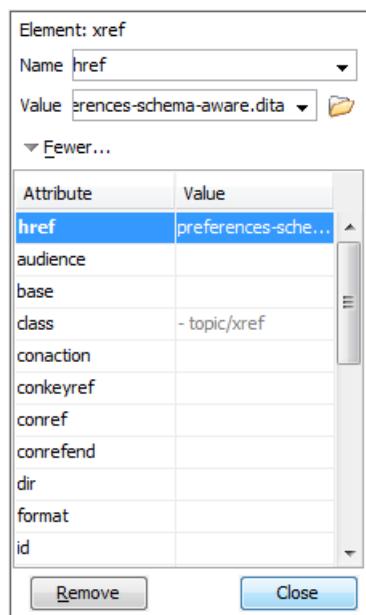

#### Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

#### Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 162: In-place Attributes Editor (Full Version)**

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

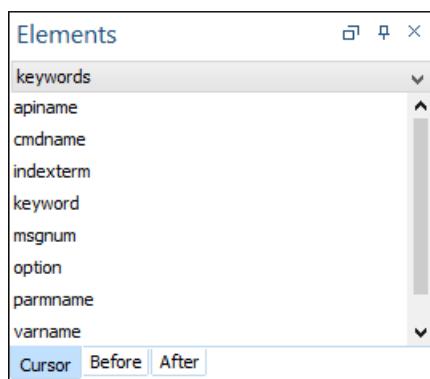

#### Elements View in Author Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only items allowed at cursor position option** is disabled in the **Views preferences page**, two additional tabs (**Before** and **After**) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

**Figure 163: Elements View in Author Mode**

#### Entities View

**Entities** provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- *Built-in* or *Predefined* - Entities that are part of the predefined XML markup (&lt;, &gt;, &amp;, &apos;, &quot;).
- *Internal* - Defined in the DOCTYPE declaration header of the current XML.
- *External* - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
concept-att	(topic concept)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&concept-att; ...
indexing-d-att	(topic indexing-d)
nbsps	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

**Figure 164: Entities View**

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and \* wildcards. Also, you can enter multiple filters by separating them with a comma.

### Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position . Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, and XML Schema document types. You can also [define your own code templates and share them with others](#).

To get a complete list of available code templates, press **Ctrl + Shift + Space** in **Text** mode. To enter the code template, select it from the list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it. Code templates are displayed with a  symbol in the content completion list.

When the **Content Completion Assistant** is invoked (**Ctrl + Space (Command + Space on OS X)** in **Text** mode or **Enter** in **Author** mode), it also presents a list of code templates specific to the type of the active editor.

To watch our video demonstration about code templates, go to [https://www.oxygenxml.com/demo/Code\\_Templates.html](https://www.oxygenxml.com/demo/Code_Templates.html).

### Outline View in Author Mode

The **Outline** view in **Author** mode displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

### Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.

- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

## Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

It also includes a  **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

## Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (**Ctrl (Command on OS X)**) key after dragging, a copy operation will be performed instead of a move.

The drag and drop actions in the **Outline** view can be *disabled and enabled from a Preferences page*.

**Tip:** You can select and drag multiple nodes in the **Outline** view when editing in **Author** mode.

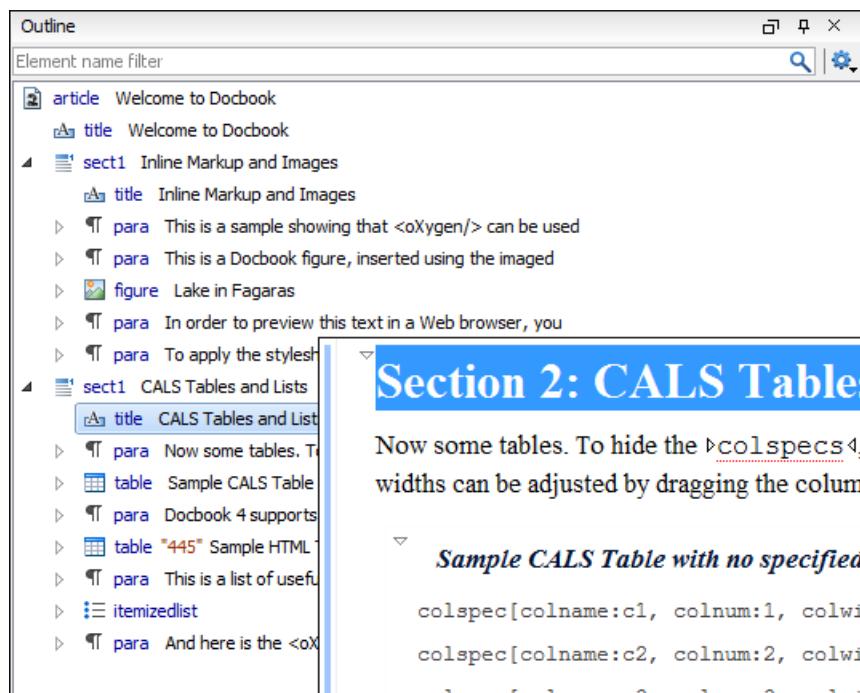

Figure 165: Outline View

## Outline View Filters in Author Mode

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

The following actions are available in the  **Settings** menu of the **Outline** view when editing in **Author** mode:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

### Show element name

Show/hide element name.

### Show text

Show/hide additional text content for the displayed elements.

### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

## Outline View Contextual Menu Actions in Author Mode

The contextual menu of the **Outline** view in **Author** mode contains the following actions:

### Edit Attributes

Allows you to edit the attributes of a selected node. For more details about this action, see [Attributes View in Author Mode](#) on page 219.

### Edit Profiling Attributes

Allows you to change the [profiling attributes](#) defined on all selected elements.

### Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

### Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

### Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

### Cut, Copy, Paste, Delete editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content. The **Paste before** and **Paste after** actions allow you to insert a well-formed element before or after the currently selected element. The **Paste as XML** action pastes copied content that is considered to be valid XML, preserving its XML structure.

### Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

## Rename Element

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

## Expand More

Expands the structure tree of the currently selected element.

## Collapse All

Collapses all of the structure tree of the currently selected node.

**Tip:** You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

### Related information

[Attributes View in Author Mode](#) on page 219

## Finding and Replacing Text

You can search for a specific word or string of characters using the following features:

- [Find/Replace dialog box](#)
- [Find/Replace in Files dialog box](#)
- [Quick Find toolbar](#)
- [Find all Elements dialog box](#)

Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

## Reviewing Documents

Oxygen XML Editor includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

## Tracking Document Changes

The **Track Changes** feature is a way to keep track of the changes you make in a document. **Track Changes** highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the [Track Changes feature is activated](#), insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The tracked changes are also displayed in the [Review view](#) and you can also choose to present the changes in [callouts](#) by enabling [Track Changes Deletions](#) and [Track Changes Insertions](#) in the [Callouts preferences page](#).

## Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in [callouts](#) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the [Review preferences page](#).

## Highlighting Content

Oxygen XML Editor includes a highlighting feature that allows you to create digital markers to emphasise important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

## Using the Review View

Oxygen XML Editor includes a **Review view** that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The **Review** view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

## Printing Review Information

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the **Comments option** is enabled in the [Callouts preferences page](#), comment callouts will also be included (same with tracked change callouts if their corresponding options are enabled in the [Callouts preferences page](#)).

## Managing Tracked Changes

Oxygen XML Editor includes a *Track Changes* feature that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view**.

The *Track Changes* feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the **Review view** and **Attributes view**.

To watch our video demonstration about the *Track Changes* support, go to [https://www.oxygenxml.com/demo/Change\\_Tracking.html](https://www.oxygenxml.com/demo/Change_Tracking.html).

## Types of Tracked Changes

The types of tracked changes include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

**Important:** If you copy content in **Author** mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

## Activating the Change Tracking Feature

To activate the *Track Changes* feature for the current document, use any of the following methods:

- Click the  **Track Changes** button on the toolbar.
- Select  **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.

- Select  **Track Changes** from the **Edit > Review** menu.

When **Track Changes** is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the [Review preferences page](#), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Docbook 4 supports  tables:

*Sample XHTML Table with fixed width and proportional column widths*

```
col[span:1, width:2.08*]
col[span:1, width:0.46*]
```

Person Name	Age
Jane	26
Bart	24
Alexander	<u>22</u>
John	<u>25</u>

*They belong are all students of the computer science department*

Inserted by John Doe  
Wed Apr 08 16:10:32 EEST 2009

This is a list of useful  links:

**Figure 166: Change Tracking in Author Mode**

When hovering over a change a tooltip displays information about the author and modification time.

### Change Tracking Contextual Menu Actions

You can right-click any change in **Author** mode to access the following contextual menu actions:

#### **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

#### **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

You can accept or reject multiple changes at once by selecting a block of content that contains the changes and then  **Accept Change(s)** or  **Reject Change(s)** from the contextual menu or toolbar.

### Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

## **Track Changes**

Enables or disables the track changes support for the current document.

## **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

## **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

## **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

## **Track Changes Visualization Modes Drop-Down Menu**

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

-  **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the **Author** mode.
-  **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
-  **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
-  **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to **View All Changes/Comments**.

**Note:** If you use  **View Final** mode and  **View Original** mode, callouts are not displayed for comments or changes. To display callouts, use the  **View All Changes/Comments** mode.

## **Highlight**

Enables or disables the **Highlight tool**. Use the  **Highlight** drop-down menu to select a new color.

## **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

## **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## **Manage Reviews**

Opens the **Review view**.

## Tracked Change Callouts

You can also choose to display insertion and deletion changes in callouts in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by enabling [Track Changes Deletions](#) and [Track Changes Insertions](#) in the [Callouts preferences page](#). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see [Author Callouts](#) on page 359.

## Tracked Changes in the Review View

The **Review** view is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see [Review View](#) on page 363.

## Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validations or transformations. For each change, the author name and the modification time are preserved.

**Example - Insertion Change:** The following processing instruction is an example of how an *insertion* change is stored in a document:

```
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?
oxy_insert_end?>
```

**Example - Deletion Change:** The following processing instruction is an example of how a *deletion* change is stored in a document:

```
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

### Tracked Changes Behavior

The behavior of the **Track Changes** feature depends on the context, the type of change, and whether or not it is activated.

## Inserting Content

If the **Track Changes** feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the **Track Changes** feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an **INSERT**.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an **INSERT** by the current author.

- If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If we insert in regular content, the current inserted content appears marked as an **Insert** change.

## Surrounding Content

If the **Track Changes** feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  - If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

## Deleting Characters

If the **Track Changes** feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in nothing happening.
- Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the **INSERT** change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the **Track Changes** feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in the following:
  - If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
  - If another author created the **Delete** change, nothing happens.
- Deleting content in an existing **Insert** change results in the following:
  - If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
  - If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
- Deleting in regular content results in the content being marked as a **Delete** change by the current author.

## Deleting Selections of Content

If the **Track Changes** feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the **Track Changes** feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
  - If the **Insert** is made by the same author, the change disappears and the content is deleted.

- If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

## Deleting Tags

Assuming you are using any of the *Tag Display Modes* other than **No Tags** and the **Track Changes** feature is disabled, the following behavior is possible:

- If you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the *Tag Display Modes* other than **No Tags** and the **Track Changes** feature is enabled, the following behavior is possible:

- If you delete a start tag of an *inline* element, both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

## Copying Content

If the **Track Changes** feature is disabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the **Track Changes** feature is enabled and you copy content, the following behavior is possible:

- If the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

## Pasting Content

If the **Track Changes** feature is disabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the **Track Changes** feature is enabled and you paste content, the following behavior is possible:

- If the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

## Tracked Changes Limitations

There are some inherent limitations to the change tracking feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the **Track Changes** feature enabled. For example, some of the table-related actions ( **Delete Row(s)**, **Delete Column(s)**, **Join Cells**, **Split Cell**) ignore the **Track Changes** feature when executing the action.

## Tracked Changes XML Markup

Depending on the type of edits, the following track changes markup appears in the document source code when you activate the **Track Changes** feature:

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Insertion	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Split	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type="split"
Surround	<?oxy_insert_start?>	<?oxy_insert_end?>	author, timestamp, type="surround"
Deletion	<?oxy_delete?>	-	author, timestamp, content
Comment	<?oxy_comment_start?>	<?oxy_comment_end?>	author, timestamp, comment, mid
Attribute Change	<?oxy_attributes?>	-	id, type, oldValue, author, timestamp

If a comment intersects another, the `mid` attribute is used to correctly identify start and end processing instruction markers.

### Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and tracked changes is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as callouts (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, enable the **Comments option** in the **Callouts preferences page**. Comments are also displayed in the **Review view**.

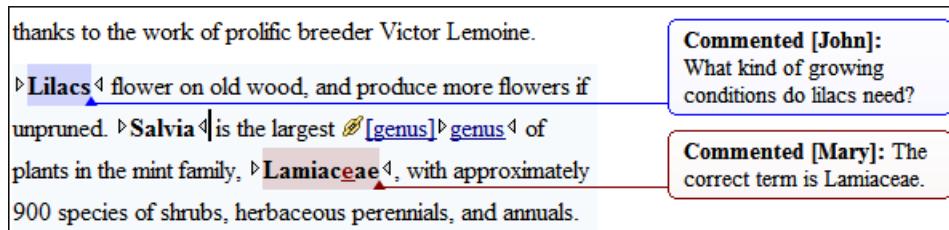

Figure 167: Comments in Author Mode

### Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.

#### Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the **Add Comment** action from the toolbar (or in the **Review** submenu of the contextual menu).

#### Show/Edit Comments

To edit an existing comment that you have added in the main editing area in **Author** mode, select the **Show/Edit Comments** action from the toolbar (or in the **Review** submenu of the contextual menu).

The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

#### Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select **Remove Comment(s)** from the toolbar (or in the **Review** submenu of the contextual menu).

**Tip:** When adding or editing a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

## Managing Comments in Callouts

As long as the [Comments option](#) is enabled in the [Callouts preferences page](#), comments are also displayed in [callouts](#). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

### Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review](#) view.

### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

### Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

### Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

### Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

**Tip:** When adding, editing, or replying to a comment, you can use [Enter](#) to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use [Ctrl + Enter](#) to accept your changes and close the dialog box.

## Managing Comments in the Review View

The [Review](#) view is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the [Review](#) view, the contextual menu includes the following actions.

### Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review](#) view.

### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

### Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

## Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

## Show only reviews by '<author name>'

Filters the comments to only show comments for the particular author.

## Remove all Comments

Removes all comments from the document.

## Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300"
 comment="Do not change this content"?>
 Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200"
 comment="We should not forget about recycling the oil and oil filter!"
 parentID="vws_x4l_1v" mid="4"?>
```

## Managing Highlights

Use the  **Highlight** tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

To watch our video demonstration about using the **Highlight** tool, go to [https://www.oxygenxml.com/demo/Highlight\\_Tool.html](https://www.oxygenxml.com/demo/Highlight_Tool.html).

## Using the Highlight Tool

You can find the  **Highlight** action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:

1. Click the  **Highlight** icon on the toolbar.  
**Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.
2. Click the small arrow next to the  **Highlight** icon and select the color that you want to use for the highlighting.
3. Select the content you want to highlight. To mark multiple parts of a document, press and hold **Ctrl (Meta on Mac OS)** and select the parts you want to highlight.
4. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press **Ctrl + A (Command + A on OS X)** if you want to select all of the text.
2. Click the small arrow next to the  **Highlight** icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.

- To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

**Note:** Oxygen XML Editor preserves the highlighting of a document between working sessions.

## Review View

The **Review** view is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

### Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

### Remove Highlight

Removes the selected highlight.

### Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

### Remove All Highlights

Removes all highlights from the document.

## Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
The highlights are stored<?oxy_custom_end?>
```

### Related information

[Review View](#) on page 363

## Author Callouts

A *callout* is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor uses callouts to present comments and tracked change modifications that you or other members of your team have added to the document.

To watch our video demonstration about the Callouts support, go to <https://www.oxygenxml.com/demo/CalloutsSupport.html>.

### Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the [Review preferences page](#). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Editor automatically assigns a color based upon the [Colors for automatic assignment list](#).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, enable the [Show all connecting lines option](#) in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

## Winter Flowers

Winter is the season of cold weather. The season occurs during December - February in Northern hemisphere. In the Southern hemisphere winter occurs during June - August.

Some of the flowers blooming in winter are:

Acashia, Alstromeria, Amaryllis, Carnation, Chrysanthemums, Cyclamen, Evergreens, Gerbera Daisy, Ginger, Helleborus, Holly berry, Lily, Asiatic Lily, Casa Blanca Lily, Narcissus, Orchid, Pansy, Pepperberry, Phlox, Protea, Queen Ann's Lace, Roses, Star of Bethlehem, Statice.

**Deleted [Mary]:** Delete any extra spacing before and after punctuation marks.

**Deleted [Mary]:** Also use a single space between words.

**Commented [John]:** We should include one more topic with information about Narcissus.

**Commented [Bob]:** It's a good idea to add more plants (consider including also Roses).

Figure 168: Multiple Author Callouts

**Note:** Oxygen XML Editor displays callouts only if View All Changes/Comments or View Only Changes/Comments by is selected in the Track Changes Visualization Modes drop-down menu. Oxygen XML Editor does not display callouts in View Final and View Original modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserve elements that contain long fragments (such as a DITA codeblock element or programlisting in DocBook). To help you view the text under the covered area, Oxygen XML Editor applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

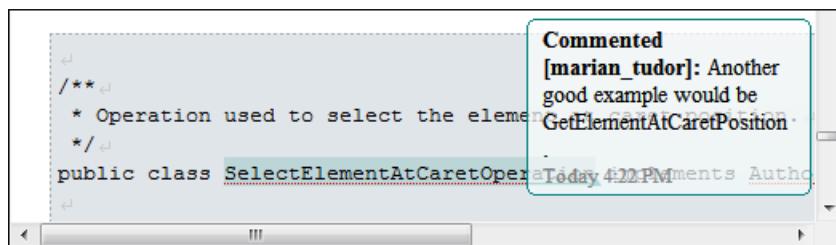

Figure 169: Transparent Callout

### Adjusting Callout Width

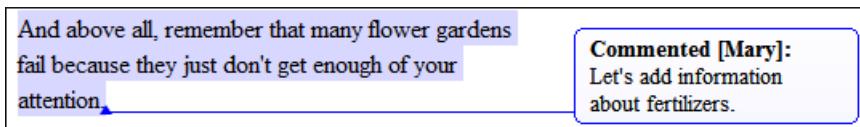

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the **Initial Width option** in the **Callouts** preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the **Text Lines Count Limit option**. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

### Type of Callouts in Oxygen XML Editor

Oxygen XML Editor uses callouts to display comments and tracked changes that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the **Callouts preferences page**. You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the [Comments option](#) is enabled in the [Callouts preferences page](#), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also enable the [Show review time option](#) to include timestamp information in the comment callouts.

**Figure 170: Comment Callouts**

There are several types of comments that can be added in **Author** mode:

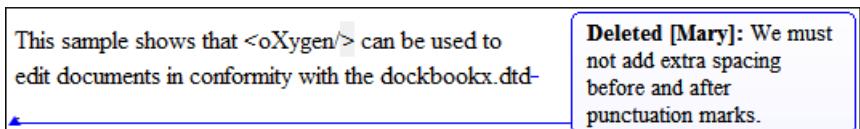

- *Author Review Comments* - Comments that you associate with specific content. To insert this type of comment, select the content and use the **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).
- *Comments Added to Tracked Changes* - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select **Comment Change**.
- *Replies to Comments* - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select **Reply**. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

**Figure 171: Callout for a Comment with Replies**

**Tip:** When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the [Track Changes Deletions option](#) is enabled in the [Callouts preferences page](#), deletions that are made while the *Track Changes* feature is enabled are displayed in callouts. A deletion callout contains the type of callout (**Deleted**) and the name of the author that made the deletion. You can also enable the [Show deleted content in callout option](#) to display the actual deleted content in the callout. Additionally, you can enable the [Show review time option](#) to include timestamp information in the deletion callouts.

**Figure 172: Deletion Callouts**

- **Tracked Change Insertion Callouts** - As long as the [Track Changes Insertions option](#) is enabled in the [Callouts preferences page](#), insertions that are done while the *Track Changes* feature is enabled are displayed in callouts. An insertion callout contains the type of callout (**Inserted**) and the name of the author that inserted the content. You can also enable the [Show inserted content in callout option](#) to display the actual deleted content

in the callout. Additionally, you can enable the [Show review time option](#) to include timestamp information in the deletion callouts.

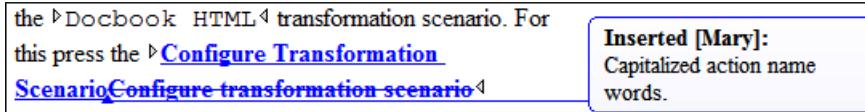

Figure 173: Insertion Callouts

### Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

#### Insertion or Deletion Callout Actions

The following actions are available in the contextual menu of an insertion or deletion callout:

##### Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

##### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

##### ✓ Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

##### ✗ Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

##### 📝 Comment Change

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

##### Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

##### ⚙️ Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

### Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

##### Reply

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

##### Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the

callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

#### Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

#### Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

#### Callouts Options

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

### Printing Callouts

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

### Review View

The **Review** view is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see [Review View](#) on page 363.

#### Related information

[Managing Tracked Changes](#) on page 350

[Managing Comments](#) on page 356

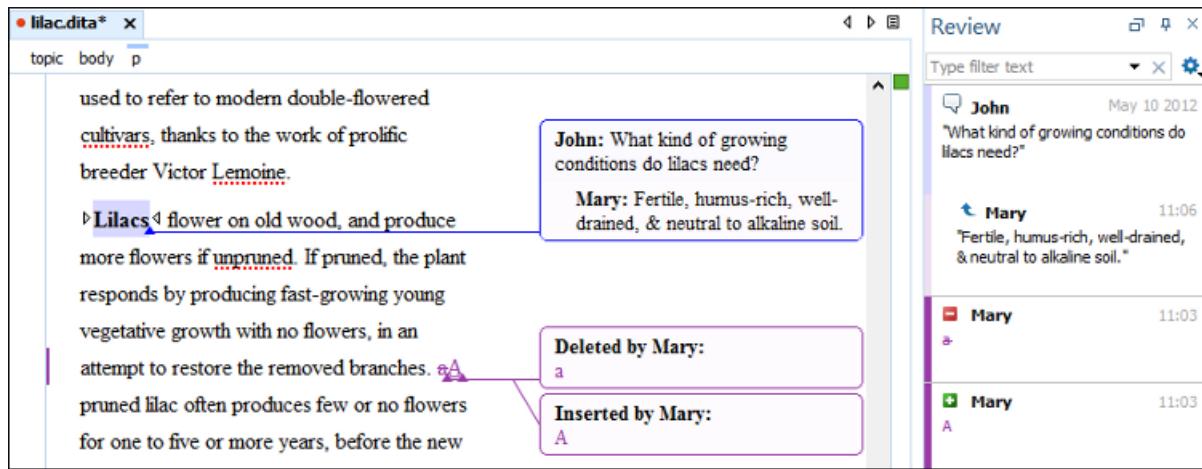

[Review View](#) on page 363

### Review View

The **Review** view is a framework-independent panel, available both for built-in and custom XML document frameworks. It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes using a single view.

The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

**Figure 174: Review View**

To watch our video demonstration about the **Review** view, go to [https://www.oxygenxml.com/demo/Review\\_Panel.html](https://www.oxygenxml.com/demo/Review_Panel.html).

### Activating the Review View

To activate the **Review** view, do one of the following:

- Click the **Manage reviews** button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.
- Open it from the **Window > Show View** menu.

### Review View Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. Use the small arrow symbol from the right side of the search field to display the search history.

The **Settings** menu includes the following options:

- **Show highlights** - Controls whether or not the **Review** view displays the highlighting in your document.
- **Show comments** - Controls whether or not the **Review** view displays the comments in the document you are editing.
- **Show track changes** - Controls whether or not the **Review** view displays the inserted and deleted content in your document.
- **Show review time** - Displays the time when the edits from the **Review** view were made.
- **Configure review options** - Opens the [Review preferences page](#) where you can configure various options for review information.

### Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the **Review** view:

#### Remove

Available for highlights and comments presented in the **Review** view and it removes the particular highlight or comment from your document and moves to the next change.

#### Accept

Available for inserted and deleted content presented in the **Review** view and it accepts the particular change in your document and moves to the next change.

#### Reject

Available for inserted and deleted content presented in the **Review** view and it rejects the particular change in your document and moves to the next change.

## Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the **Review** view:

### Reply

Opens the **Reply** dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

### Mark as Done

This toggles the comment or change as being done in the contextual menu and grays it out in the callout. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

### Show Comment

Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

### Edit Comment

Available for comments you have added and you can use this action to edit a comment.

### Remove Comment

Use this action to remove the selected comment.

### Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

### Remove All Comments

Use this action to remove all the comments that appear in the edited document.

### Change Color

Available for highlights and it opens a palette that allows you to choose a new color for the highlighted content.

### Remove Highlight

Use this action to remove the selected highlight.

### Remove Highlights with the Same Color

Use this action to remove all the highlights with the same color from the entire document.

### Remove All Highlights

Use this action to remove all the highlights in your document.

### Accept Change

Accepts the selected change and moves to the next change.

### Reject change

Rejects the selected change and moves to the next change.

### Comment change

Available for insertions or deletions and you can use this option to add a comment for the particular change.

### Accept all changes

Accepts all the changes made to a document.

### Reject all changes

Rejects all the changes made to a document.

[Managing Highlights](#) on page 358

[Author Callouts](#) on page 359

## Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appear in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for *expert* users and another section for *novice* users, while unmarked sections are included in all renditions.

## Profiling Attributes and Condition Sets

Oxygen XML Editor allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in **Author** mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

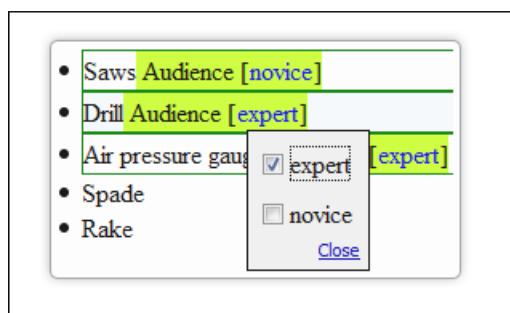

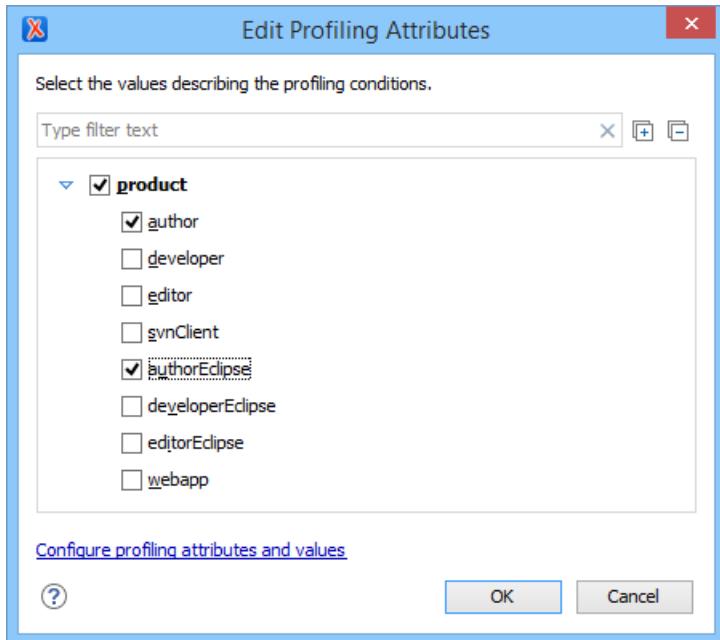

Figure 175: Example: Profiling Content

Oxygen XML Editor includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs. You can also define your own profiling attributes for each document type (framework) and your profiling configuration can be shared amongst content authors through the project file.

## Apply Profiling to DITA Content

To apply a profiling attribute to DITA content, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile specific elements in a topic or map, right-click inside the element and select **Edit Profiling Attributes**. The **Edit Profiling Attributes** dialog box is displayed, allowing you to check each of the profiling tokens that apply for each attribute.

**Figure 176: Edit Profiling Attributes Dialog Box**

The profiling attributes and their potential values that appear in this dialog box depend on what has been configured in Oxygen XML Editor. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **+ Expand All**/**- Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your *root DITA map* references a *DITA subject scheme map* that defines values for the profiling attributes, those values are used. Oxygen XML Editor collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the *DITA Maps Manager* (or set as the *root map*). In the *image above* (taken from the Oxygen XML Editor documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.
- If your project defines *project-level configuration values for the profiling attributes*, those values are used.
- If Oxygen XML Editor defines *global-level configuration values for the profiling attributes*, those values are used.
- Otherwise, a generic default set of profiling attributes and values are available.

### Visualizing Profiled Content

You can visualize the effect of profiling content by using the profiling tools in the **Profiling/Conditional Text** drop-down menu that is located on the **DITA Maps Manager** toolbar. You can select which profiles to show, or apply colors to text that is profiled in various ways, as shown in the following image:

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;
- product [Gasoline]
- Sharpen the blades:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Using an electric grinder or a file, grind the length of the blade until it is sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

Figure 177: Example: Profiled Content

#### Related information

[Customize Profiling Conditions](#) on page 1182

### Managing Profiling Attributes

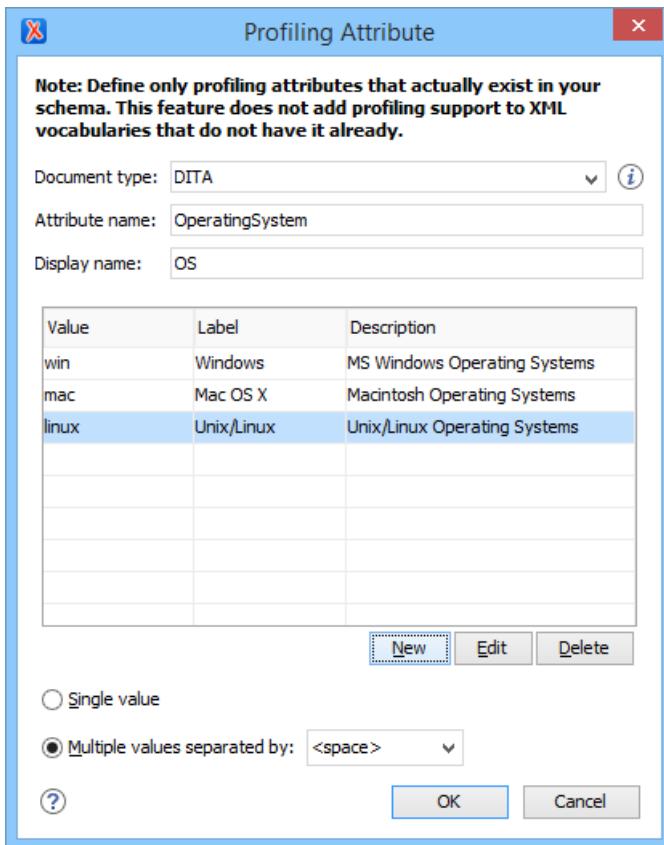

Oxygen XML Editor includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework). You can then apply the profiling attributes to content in **Author** mode to see how the profiling will affect the output.

#### Create Profiling Attributes

To create custom profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.
3. In the **Profiling Attributes** section, press the **New** button.

**Step Result:** The **Profiling Attribute** configuration dialog box is opened.

**Figure 178: Profiling Attribute Dialog Box**

- Configure your profiling attributes as desired. The following options are available in this dialog box:

#### Document type

Select the document type (framework) for which you have defined profiling attributes.

**Tip:** You can use the \* or ? wildcards in this combo box. For example, DITA\* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

#### Attribute name

The name of the new profiling attribute.

#### Display name

This optional field is used for descriptive rendering in profiling dialog boxes.

#### Attribute Values Table

This table displays the values for the profiling attribute and allows you to configure them by using the following buttons at the bottom of the table:

##### New

Opens a dialog box that allows you to insert a new value. The fields that can be configured in this dialog box correspond to the columns in the table and are as follows:

- Value** - The attribute value.
- Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode ([Edit Profiling Attributes dialog box](#), [Condition Set dialog box](#), [Profiling tab in the Edit Properties dialog box](#), [DITA Maps Manager](#)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- Description** - A description for the attribute value that will be displayed in the [Attribute Values Table](#).

##### Edit

Use this button or double-click an attribute value to modify it.

### Delete

Removes the selected attributed value.

### Single value

Select this option if you want the attribute to only accept a single value.

### Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save the profiling attribute.

## Editing Existing Profiling Attributes

To modify an existing profiling attribute or its values, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling / Conditional Text**.
2. In the **Profiling Attributes** section, press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a profiling attribute or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Profiling Attributes** configuration dialog box is opened:

3. Modify your profiling attribute as desired.
4. To add or modify attribute values, use the **New**, **Edit**, or **Delete** buttons under the attribute values table.
5. Click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
6. Click **Apply** to save your modifications.

## Adding or Editing Profiling Attribute Values

There are several ways to add values to existing profiling attributes.

- Use the procedure in the [Editing Existing Profiling Attributes](#) section to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor](#) in **Author** mode, the [Attributes view](#), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the [Profiling / Conditional Text preferences page](#) where you can edit the profiling configuration.

**Note:** If the [Allow contributing extra profiling attribute values](#) option is disabled in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this second method will not be possible.

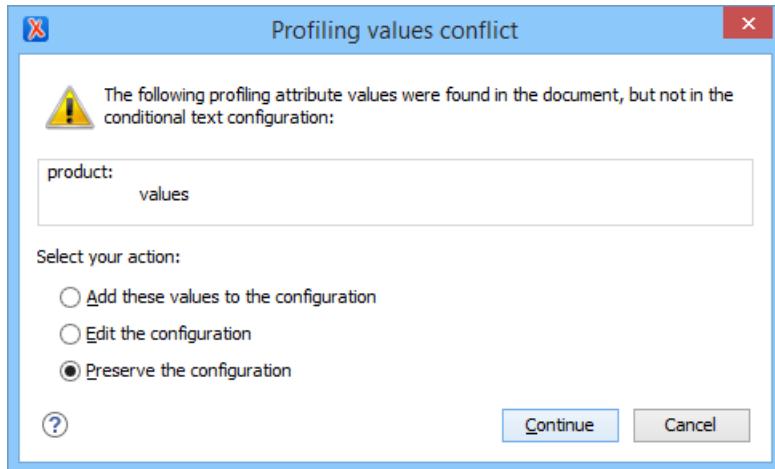

Figure 179: Profiling Values Conflict Dialog Box

### Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see [Sharing a Project - Team Collaboration](#) on page 277.

### Apply Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements in the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

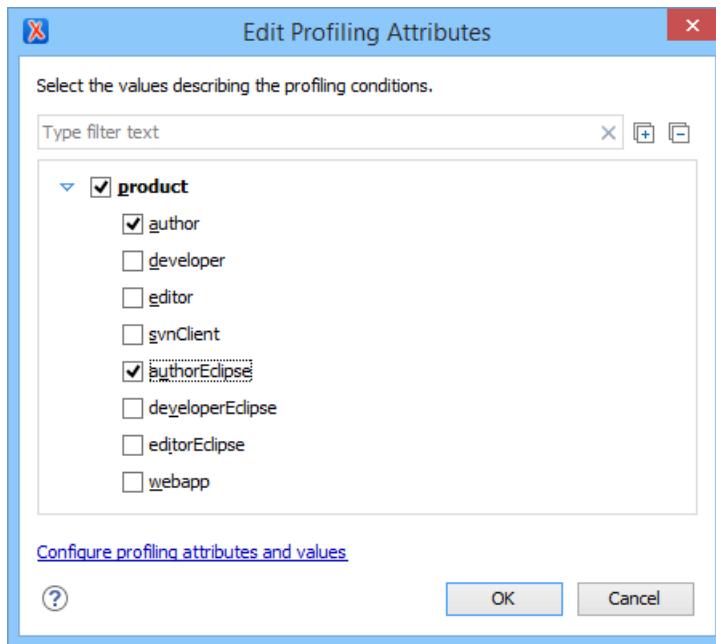

To profile a fragment from your document, select the fragment in the **Author** editing mode and follow these steps:

1. Invoke the **Edit Profiling Attributes** action from the contextual menu in **Author** mode.

**Step Result:** The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (framework). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **+ Expand All**/**- Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have **defined profiling attribute values** for the DITA document type in the **Profiling/Conditional Text preferences page** and you store them at **project-level**, those values are displayed in the dialog box.
- If you have **defined profiling attribute values** for the DITA document type in the **Profiling/Conditional Text preferences page** and you store them at **global-level**, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

**Figure 180: Edit Profiling Attributes Dialog Box**

2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the document fragment.
3. Click **OK** to finish the profiling configuration.

**Result:** The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the **Show Profiling Attributes** option (available in the [Profiling / Conditional Text toolbar menu](#)) is enabled, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 181: Profiling Attribute Value Form Control Pop Up**

#### Related information

[Customize Profiling Conditions](#) on page 1182

#### Managing Profiling Condition Sets

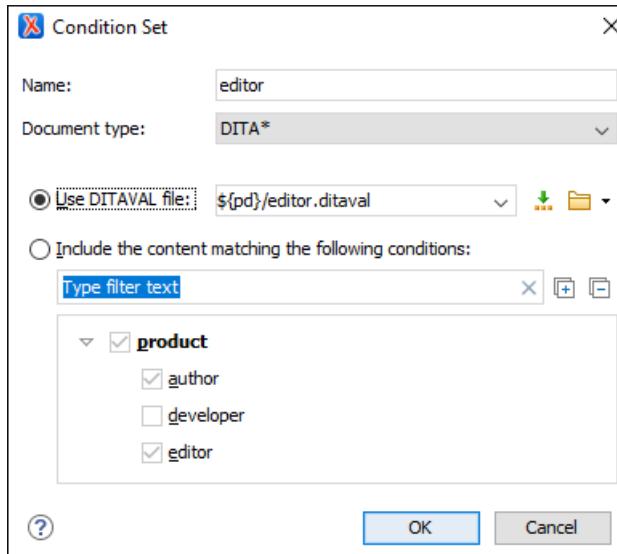

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

## Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling / Conditional Text**.
2. In the [Profiling Condition Sets section](#), press the **New** button.

**Step Result:** The **Condition Set** configuration dialog box is opened.

**Figure 182: Condition Set Dialog Box**

3. Configure your condition set as desired. The following options are available in this dialog box:

### Name

The name of the new condition set.

### Document type

Select the document type (framework) for which you have defined profiling attributes.

### Use DITAVAL file

Select this option if you want the *Profiling Condition Set* to reference a DITAVAL file. You can specify the path by using the text field, its history drop-down, the [Insert Editor Variables](#) button, or the browsing tools in the [Browse](#) drop-down list.

### Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes in this section. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save the condition set. All saved profiling condition sets are available in the [Profiling / Conditional Text toolbar drop-down menu](#).

## Editing Existing Profiling Condition Sets

To modify an existing profiling condition set, follow these steps:

1. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > Profiling / Conditional Text**.
2. In the [Profiling Condition Sets section](#), press the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a condition set or the **Up** and **Down** buttons to change their priority).

**Step Result:** If you use the **Edit** button, the **Condition Set** configuration dialog box is opened:

3. Modify your condition set as desired.

4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save your modifications.

## Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see [Sharing a Project - Team Collaboration](#) on page 277.

### Apply Profiling Condition Sets

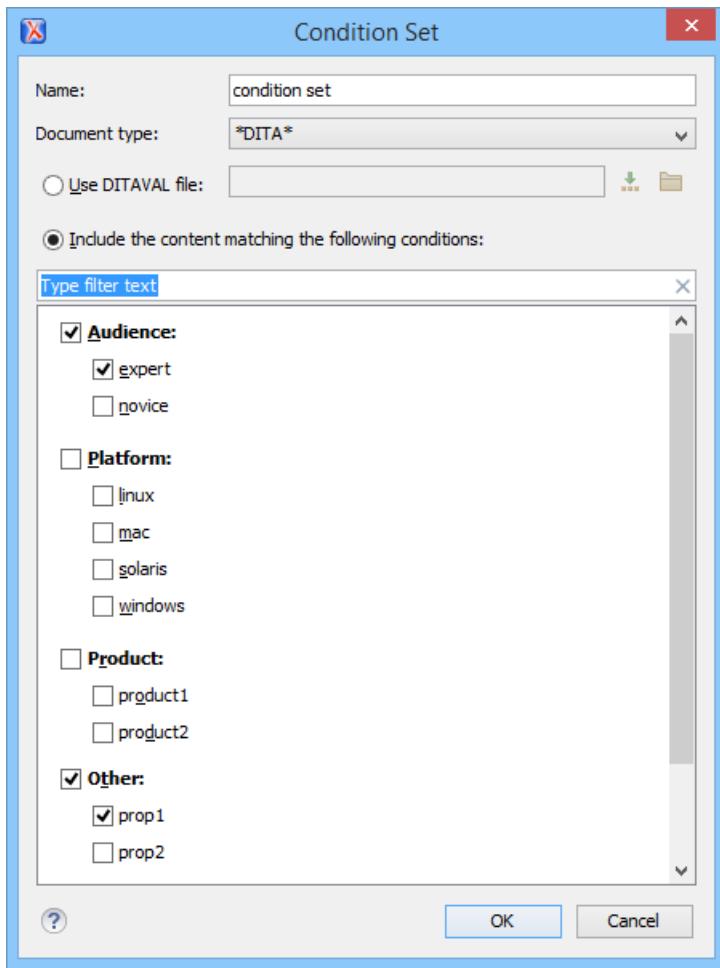

All defined Profiling Condition Sets are available as shortcuts in the [Profiling / Conditional Text toolbar menu](#). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline** view, and **DITA Maps Manager** view (for DITA documents). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

#### EXAMPLE:

Suppose that you have the following document:

<b>Spray painting</b>		
Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.		
<b>Context:</b>		
The garage is a good place to spray paint.		
<b>Step 1</b>		
Move the car out of the garage to avoid getting paint on it. Audience [novice]		
<b>Step 2</b>		
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]		
<b>Step 3</b>		
Place the object to be painted on the covered area. Audience [expert] Other [prop2]		
<b>Step 4</b>		
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]		
<b>Step 5</b>		
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]		

If you apply the following condition set, it means that you want to filter out the content to only include content written for an expert audience and content that has the *Other* attribute value of *prop1*.

This is how the document looks after you apply the condition set:

## Spray painting

**Short Description:** When paint is applied using a spray nozzle, it is referred to as spray painting.

**Context:**

- ▼ The garage is a good place to spray paint.

<b>Step 1</b>	Move the car out of the garage to avoid getting paint on it. Audience [novice]
<b>Step 2</b>	Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]
<b>Step 3</b>	Place the object to be painted on the covered area. Audience [expert] Other [prop2]
<b>Step 4</b>	Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]
<b>Step 5</b>	Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

### Profiling / Conditional Text Toolbar Menu

The  **Profiling / Conditional Text** menu (available on the toolbar) allows you to select some settings for how profiled content is shown in the editor. It also displays a list of the profiling conditions sets that are defined in the current framework, and it includes an option that opens a preferences page where you can define and configure profiling attributes and condition sets.

The  Profiling / Conditional Text menu includes the following:

### Show Profiling Colors and Styles

Enable this option to turn on conditional colors and styling.

### Show Profiling Attributes

Enable this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

### Show Excluded Content

Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the **Outline** and **DITA Maps Manager** views. When this option is enabled, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, disable this option.

**Note:** To remind you that document content is hidden, Oxygen XML Editor displays labels showing the currently applied condition set. These labels are displayed in the **Author** mode editing area, the **Outline** view and **DITA Maps Manager** view. Right-click any of the labels to quickly access the **Show Excluded Content** action.

### List of all profiling condition sets that match the current document type

Click a condition set entry to activate it.

### Profiling Settings

Opens the [profiling options preferences page](#), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the [colors/styles preferences page](#) and the [attributes rendering preferences page](#).

All these settings are associated with the current project, being restored the next time you open it. For a new project all Profiling/Conditional Text menu actions states are reset to their default values.

### Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can customize the **Author** mode editing area to mark profiled content so you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;
- product [Gasoline]
- Sharpen the blades:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Using ▶ an electric grinder or <sup>4</sup> audience [ExpertUser] a file, grind the length of the blade until it is sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

**Figure 183: Example: Profiling Colors and Styles**

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

### Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Enable the **Show Profiling Colors and Styles option** from the Profiling / Conditional Text toolbar drop-down menu.
2. Go to Profiling Settings from the Profiling / Conditional Text toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text options page**. Select the **Colors and Styles options page**.
3. Configure the styling for your profiling attribute values.

**Result:** The styling is now applied in the **Author** editing mode, the **Outline** view, and in the **DITA Maps Manager** view (if you are working with DITA documents). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box and in the inline form control pop up that allows you to quickly set the profiling attributes.

**Figure 184: Profiling Attribute Value Form Control Pop Up**

**Alternate Method for DITA:** If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the [Styling the Rendering of Profiled Content Using a DITAVAL File](#) on page 1642 topic.

### Adding Tables in Author Mode

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in various document types (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used frameworks.

### Editing Tables in Author Mode

Oxygen XML Editor provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

#### Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **colspect** section that appears above the table

in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The predefined DITA, DocBook, and XHTML frameworks support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

Person Name	Age
Jane	26
Bart	24
Alexander	22

They are all students of the computer science department

Figure 185: Resizing a Table Column in Author Mode

### Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to for row selection and to for column selection and that specific row or column is highlighted. You can use the **Ctrl** and **Shift** keys to select multiple rows.

### Selecting Cells

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a [RTL document](#)) to select it. The cursor changes to when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

### Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

### Copy/Cut and Paste

In Oxygen XML Editor, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Editor preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

## **Deleting Content**

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

## **Navigating Cells**

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the **Quick navigation in tables option** is disabled in the **Cursor Navigation** preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

## **Related information**

[Adding Tables in DocBook](#) on page 379

[Adding Tables in DITA Topics](#) on page 387

[Adding Tables in XHTML Documents](#) on page 397

## **Adding Tables in DocBook**

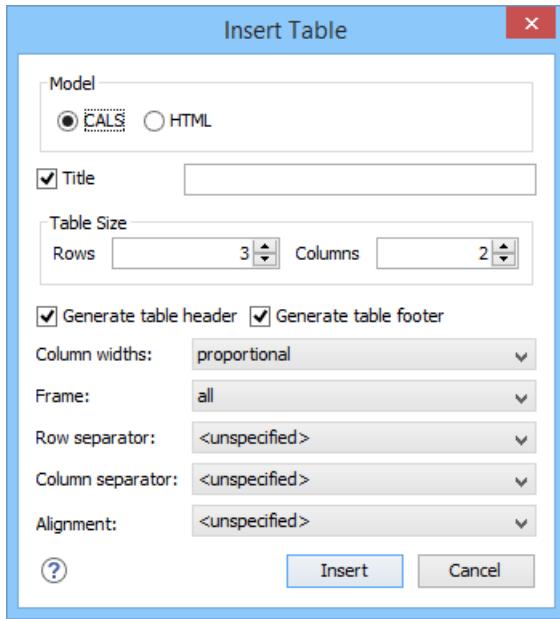

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

## **Inserting a CALS Table Model in DocBook**

To insert a **CALS** table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the **HTML** model.

**Figure 186: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

#### Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Generate table footer

If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*`" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspect**s (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

#### Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author mode**, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspeccs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspeccs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

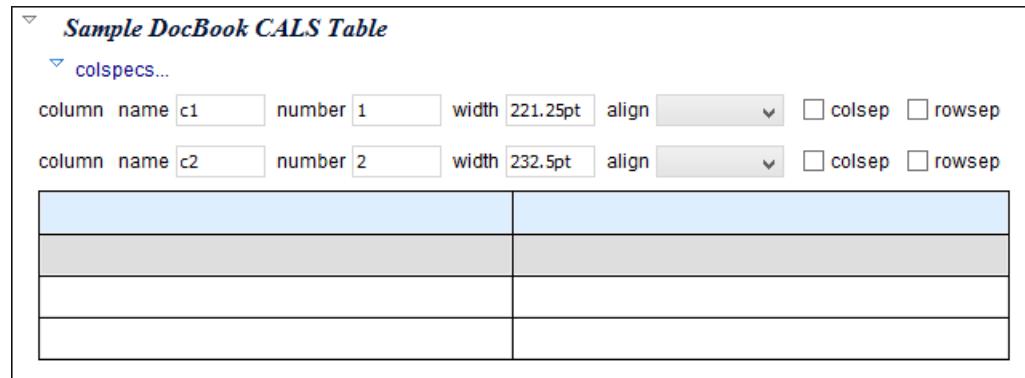

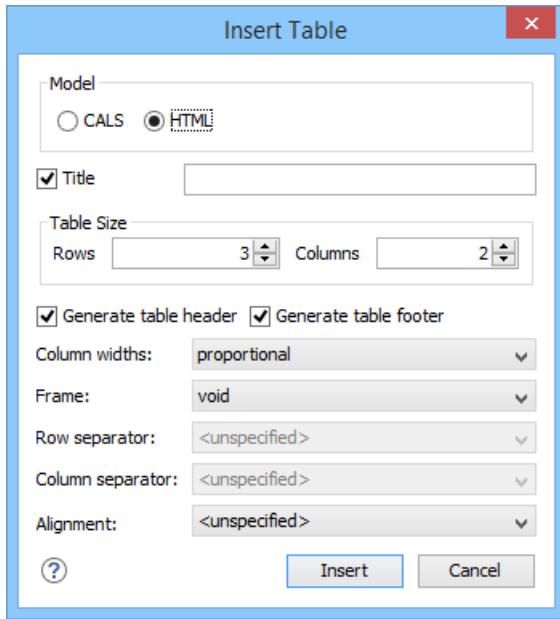

Figure 187: CALS Table in DocBook

### Inserting an HTML Table Model

To insert an *HTML* table model in DocBook documents, select the **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table **Model**.

**Figure 188: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **HTML** table model:

#### Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Generate table footer

If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

#### Column widths

Allows you to specify the type of properties for column widths (`width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `width` attribute (in a `col` element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form `"0*"` (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

#### Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The **justify** value cannot be rendered in **Author mode**, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode**, it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**).

You can also use the  **Table Properties** (**Ctrl + T (Command + T on OS X)**) action from the toolbar or contextual menu to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

### DocBook Table Layouts

The DocBook framework supports the following two table model layouts:

- [CALS table model](#)
- [HTML table model](#)

### CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a CALS table includes a **cols** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the **Author mode**, the `cols` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Sample CALS Table with no specified width and proportional column widths

colspe...

column name c1	number 1	width 0.32*	align	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c2	number 2	width 1.49*	align	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c3	number 3	width 1.15*	align	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c4	number 4	width 0.4*	align	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c5	number 5	width 1.67*	align	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep

Horizontal Span

f1	f2	f3	f4	f5	
b1	b2	b3	b4	Vertical Span	
c1					
d1	Spans Both directions				
			d4	d5	

Figure 189: CALS Table in DocBook

### HTML Table Model Layout

Choosing an *HTML* table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) *HTML* table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (*width* attribute) or the text alignment (*align* attribute). Although these properties appear as part of the **Author mode**, they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Sample HTML Table

column title	span	width 50%	align
column title	span	width 50%	align
<b>Column 1</b>		<b>Column 2</b>	
Data A		Data B	
Data C		Data C	

Figure 190: HTML Table in DocBook

### Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the CALS model. If you want to overwrite this behavior and instruct Oxygen XML Editor to convert them to *HTML* tables, set the *docbook.html.table* parameter to 1. You can find this parameter in the following stylesheet:

- *[OXYGEN\_INSTALL\_DIR]/frameworks/docbook/resources/xhtml12db5Driver.xls* for DocBook 5
- *[OXYGEN\_INSTALL\_DIR]/frameworks/docbook/resources/xhtml12db4Driver.xls* for DocBook 4

### Table Validation in DocBook

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table *cols* attribute.
- A row has more cells than the number of columns detected from the table *cols* attribute.
- A cell has a vertical span greater than the available rows count.
- The number of *colspecs* is different than the number of columns detected from the table *cols* attribute.

- The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- The value of the cols, rowsep, or colsep attributes are not numeric.
- The namestart, nameend, or colname attributes point to an incorrect column name.

## HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the colspan, rowspan, or span attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

### Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**).

You can use the  **Table Properties (Ctrl + T (Command + T on OS X))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

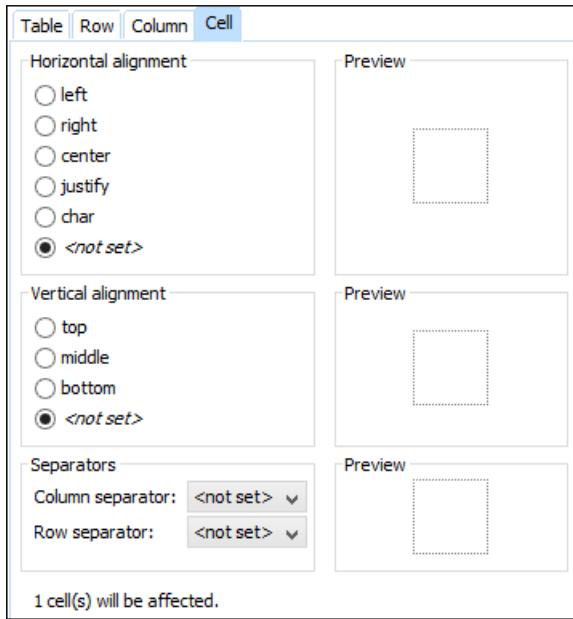

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 191: Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)**

The options in the four tabs include the following:

#### **Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

#### **Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

#### **Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

#### **Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

#### **Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

#### **Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).

## Edit Table Properties for an *HTML* Table Model

For an *HTML* table model, the **Table properties** dialog box includes four tabs of options (**Table**, **Row**, **Column**, and **Cell**) and the options include a **Preview** pane that shows a representation of the modification.

The options in the four tabs include the following:

### Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

### Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `thead`, `tbody`, or `tfoot` attribute).

### Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

### Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`vAlign` attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the `bottom` value. However, if the fonts are different sizes, the `baseline` value often makes the table look better.

## Related information

[Editing Tables in Author Mode](#) on page 377

## Adding Tables in DITA Topics

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

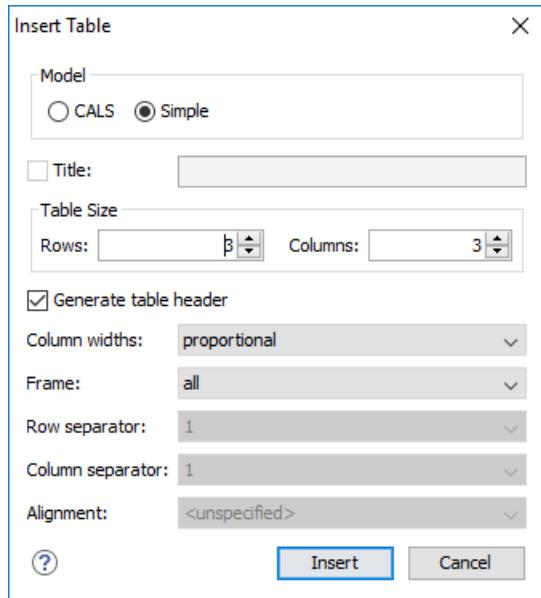

- [DITA Simple table model](#) - This is the most commonly used model for basic tables.
- [CALS table model \(OASIS Exchange Table Model\)](#) - This is used for more advanced functionality.
- [DITA Choice table model](#) - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- [DITA Properties table model](#) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

## Inserting a Simple Table Model

To insert a *Simple* DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the **Model**.

**Figure 192: Insert Table Dialog Box - Simple Model**

The dialog box allows you to configure the following options when you select the **Simple** table model:

#### Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

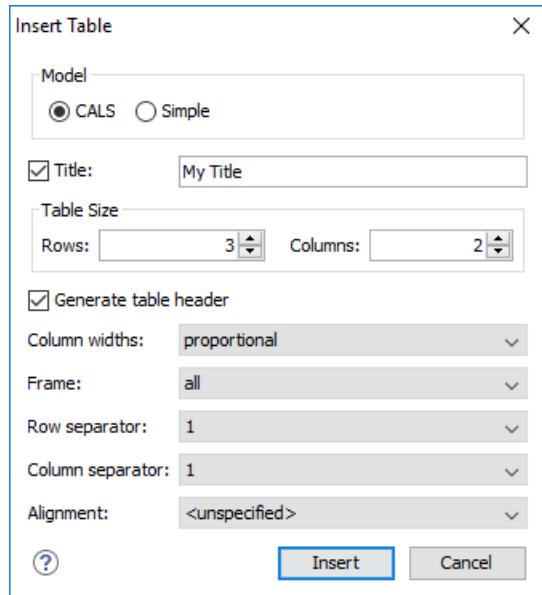

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

### Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

**Figure 193: Insert Table Dialog Box - CALS Model**

The dialog box allows you to configure the following options when you select the **CALS** table model:

#### Title

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*`" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspect** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

## Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

## Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

## Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

## Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author mode**, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspeccs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the `colspeccs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 194: CALS Table in DITA

### Inserting a Choice Table Model

To insert a *Choice* table within a *step* element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the **Content Completion Assistant**. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

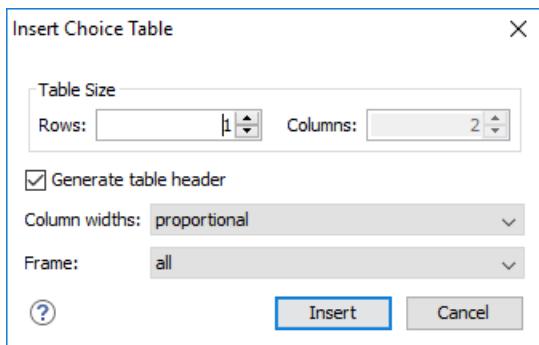

Figure 195: Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in

**Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

### Frame

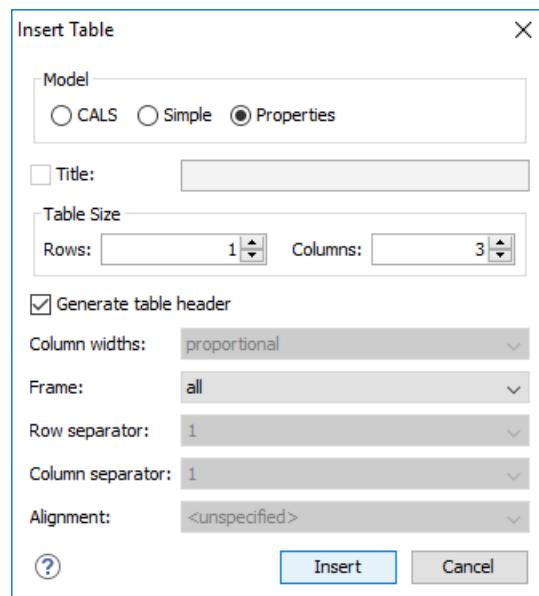

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

### Inserting a Properties Table Model

To insert a *Properties* table within a `refbody` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the **Content Completion Assistant**. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

**Figure 196: Insert Table Dialog Box - Properties Model**

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). See the [DITA documentation](#) for a full explanation of these attributes.

You can also use the  [\*\*Table Properties \(Ctrl + T \(Command + T on OS X\)\)\*\*](#) action from the toolbar or contextual menu (or **DITA** menu) to *modify many of the properties of the table*.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

### Related information

[Editing Tables in Author Mode](#) on page 377

### DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- [CALS table model](#)
- [Simple table model](#)
- [Choice table model](#)
- [Properties table model](#)

### CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a CALS table includes a `colspeсs` section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the [Author mode](#), the `colspeсs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Sample CALS Table with no specified width and proportional column widths

colspe...

column name c1	number 1	width 0.32*	align ▾	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c2	number 2	width 1.49*	align ▾	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c3	number 3	width 1.15*	align ▾	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c4	number 4	width 0.4*	align ▾	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name c5	number 5	width 1.67*	align ▾	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
Horizontal Span	a3	a4	a5		
f1 f2	f3	f4	f5		
b1	b2	b3	b4	▷ Vertical <sup>4</sup> Span	
c1			c4		
d1	Spans ▷ Both <sup>4</sup> directions			d4	d5

Figure 197: CALS Table in DITA

### Simple Table Model Layout

When choosing a *Simple* table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 198: DITA Simple Table

### Choice Table Model Layout

A *Choice* table model is used within a *step* element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The *choicetable* element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting *choicetable* from the **Content Completion Assistant** (within a *step* element) or by using the  **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

Figure 199: DITA Choice Table

### Properties Table Model Layout

A *Properties* table model is used within a *refbody* element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting *properties(wizard)* from the **Content Completion Assistant** (within a *refbody* element) or by using the  **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Property Type	Property Value	Property Description
A	B	C

**Figure 200: DITA Properties Table**

### Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map with the  **Validate and Check for Completeness** action, if the *Report table layout problems option is enabled in the DITA Map Completeness Check dialog box*, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

#### CALS Tables

- A row has fewer cells than the number of columns detected from the table cols attribute.
- A row has more cells than the number of columns detected from the table cols attribute.
- A cell has a vertical span greater than the available rows count.
- The number of colspecs is different than the number of columns detected from the table cols attribute.
- The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- The value of the cols, rowsep, or colsep attributes are not numeric.
- The namest, nameend, or colname attributes point to an incorrect column name.

#### Simple or Choice Tables

- A row has fewer cells than the number of table columns.

### Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties (Ctrl + T (Command + T on OS X))** action from the toolbar or the **Table** submenu of the contextual menu (or DITA menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

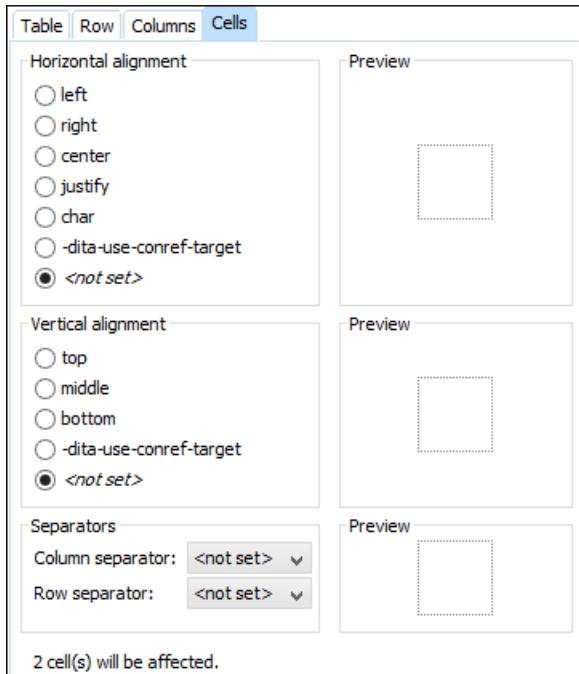

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

### Edit Table Properties for a CALS Table Model

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 201: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)**

The options in the four tabs include the following:

#### **Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

#### **Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

#### **Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

#### **Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

## Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

## Edit Table Properties for a *Simple, Choice, or Properties* Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

### Table tab

#### Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

### Row tab (not available for *Properties* tables)

#### Row type

Allows you change the row to a body or header type of row.

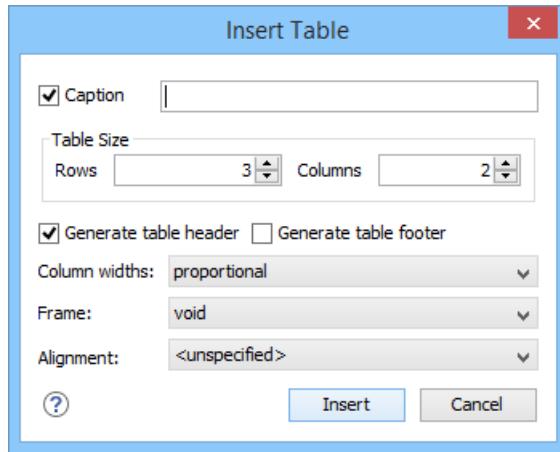

### Related information

[Adding Tables in DITA Topics](#) on page 387

[Editing Tables in Author Mode](#) on page 377

### Adding Tables in XHTML Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

**Figure 202: Insert Table Dialog Box in XHTML**

The dialog box allows you to configure the following options:

#### Caption

If this checkbox is enabled, you can specify a title (caption) for your table in the adjacent text box.

#### Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

#### Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

#### Generate table footer

If enabled, an extra row will be inserted at the bottom of the table to be used as the table footer.

#### Column widths

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, width="1\* 2\* 3\*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1\*.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0\*" (zero asterisk), which means that the width of the each column in the group should be the minimum width necessary to hold the contents.

#### Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

#### Alignment

Specifies the alignment of the text within the table (align attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode**, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

### Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

#### XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a **colspecs** section that allows you to easily configure some properties. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although they appear as part of the **Author mode**, the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

The screenshot shows a table with three columns and four rows. The first row has three cells labeled 'x', 'y', and 'Spans ▷ Horizontally'. The second row has two cells labeled 'Spans ▷ Vertically' and 'b'. The third row has three cells labeled 'd', 'e', and 'f'. The fourth row has three cells labeled 'g', 'h', and 'i'. A fifth row is partially visible with cells labeled 'k' and 'l'. The table has a light blue header row. Cell 'b' spans both columns of the second row. Cell 'f' spans both columns of the third row. Cell 'i' spans both columns of the fourth row. Cell 'l' spans both columns of the fifth row.

Figure 203: Table Layout in XHTML Documents

### Adding Tables in TEI Documents

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

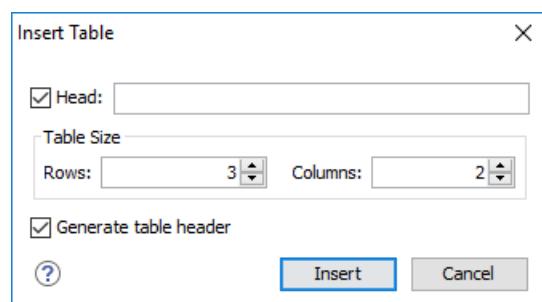

Figure 204: Insert Table Dialog Box in TEI

The dialog box allows you to configure the following options:

## Head

If this checkbox is enabled, you can specify a title for your table in the adjacent text box.

## Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

## Generate table header

If enabled, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

## Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode**.

## Sorting Content in Tables and List Items

Oxygen XML Editor offers support for sorting the content of tables and list items of ordered and unordered lists.

What do you want to do?

- *Sort an entire table.*
- *Sort a selection of rows in a table.*
- *Sort a table that contains cells merged over multiple rows.*
- *Sort list items.*

## Sorting a Table

To sort rows in a table, select the entire table (or specific rows) and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

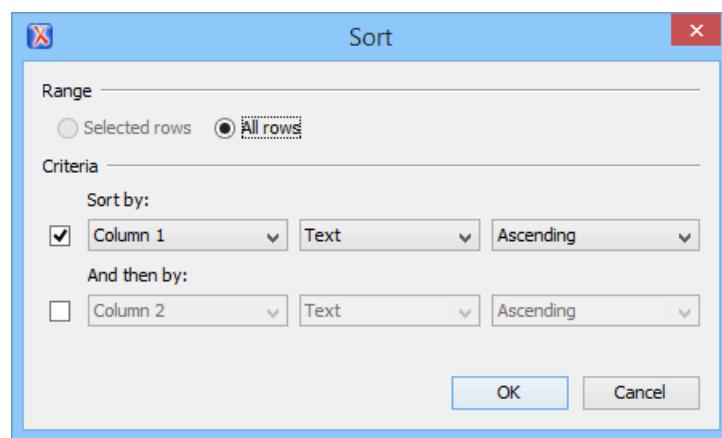

Figure 205: Sort Dialog Box

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:** When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:

- **Text** - Alphanumeric characters.
- **Numeric** - Regular integer or floating point numbers are accepted.
- **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

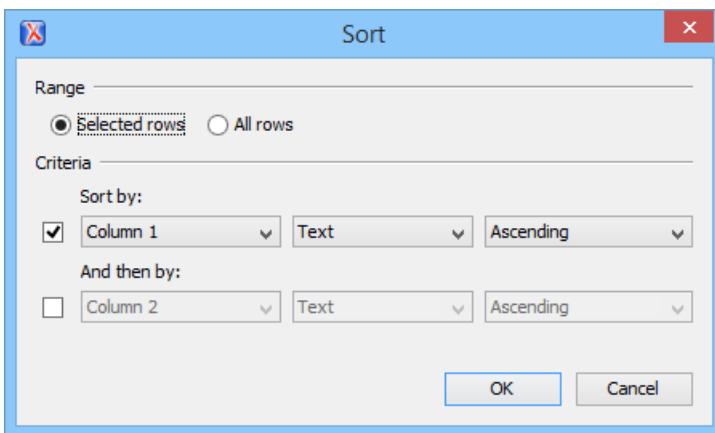

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

### Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.

**Figure 206: Sort Selected Rows**

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

## Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, enable the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

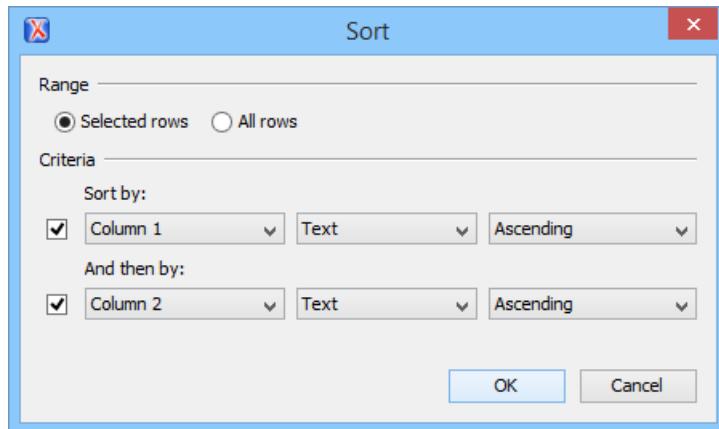

Figure 207: Sorting Based on Multiple Criteria

## Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain `rowspans`.

**Note:** For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

## Sorting List Items

A sorting operation can be performed on various types of lists and list items. Oxygen XML Editor provides support for sorting the following types of lists:

- Ordered list (ol)
- Unordered list (ul)
- Parameter list (paraml)
- Simple list (s1)
- Required conditions (reqconds)
- Supplies list (supplyli)
- Spare parts list (sparesli)
- Safety conditions (safety)
- Definitions list (d1)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

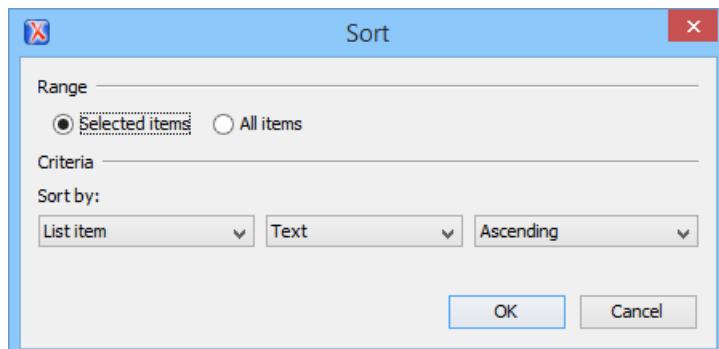

Figure 208: Sorting List Items

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.

## Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the  **Insert Image** action from the toolbar and choose the image file you want to insert. Oxygen XML Editor tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the `file:/C:/project/xml/dir/img1.jpg` image into the `file:/C:/project/xml/doc1.xml` document, Oxygen XML Editor inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.  
**Note:** The  **Insert Image** action is available for the following document types: DocBook 4, DocBook 5, DITA, TEI P4, TEI P5, XHTML.
- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `href` attribute in an `image` element:

```
<image href="../images/image_file.png"/>
```

**Note:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor will insert it as a reference to the image file the same as the drag/drop method.
- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

## Related information

[Image Map Editor](#) on page 407

[Image Rendering in Author Mode](#) on page 403

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics](#) on page 1575

## Image Rendering in Author Mode

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

**Table 8: Supported Image Formats**

Image Type	Support	Additional Information
GIF	built-in	Animations not yet supported
JPG, JPEG	built-in	<i>JPEG images with CMYK color profiles</i> are properly rendered only if color profile is inside the image.
PNG	built-in	
SVG, SVGZ, WMF	built-in	Rendered using the open-source Apache Batik library that supports SVG 1.1.
BMP	built-in	
TIFF	built-in	Rendered using a part of the Java JAI Image library.
EPS	built-in	Renders the preview TIFF image inside the EPS.
AI	built-in	Renders the preview image inside the Adobe Illustrator file.
JPEG 2000, WBMP	plugin	Renders by <i>installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in</i> .
CGM	plugin	Renders by <i>installing an additional library</i> .
PDF	plugin	Renders by <i>installing the Apache PDF Box library</i> .

When an image cannot be rendered, Oxygen XML Editor **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Enable the *Show very large images* option.
- The image format is not supported by default. It is recommended to *install the Java Advanced Imaging(JAI) Image I/O Tools plug-in*.

## Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.
- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the *scale* attribute.

**Note:** As a Java application, Oxygen XML Editor uses the Java Advanced Imaging API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the *[OXYGEN\_INSTALL\_DIR]/lib* directory.

*Customize Oxygen XML Editor to Render CGM Images (Experimental Support)*

Oxygen XML Editor provides experimental support for CGM 1.0 images.

**Attention:** Image hotspots are not supported.

Since this is an experimental support, some graphical elements might be missing from the rendered image.

The CGM rendering support is based on a third party library. In its free of charge variant it renders the images watermarked with the string Demo, painted across the panel. You can find more information about ordering the fully functioning version here: <http://www.bdaum.de/cgmpanel.htm>.

Follow this procedure to enable the rendering of CGM images in **Author** mode:

1. Download the CGMPANEL.ZIP from <http://www.bdaum.de/CGMPANEL.ZIP>.
2. Unpack the ZIP archive and copy the cgmpanel.jar into the *[OXYGEN\_INSTALL\_DIR]\lib* directory.

**3.** Restart the application.

*Customize Oxygen XML Editor to Render PDF Images (Experimental Support)*

Oxygen XML Editor provides experimental support for PDF images using the Apache PDFBox library.

To enable the rendering of PDF images in **Author** mode, follow this procedure:

1. Go to <http://pdfbox.apache.org/downloads.html> and download the pre-built PDFBox standalone binary JAR files: **pdfbox-2.0.3.jar**, **fontbox-2.0.3.jar**, and **xmpbox-2.0.3.jar**. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

**Note:** It is not recommended to use **pdfbox-app-2.0.3.jar** file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Editor.

2. Create a subfolder called **pdfImageJars** in the **[OXYGEN\_INSTALL\_DIR]\lib** directory.
3. Copy the downloaded JAR libraries to that newly created subfolder.
4. Restart the application.

*Customize Oxygen XML Editor to Render PSD Images*

Oxygen XML Editor provides support for rendering PSD (Adobe Photoshop) images.

To enable the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following JAR files:

- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/common/common-lang/3.1.0/common-lang-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/common/common-io/3.1.0/common-io-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/common/common-image/3.1.0/common-image-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/imageio/imageio-core/3.1.0/imageio-core-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar>
- <http://search.maven.org/remotecontent?filepath=com/twelve-monkeys/imageio/imageio-psd/3.1.0/imageio-psd-3.1.0.jar>

2. Copy the downloaded JAR libraries to the **[OXYGEN\_INSTALL\_DIR]\lib** directory.

3. Restart the application.

*Customize Oxygen XML Editor to Render EPS and AI Images*

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor cannot render the image.
- The EPS image includes a TIFF preview picture.

**Note:** Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Editor renders the image correctly.

*Installing Java Advanced Imaging (JAI) Image I/O Tools Plugin*

Certain special image types can be rendered in Oxygen XML Editor by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

### How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Editor and open the **Help > About** dialog box. Go to the **System properties** tab and look for the **java.runtime.name** and **java.home** properties. Keep their values for later use.

- Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.
- Note:** The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.
- Run the installer. When the installation wizard displays the **Choose Destination Location** page, fill-in the **Destination Folder** field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

## OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

- Download a Linux (tar.gz) distribution of the JAI Image I/O Tools plugin. A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.
- In the `[OXYGEN_INSTALL_DIR]/lib` directory, create a directory named `endorsed` (`[OXYGEN_INSTALL_DIR]/lib/endorsed`).
- Unpack the tar.gz. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its `lib` directory and paste them in the `[OXYGEN_INSTALL_DIR]/lib/endorsed` directory.
- Restart the application and the JAI Image I/O support will be up and running.

## Using Retina/HiDPI Images in Author Mode

Oxygen XML Editor provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myImage@2x.png`).

You can reference an image to style an element in a CSS by using the `url` function in the `content` property, as in the following example:

```
listItem:before{
 content: url('../img/myImage.png');
```

This would place the image that is loaded from the `myImage.png` file just before the `listItem` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Editor also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

## Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor:

Color Theme	Referred Image File	Double Density Image File	Triple Density Image File
normal	../img/myImage.png	../img/myImage@2x.png	../img/myImage@3x.png
dark	../img/myImage_dark.png	../img/myImage_dark@2x.png	../img/myImage_dark@3x.png

## Related information

[Adding Retina/HiDPI Icons in a Framework](#) on page 1158

## Image Map Editor

Oxygen XML Editor includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an *image map* is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

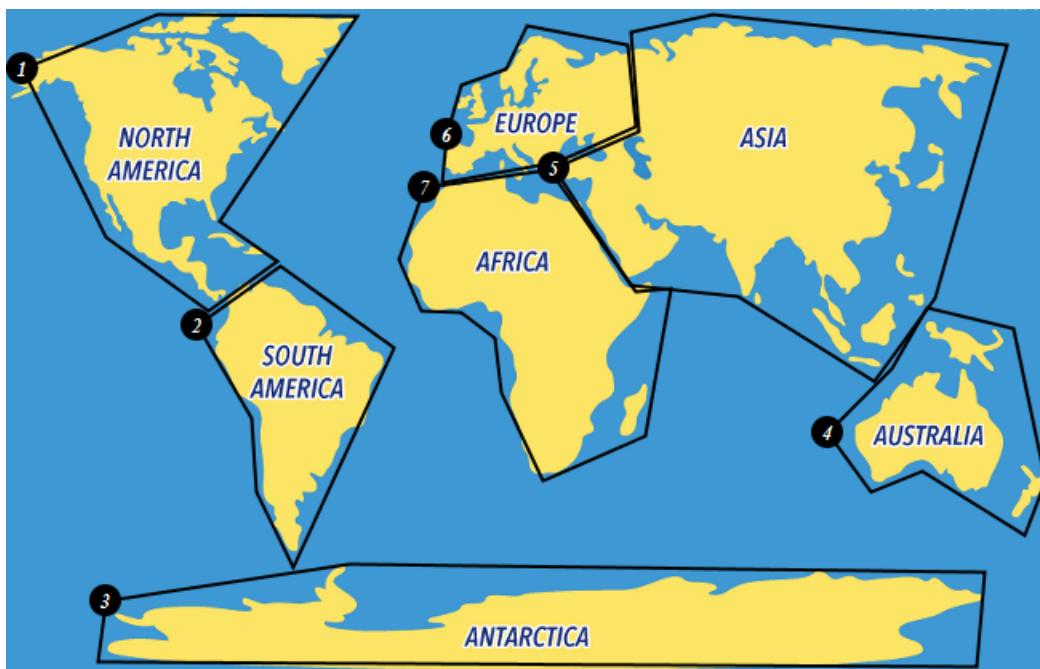

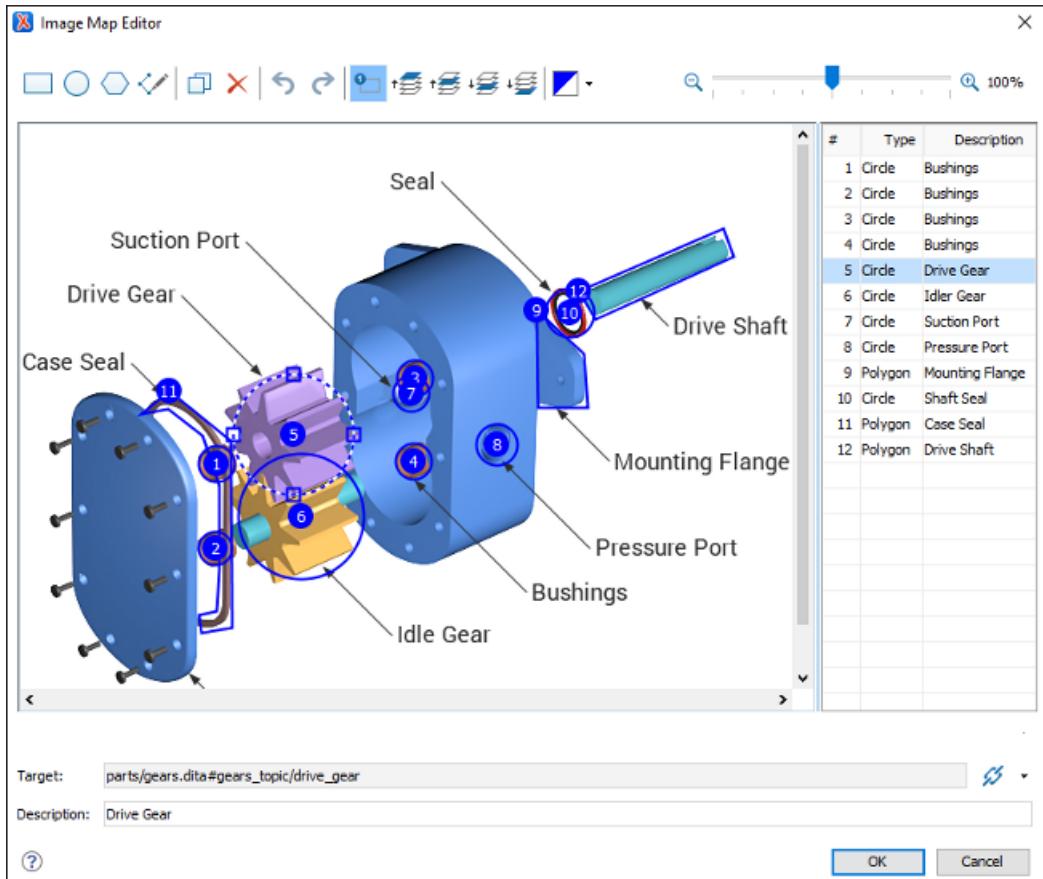

Figure 209: Image Map Rendered in Author Mode

## Image Maps in DITA

Oxygen XML Editor includes support for *image maps* in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 210: Image Map Editor in DITA**

### Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

##### **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

##### **New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

##### **New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

##### **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

##### **Duplicate**

Use this button to create a duplicate of the currently selected shape.

### Delete

Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

### Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

### Send Shape Backward

Use this button to send the currently selected shape back one layer.

### Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

### Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

#### Add Point

Adds a point to *Polygon* or *Free Form* shapes.

#### Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

#### Duplicate

Create a duplicate of the currently selected shape.

#### Delete

Delete the currently selected shape.

#### New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

### New Polygon

Creates a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### Undo

Use this action to undo the last action.

### Redo

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of *Inserting links in DITA* by using the identical **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see *Inserting a Link in Oxygen XML Editor* on page 1610.

### Description

You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details section** in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

## How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**, **New Circle**, or **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, use one of the *linking options* in the **Link** drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

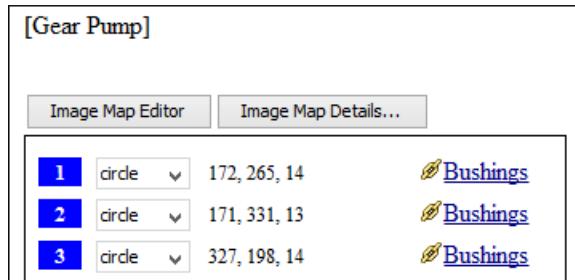

Figure 211: Image Map Details

### How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

[Adding Images in DITA Topics](#) on page 1574

## Image Maps in DocBook

Oxygen XML Editor includes support for *image maps* in DocBook documents through the use of the `areaspec` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

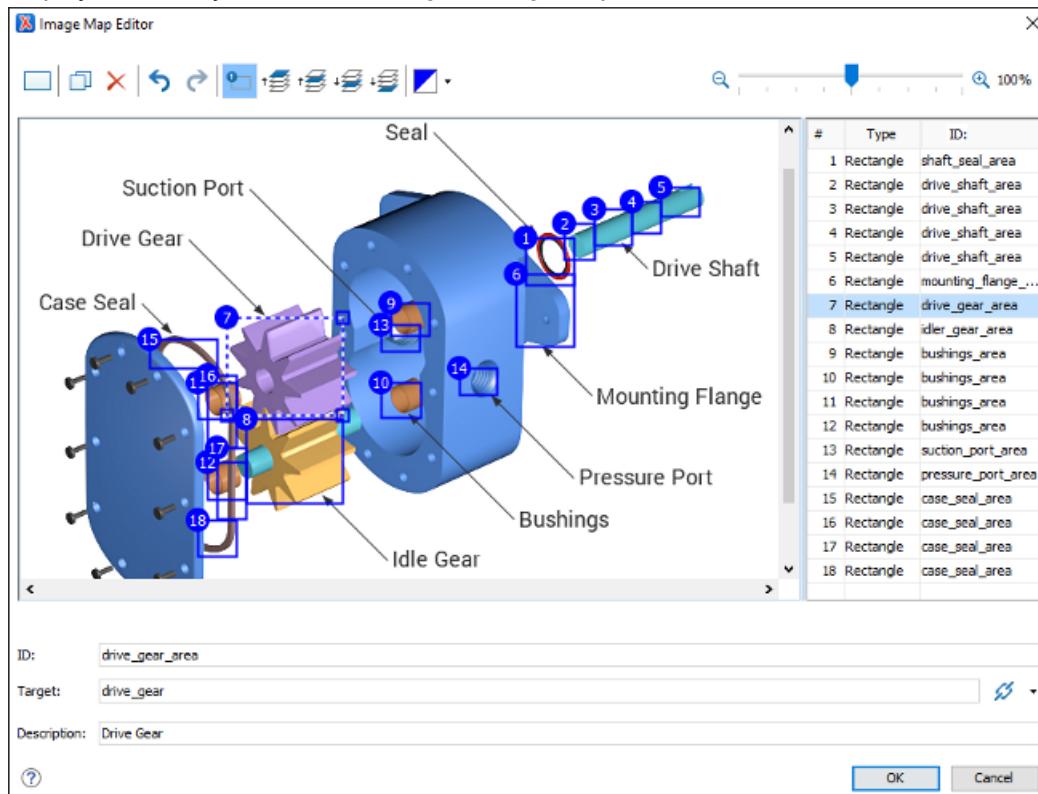

Figure 212: Image Map Editor in DocBook

## Image Map Editor Interface in DocBook

The interface of the **Image Map Editor** consists of the following sections and actions:

### Toolbar

#### New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

#### Duplicate

Use this button to create a duplicate of the currently selected shape.

#### Delete

Use this button to delete the currently selected shape.

#### Undo

Use this button to undo the last action.

#### Redo

Use this button to redo the last action that was undone.

#### Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

### **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

### **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

### **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

### **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

### **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

### **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

## **Image Pane**

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

### **Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

#### **Duplicate**

Create a duplicate of the currently selected shape.

#### **Delete**

Delete the currently selected shape.

#### **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

#### **Undo**

Use this action to undo the last action.

#### **Redo**

Use this action to redo the last action that was undone.

## **Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## **Properties**

### **ID**

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular area element.

## Target

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the  Link drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference** or **Web Link**. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an xlink:href attribute.

## Description

You can enter an optional description for the selected area that will be displayed in the **Image Map Details section** in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

## How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the  **New Rectangle** button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, enter an **ID** and use one of the *linking options* in the  Link drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select  **New Rectangle** button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

## How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:** If you want to link a set of related area elements, you can use areaset elements. To add areaset elements, and area elements to the areaset, switch to **Text** mode and insert them manually.

## Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers**

button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (↑, ↓, ←, →).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

## Image Maps in TEI

Oxygen XML Editor includes support for *image maps* in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using zone elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

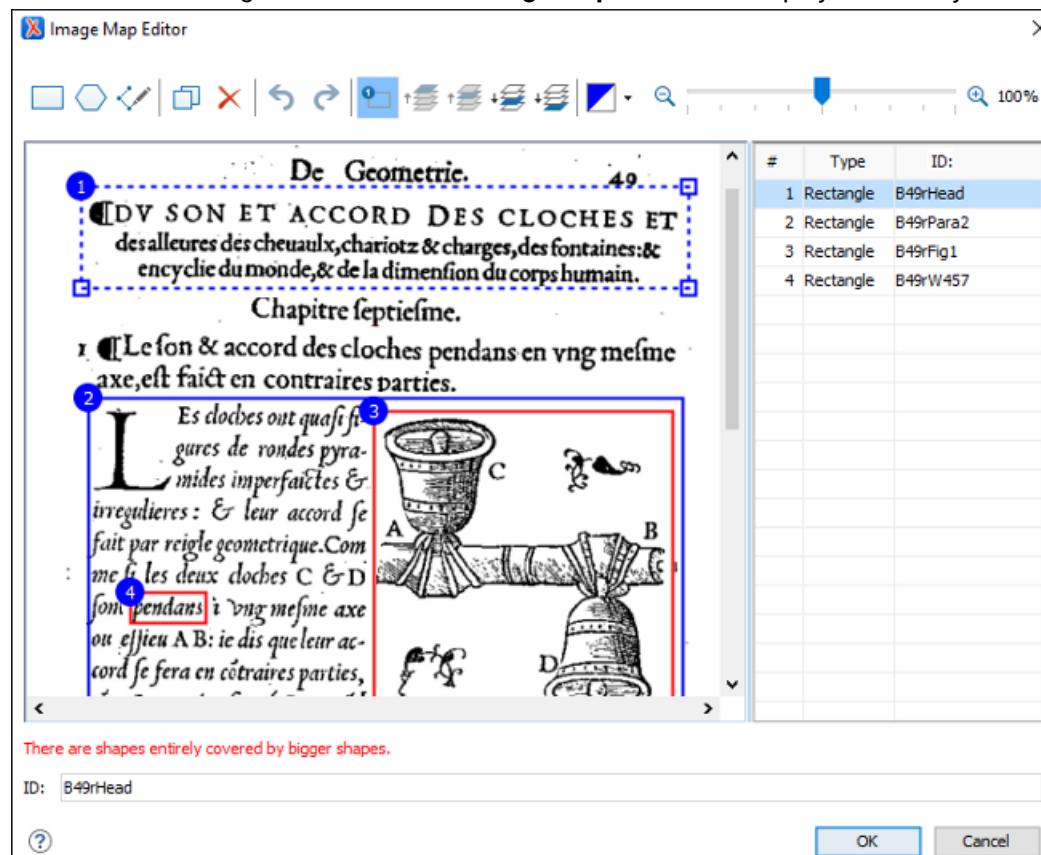

Figure 213: Image Map Editor in TEI

## Image Map Editor Interface in TEI

The interface of the **Image Map Editor** consists of the following sections and actions:

### Toolbar

#### New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

## **New Polygon**

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

## **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

## **Duplicate**

Use this button to create a duplicate of the currently selected shape.

## **Delete**

Use this button to delete the currently selected shape.

## **Undo**

Use this button to undo the last action.

## **Redo**

Use this button to redo the last action that was undone.

## **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

## **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

## **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

## **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

## **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

## **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

## **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

## **Image Pane**

This main image pane is where you work with shapes to add areas (zones) within an image. Use the mouse to move shapes around in the image to the desired area and drag the points on a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted line.

## **Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

### **Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

### Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

### Duplicate

Create a duplicate of the currently selected shape.

### Delete

Delete the currently selected shape.

### New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

### New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### Undo

Use this action to undo the last action.

### Redo

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### ID

The identifier for the selected area. This will become the value of the `xml:id` attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

## How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a `facsimile` element to support the **Image Map Editor** feature.
2. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons ( **New Rectangle** or  **New Polygon**).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
5. With the shape selected, enter an **ID**.
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.

- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

### How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Restriction:** Currently, if zone elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the zone elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** ().

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

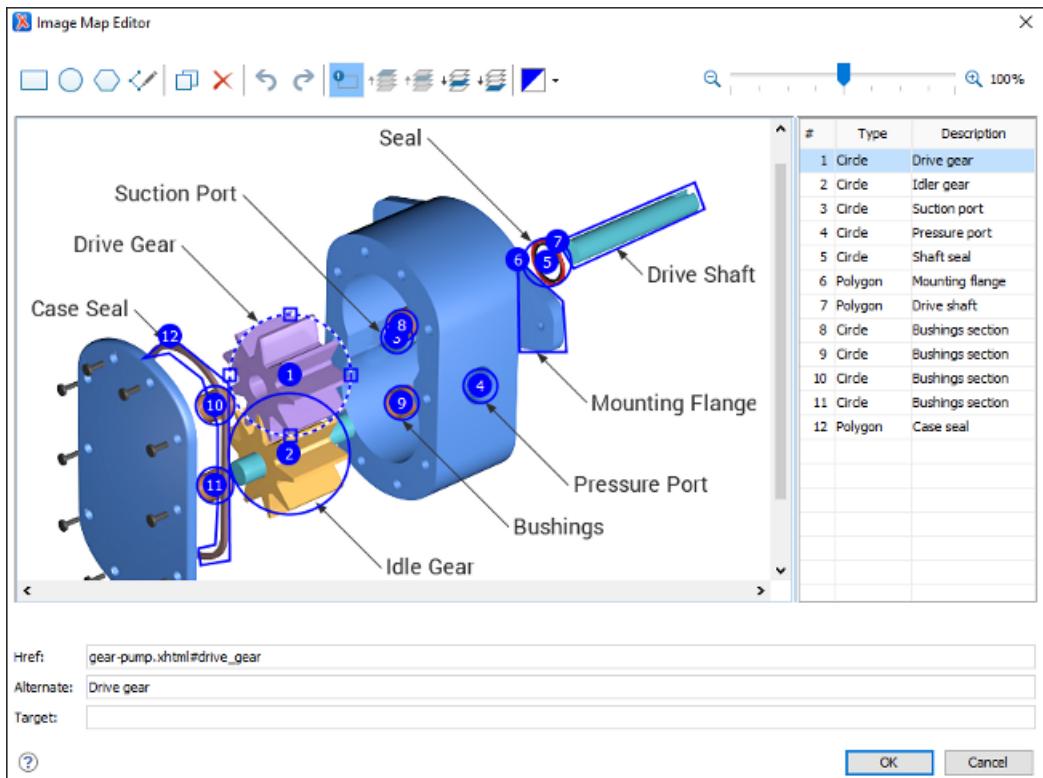

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Image Maps in XHTML

Oxygen XML Editor includes support for *image maps* in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `img` element) may be associated with an image map (in the form of a `map` element) by specifying a `usemap` attribute on the `img` element. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 214: Image Map Editor in XHTML**

### Image Map Editor Interface in XHTML

The interface of the **Image Map Editor** consists of the following sections and actions:

#### Toolbar

##### New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

##### New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

##### New Polygon

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

##### New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

##### Duplicate

Use this button to create a duplicate of the currently selected shape.

##### Delete

Use this button to delete the currently selected shape.

### Undo

Use this button to undo the last action.

### Redo

Use this button to redo the last action that was undone.

Use this button to toggle between showing or hiding the numbers for the shapes.

Use this button to bring the currently selected shape forward to the top layer.

Use this button to bring the currently selected shape forward one layer.

Use this button to send the currently selected shape back one layer.

Use this button to send the currently selected shape back to the bottom layer.

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Use this slider to zoom the image in or out in the main image pane.

## Image Pane

This main image pane is where you work with shapes to add hyperlinks to multiple areas within an image. Use the mouse to move shapes around in the image pane. You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously. You can also drag the points of a selected shape to adjust its size and shape. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.

### Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Adds a point to *Polygon* or *Free Form* shapes.

Removes the current point from *Polygon* or *Free Form* shapes.

Create a duplicate of the currently selected shape.

Delete the currently selected shape.

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

### New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

### Undo

Use this action to undo the last action.

### Redo

Use this action to redo the last action that was undone.

## Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the **Alternative** property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

## Properties

### Href

Specifies the hyperlink target for the selected area. This will become the value of the href attribute for the particular area element. The possible values are:

- **An Absolute URL** - A URL of another web site (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your web site (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).
- **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto://`, `file://`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello')`);

### Alternate

The description for the selected area. The value is inserted in an alt attribute in the particular area element. This is a required attribute to present a text alternative for browsers that do not display images.

### Target

Specifies where to open the linked resource. The allowed values are:

- **\_blank** - Opens the linked resource in a new window or tab.
- **\_self** - Opens the linked resource in the same frame as it was clicked.
- **\_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

## How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

**Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**, **New Circle**, or **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* to adjust its layer and color, or to perform other editing actions.
4. With the shape selected, specify the hyperlink target in the **Href field** and enter a description for the selected area in the **Alternate field**.
5. (Optional) Specify where the hyperlink resource will be opened in the **Target field**.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

### How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map with a visual editor. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Related information

[HTML Image Map Specifications](#)

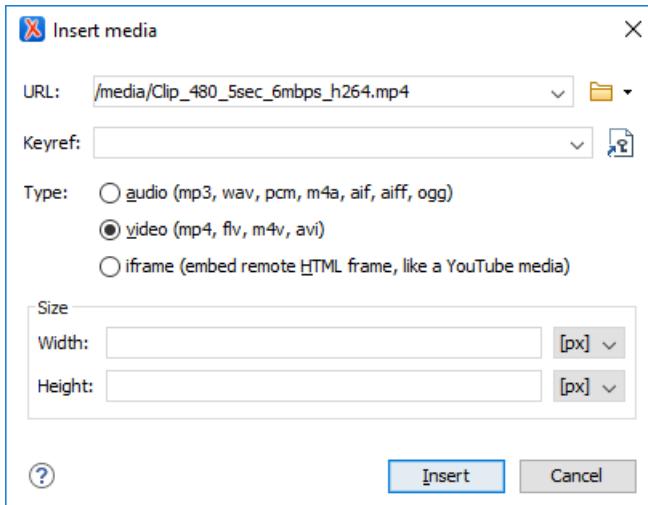

### Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs. There is a toolbar button () that allows you to insert and configure a reference to the media resource.

### Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. The **Insert Media** dialog box appears.

**Figure 215: Insert Media Dialog Box**

3. Configure the options in this dialog box and click **Insert**.

The **Insert Media** dialog box includes the following options:

#### URL

Use this option to specify a URL for a media resource. It will insert the URL as the value of a `data` attribute of an `object` element. You can type the URL of the resource you want to insert or use the **Browse** drop-down menu to select it.

#### Keyref

You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map. Use this dialog box to insert the selected key as the value of the `datakeyref` attribute of an `object` element. All keys that are presented in the dialog box are gathered from the root map of the current DITA map.

**Tip:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link.

#### Type

Oxygen XML Editor detects and automatically selects the media type based upon the specified resource in the **URL field**. You can manually change the type, but keep in mind that in the publishing stage the **object element is converted to an HTML5 element** based upon the type selected here. You can choose between: **audio**, **video**, or **iframe**.

#### Size

Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a `width` and `height` attribute, respectively. For audio clips, only the **Width** can be adjusted.

**Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in **Author** mode so that it can be played directly from there.

**Result in Output:** In the publishing stage, the `object` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `object` element is converted to an HTML5 `video` element.
- **Audio Clips** - The `object` element is converted to an HTML5 `audio` element.
- **Embedded HTML Frames** - The `object` element is converted to an HTML5 `iframe` element.

**Tip:** There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select **Copy embed code**), you can then paste the contents of the clipboard in the **URL field**, and the **Type** will automatically be set on **iframe**, while the **Width and Height** will be populated according to the detected size.

## Related information

[Adding Images in DITA Topics](#) on page 1574

[Adding Video and Audio Objects in DITA WebHelp Output](#) on page 847

## Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Editor includes a pre-installed plugin that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```
.....
<foreign outputclass="html-embed"><![CDATA[
 <iframe width="420" height="315"
 src="https://www.youtube.com/embed/qepRkQxhTX"
 frameborder="0" allowfullscreen="true">
 </iframe>
]]></foreign>
....
```

The converted HTML output would look like this:

```
.....
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
.....
```

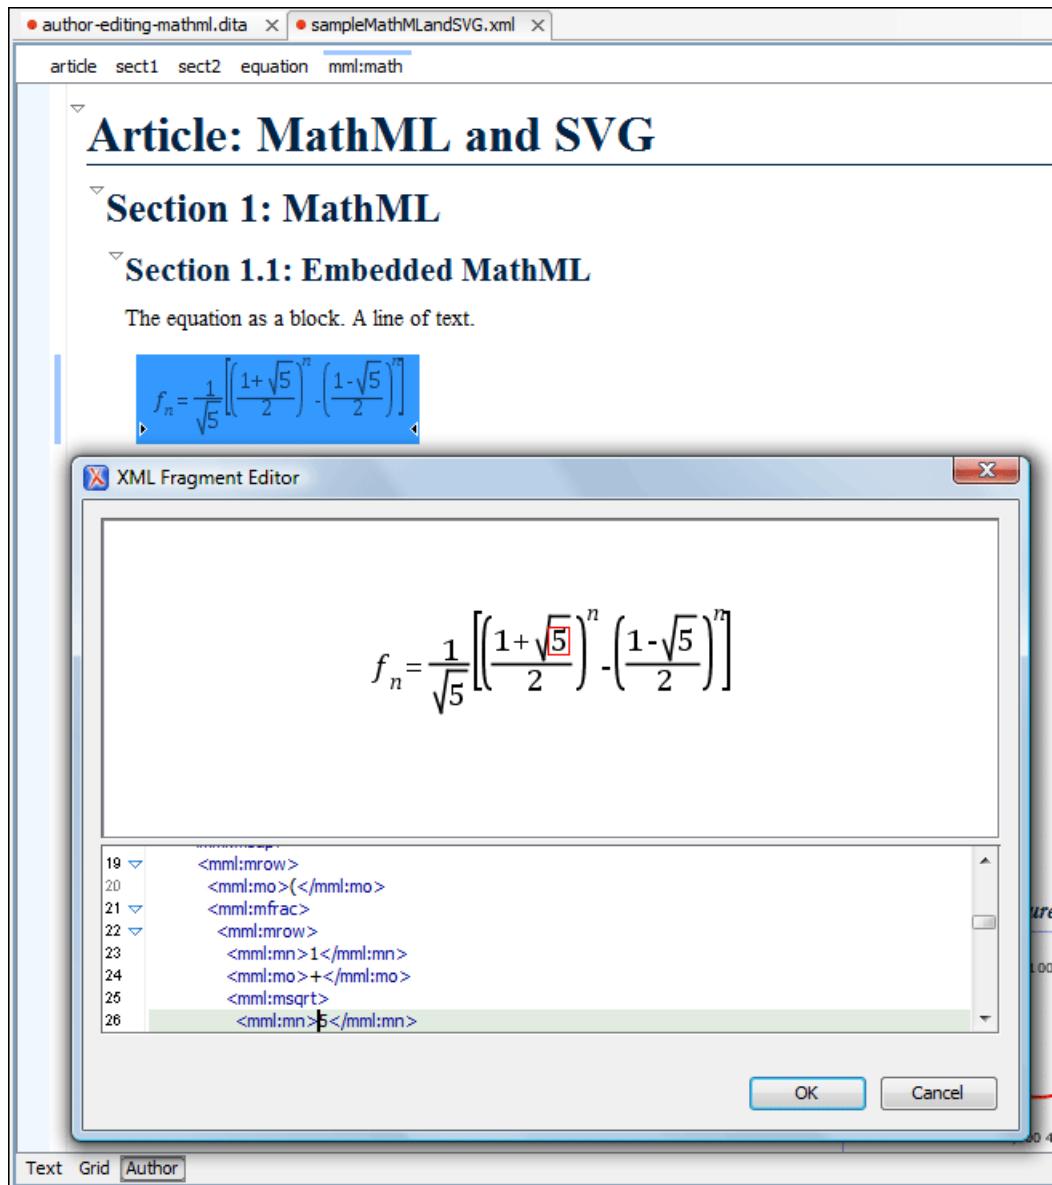

The plugin is also available on the [oxygenxml GitHub projects page](#).

## Related information

[Adding Video and Audio Objects in DITA WebHelp Output](#) on page 847

## Editing MathML Notations

The **Author** editor includes a built-in editor for *MathML* notations. To start the *MathML* editor, either double-click a *MathML* notation, or select the **Edit Equation** action from its contextual menu. In the *MathML* editor you can edit the mathematical symbols of a *MathML* notation. You can open a *MathML* file of your current project directly in the *MathML* editor. To do this, select **Open with > MathML editor** from the contextual menu in the **Project** view.

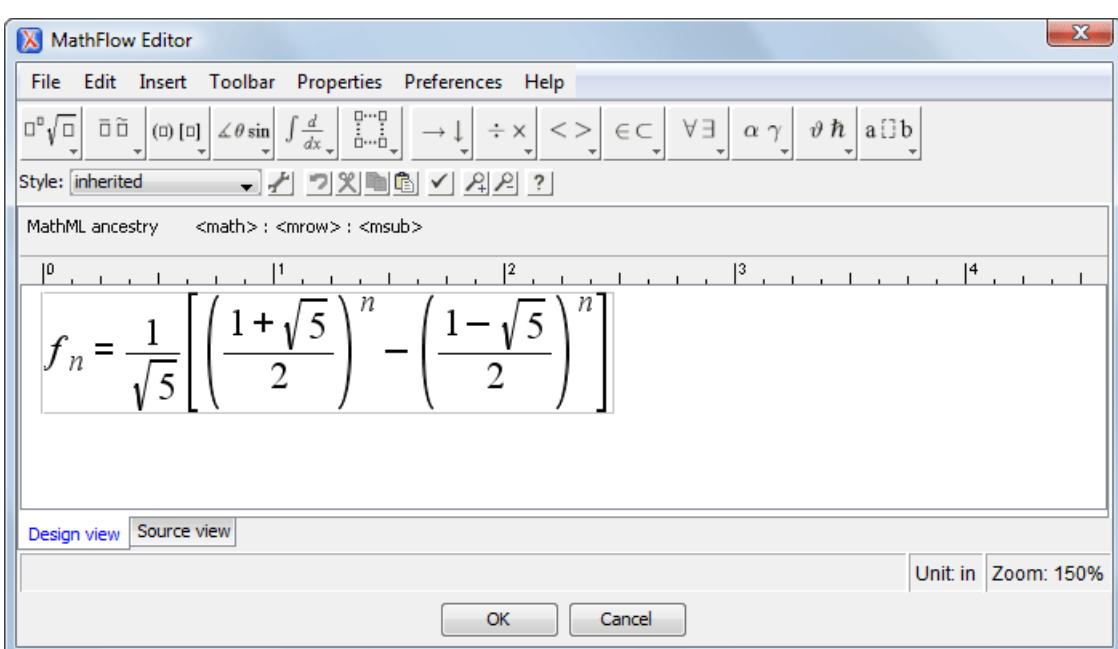

**Figure 216: Default MathML Editor**

The font size and font family that is used for the equations is based upon the context in which the MathML equation appears. To configure the minimum font size of the equation, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit modes > Author > MathML**.

#### Configure the MathFlow Editor

The *MathFlow Components* product can replace the default *MathML* editor with a specialized *MathML* editor. You have to [purchase a MathFlow Component from Design Science](#) and configure it in Oxygen XML Editor with the following procedure:

1. Install *MathFlow* by using the *Universal* installer (for versions prior to 2.1, use the *MathFlow SDK*).
2. Set the path to the *MathFlow* install folder [in the MathML preferences page](#).
3. Set the path to the *MathFlow* license file [in the MathML preferences page](#).

**Figure 217: Default MathFlow Editor**

### MathML Equations in HTML Output

Currently, only **Firefox** can render **MathML** equations embedded in the **HTML** code. **MathJax** is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded **MathML** equations and you want to properly view the equations in published **HTML** output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the **MathJax** script in the **head** element of all **HTML** files that have the equation embedded.

For example:

```
<script type="text/javascript"
 src="http://cdn.mathjax.org/mathjax/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

For DITA documents, you can also use the following procedure:

1. *Edit the DITA Map WebHelp transformation scenario* and open the **Parameters** tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
  - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your resource file.
  - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

### Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** action.

To refresh the content of the referenced resources you can use the **Refresh references** action. However, this action will not refresh the expanded external entities, for which you will need to use the **Reload** action.

## Generating IDs for Elements in Author Mode

Oxygen XML Editor allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** or an *in-place attribute editor*. Oxygen XML Editor also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

### Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu or the framework-specific menu (**DITA**, **DocBook**, or **TEI**). This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options dialog box** that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### Automatically Generate IDs

Oxygen XML Editor includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options dialog box** that is displayed when you select the **ID Options** action from the framework-specific menu (**DITA**, **DocBook**, or **TEI**). If enabled, Oxygen XML Editor automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

### ID Options Dialog Box

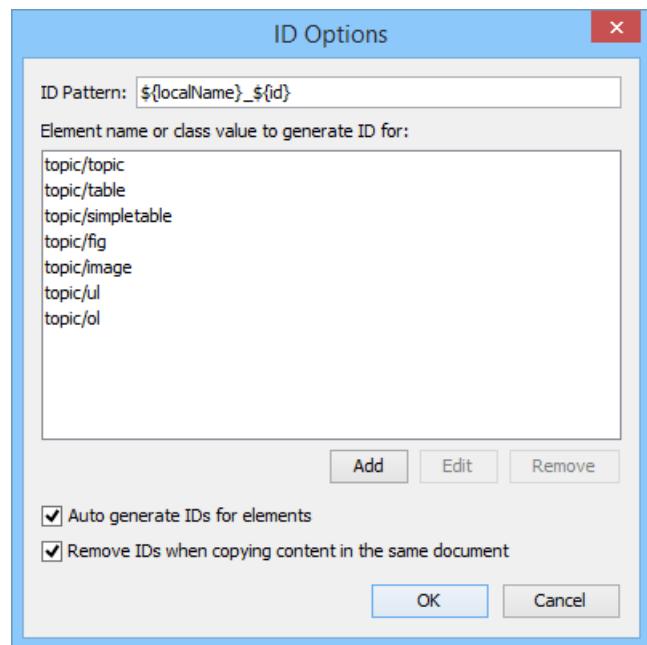

Figure 218: ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options in regards to generating ID values:

#### ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor *Editor Variables*.

#### Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

### Auto generate IDs for elements

If enabled, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

### Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, disable this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

### Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

**Note:** Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.

- If the **Auto generate IDs for elements option** is enabled and you duplicate elements with existing IDs, Oxygen XML Editor assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements option** is disabled and you duplicate elements with existing IDs, the ID values are removed from the duplicates. However, when elements are duplicated in the same document, this option has no effect and IDs are preserved if the **Remove IDs when copying content in the same document option** is disabled.
- If the **Remove IDs when copying content in the same document option** is enabled, the ID values are removed from elements that are duplicated in the same document. However, enabling this option has no effect if the **Auto generate IDs for elements** option is enabled.
- If the **Remove IDs when copying content in the same document option** is disabled, the ID values are preserved when elements are duplicated in the same document. This option has no affect on elements that are duplicated in other documents.

### Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI frameworks.

In the frameworks folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the resources folder within the particular framework. For example, the configuration file for the DITA framework is located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml`.

### Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other member of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your framework according to your needs.
2. Bundle a modified version of the entire framework folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/`). To do this:
  - a. Open the **Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
  - b. Select your framework and click the **Extend** button.
  - c. In the **Document type configuration dialog box** that is now displayed, select **External** for the **Storage** option. By default, this will save the extension in a new folder in the frameworks folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)`), but you can also use the  **Browse** button to specify a specific name and folder.

- d. In this new extension folder, create a new folder called resources and add your modified idGenerationDefaultOptions.xml file to this new resources folder.
  - e. Go back to the **Document Type Association** preferences page, select the extended framework, and click **Edit**.
  - f. Go to the **Classpath tab**, add a reference to your new resources folder, and move this reference up (using the icon) so that it is the first one that appears in the list.
  - g. Click **OK** and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in [Sharing a Document Type \(Framework\)](#) on page 1205.

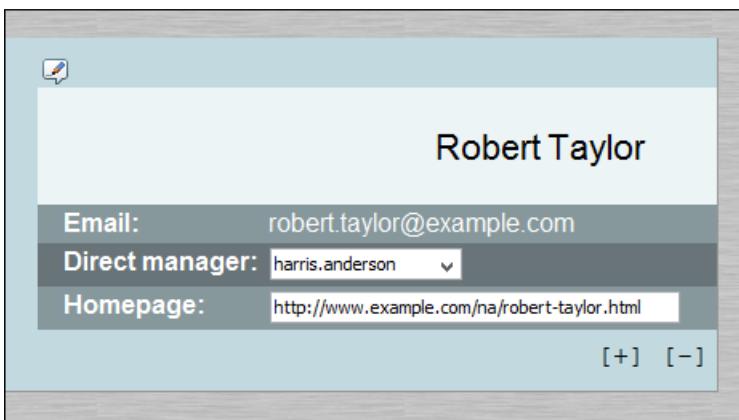

### Using Form Controls in Author Mode

You can use form controls in **Author** mode in a variety of ways to make it easier to capture, organize, and edit content. Oxygen XML Editor includes [built-in form controls](#) that can be used by content authors in **Author** mode. The types of built-in form controls that you can use include the following:

- **Text Field** - A graphical user interface box that allows you to enter a single line of text.
- **Combo Box** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Checkbox** - A graphical user interface box that you can click to select or deselect a value.
- **Pop-up** - A contextual menu that provides quick access to various actions.
- **Button** - A graphical user interface object that performs a specific action.
- **Button Group** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Text Area** - A box that allows you to enter multiple lines of text.
- **URL Chooser** - A dialog box that allows you to select the location of local or remote resources.
- **Date Picker** - A form control object that allows you to select a date in a specified format.
- **HTML Content** - A graphical user interface box that is used for rendering HTML content.

You can also [implement custom form controls](#) for more specific needs.

The following image is an example of how form controls can be used by content authors in **Author** mode. It includes several button form controls, a combo box, and a text field. The icon is a button form control that is assigned a specific action that changes the layout to an editing mode. The and icons are also button form controls that are assigned specific actions to add or delete records from the document. The *Direct manager* row includes a combo box form control that is both a drop-down menu and an editable text field, while the *Homepage* row includes a simple editable text field form control.

**Figure 219: Example of Form Controls in Author Mode**

You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled *samples* project (located in the *samples* folder inside the Oxygen XML Editor installation directory) contains a file called *personal.xml* that contains form controls. You can use this file, along with its corresponding *personal.css*

file (form controls are defined in the CSS) to experiment with an example of how form controls can be implemented in **Author** mode.

## Contextual Menu Actions in Author Mode

Oxygen XML Editor includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in **Author** mode, the contextual menu includes *general* actions that are available for all of the recognized document types and *document type-specific* actions that are configured for each document type.

### General Contextual Menu Actions in Author Mode

The *general* actions that are available in the contextual menu (some of them are also available in the submenus of the **Document** menu) for all document types include the following:

#### **Quick Fix (Alt + 1 (Command + Alt + 1 on OS X))**

Available when the contextual menu is invoked on an error where *Oxygen XML Editor can provide a quick fix*.

#### **Open Image**

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Editor *Image Viewer* or in a default system application associated with the current image type.

#### **Track Changes Actions**

Available when the **Track Changes** feature is enabled and the contextual menu is invoked on a change. The following options are available:

##### **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

##### **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

##### **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

#### **Author Callout Actions**

Available when the contextual menu is invoked on a callout. If enabled in the *Callouts preferences page*, the callouts are displayed in **Author** mode for comments, tracked insertion changes, or tracked deletion changes.

#### **Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

##### **Reply**

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

##### **Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state.

The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

#### **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

#### **Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

#### **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

#### **Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a *comment* callout box:

##### **Reply**

Opens a dialog box that allows you to add a reply to a comment or tracked change. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review** view.

##### **Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for tracked changes that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

#### **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

#### **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

#### **Callouts Options**

Select this option to open the [Callouts preference page](#) where you can configure various callout options.

#### **Edit Attributes**

Displays an *in-place attributes editor* that allows you to manage the attributes of an element.

## Edit Profiling Attributes

Allows you to change the *profiling attributes* defined on all selected elements.

## Insert submenu

This submenu includes insert actions that are specific to each framework, along with the following general action:

### Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e. g. #65
- &#<decimal value>; - e. g. &#65
- #x<hexadecimal value> - e. g. #x41
- &#x<hexadecimal value>; - e. g. &#x41

### Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

### Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

### Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

### Paste special submenu

This submenu includes special paste actions that are specific to each framework, as well as the following general paste actions:

#### Paste As XML

Pastes clipboard content that is considered to be XML, preserving its XML structure.

#### Paste As Text

Pastes clipboard content, ignoring any structure or styling markup.

## Select submenu

This submenu allows you to select the following:

### Element

Selects the entire element at the current cursor position.

### Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

### Parent

Selects the entire parent element at the current cursor position.

## Text submenu

This submenu contains the following actions:

### To Lower Case

Converts the selected content to lower case characters.

### To Upper Case

Converts the selected content to upper case characters.

### Capitalize Sentences

Converts to upper case the first character of every selected sentence.

### Capitalize Words

Converts to upper case the first character of every selected word.

## Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with [change tracking](#) is ignored when counting words.

## Convert Hexadecimal Sequence to Character ([Ctrl + Shift + X \(Command + Shift + X on OS X\)](#))

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

## Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

### **Toggle Comment**

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

### **Move Up (Alt + UpArrow)**

Moves the current node or selected nodes in front of the previous node.

### **Move Down (Alt + DownArrow)**

Moves the current node or selected nodes after the subsequent node.

### **Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

### **Join Elements**

Joins two adjacent *block* elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the [Delete](#) or [Backspace](#) keys and the cursor is positioned between the boundaries of these two elements.

### **Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the [Position cursor between tags option](#) is enabled in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the [Position cursor between tags option](#) is disabled in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

### **Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

### **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

### **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the [Delete](#) or [Backspace](#) keys.

### **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

### **Remove Text**

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

### **Attributes submenu**

Contains predefined XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

#### **Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

#### **Delete attribute**

Allows you to remove one or more attributes.

#### **Rename attribute**

Allows you to rename an attribute.

#### **Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

### **Comments submenu**

Contains predefined XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

#### **Delete comments**

Allows you to delete comments found inside one or more elements.

### **DITA submenu**

Contains predefined XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

#### **Change topic ID to file name**

Changes the ID of a topic to be the same as its file name.

#### **Convert simple tables to CALS tables**

Converts all DITA simple tables to CALS tables in the specified scope.

### **Elements submenu**

Contains predefined XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

#### **Delete element**

Allows you to delete elements.

#### **Delete element content**

Allows you to delete the content of elements.

#### **Insert element**

Allows you to insert new elements.

#### **Rename element**

Allows you to rename elements.

#### **Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

#### **Wrap element**

Allows you to surround elements with element tags.

#### **Wrap element content**

Allows you to surround the content of elements with element tags.

### **Fragments submenu**

Contains predefined XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

#### **Insert XML fragment**

Allows you to insert an XML fragment.

### **Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

### **Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

### **JATSKit submenu**

Contains predefined XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

#### **Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

#### **Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

### **Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

### **Review submenu**

This submenu includes the following actions:

#### **Track Changes**

Enables or disables the track changes support for the current document.

#### **Accept Change(s)**

Accepts the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

#### **Reject Change(s)**

Rejects the tracked change located at the cursor position and moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

#### **Comment Change**

Opens a dialog box that allows you to add a comment to an existing tracked change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

#### **Highlight**

Enables the highlighting tool that allows you to mark text in your document.

#### **Colors**

Allows you to select the color for highlighting text.

#### **Stop highlighting**

Use this action to disable the highlighting tool.

#### **Remove highlight(s)**

Use this action to remove highlighting from the document.

#### **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

#### **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

### Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

### Manage Reviews

Opens the [Review view](#).

## Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

### Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

### Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

### Search References in

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### Search Occurrences in file

Searches for the occurrences of the ID in the current document.

## Folding submenu

This submenu includes the following actions:

### Toggle Fold

Toggles the state of the current fold.

### Collapse Other Folds ([Ctrl + NumPad/ \(Command + NumPad/ on OS X\)](#))

Folds all the elements except the current element.

### Collapse Child Folds ([Ctrl + NumPad. \(Command + NumPad. on OS X\)](#))

Folds the elements indented with one level inside the current element.

### Expand Child Folds

Unfolds all child elements of the currently selected element.

### Expand All ([Ctrl + NumPad\\* \(Command + NumPad\\* on OS X\)](#))

Unfolds all elements in the current document.

## Inspect Styles

Opens the [CSS Inspector view](#) that allows you to examine the CSS rules that match the currently selected element.

## Options

Opens the [Author mode options page](#).

## Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of **Author** mode for the following document types (click the links to see the default actions that are available for each specific document types):

- [DocBook4 Author Actions](#)
- [DocBook5 Author Actions](#)
- [DITA Author Actions](#)
- [DITA Map Author Actions](#)

- [XHTML Author Actions](#)
- [TEI ODD Author Actions](#)
- [TEI P4 Author Actions](#)
- [TEI P5 Author Actions](#)
- [JATS Author Actions](#)

## Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Editor provides validation functions that enable you to easily identify errors and their location.

[Working with Modular XML Files in the Master Files Context](#)

### Checking XML Well-Formedness

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

### Well-Formedness Rules

The XML Syntax rules for *Well-formed XML* are as follows:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules are as follows:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules are as follows:

- The *xml* prefix is by definition bound to the namespace name: <http://www.w3.org/XML/1998/namespace>. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: <http://www.w3.org/2000/xmlns/>. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

## Check for Well-Formedness

To check if a document is *Namespace Well-Formed XML*, select the  **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on OS X))** action from the **Document > Validate** menu or from the  **Validation** drop-down menu on the toolbar.

The selected files in the current project can also be checked for well-formedness with a single action by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project view**.

If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

### A non Well-formed XML Document

```
<root><tag></root>
```

When **Check Well-Formedness** is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert `</tag>`.

### A non Namespace-wellformed Document

```
<x::y></x::y>
```

When **Check document form** is performed the following error is raised:

```
Element does not match QName production: QName ::= (NCName' ':')?NCName .
```

### A non Namespace-valid Document

```
<x:y></x:y>
```

When **Check document form** is performed the following error is raised:

```
The prefix "x" for element "x:y" is not bound.
```

## Validating XML Documents Against a Schema

A *Valid XML document* is a *Well-Formed XML document* that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

The  **Validate** function ensures that your document is compliant with the rules defined by an associated DTD, XML Schema, Relax NG, or Schematron schema. XML Schema or Relax NG schema also allows you to embed Schematron rules. For Schematron validations you can also select the *validation phase*.

### Related information

[Presenting Schematron Validation Issues](#)

[Associating a Schema to XML Documents](#) on page 464

## Automatic Validation

Oxygen XML Editor can be configured to automatically mark validation errors in the document as you are editing. The [Enable automatic validation option](#) in the [Document Checking preferences page](#) controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a [configurable delay](#) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. The arrow buttons of the dialog box enable the navigation to other errors issued by the Automatic Validation feature.

[Presenting Validation Errors in Author Mode](#) on page 231

## Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Editor.

### Manually Validate Current Document

To manually validate the currently edited document, use one of the following actions:

#### **Validate (Ctrl + Shift + V (Command + Shift + V on OS X))**

Available from the  **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project** view .

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also reparses the XML catalogs and resets the schema used for content completion.

#### **Validate (cached)**

Available from the  **Validation** drop-down menu on the toolbar or the **Document > Validate** menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

**Note:** Automatic validation also caches the associated schema.

### Validate with

Available from the  **Validation** drop-down menu on the toolbar, (or **Document > Validate** menu).

This action opens a dialog box that allows you to [specify a schema for validating the current document](#).

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

**Note:** The **Validate with** action does not work for files loaded through an [Oxygen XML Editor custom protocol plugin](#) developed independently and added to Oxygen XML Editor after installation.

### Validate with Schema

Available from the **Validate** submenu when invoking contextual menu in the **Project** view .

This action opens a dialog box that allows you to [specify a schema for validating all selected files](#).

## Other Validation Options

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

The  **Validation options** button, available in the **Document > Validate** menu, allows you to quickly access to the *validation options* for the built-in validator in the Oxygen XML Editor preferences page.

**Tip:** If a large number of validation errors are detected and the validation process takes too long, you can *limit the maximum number of reported errors in the Document Checking preferences page*.

### Related information

### Presenting Validation Errors in Text Mode

Oxygen XML Editor can be configured to *automatically validate documents* while editing in the **Text** mode, and actions are also available to *manually validate documents* on-request.

A line with a validation issue is marked in the editor panel by underlining the problem region with a colored line, according to the type of issue. The issues are also marked with a colored marker in the right vertical stripe. You can configure the color for each type in the [Document Checking preferences page](#).

- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and *possible quick fixes* (if available for that issue).

**Figure 220: Presenting Validation Errors in Text Mode**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

#### Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

## Middle Part of the Stripe

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights option**.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#)).

## Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the  button can be used to clear all the validation markers.

Status messages from every validation action are logged in the [Information view](#).

If you want to see all the validation messages grouped in the [Results panel](#), you should use the  **Validate** action from the toolbar or **Document > Validate** menu..

## Presenting Validation Errors in Author Mode

Oxygen XML Editor can be configured to [automatically validate documents](#) while editing in the **Author** mode, and actions are also available to [manually validate documents](#) on-request.

Validation issues are marked in **Author** mode with a colored underline in the editing pane and a colored marker in the right vertical stripe, according to the type of issue. You can configure the color for each type in the [Document Checking preferences page](#).

- **Validation Errors** - By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
- **Validation Warnings** - By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
- **Validation Info** - By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes](#) (if available for that issue).

Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page](#) where you can configure some validation options (such as the colors used to present the validation issues). Some validation messages include an icon () that provides a link to a style guide or specification.

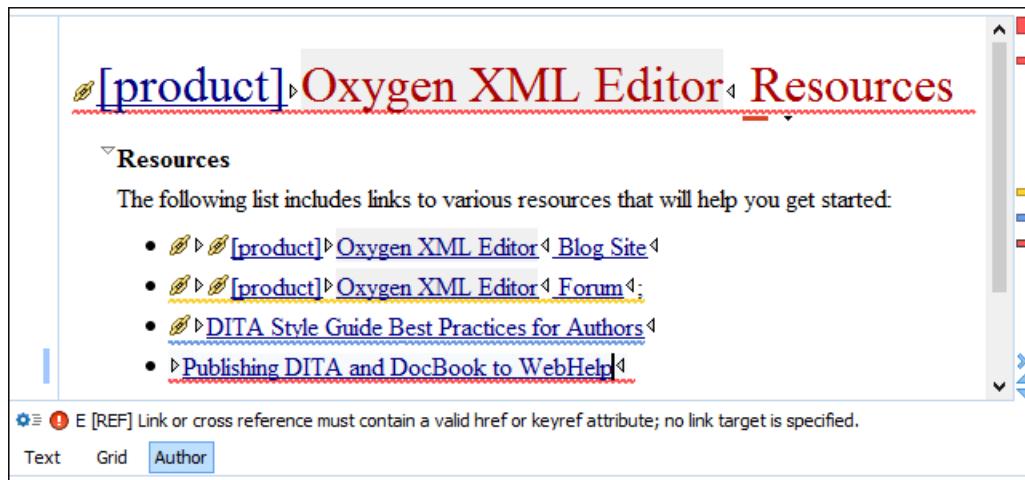

Figure 221: Presenting Validation Errors in Author Mode

Also, the vertical stripe on the right side of the editor panel is designed to display the errors found during the validation process and to help you locate them in the document. The stripe contains the following:

#### Upper Part of the Stripe

By default, a success indicator square will turn green if the validation is successful or if only validation info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous issues, only the first three are presented in the tool tip.

#### Middle Part of the Stripe

By default, errors are depicted with red markers, warnings with yellow markers, and info messages with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights option**.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the [Document checking preferences page](#) where you can configure some validation options).

#### Bottom Part of the Stripe

Two navigation arrows ( ) allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the button can be used to clear all the validation markers.

Status messages from every validation action are also logged in the [Information view](#).

If you want to see all the validation messages grouped in the [Results panel](#), you should use the **Validate** action from the toolbar or **Document > Validate** menu..

#### Related information

[Validating XML Documents Against a Schema](#) on page 438

[Presenting Schematron Validation Issues](#)

#### Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the assert and assertion elements, set the message attribute on these elements.

- For Xerces, the message attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the message attribute has to belong to the `http://saxon.sourceforge.net/` namespace.

The value of the message attribute is the error message displayed if the assertion fails.

## Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the [Custom Validation Engines preferences page](#). After a custom validation engine is [properly configured](#), it can be applied on the current document by selecting it from the list of custom validation engines in the Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the [output message format](#) of Oxygen XML Editor for linked messages:

- **LIBXML** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. XML catalogs support (the –catalogs parameter) and XInclude processing (–xinclue) are enabled by default in the preconfigured LIBXML validator. The --postvalid parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the --dtdvalid \${ds} parameter manually to the DTD validation command line. \${ds} represents the detected DTD declaration in the XML document.

**CAUTION:** File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in XML catalog files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor is installed in the default location on Windows (C:\\Program Files) because the built-in XML catalog files are stored in the frameworks subfolder of the installation folder and in this case, the file path contains at least one space character.

**Attention:** On OS X, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

- **Saxon-EE** - Included in Oxygen XML Editor. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be [configured in Preferences](#).
- **MSXML 4.0** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **XSV** - Not included in Oxygen XML Editor. Windows and Linux distributions of XSV can be downloaded from <http://www.cogsci.ed.ac.uk/~ht/xsv-status.html>. The executable path is [already configured in Oxygen XML Editor](#) for the [OXYGEN\_INSTALL\_DIR]/xsv installation folder. If it is installed in a different folder, the predefined executable path must be [corrected in Preferences](#). It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.
- **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Editor. It can be downloaded [from here](#) (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory [OXYGEN\_INSTALL\_DIR]/sqc. If it is installed in a different folder, the predefined executable path and working directory must be [corrected in the Preferences page](#). It is associated to XSD Editor.

A custom validator cannot be applied on files loaded through an [Oxygen XML Editor custom protocol plugin](#) developed independently and added to Oxygen XML Editor after installation.

### Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor window. If such an output message (warning, error, fatal error, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- *Type*: [F|E|W] (the string *Type*: followed by a letter for the type of the message: fatal error, error, warning) - this property is optional in a linked message.
- *SystemID*: a system ID of a file (the string *SystemID*: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- *Line*: a line number (the string *Line*: followed by the number of the line that will be highlighted).
- *Column*: a column number (the string *Column*: followed by the number of the column where the highlight will start on the highlighted line) - this property is optional in a linked message.
- *EndLine*: a line number (the string *EndLine*: followed by the number of the line where the highlight ends) - this property is optional in a linked message.
- *EndColumn*: a column number (the string *EndColumn*: followed by the number of the column where the highlight ends on the end line) - this property is optional in a linked message.

**Note:** The *Line/Column* pair works in conjunction with the *EndLine/EndColumn* pair. Thus, if both pairs are specified, then the highlight starts at *Line/Column* and ends at *EndLine/EndColumn*. If the *EndLine/EndColumn* pair is missing, the highlight starts from the beginning of the line identified by the *Line* parameter and ends at the column identified by the *Column* parameter.

- *AdditionalInfoURL*: the URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- *Description*: message content (the string *Description*: followed by the content of the message that will be displayed in the output view).

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

## Validation Scenarios

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Editor validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors in regards to parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Editor (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist

- XML Database, Documentum xDB (X-Hive/DB) 10 XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document in which the *master file* includes smaller fragment files using XML entity references.
- Note:** If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Master Files Support](#) on page 279 or [Working with Modular XML Files in the Master Files Context](#) on page 472.

To watch our video demonstration about how to use a validation scenario in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Validation\\_Scenario.html](https://www.oxygenxml.com/demo/Validation_Scenario.html).

### Creating a New Validation Scenario

To create a validation scenario, follow these steps:

- Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view ).

The **Configure Validation Scenario(s)** dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework are rendered in bold.

**Note:** If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Master Files Support](#) on page 279 or [Working with Modular XML Files in the Master Files Context](#) on page 472.

**Figure 222: Configure Validation Scenario Dialog Box**

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

#### Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

### Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

### Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

### Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

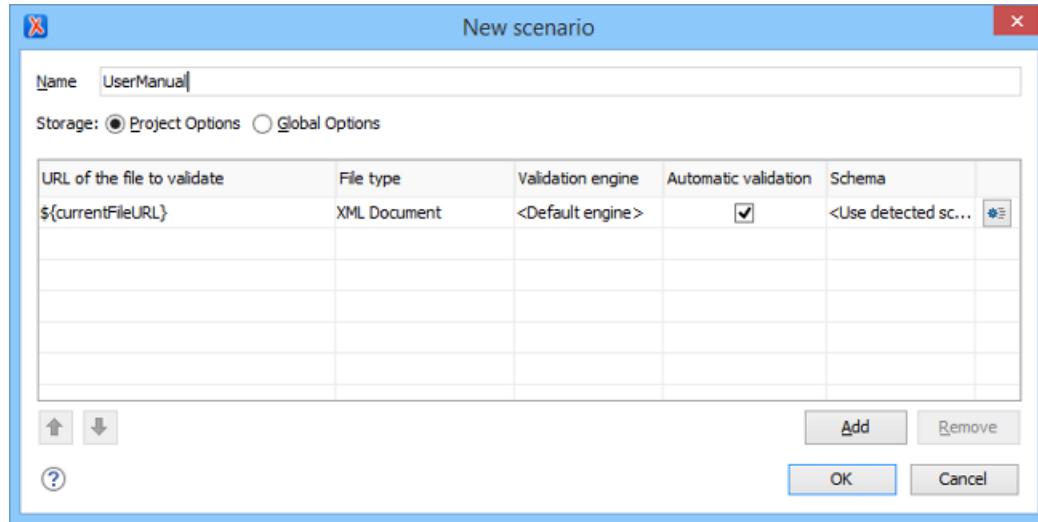

**Note:** When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

### Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a scenarios file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

## 2. To add a scenario, click the **New** button.

The **New scenarios** dialog box is displayed and it lists all the validation units for the scenario.

**Figure 223: Create New Validation Scenario**

This scenario configuration dialog box allows you to configure the following information and options:

#### Name

The name of the validation scenario.

#### Storage

You can choose between storing the scenario in the **Project Options** or **Global Options**.

#### URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

\${Desktop} - My Desktop \${start-dir} - Start directory of custom validator \${standard-params} - List of standard params for command line \${cfn} - The current file name without extension \${currentFileURL} - The path of the currently edited file (URL) \${cfd} - The path of current file directory (URL) \${frameworks} - Oxygen frameworks directory (URL) \${pdu} - Project directory (URL) \${oxygenHome} - Oxygen installation directory (URL) \${home} - The path to user home directory (URL) \${pn} - Project name \${env(VAR_NAME)} - Value of environment variable VAR_NAME \${system(var.name)} - Value of system variable var.name
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Figure 224: Insert an Editor Variable**

#### File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

#### Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XQuery preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map [Validate and Check for Completeness action](#), but for a local file rather than an entire DITA map).

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#) on page ).

#### Automatic validation

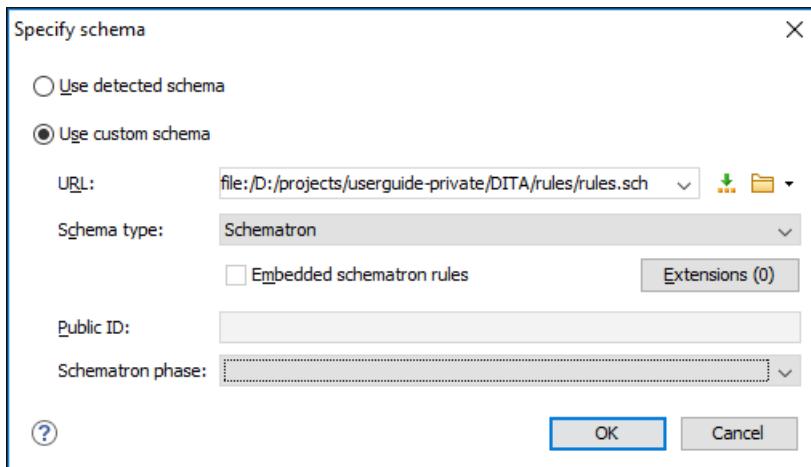

If this option is checked, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#), then this option is ignored, as the preference setting has a higher priority.

#### Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

##### **Specify Schema**

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

**Figure 225: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

#### **Use detected schema**

Uses the *schema detected for the particular document*.

#### **Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

#### **Move Up**

Moves the selected scenario up one spot in the list.

#### **Move Down**

Moves the selected scenario down one spot in the list.

#### **Add**

Adds a new validation unit to the list.

#### **Remove**

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the *validation phase*.

4. Press **OK**.

The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and press the **Apply associated** button to run the validation scenario.

#### Editing a Validation Scenario

To edit an existing validation scenario, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view ).

The **Configure Validation Scenario(s)** dialog box is displayed. It contains predefined and user-defined scenarios. The predefined scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular framework are rendered in bold.

**Note:** If a master file is associated with the current file, the validation scenarios defined in the master file are used and take precedence over the default scenarios defined for the particular framework. For more information on master files, see [Master Files Support](#) on page 279 or [Working with Modular XML Files in the Master Files Context](#) on page 472.

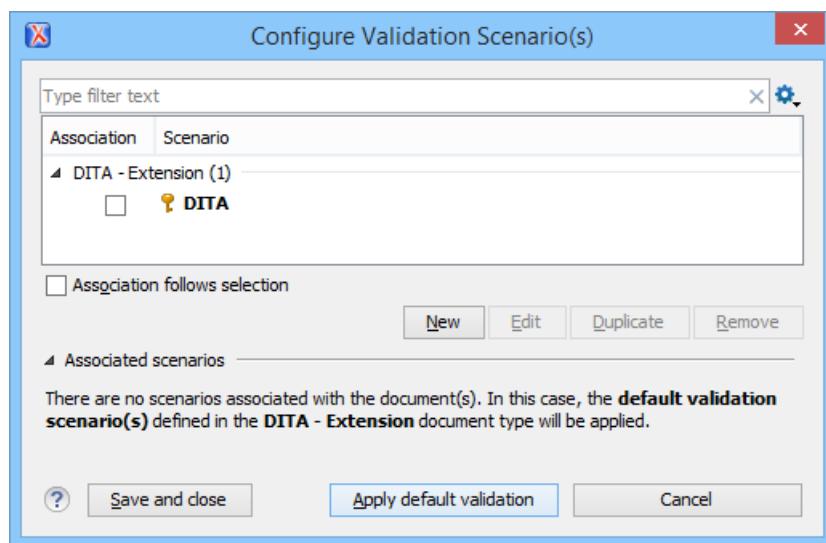

Figure 226: Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

#### Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

#### Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

#### Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

#### Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.

- Keep both scenarios.

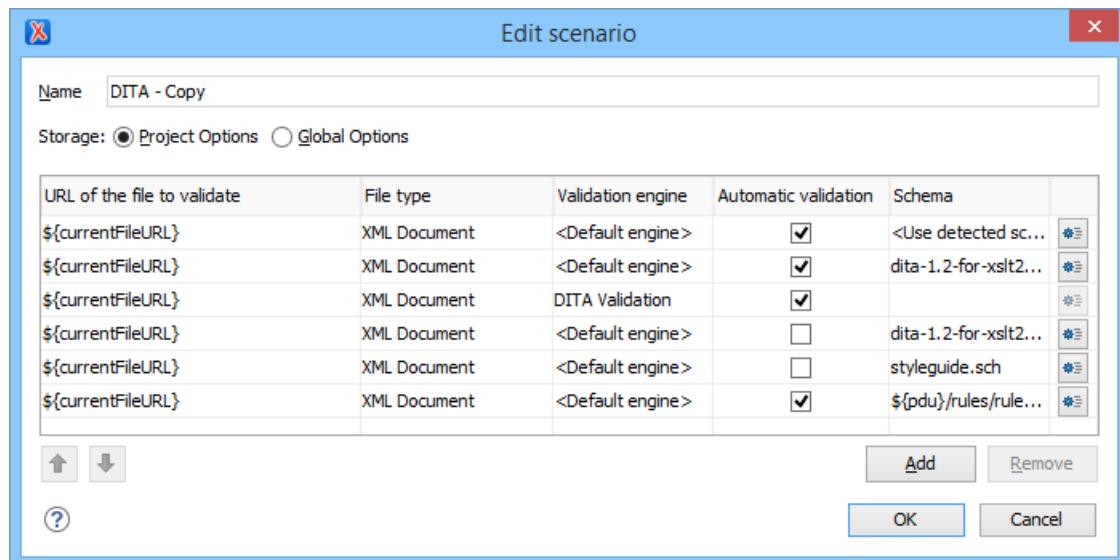

**Note:** When you keep both scenarios, Oxygen XML Editor adds **imported** to the name of the imported scenario.

### Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a **scenarios** file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and press the **Edit** button. If you try to edit one of the *read-only* predefined scenarios, you will receive a warning message that Oxygen XML Editor needs to create a customizable duplicate (you can also use the **Duplicate** button).

The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

**Figure 227: Edit Validation Scenario**

This scenario configuration dialog box allows you to configure the following information and options:

#### Name

The name of the validation scenario.

#### Storage

You can choose between storing the scenario in the **Project Options** or **Global Options**.

#### URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an *editor variable* or a *custom editor variable*.

\${Desktop} - My Desktop \${start-dir} - Start directory of custom validator \${standard-params} - List of standard params for command line \${cfn} - The current file name without extension \${currentFileURL} - The path of the currently edited file (URL) \${cfd} - The path of current file directory (URL) \${frameworks} - Oxygen frameworks directory (URL) \${pdu} - Project directory (URL) \${oxygenHome} - Oxygen installation directory (URL) \${home} - The path to user home directory (URL) \${pn} - Project name \${env(VAR_NAME)} - Value of environment variable VAR_NAME \${system(var.name)} - Value of system variable var.name
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**Figure 228: Insert an Editor Variable**

#### File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

#### Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page](#), [XQuery preferences page](#), [XML Schema preferences page](#)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA map [Validate and Check for Completeness action](#), but for a local file rather than an entire DITA map).

The **Table Layout Validation** engine looks for table layout problems (for more information, see [Report table layout problems](#) on page ).

#### Automatic validation

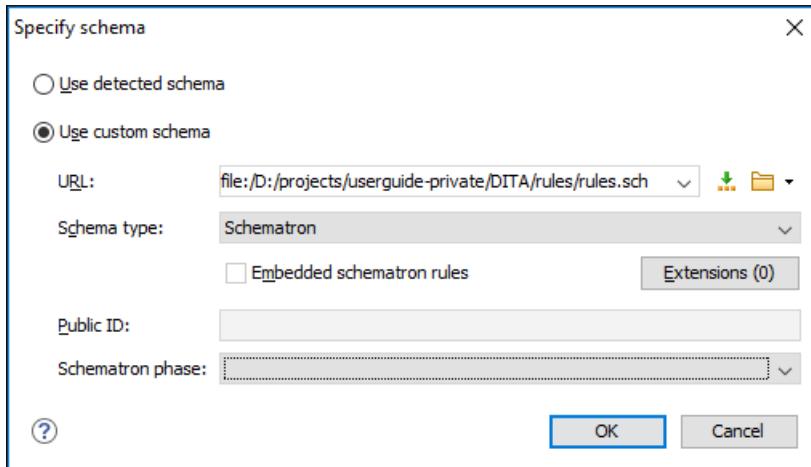

If this option is checked, the validation operation defined by this row is also applied by [the automatic validation feature](#). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#), then this option is ignored, as the preference setting has a higher priority.

#### Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

##### **Specify Schema**

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

**Figure 229: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

#### **Use detected schema**

Uses the *schema detected for the particular document*.

#### **Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

#### **Move Up**

Moves the selected scenario up one spot in the list.

#### **Move Down**

Moves the selected scenario down one spot in the list.

#### **Add**

Adds a new validation unit to the list.

#### **Remove**

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the *validation phase*.
4. When you are done configuring the scenario, press **OK**.

The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word **copy** at the end of its name.

## Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at project level or by [exporting them to a specialized scenarios file](#) that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** or **Global Options**.

Selecting **Project Options** stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios.

## References to XML Schema Specification

If validation is done against XML Schema, Oxygen XML Editor indicates a specification reference relevant for each validation error. The error messages contain an **Info** field that, when clicked, will open the browser on the *XML Schema Part 1: Structures* specification at exactly the point where the error is described. This allows you to understand the reason for that error.

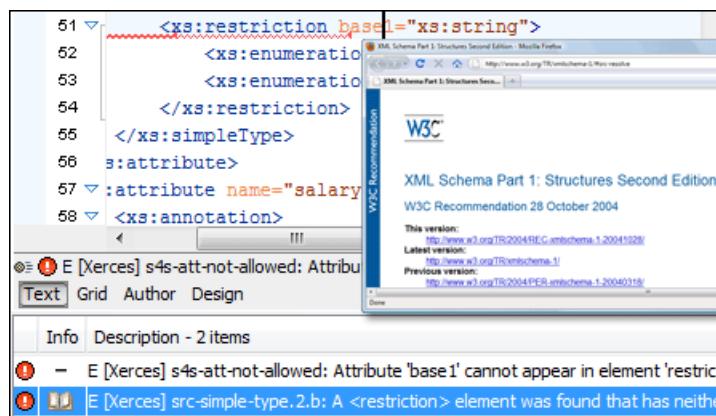

Figure 230: Link to Specification for XML Schema Errors

## Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an [XML catalog](#).

For example, if the XML document contains a reference to a remote schema docbook.rng like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
 type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
 uri="rng/docbook.rng"/>
```

An XML catalog can also be used to map a W3C XML Schema specified with a URN in the `xsi:schemaLocation` attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
 uri="topic.xsd"/>
```

### Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `listitem` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
 "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
 <title>Article Title</title>
 <sect1>
 <title>Section1 Title</title>
 <itemizedlist>
 <listitem>
 <link>a link here</link>
 </listitem>
 </itemizedlist>
 </sect1>
</article>
```

The **Validate Document** action will return the following error:

Unexpected element "link". The content of the parent element type must match "(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist|variablelist|caution|important|note|tip|warning|literallayout|programlisting|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco|informalequation|informalexample|informalfigure|informaltable|equation|example|figure|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights|abstract|authorblurb|epigraph|indexterm|beginpage)+".

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `listitem` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that "The content of element type must match".

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to lookup the element and read about it. In this case, you should learn about the child elements of `listitem` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

## Finding and Replacing Text in the Current File

This section walks you through the find and replace features available in Oxygen XML Editor.

You can use a number of advanced views depending on what you need to find in the document you are editing or in your entire project. The [Find/Replace dialog box](#) allows you to search through the current project or selected resources and offers a set of options to improve your search. The [Find All Elements/Attributes dialog box](#) allows you to search through the structure of the current document for elements and attributes.

As an alternative to the dedicated search operations, you can also use the [Quick Find toolbar](#).

### Find/Replace Dialog Box

To open the **Find/Replace** dialog box, use the **Find/Replace** action that is available in the **Find** menu, on the toolbar, or by pressing **Ctrl + F (Command + F on OS X)**. It is also invoked by the **Find/Replace** contextual menu action found in certain views.

You can use the **Find/Replace** dialog box to perform the following operations:

- Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.
- Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the white spaces contained in the fragment you are searching for.

**Note:** The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in the **Results view**.

The *find* operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the **Find** and **Replace with** areas, do one of the following:

- Press **Ctrl + Enter (Command + Enter on OS X)** on your keyboard.
- Use the **Insert newline** contextual menu action.

You can use *Perl-like regular expressions syntax* to define patterns. A content completion assistance window is available in the **Find** and **Replace with** areas to help you edit regular expressions. It is activated every time you type \ (backslash key) or on-demand if you press **Ctrl + Space (Command + Space on OS X)** on your keyboard.

The *replace* operation can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

To replace the tag-name start tag and its attributes with the new-tag-name tag use as **Find** the expression <tag-name(1s+)(.\*> and as **Replace with** the expression <new-tag-name\$1\$2>.

The **Find/Replace** dialog box contains the following options:

- **Find** - The target character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation (\xNNNN) and octal notation (\0NNNN) can be used. In this case you have to select the **Regular expression option**. For example, to search for a space character you can use the \u0020 code.
- **Replace with** - The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the **Regular expression option** is selected.

**Note:** Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.

**Tip:** Special characters such as *newline* and *tab* can be inserted in the **Find** and **Replace with** text boxes using dedicated actions in the contextual menu (**Insert newline** and **Insert tab**).

Unicode characters in the \uNNNN format can also be used in the **Replace with** area.

- The  **History** button - Contains lists of the last find and replace expressions. Use the **\*Clear history** action from the bottom of the lists to remove these expressions.
- **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.

**Note:** The **Content Completion Assistant** helps you input XPath expressions, valid in the current context.

- **Direction** - Specifies if the search direction is from current position to end of file (**Forward**) or to start of file (**Backward**).
- **Scope** - Specifies whether the **Find/Replace** operation is executed over the entire content of the edited document (**All** option), or over the selected lines of text (**Only selected lines** option). If the selection spans across multiple lines, when you open the **Find/Replace** dialog box, the scope is set to **Only selected lines**.
- **Case sensitive** - When checked, the search operation follows the exact letter case of the text entered in the **Find** field.
- **Whole words only** - Only entire occurrences of a word are included in the search operation.
- **Incremental** - The search operation is started every time you type or delete a letter in the **Find** text box.
- **Regular expression** - When this option is enabled, you can use regular expressions in *Perl-like regular expressions syntax* to look for specific pieces of text.
  - **Dot matches all** - A dot used in a regular expression also matches end of line characters.

- **Canonical equivalence** - If enabled, two characters will be considered a match if, and only if, their full canonical decompositions match. For example, the á symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is disabled by default.
- **Wrap around** - When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.
- **Enable XML search options** - This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:
  - **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
  - **Element contents** - Search in the text content of XML elements.
  - **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
  - **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
  - **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
  - **PIs (Processing Instructions)** - Only the content are searched, skipping '<?', '?>'. e. g.: <?processing instruction?>
  - **CDATA** - Searches inside content of CDATA sections.
  - **DOCTYPE** - Searches inside content of DOCTYPE sections.
  - **Entities** - Only the entity names are searched.

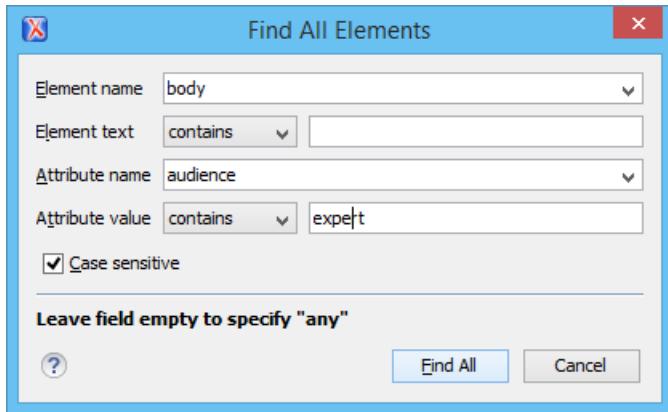

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you enable all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, disable **Enable XML search options**.

- **Find All Elements** - Available when editing in **Author** mode, you can use this link to extend the search scope to XML-specific markup (names and values of both attributes and elements).
- **Find** - Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.
- **Replace** - Executes a replace operation for the target followed by a find operation for the next occurrence.
- **Find All** - Executes a find operation and displays all results in the **Results view**. The results are *displayed in the Results view*.
- **Replace All** - Executes a replace operation in the entire scope of the document.
- **Replace to End** - Executes a replace operation starting from current target until the end of the document, in the direction specified by the current selection of the **Direction** switch (**Forward** or **Backward**).

### Find All Elements Dialog Box

To open the **Find All Elements** dialog box, go to **Find > Find All Elements(Ctrl + Shift + E (Command + Shift + E on OS X))** or from the shortcut **Find All Elements** that is available in *the Find / Replace dialog box*. It assists you in defining XML element / attribute search operations in the current document.

**Figure 231: Find All Elements Dialog Box**

The dialog box can perform the following actions:

- Find all the elements with a specified name
- Find all the elements that contain, or does not contain, a specified string in their text content
- Find all the elements that have a specified attribute
- Find all the elements that have an attribute with, or without, a specified value

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify any element name, leave the field empty.  
**Note:** Use the qualified name of the element (<namespace prefix>:<element name>) when the document uses this element notation.
- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For any element text, select **equals** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.
- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For any or no attribute name, leave the field empty.

- Note:** Use the qualified name of the attribute (<namespace prefix>:<attribute name>) when the document uses this attribute notation.
- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For any or no attribute value, select **equals** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.
  - **Case sensitive** - When this option is checked, operations are case-sensitive

When you press **Find All**, Oxygen XML Editor tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

#### Quick Find Toolbar

A reduced version of the [Find / Replace dialog box](#) is available as a [dockable toolbar](#). To display it press the [Alt + Shift + F \(Command + Alt + F on OS X\)](#) key combination or invoke the **Find > Quick Find** action. By default, the toolbar is displayed at the bottom of the Oxygen XML Editor window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the [Close](#) button or [Esc](#) key.

All matches are highlighted in the current editor.

The toolbar offers the following controls:

- A search input box where you insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.
- **Next** and **Previous** buttons. They allow you to advance to the next or previous match.
- **All** button. Highlights in the current document all matches of the search string.
- **Incremental** checkbox. The search operation is started every time you type or delete a character in the search input box.
- **Case sensitive** checkbox. When selected, the search operation follows the exact letter case of the search text.
- Shortcuts to the  [Find/Replace](#) and  [Find/Replace in Files](#) dialog boxes.

### Keyboard Shortcuts for Finding the Next and Previous Match

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3** (**Command + Shift + G** on OS X) keyboard shortcuts. They are useful for quickly repeating the last find action performed in the [Find / Replace dialog box](#), taking into account the same find options.

**Restriction:** These shortcuts only take XPath expressions into account if the **Find / Replace** dialog box remains opened. Once you close it, the XPath expressions are no longer considered.

### Regular Expressions Syntax

Oxygen XML Editor uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor does not support the following constructs:

- The conditional constructs `(?{X})` and `(?(condition)X|Y)`.
- The embedded code constructs `(?{code})` and `(??{code})`.
- The embedded comment syntax `(?#comment)`.
- The preprocessing operations `\L`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Editor/Java in the text searches from the **Find/Replace** dialog boxes. The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the **Find/Replace** dialog boxes:

- `/w` - `[#x0000-#x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W` - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc ]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

### Related information

## Finding and Replacing Text in Multiple Files

To open the **Find/Replace in Files** dialog box, use the  **Find/Replace in Files** action that is available in the following locations::

- The **Find** menu.
- The main toolbar.
- The contextual menu of the **DITA Maps Manager** view.
- The contextual menu of the **Project** view.
- The contextual menu of the **Data Source Explorer** view for most types of database connections.

The operation works on both local and remote files from an (S)FTP, WebDAV or [CMS](#) server.

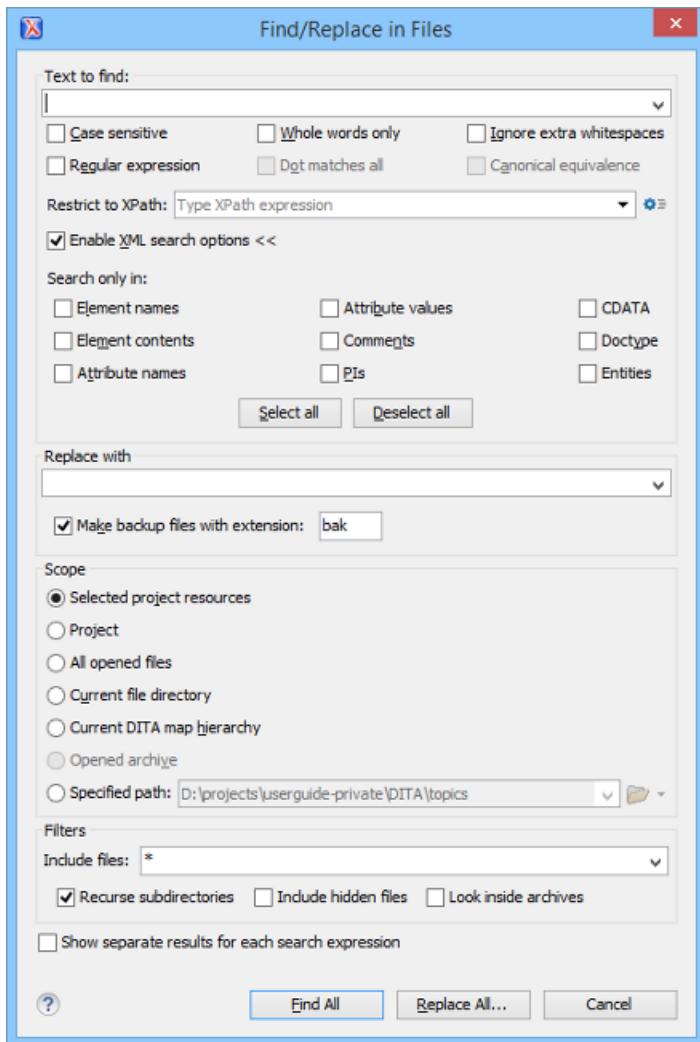

It enables you to define *Search for* or *Search for and Replace* operations across a number of files. You can use [Perl-like regular expression syntax](#) to match patterns in text content. The *replace* operation can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

To replace the tag-name start tag and its attributes with the new-tag-name tag use as **Text to find** the expression `<tag-name(\s+)(.*)>` and as **Replace with** the expression `<new-tag-name $1$2>`.

The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Editor uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: .xml, .xsl, .fo, .xsd, .rng, .nvd1, .sch, .wsdl or [an extension associated with the XML editor type](#). For the other files it uses [the encoding configured for non-XML files](#).

You can cancel a long operation at any time by pressing the **Cancel** button of the progress dialog box displayed when the operation is executed.

Since the content of read-only files cannot be modified, the **Replace** operation is not processing those files. For every such file, a warning message is displayed in the message panel.

**Figure 232: Find / Replace in Files Dialog Box**

The dialog box contains the following options:

- **Text to find** - The target character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation (\xNNNN) and octal notation (\0NNNN) can be used. In this case you have to select the **Regular expression** option. For example, to search for a space character you can use the \u0020 code.
  - **Case sensitive** - When checked, the search operation follows the exact letter case of the value entered in the **Text to find** field.
  - **Whole words only** - Only entire occurrences of a word are included in the search operation.
  - **Ignore extra whitespaces** - If enabled, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation.
  - **Regular expression** - When this option is enabled, you can use regular expressions in [Perl-like regular expressions syntax](#) to look for specific pieces of text.
    - **Dot matches all** - A dot used in a regular expression also matches end of line characters.
    - **Canonical equivalence** - If enabled, two characters will be considered a match if, and only if, their full canonical decompositions match. For example, the ä symbol can be inserted as a single character or as two characters (the a character, followed by the tilde character). This option is disabled by default.
  - **XPath** - The XPath 2.0 expression you input in this combo is used for restricting the search scope.
- Note:** The **Content Completion Assistant** helps you input XPath expressions, valid in the current context.
- **Enable XML search options** - This option is only available when editing in **Text** mode. It provides access to a set of options that allow you to search specific XML component types:

- **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
- **Element contents** - Search in the text content of XML elements.
- **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
- **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
- **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters ('<!--', '-->').
- **PIs (Processing Instructions)** - Only the content are searched, skipping '<?', '?>'. e. g.: <?processing instruction?>
- **CDATA** - Searches inside content of CDATA sections.
- **DOCTYPE** - Searches inside content of DOCTYPE sections.
- **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you enable all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, disable **Enable XML search options**.

- **Replace with** - The character string with which to replace the target. It may contain regular expression group markers if the search expression is a regular expression and the **Regular expression** checkbox is checked.
- **Make backup files with extension** - In the replace process Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.
- **Selected project resources** - Searches only in the selected files of the currently opened project. This option is not displayed when this dialog box is opened from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.
- **Project files** - Searches in all files from the current project. This option is not displayed when this dialog box is opened from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.
- **All opened files** - Searches in all files opened in Oxygen XML Editor (regular files or DITA maps). You are prompted to save all modified files before any operation is performed. This option is not displayed when this dialog box is started from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.
- **Current file directory** - The search is done in the directory of the file opened in the current editor panel. If there is no opened file, this option is disabled. This option is not displayed when this dialog box is opened from the contextual menu of the **DITA Maps Manager view** and **Archive Browser** view.
- **Current DITA Map hierarchy** - The search is done in all maps and topics referenced by the currently selected DITA map, opened in the **DITA Maps Manager** view.
- **Opened archive** - The search is done in an archive opened in the **Archive Browser** view. Displayed only when this dialog box is opened from the **Archive Browser** view.
- **Specified path** - Chooses the search path.
- **Include files** - Narrows the scope of the operation only to the files that match the given filters.
- **Recurse subdirectories** - When enabled, the *pretty print* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the search is also performed in the hidden files.
- **Include archives** - When enabled, the search is also done in all individual file entries from all supported ZIP-type archives.
- **Show separate results for each search expression** - When enabled, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the *Find in Files* tab, replacing any previous search results.
- **Find All** - Executes a find operation and returns the result list to the message panel. The results are *displayed in a view* that allows grouping the results as a tree with two levels.
- **Replace All** - Replaces all occurrences of the target contained in the specified files.

When you replace a fragment of text, Oxygen XML Editor provides a preview of the changes you make. The **Preview** dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final

result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The **Next change** and **Previous change** buttons allow you to navigate through the changes displayed in the **Preview** dialog box.

**CAUTION:** Use this option with caution. Global search and replace across all project files does not open the files containing the targets, nor does it prompt on a per occurrence basis, to confirm that a replace operation must be performed. As the operation simply matches the string defined in the find field, this may result in replacement of matching strings that were not originally intended to be replaced.

## Regular Expressions Syntax

Oxygen XML Editor uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor does not support the following constructs:

- The conditional constructs (`(?{X})`) and (`(?(condition)X|Y)`).
- The embedded code constructs (`(?{code})`) and (`(??{code})`).
- The embedded comment syntax (`(?#comment)`).
- The preprocessing operations `\L`, `\U`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Editor/Java in the text searches from the **Find/Replace** dialog boxes. The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs in the **Find/Replace** dialog boxes:

- `/w - [#x0000-#x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W - [\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than `9` is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc ]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

## Search and Refactor Actions for IDs and IDREFS

Oxygen XML Editor allows you to search for ID declarations and references (IDREFS) and to [define the scope of the search and refactor operations](#). These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the [Quick Assist](#) menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

### Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation](#). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

### Rename in File

Renames the ID you are editing and all its occurrences from the current file.

**Note:** Available in the **Text** mode only.

### Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

#### Search References in

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

### Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations](#) dialog box, this scope will be used instead.

**Note:** Available in the **Text** mode only.

#### Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the [Select the scope for the Search and Refactor operations](#).

**Note:** Available in the **Text** mode only.

### Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

**Tip:** A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the [Ctrl + Single-Click \(Command + Single-Click on OS X\)](#) navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

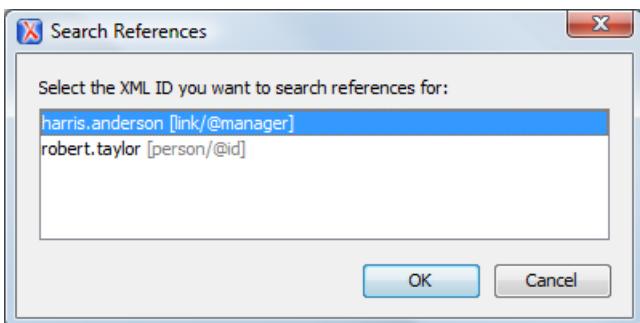

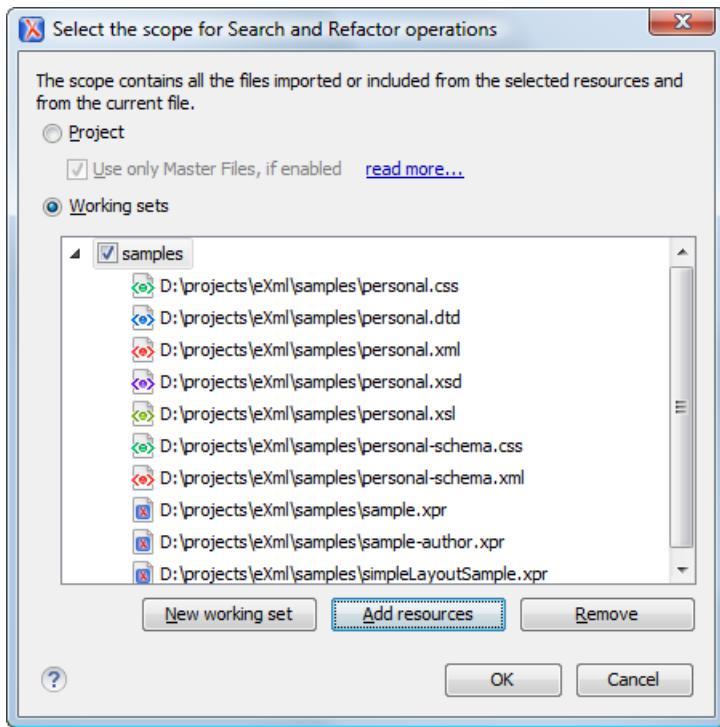

Figure 233: Selecting an ID in the Author Mode

#### Related information

[Working with Modular XML Files in the Master Files Context](#)

#### Search and Refactor Operations Scope

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the Quick Assist action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click [read more](#) for details about the **Master Files support**.

**Figure 234: Change Scope Dialog Box**

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

## Associating a Schema to XML Documents

Oxygen XML Editor relies on schemas to validate XML documents and to compute valid proposals for the Content Completion Assistant.

### Supported Types of Schema

The following schema types are supported:

- W3C XML Schema 1.0 and 1.1 (with and without embedded Schematron rules)
- DTD
- Relax NG - XML syntax (with and without embedded Schematron rules)
- Relax NG - compact syntax
- NVDL
- Schematron (both ISO Schematron and Schematron 1.5)

### Detecting a Schema

For the purposes of using validation and content completion mechanisms, Oxygen XML Editor tries to detect a schema by searching multiple locations, in the following order:

- The *schema defined in a validation scenario*.
- The *schema defined in the validation scenarios associated with the particular document type* (if defined).
- The *schema that is associated directly in the XML document*.

**Note:** If a DTD schema is specified in the document, the content completion for **Author** mode is based on this schema (even if there is already one detected from the validation scenario).

- The *schema defined in the Document Type Association*.

In addition, the locations of the schema can be mapped through the use of an *XML Catalog*. For more information, see *Resolving Schema Locations Through XML Catalogs* on page 471.

**Tip:** To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

#### Related information

[Working with Modular XML Files in the Master Files Context](#)

#### Associating a Schema Through a Validation Scenario

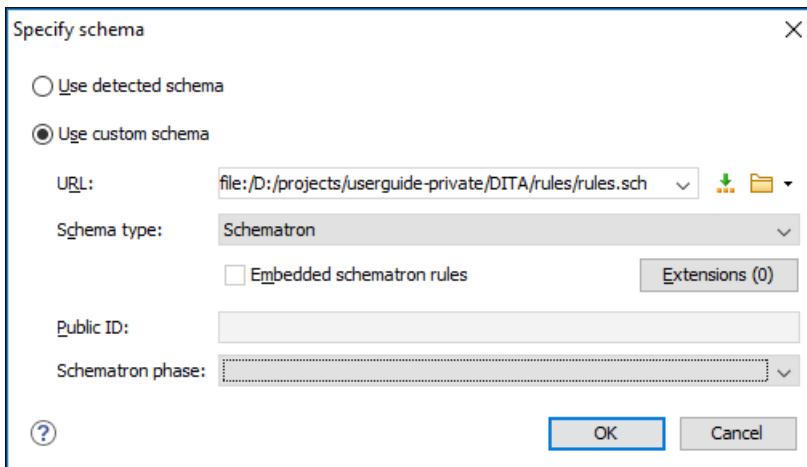

Oxygen XML Editor uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in [validation scenarios](#) and there are several methods that can be used to do so.

#### Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view ).
2. Press the **New** button to create a new validation scenario or the **Edit** button to modify an existing one.
3. [Add or configure validation units](#) according to your needs and click the **Specify Schema** button.

**Step Result:** The **Specify Schema** dialog box is displayed:

**Figure 235: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

##### Use detected schema

Uses the [schema detected for the particular document](#).

##### Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a [custom protocol](#). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.

- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

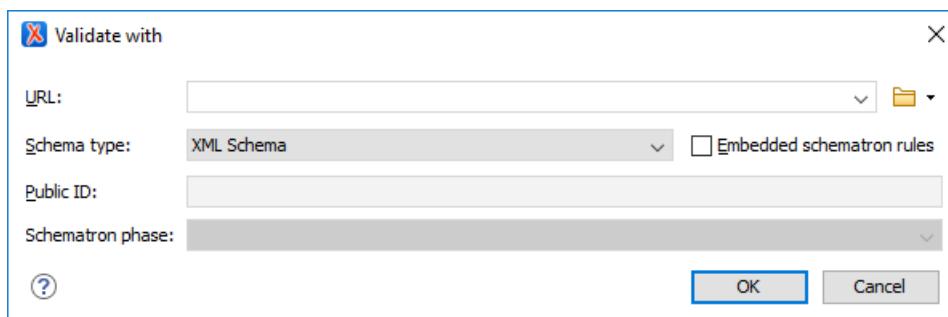

**Result:** The schema is now associated with that validation scenario whenever it is invoked.

### Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

**Step Result:** The **Validate with** dialog box is displayed:

**Figure 236: Validate with Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
3. Click **OK**.

**Result:** The current document is validated using the schema you specified.

**Tip:** To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

## Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project** view .
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

**Step Result:** The **Validate with** dialog box is displayed:

**Figure 237: Validate with Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
  - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
  - **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
  - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
  - **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
  - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
4. Click **OK**.

**Result:** The selected documents are validated using the schema you specified.

## Associating a Schema in Validation Scenarios Defined in the Document Type

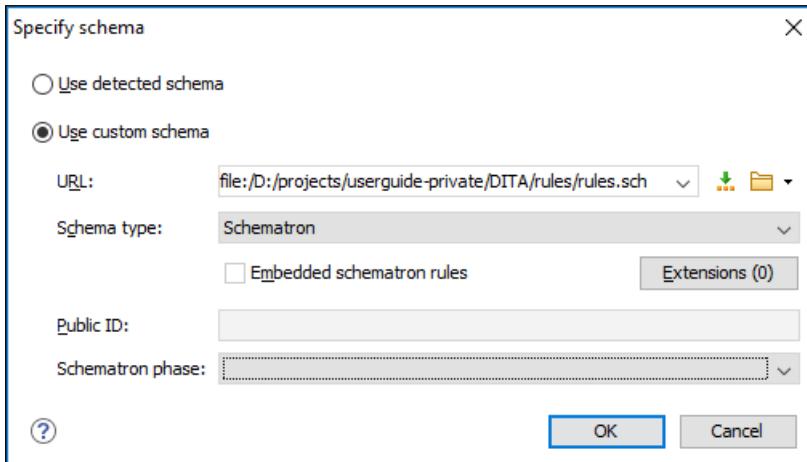

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Editor uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the *Document Type Association*, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **Document Type Association**.
  2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing framework (or use the **New** button to create a new one).
- Step Result:** This opens a [Document type configuration dialog box](#).
3. Go to the **Validation** tab.
  4. Create or edit a validation scenario:

- a. To *create a new validation scenario*, click the  **New** button.
  - b. To *edit the properties of an existing validation scenario*, select it and click the  **Edit** button (you can also use the  **Duplicate** button to copy an existing scenario and edit its properties).
5. *Add or configure validation units* according to your needs and click the  **Specify Schema** button.

**Step Result:** The **Specify Schema** dialog box is displayed:

**Figure 238: Specify Schema Dialog Box**

The **Specify Schema** dialog box contains the following options:

#### Use detected schema

Uses the *schema detected for the particular document*.

#### Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a *custom protocol*. You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** button, or the browsing tools in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
7. Click **OK** on both dialog boxes.

**Result:** The schema is now associated with the validation scenario you just configured for that particular document type.

## Associating a Schema Directly in XML Documents

### Associate Schema Action

The schema used by the Content Completion Assistant and document validation engine can be associated with the current document by using the  **Associate Schema** action. For most of the schema types, it uses [the XML-model processing instruction](#), with the exceptions of:

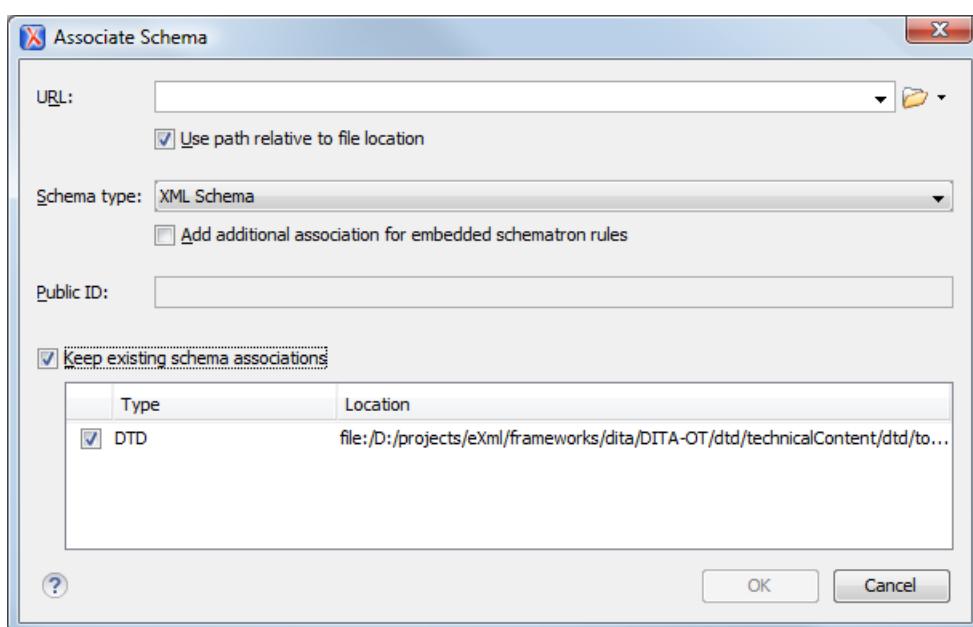

- **W3C XML Schema** - The xsi:schemaLocation attribute is used.
- **DTD** - The DOCTYPE declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of document type level.

To associate a schema to the current document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **Document > Schema** menu).

**Step Result:** The **Associate Schema** dialog box is displayed:

**Figure 239: Associate Schema Dialog Box**

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a [custom protocol](#).
- **Use path relative to file location** - Enable this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Add additional association for embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, enable this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Keep existing schema associations** - Enable this option to use the existing schema associations of the currently edited document.

- Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.
- Click **OK**.

**Result:** The schema association is created based upon the specified type.

- XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
  - xsi:schemaLocation attribute, if the root element of the document sets a default namespace with an xmlns attribute.
  - xsi:noNamespaceSchemaLocation attribute, if the root element does not set a default namespace.
- DTD** - The association with a DTD is added as a DOCTYPE declaration.
- Other** - The association with a Relax NG, Schematron, or NVDL schema is added as *xml-model processing instruction*.

**Tip:** To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

### Associate Schema with the `xml-model` Processing Instruction

The `xml-model` processing instruction associates a schema with the XML document that contains the processing instruction. It must be added at the beginning of the document, just after the XML prolog. The following code snippet contains an `xml-model` processing instruction declaration:

```
<?xml-model href="../schema.sch" type="application/xml"
 schematypens="http://purl.oclc.org/dsdl/schematron" phase="ALL"
 title="Main schema"?>
```

It is available in the [Content Completion Assistant](#), before XML document root element, and includes the following attributes:

- href** (required) - The schema file location.
- type** - The content type of the schema. This is an optional attribute with the following possible values for each specified type:
  - DTD - The recommended value is `application/xml-dtd`.
  - W3C XML Schema - The recommended value is `application/xml`, or can be left unspecified.
  - RELAX NG XML Syntax - The recommended value is `application/xml`, or can be left unspecified.
  - RELAX NG Compact Syntax - The recommended value is `application/relax-ng-compact-syntax`.
  - Schematron - The recommended value is `application/xml`, or can be left unspecified.
  - NVDL - The recommended value is `application/xml`, or can be left unspecified.
- schematypens** - The namespace for the schema language of the referenced schema with the following possible values:
  - DTD - Not specified.
  - W3C XML Schema - The recommended value is `http://www.w3.org/2001/XMLSchema`.
  - RELAX NG XML Syntax - The recommended value is `http://relaxng.org/ns/structure/1.0`.
  - RELAX NG Compact Syntax - Not specified.
  - Schematron - The recommended value is `http://purl.oclc.org/dsdl/schematron`.
  - NVDL - The recommended value is `http://purl.oclc.org/dsdl/nvd1/ns/structure/1.0`.
- phase** - The phase name for the validation function in Schematron schema. This is an optional attribute. To run all phases from the Schematron, use the special `#ALL` value. If the phase is not specified, the default phase that is configured in the Schematron will be applied.
- title** - The title for the associated schema. This is an optional attribute.

Older versions of Oxygen XML Editor used the `oxygen` processing instruction with the following attributes:

- RNGSchema** - Specifies the path to the Relax NG schema that is associated with the current document.
- type** - Specifies the type of Relax NG schema. It is used along with the `RNGSchema` attribute and can have the value `xml` or `compact`.

- NVDLSchema - Specifies the path to the NVDL schema that is associated with the current document.
- SCHSchema - Specifies the path to the SCH schema that is associated with the current document.

**Note:** Documents that use the oxygen processing instruction are compatible with newer versions of Oxygen XML Editor.

#### Related information

[Validating XML Documents](#) on page 437

[Content Completion Assistant in Text Mode](#) on page 293

[Content Completion Assistant in Author Mode](#) on page 337

#### Associating a Schema in the Document Type Association

The schema used to compute valid proposals in the Content Completion Assistant and by the document validation engine to report errors and warnings can be defined in each particular document type (framework). This schema will be used only if one is not detected in the current XML file.

To associate a schema in a particular Document Type Association, follow these steps:

1. Open the **Preferences dialog box (Options > Preferences)** and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing framework (or use the **New** button to create a new one).

**Step Result:** This opens a [Document type configuration dialog box](#).

3. Go to the **Schema tab**.
4. Select the schema type and its URI.
5. Click **OK**.

**Result:** The schema is now associated with the particular document type and will be used by the Content Completion Assistant and validation engine if a schema is not detected in the current XML document.

#### Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an [XML Catalog](#). Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteUri`, `delegateUri` mappings from the [XML Catalog](#)). If this succeeds, the process ends here.
- If the [Resolve schema locations also through system mappings option](#) is selected, it attempts to resolve the schema location as a system ID (`system`, `systemSuffix`, `rewriteSuffix`, `rewriteSystem` from the [XML Catalog](#)). If this succeeds, the process ends here.
- If the [Process "schemaLocation" namespaces through URI mappings for XML Schema option](#) is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the `schemaLocation` attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual [schema location](#) is used.

#### Learn Document Structure when Schema is not Detected

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Editor is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file to provide a DTD as an initialization source for [content completion](#) and [document validation](#). This feature is also useful for producing DTDs for documents that contain personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Editor automatically learns the document structure and uses it for [content completion](#). To disable this feature, disable the [Learn on open document option in the user preferences](#).

#### Related information

[Detecting a Schema](#) on page 464

## Create a DTD from Learn Document Structure Option

When there is no schema associated with an XML document, Oxygen XML Editor can learn the document structure by parsing the document internally. This feature is enabled with the [Learn on open document option](#) that is available in the user preferences.

To create a DTD from the learned structure, follow these steps:

1. Open the XML document for which a DTD will be created.
2. Go to **Document > XML Document > Learn Structure (Ctrl + Shift + L (Command + Shift + L on OS X))**.  
The **Learn Structure** action reads the mark-up structure of the current document. The **Learn completed** message is displayed in the application status bar when the action is finished.
3. Go to **Document > XML Document > Save Structure (Ctrl + Shift + S (Command + Shift + S on OS X))** and enter the DTD file path.
4. Press the **Save** button.

## Working with Modular XML Files in the Master Files Context

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the master XML files.

You can set a main XML document either using the [master files support from the Project view](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a master file include:

- Correct validation of a module in the context of a larger XML structure.
- **Content Completion Assistant** displays all collected entities and IDs starting from the master files.
- Oxygen XML Editor uses the schema defined in the master file when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The master files defined for the current module determines the [scope of the search and refactoring actions](#) for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Editor performs the search and refactoring actions in the context that the master files determine, improving the speed of execution.

To watch our video demonstration about editing modular XML files in the master files context, go to [https://www.oxygenxml.com/demo/Working\\_With\\_XML\\_Modules.html](https://www.oxygenxml.com/demo/Working_With_XML_Modules.html).

### Related information

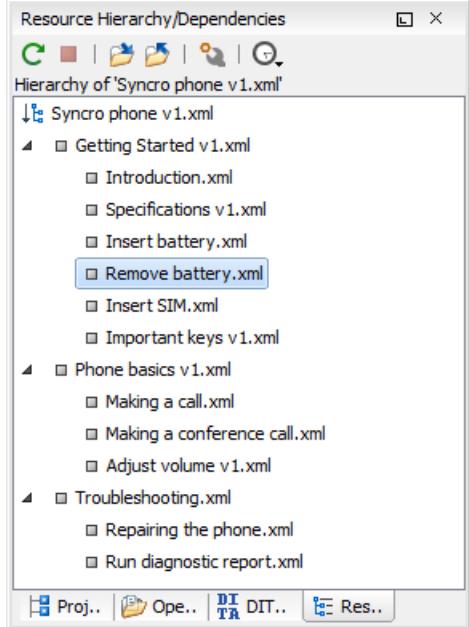

[Master Files Support](#) on page 279

[XML Resource Hierarchy/Dependencies View](#) on page 472

## XML Resource Hierarchy/Dependencies View

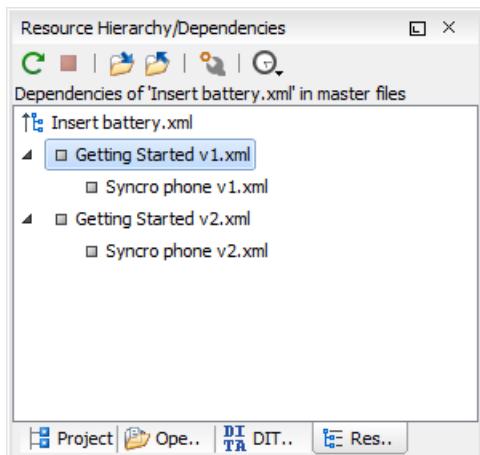

The **Resource Hierarchy/Dependencies** view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the *Xinclude* and *External Entity* mechanisms. To define the scope for calculating the dependencies of a resource, click  [Configure dependencies search scope](#) on the **Resource Hierarchy/Dependencies** toolbar.

To open this view, go to **Window > Show View > Resource Hierarchy/Dependencies**. As an alternative, right-click the current document and either select **Resource Hierarchy** or **Resource Dependencies**.

**Figure 240: Resource Hierarchy/Dependencies View - Hierarchy for Syncro phone v1.xml**

The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

**Figure 241: Resource Hierarchy/Dependencies View - Dependencies for Insert battery.xml**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

**Refresh**

Refreshes the Hierarchy/Dependencies structure.

**Stop**

Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

## Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

## History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

### **Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

### **Copy location**

Copies the location of the resource.

### **Move resource**

Moves the selected resource.

### **Rename resource**

Renames the selected resource.

### **Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

### **Show Resource Dependencies**

Shows the dependencies for the selected resource.

## Add to Master Files

Adds the currently selected resource in [the Master Files directory](#).

### **Expand All**

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

### **Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

**Note:** The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource](#). Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

### **Related information**

[Working with Modular XML Files in the Master Files Context](#) on page 472

[Search and Refactor Operations Scope](#) on page 463

## **Moving/Renaming XML Resources**

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

## Working with XML Catalogs

An *XML Catalog* maps a system ID or a URI reference pointing to a resource (stored either remotely or locally) to a local copy of the same resource. If XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the Internet connection is slow.

Oxygen XML Editor supports any XML Catalog file that conforms to one of the following:

1. [OASIS XML Catalogs Committee Specification v1.1](#).
2. [OASIS Technical Resolution 9401:1997](#), including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS XML Catalog specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements `systemSuffix` and `uriSuffix`.

Depending on the resource type, Oxygen XML Editor uses different catalog mappings.

**Table 9: Catalog Mappings**

Document	Referenced Resource	Mappings
XML	DTD	system or public The <a href="#">Prefer option</a> controls which one of the mappings should be used.
	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied): <ol style="list-style-type: none"><li>1. resolve the schema using <i>URI</i> catalog mappings.</li><li>2. resolve the schema using system catalog mappings.</li></ol>
	Relax NG	
	Schematron	
	NVDL	This happens only if the <a href="#">Resolve schema locations also through system mappings option</a> is enabled (it is by default). <ol style="list-style-type: none"><li>3. resolve the root namespace using <i>URI</i> catalog mappings.</li></ol>
XSL	XSL/ANY	<i>URI</i>
CSS	CSS	<i>URI</i>
XML Schema	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied): <ol style="list-style-type: none"><li>1. resolve schema reference using <i>URI</i> catalog mappings.</li><li>2. resolve schema reference using system catalog mappings.</li></ol>
Relax NG	Relax NG	This happens only if the <a href="#">Resolve schema locations also through system mappings option</a> is enabled (it is by default). <ol style="list-style-type: none"><li>3. resolve schema namespace using <i>uri</i> catalog mappings.</li></ol>

## Creating an XML Catalog with a Template

An XML Catalog file can be created quickly in Oxygen XML Editor starting from the two XML Catalog document templates called *OASIS XML Catalog 1.0* and *OASIS XML Catalog 1.1* and available when [creating new document templates](#).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog
 PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
 "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">

<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">

 <!-- Use "system" and "public" mappings when resolving DTDs -->
 <system
 systemId="http://www.docbook.org/xml/4.4/docbookx.dtd"
 uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>

 <!-- "systemSuffix" matches any system ID ending in a specified string -->
 <systemSuffix
 systemIdSuffix="docbookx.dtd"
 uri="frameworks/docbook/dtd/docbookx.dtd"/>

 <!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
 <uri
 name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
 uri="frameworks/docbook/5.0/rng/docbookxi.rng"/>

 <!-- The "uriSuffix" matches any URI ending in a specified string -->
 <uriSuffix
 uriSuffix="docbook.xsl"
 uri="frameworks/docbook/xsl/fo/docbook.xsl"/>

</catalog>
```

## How Oxygen XML Editor Determines which Catalog to Use

An XML catalog is used to resolve references for document validation and transformations and it maps such references to the built-in local copies of the schemas of the Oxygen XML Editor frameworks (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Editor includes a built-in catalog set as default, but you can also create your own and Oxygen XML Editor looks for catalogs in the following order:

- Global user-defined catalogs that are set in the [XML Catalog preferences page](#).
- User-defined catalogs that are set at document type level, in the [Catalog tab](#) from the [Document Type configuration dialog box](#).
- Default built-in catalogs.

An XML catalog can be used to map a W3C XML Schema specified with an URN in the `xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
 uri="topic.xsd"/>
```

## Related information

[XML Catalog Preferences](#) on page 109

## Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an [XML Catalog](#). Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteUri`, `delegateUri` mappings from the XML Catalog). If this succeeds, the process ends here.
- If the ***Resolve schema locations also through system mappings*** option is selected, it attempts to resolve the schema location as a system ID (`system`, `systemSuffix`, `rewriteSuffix`, `rewriteSystem` from the XML Catalog). If this succeeds, the process ends here.
- If the ***Process "schemaLocation" namespaces through URI mappings for XML Schema*** option is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the `schemaLocation` attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual ***schema location*** is used.

## Editing Large XML Documents with DTD Entities or XInclude

Consider the case of documenting a large project. It is likely that there will be several people involved. The resulting document can be few megabytes in size. The question becomes how to deal with this amount of data in such a way that work parallelism will not be affected.

Fortunately, XML provides two solutions for this: *DTD Entities* and *XInclude*. A master document can be created, with references to the other document parts, containing the document sections. The users can edit the documents individually, then apply an XSLT stylesheet over the master and obtain the output files in various formats (for example, PDF or HTML).

### Including Document Parts with DTD Entities

There are two conditions for including a part using DTD entities:

- The master document should declare the DTD to be used, while the external entities should declare the XML sections to be referenced.
- The document containing the section must not define again the DTD.

A master document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM ".../xml/docbookx.dtd" [
 <!ENTITY testing SYSTEM "testing.xml" >
]>
<book>
 <chapter> ...
```

The referenced document looks like this:

```
<section> ... here comes the section content ... </section>
```

#### Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

At a certain point in the master document there can be inserted the section *testing.xml* entity:

```
... &testing; ...
```

When splitting a large document and including the separate parts in the master file using external entities, only the master file will contain the Document Type Definition (the DTD) or other type of schema. The included sections can not define the schema again because the main document will not be valid. If you want to validate the parts separately you have to *use XInclude* for assembling the parts together with the master file.

### Including Document Parts with XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. It enables larger documents to be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files in the main file. XInclude is targeted as the replacement for External Entities. The advantage of using XInclude is that, unlike the entities method, each of the assembled documents is permitted

to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE, as is the case with External Entities. This makes XInclude a more convenient and effective method for managing XML instances that need to be stand-alone documents and part of a much larger project.

The main application for XInclude is in the document-oriented content frameworks such as manuals and Web pages. Employing XInclude enables you to manage content in a modular fashion that is akin to Object Oriented methods used in languages such as Java, C++ or C#.

The advantages of modular documentation include: reusable content units, smaller file units that are easier to be edited, better version control and distributed authoring.

### Include a chapter in an article using XInclude

Create a chapter file and an article file in the samples folder of the Oxygen XML Editor install folder.

Chapter file (`introduction.xml`) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
 <title>Getting started</title>
 <section>
 <title>Section title</title>
 <para>Para text</para>
 </section>
</chapter>
```

Main article file looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[<!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
 <title>Install guide</title>
 <para>This is the install guide.</para>
 <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
 href="introduction.xml">
 <xi:fallback>
 <para>
 <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
 </para>
 </xi:fallback>
 </xi:include>
</article>
```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the `xi` namespace to certain elements defined by the DocBook DTD.
- The `href` attribute of the `xi:include` element specifies that the `introduction.xml` file will replace the `xi:include` element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the `xi:fallback` element - a `FIXME` message.

If you want to include only a fragment of a file in the master file, the fragment must be contained in a tag having an `xml:id` attribute and you must use an XPointer expression pointing to the `xml:id` value.

**Notice:** Oxygen XML Editor supports the [XPointer Framework](#) and the [XPointer element\(\) Scheme](#), but it does NOT support the [XPointer xp pointer\(\) Scheme](#).

For example, if the master file is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
 schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
 <xi:include href="a.xml" xpointer="a1"
```

```
 xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the a.xml file is:

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
 <a xml:id="a1">test
</test>
```

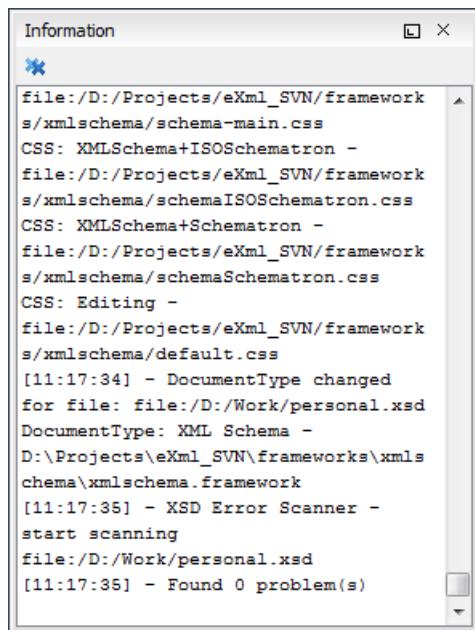

after resolving the XPointer reference the document is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
 schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
 <a xml:id="a1" xml:base="a.xml">test
</test>
```

The XInclude support in Oxygen XML Editor is enabled by default. To [configure it, open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > Enable XInclude processing**. When enabled, Oxygen XML Editor will be able to validate and transform documents comprised of parts added using XInclude.

## Viewing Status Information

Status information generated by operations such as *schema detection*, *manual validation*, *automatic validation*, and *transformations* are fed into the **Information** view, allowing you to monitor how the operation is being executed.

**Figure 242: Information view messages**

Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages can be controlled with the [\*\*Maximum number of lines\*\*](#) option in the **Views** preference page.

To make the view visible, select **Window > Show View > Information**.

## Making a Persistent Copy of Results

The **Results** view displays the results from the following operations:

- [\*document validation\*](#)
- [\*checking the form of documents\*](#)
- [\*XSLT or FO transformation\*](#)

- [find all occurrences of a string in a file](#)
- [find all occurrences of a string in multiple files](#)
- [applying an XPath expression to the current document](#)

To make a persistent copy of the **Results** view, use one of these actions:

#### **File > Save Results**

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

#### **File > Print Results**

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results panel**. The action is also available on the right-click menu of the **Results** panel.

#### **Save Results as XML from the contextual menu**

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
 <Incident>
 <engine>The engine who provide the error.</engine>
 <severity>The severity level</severity>
 <Description>Description of output message.</Description>
 <SystemID>The location of the file linked to the message.</SystemID>
 <Location>
 <start>
 <line>Start line number in file.</line>
 <column>Start column number in file</column>
 </start>
 <end>
 <line>End line number in file.</line>
 <column>End column number in file</column>
 </end>
 </Location>
 </Incident>
</Report>
```

#### **Related information**

[Results View](#) on page 197

## **Editor Highlights**

An *editor highlight* is a text fragment emphasized by a colored background.

Highlights are generated in both **Text** and **Author** mode when the following actions generate results:

- Find/Replace in Files
- Open/Find Resource
- Find All
- Find All Elements
- XPath in Files
- Search References
- Search Declarations

By default, Oxygen XML Editor uses a different color for each type of highlight (*XPath in Files*, *Find/Replace*, *Search References*, *Search Declarations*, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the [Editor preferences page](#). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the document.
- Clicking the **Next** and **Previous** buttons (➡) from the bottom of the range ruler.

**Note:** When there are multiple types of highlights in the document, the **Next** and **Previous** buttons (➡) navigate through highlights of the same type.

- Clicking the messages displayed in the [Results view](#) at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the **\*Remove all** button from bottom of the range ruler.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the **\*Remove all** button from the results panel at the bottom of the editor.

**Note:** Use the **Highlight all results in editor** button to either display all the highlights or hide them.

## Printing a File

Printing is supported in **Text**, **Author**, and **Grid** modes. The **Print(Ctrl + P (Command + P on OS X))** action that is available from **File** menu displays the **Page Setup** dialog box, used for defining the page size and orientation properties for printing.

A **Print Preview** action is also available in the **File** menu. It allows you to manage the format of the printed document.

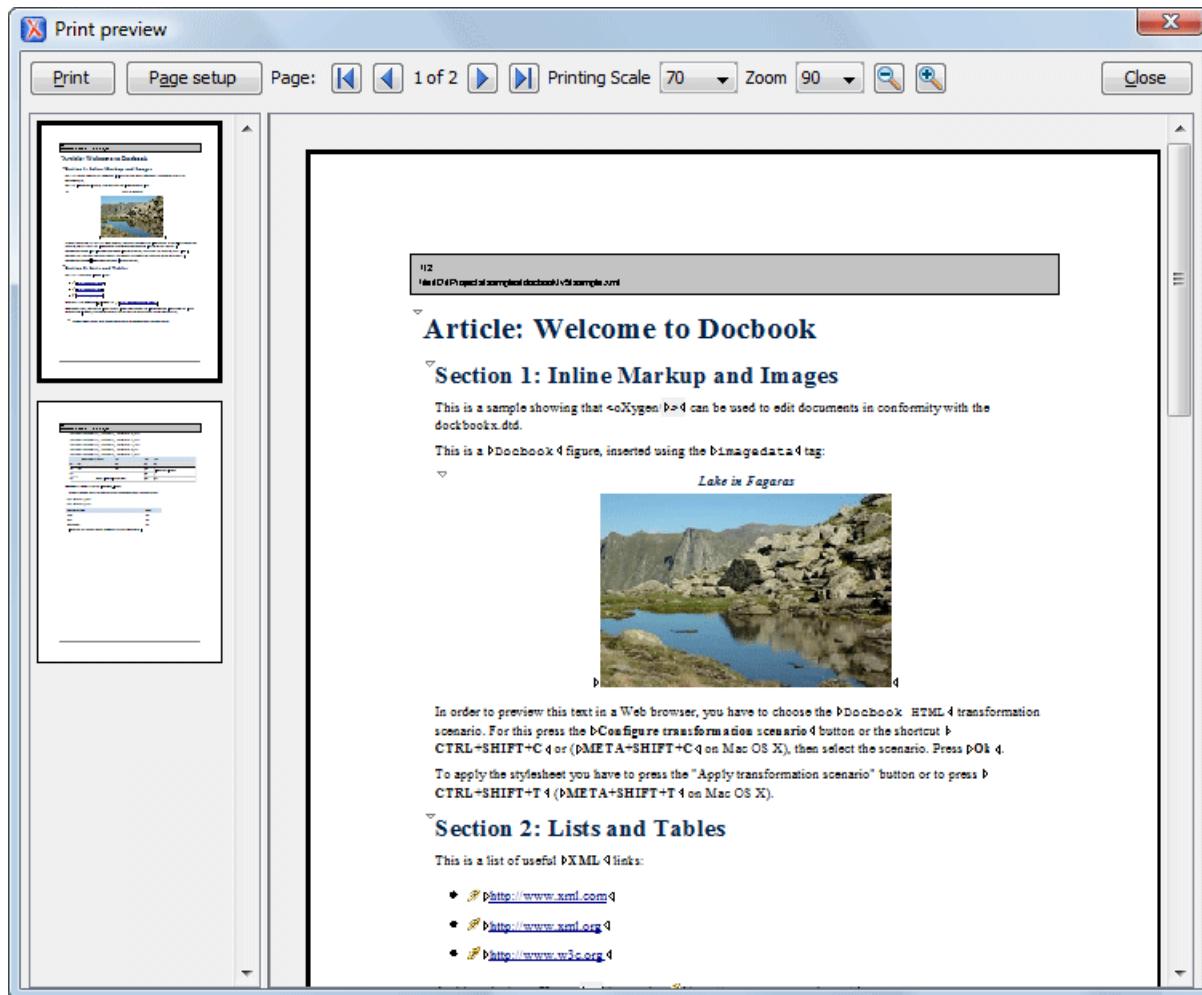

Figure 243: Print Preview Dialog Box

The main window is split in three sections:

- Preview area** - Displays the formatted document page as it will appear on printed paper.
- Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

## Other Printing Features

- If you are printing a document that is opened in the **Author** visual editing mode, you can use the [CSS print media type](#) to change the styling in the printed output.
- If you are printing a document that is opened in **Author** mode and it contains [Tracked Changes](#), you can print (or print preview) a copy of the document as if all changes have been accepted by switching the [Track Changes Visualization Mode](#) to [View Final](#).
- If you are printing a document that is opened in **Text** mode and line numbers are displayed (the [Show line numbers option](#) is enabled), the printed output will include the line numbers.
- If you are printing an XML document that is opened in **Text** mode and the [folding support](#) is activated (the [Enable folding option](#) is enabled), the printed output will include the current folded state. Note that this applies to printing an entire document and not selections within the document.
- If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.

## XML Quick Fixes

The Oxygen XML Editor Quick Fix support helps you resolve errors that appear in an XML document by offering quick fixes to problems such as missing required attributes or invalid elements. Quick fixes are available in **Text** mode and **Author** mode

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window and the available quick fixes include a link that can be used to perform the fix.

Figure 244: Quick Fix Presented in a Tooltip in Text Mode

Figure 245: Quick Fix Presented in a Tooltip in Author Mode

- When hovering over the error or warning in **Author** mode, a small quick fix drop-down menu is presented. You can use the drop-down menu to display a list of available quick fixes to select from for the particular error or warning.

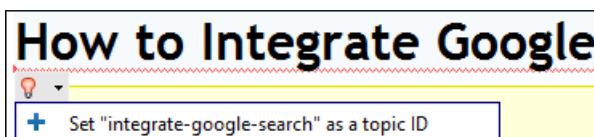

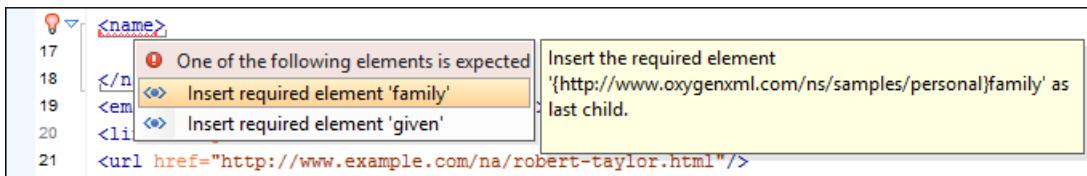

Figure 246: Quick Fix Drop-Down Menu in Author Mode

- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.

**Figure 247: Quick Fix Menu Invoked by Clicking on the Icon**

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of quick fixes is recomputed to ensure that you always have valid proposals.

**Note:** A quick fix that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the *Content Completion Assistant options* are configured.

#### Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers quick fixes for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in **Text mode** and **Author mode**.

Oxygen XML Editor provides quick fixes for numerous types of problems, including the following:

Problem type	Available quick fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

#### Related information

[Schematron Quick Fixes \(SQF\) on page 483](#)

#### Schematron Quick Fixes (SQF)

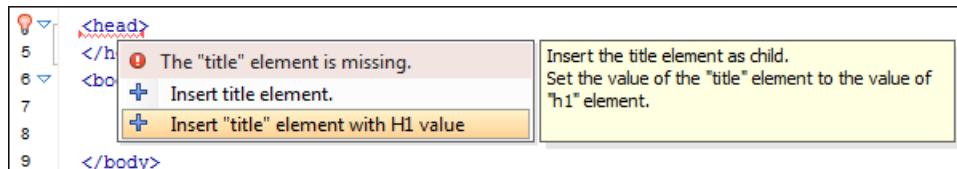

Oxygen XML Editor provides support for Schematron Quick Fixes (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match

specific naming conventions. For more details and examples, please see the following blog post: <http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html>.

## Displaying the Schematron Quick Fix Proposals

The defined Schematron Quick Fixes are displayed on validation errors in **Text** mode and **Author** mode.

**Figure 248: Example of a Schematron Quick Fix**

## Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

### XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project** view.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view.

**Note:** The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that are used also appear in the **Refactoring** submenu of the contextual menu in the **Project** view and the **DITA Maps Manager**.

### XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

#### Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

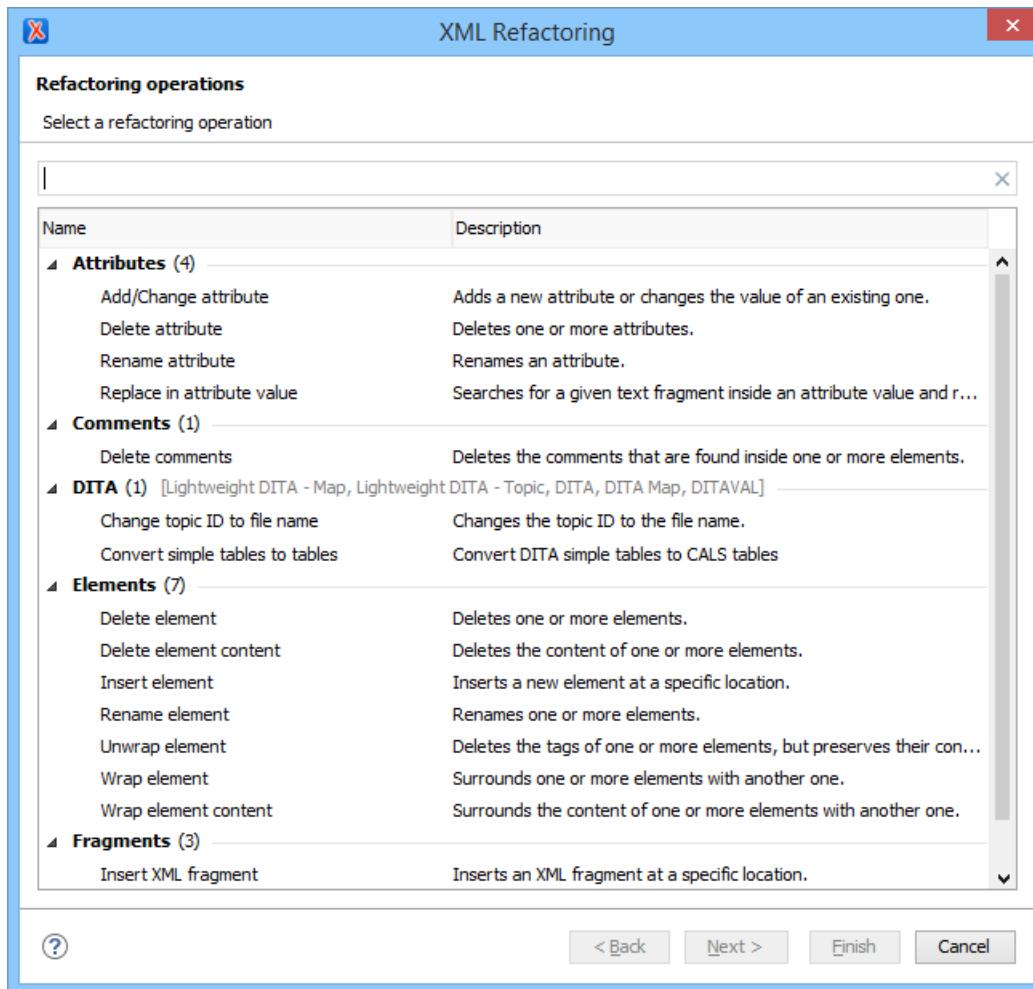

Figure 249: XML Refactoring Wizard

### Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

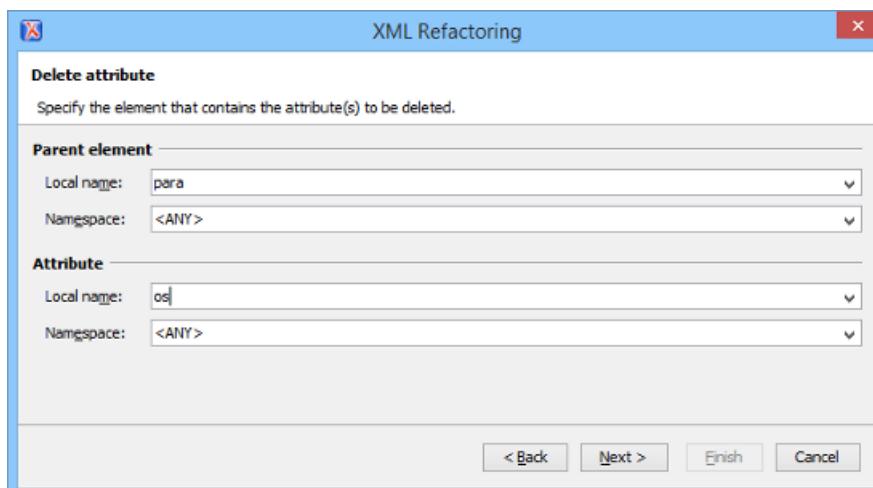

Figure 250: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

## Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map hierarchy, etc.) or you can define your own set of resources by creating a working set.

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When enabled, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When enabled, the resources inside archives will also be affected.

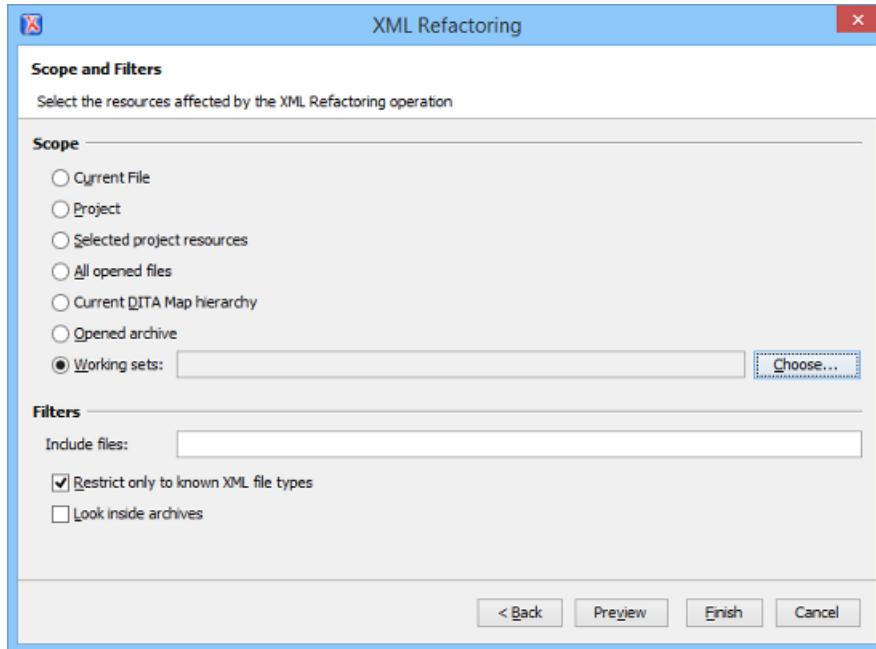

Figure 251: XML Refactoring - Scope and Filters Wizard Page

If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

**Note:** It is recommended that you use the **Preview** button to review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:** After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

## Predefined Refactoring Operations

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:** Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:

## Refactoring Operations for *Attributes*

### Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
  - **Value** - The value for the affected attribute.
- **Options** section
  - You can choose between one of the following options for the **Operation mode**:
    - **Add the attribute in the parent elements where it is missing**
    - **Change the value in the parent elements where the attribute already exists**
    - **Both**

### Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

### Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

### Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
  - **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
  - **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
  - **Find** - The text fragments to find. You can use Perl-like regular expressions.
  - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups (\$1, \$2, etc.) from the find pattern.

## Refactoring Operations for *Comments*

### Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

## Refactoring Operations for *DITA*

### Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

### Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

## Refactoring Operations for *Elements*

### Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

### Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

### Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
  - **Local name** - The local name of the element to be inserted.
  - **Namespace** - The namespace of the element to be inserted.
- **Location** section
  - **XPath** - An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

- **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

### Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

### Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

### Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element*.
  - **Namespace** - The namespace of the *Wrapper element*.

### Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
  - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

## Refactoring Operations for *Fragments*

### Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
- **Location** section
- **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

### Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

## Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

## Refactoring Operations for JATSKit

### Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

### Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

## Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.. This operation allows you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as \* or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is enabled, the scope of the operation will include files inside archives.

## Additional Notes

**Note:** There are some operations that allow <ANY> for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO\_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

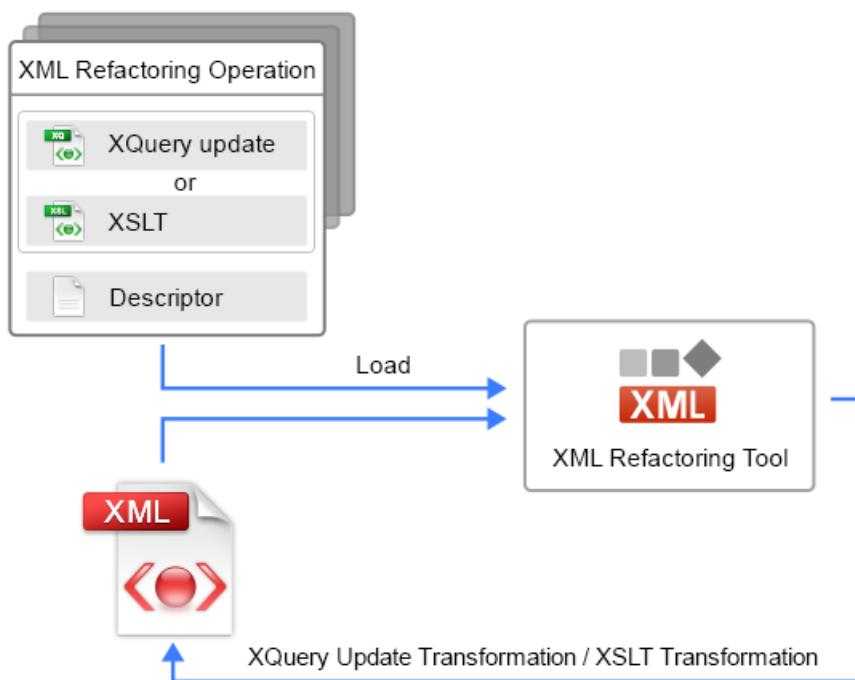

**Note:** Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-FO-XQUERY > XPath](#) page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

### Custom Refactoring Operations

While Oxygen XML Editor includes a variety of predefined XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

**Figure 252: Diagram of an XML Refactoring Operation**

All the defined custom operations are loaded by the *XML Refactoring Tool* and presented in [the Refactoring Operations wizard page](#), along with the predefined built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a *safe mode*, which implies the following:

- When loading the document:
  - The *XInclude* mechanism is disabled. This means that the resources included by using *XInclude* will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
  - The DOCTYPE will be preserved.
  - The DTD entities will be preserved as they are in the original document when the document is saved.

- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

**Restriction:** *Comments or processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments or processing instructions* that are inside the root element.

### Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. [Create an XQuery Update script or XSLT file](#).
2. [Create an XML Refactoring Operation Descriptor file](#).
3. Store both files in [one of the locations that Oxygen XML Editor](#) scans when loading the custom operations.

**Result:** Once you run the **XML Refactoring** tool again, the custom operation appears in [the Refactoring Operations wizard page](#).

#### Related information

[Storing and Sharing Refactoring Operations](#) on page 498

### Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an [XQuery Update script](#) or [XSLT stylesheet](#) that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use [our examples](#) to help you with the content.

There are cases when it is necessary to add parameters in the [XQuery script](#) or [XSLT stylesheet](#). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in [the refactoring operation descriptor file](#) that is associated with this operation.

**Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this facility by creating an [XQuery transformation scenario](#) and choose **Saxon EE** as the transformation engine. Also, you need to make sure the [Enable XQuery update option is enabled in the Saxon processor advanced options](#).

**Note:** If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the [XML /XSLT-FO-XQuery / XPath preferences page](#).

The next step in creating a custom refactoring operation is to [create a custom operation descriptor file](#).

#### Related information

[Example of an XML Refactoring Operation](#) on page 495

### Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

### Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessary when loading an XML Refactoring operation . It also contains the path to the XQuery Update script or XSLT stylesheet that is associated with the particular operation through the `script` element.

You can specify a category for your custom operations to logically group certain operations. The **category** element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: frameworks/xml\_refactoring/operation\_descriptor.xsd.

## Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within [the Configure Operation Parameters wizard page](#) for that particular operation.

The value of the first **description** element in the **parameters** section will be displayed at the top of [the Configure Operation Parameters wizard page](#).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - TEXT - Generic type used to specify a simple text fragment.
  - XPATH - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.

**Note:** The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the saxon:evaluate Saxon extension function.

**Note:** A relative XPath expression is converted to an absolute XPath expression by adding // before it (//XPathExp). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:** When writing XPath expressions, you can only use prefixes declared in the [Options > Preferences > XML > XSLT-FO-XQUERY > XPath](#) options page.

- NAMESPACE - Used for editing namespace values.
- REG\_EXP\_FIND - Used when you want to match a certain text by using Perl-like regular expressions.
- REG\_EXP\_REPLACE - Used along with REG\_EXP\_FIND to specify the replacement string.
- XML\_FRAGMENT - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.
- NC\_NAME - The parameter for NC\_NAME values. It is useful when you want to specify the local part of a QName for an element or attribute.
- BOOLEAN - Used to edit boolean parameters.
- TEXT\_CHOICE - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
 <value name="before">Before</value>
 <value name="after" default="true">After</value>
 <value name="firstChild">First child</value>
 <value name="lastChild">Last child</value>
</possibleValues>
```

## Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

### elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the label attribute is displayed in the application as the label of the text field. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the useCurrentContext attribute is set to true, the element name from the cursor position is used as proposed values for this parameter.

Example of an elementLocation:

```
<elementLocation name="elem_loc" useCurrentContext="false">
 <element label="Element location">
 <description>Element location description.</description>
 </element>
</ ElementLocation>
```

### attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the label attributes is displayed in the application as the label of the associated text fields. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the element and attribute text fields. For example, if section is entered for the element and a title is entered for the attribute, the XPath expression would be computed as //section/@title. If the value of the useCurrentContext attribute is set to true, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an attributeLocation:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
 <element label="Element path">
 <description>Element path description.</description>
 </element>
 <attribute label="Attribute" >
 <description>Attribute path description.</description>
 </attribute>
</ AttributeLocation>
```

### elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the **Name** and **Namespace** combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```
<elementParameter id="elemID">
 <localName label="Name" name="element_localName" allowsAny="true"
useCurrentContext="true">
 <description>Local name of the parent element.</description>
 </localName>
 <namespace label="Namespace" name="element_namespace" allowsAny="true">
 <description>Local name of the parent element</description>
 </namespace>
</elementParameter>
```

## attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as the label of the associated combo box. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

**Note:** An attributeParameter is dependant upon an elementParameter. The list of attributes and namespaces are computed based on the selection in the elementParameter combo boxes.

Example of an attributeParameter:

```
<attributeParameter dependsOn="elemID">
 <localName label="Name" name="attribute_localName" useCurrentContext="true">
 <description>The name of the attribute to be converted.</description>
 </localName>
 <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
 <description>Namespace of the attribute to be converted.</description>
 </namespace>
</attributeParameter>
```

**Note:** All predefined operations are loaded from the [OXYGEN\_INSTALL\_DIR]/refactoring folder.

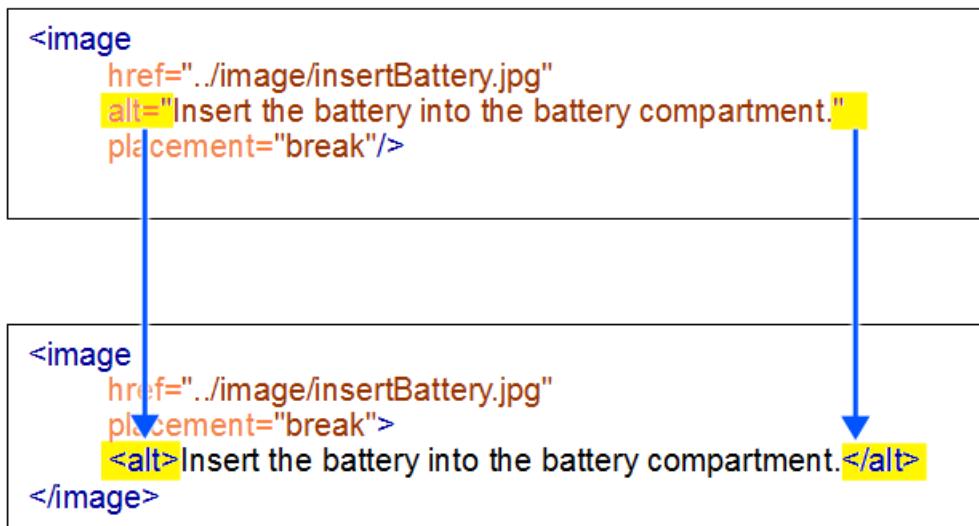

## Related information

[Example of an XML Refactoring Operation](#) on page 495

## Example of an XML Refactoring Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of image elements where a deprecated alt attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the image element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

**Figure 253: Example: Custom XML Refactoring Operation**

A new custom XML refactoring operation requires:

- An [XQuery Update script](#) or [XSLT stylesheet](#).
- An [XML Refactoring operation descriptor file](#) that contains the path to the XQuery Update script or XSLT stylesheet.

## **Example of an XQuery Update Script for Creating a Custom Operation to Convert an Attribute to an Element**

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the QName of the new element to be inserted and inserts it as the first child of the parent element.

```
(:
 XQuery document used to implement 'Convert attribute to element'
 operation from XML Refactoring tool.
:)

declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";
declare option output:method "xml";
declare option output:indent "no";

(: Local name of the attribute's parent element. :)
declare variable $element_localName as xs:string external;

(: Namespace of the attribute's parent element. :)
declare variable $element_namespace as xs:string external;

(: The local name of the attribute to be converted :)
declare variable $attribute_localName as xs:string external;

(: The namespace of the attribute to be converted :)
declare variable $attribute_namespace as xs:string external;

(: Local name of the new element. :)
declare variable $new_element_localName as xs:string external;

(: Namespace of the new element. :)
declare variable $new_element_namespace as xs:string external;

(: Convert attribute to element:)
for $node in //*
(: Find the attribute to convert :)
let $attribute :=
 $node/@*[local-name() = $attribute_localName and
 ($attribute_namespace = '<ANY>' or $attribute_namespace = namespace-uri())]

(: Compute the prefix for the new element to insert :)
let $prefix :=
 for $p in in-scope-prefixes($node)
 where $new_element_namespace = namespace-uri-for-prefix($p, $node)
return $p

(: Compute the qname for the new element to insert :)
let $new_element_qName :=
 if (empty($prefix) or $prefix[1] = '') then $new_element_localName
 else $prefix[1] || ':' || $new_element_localName

where ('<ANY>' = $element_localName or local-name($node) = $element_localName)
and
($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))

return
 if (exists($attribute)) then
 (insert node element {QName($new_element_namespace, $new_element_qName)}
 {string($attribute)} as first into $node,
 delete node $attribute)
 else ()
```

## **Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element**

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xs="http://www.w3.org/2001/XMLSchema"
 exclude-result-prefixes="xs"
 xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
 version="2.0">

 <xsl:import href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>

 <xsl:param name="element_localName" as="xs:string" required="yes"/>
 <xsl:param name="element_namespace" as="xs:string" required="yes"/>
 <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
 <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
```

```

<xsl:param name="new_element_localName" as="xs:string" required="yes"/>
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
 <xsl:copy>
 <xsl:apply-templates select="node() | @*"/>
 </xsl:copy>
</xsl:template>
<xsl:template match="/*[xr:check-local-name($element_localName, ., true())
and
xr:check-namespace-uri($element_namespace, .)]">

 <xsl:variable name="attributeToConvert"
 select="@*[xr:check-local-name($attribute_localName, ., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>

 <xsl:choose>
 <xsl:when test="empty($attributeToConvert)">
 <xsl:copy>
 <xsl:apply-templates select="node() | @*"/>
 </xsl:copy>
 </xsl:when>
 <xsl:otherwise>
 <xsl:copy>
 <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
 <xsl:copy-of select=". "/>
 </xsl:for-each>
 <!-- The new element namespace -->
 <xsl:variable name="nsURI" as="xs:string">
 <xsl:choose>
 <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
 <xsl:value-of select="" />
 </xsl:when>
 <xsl:otherwise>
 <xsl:value-of select="$new_element_namespace" />
 </xsl:otherwise>
 </xsl:choose>
 </xsl:variable>
 <xsl:element name="${$new_element_localName}" namespace="${$nsURI}">
 <xsl:value-of select="$attributeToConvert"/>
 </xsl:element>
 <xsl:apply-templates select="node()"/>
 </xsl:copy>
 </xsl:otherwise>
 </xsl:choose>
</xsl:template>
</xsl:stylesheet>

```

**Note:** The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML catalog set in the *XML Refactoring* framework.

### Example of an Operation Descriptor File for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XQuery script or XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
 id="convert-attribute-to-element"
 name="Convert attribute to element">
 <description>Converts the specified attribute to an element.
 The new element will be inserted as first child of the attribute's
 parent element.</description>
 <!-- For the XSLT stylesheet option uncomment the following line and comment
 the line referring the XQuery Update script -->
 <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
 <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
 <parameters>
 <description>Specify the attribute to be converted to element.</description>
 <section label="Parent element">
 <elementParameter id="elemID">
 <localName label="Name" name="element_localName" allowsAny="true">
 <description>Local name of the parent element.</description>
 </localName>
 <namespace label="Namespace" name="element_namespace" allowsAny="true">
 <description>Local name of the parent element</description>
 </namespace>
 </elementParameter>
 </section>
 <section label="Attribute">
 <attributeParameter dependsOn="elemID">
 <localName label="Name" name="attribute_localName">
 <description>Name of the attribute to be converted.</description>
 </localName>
 </attributeParameter>
 </section>
 </parameters>
</refactoringOperationDescriptor>

```

```

<namespace label="Namespace" name="attribute_namespace" allowsAny="true">
 <description>Namespace of the attribute to be converted.</description>
</namespace>
</attributeParameter>
</section>
<section label="New element">
 <elementParameter>
 <localName label="Name" name="new_element_localName">
 <description>The name of the new element.</description>
 </localName>
 <namespace label="Namespace" name="new_element_namespace">
 <description>The namespace of the new element.</description>
 </namespace>
 </elementParameter>
</section>
</parameters>
</refactoringOperationDescriptor>

```

**Note:** If you are using an XSLT file, the line with the `script` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

## Results

After you have created these files, copy them into a folder [scanned by Oxygen XML Editor when it loads the custom operation](#). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

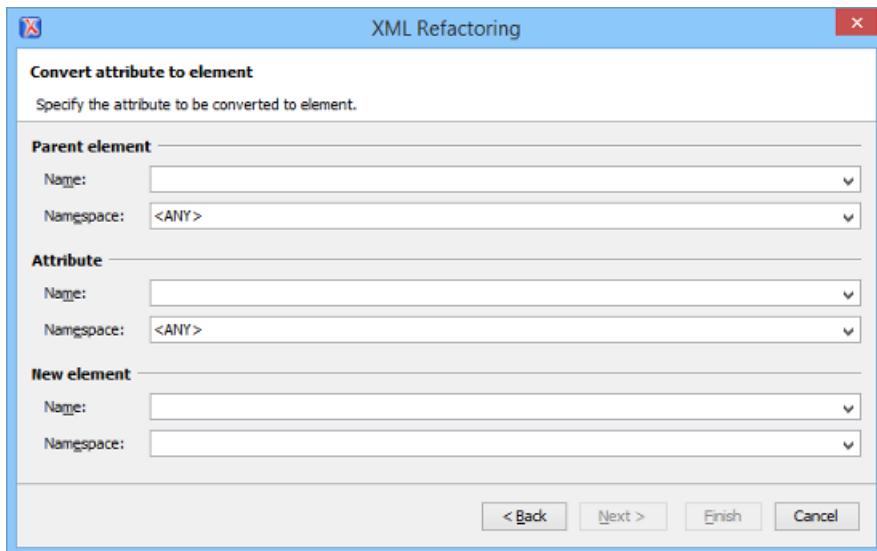

Figure 254: Example: XML Refactoring Wizard for a Custom Operation

## Storing and Sharing Refactoring Operations

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A refactoring folder, created inside a directory that is associated to a framework you are customizing.
- Any folder. In this case, you need to [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Refactoring**, and specify the same folder in the **Load additional refactoring operations from** text box.

**Note:** If you share a project with your team, you can also share the custom operation by doing the following: Then by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to project level:
  - a. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Refactoring**.
  - b. Select **Project Options** at the bottom of the dialog box.

- In the **Load additional refactoring operations from text box**, use the \${pd} editor variable so that the folder path is declared relative to the project.
- A folder specified by the [XML Refactoring Operations Plugin Extension](#).
- The refactoring folder from the Oxygen XML Editor installation directory ([OXYGEN\_INSTALL\_DIR]/refactoring/).

## Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as frameworks or projects.

After storing custom operations, you can share them with other users by sharing the resources.

## Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in [OXYGEN\_INSTALL\_DIR]/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The description of the parameters element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the [Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- An i18n folder located in directories specified through the [XML Refactoring Operations Plugin Extension](#).
- The refactoring/i18n folder from the Oxygen XML Editor installation directory ([OXYGEN\_INSTALL\_DIR]/refactoring/i18n).

### Example of a Refactoring Operation Descriptor File with i18n Support

```

<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
 name="${i18n(Remove_text_content)}">
 <description>${i18n(Remove_text_content_description)}</description>
 <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
 <parameters>
 <description>${i18n(parameters_description)}</description>
 <parameter label="${i18n(Element_name)}" name="element_localName"
 type="NC_NAME">
 <description>${i18n(Element_name_descriptor)}</description>
 <possibleValues>
 <value default="true" name="value1">${i18n(value_1)}</value>
 <value name="value2">${i18n(value_2)}</value>
 </possibleValues>
 </parameter>
 </parameters>
</refactoringOperationDescriptor>
```

## Editing XSLT Stylesheets

---

Oxygen XML Editor includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:

- **Create new XSLT files and templates** - You can use the built-in new file wizards to [create new XSLT documents or templates](#).
- **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor ([Text mode](#)).
- **Visual Editing** - XSLT stylesheets are rendered, and can be edited, in the [visual Author editing mode](#).
- **Validation** - Presents validation errors in XSLT files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes XSLT files more readable.

To watch our video demonstration about basic XSLT editing and transformation scenarios in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/XSL\\_Editing.html](https://www.oxygenxml.com/demo/XSL_Editing.html).

## Editing XSLT Stylesheets in the Master Files Context

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You can set a main XSLT stylesheet either using the [master files support from the Project view](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger stylesheet structure.
- **Content Completion Assistant** displays all components valid in the current context.
- The **Outline** displays the components collected from the entire stylesheet structure.

To watch our video demonstration about editing XSLT stylesheets in the master files context, go to <https://www.oxygenxml.com/demo/MasterFilesSupport.html>.

### Related information

[XSLT Component Dependencies View](#) on page 515

## Validating XSLT Stylesheets

Oxygen XML Editor performs the validation of XSLT documents with the help of an XSLT processor [that you can configure in the preferences pages](#) according to the XSLT version. For XSLT 1.0, the options are: Xalan, Saxon 6.5.5, Saxon 9.6.0.7 and [a JAXP transformer specified by the main Java class](#). For XSLT 2.0, the options are: Saxon 9.6.0.7 and [a JAXP transformer specified by the main Java class](#). For XSLT 3.0, the options are Saxon 9.6.0.7 and [a JAXP transformer specified by the main Java class](#).

To access the [XSLT preferences](#) quickly, use the Validation options action from the **Document > Validate** menu.

### Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XSLT/FO/XQuery > XSLT**.

You can also create new validation scenarios or edit existing ones, and you can add jars and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

1. With the XSLT file opened in Oxygen XML Editor, select the **Configure Validation Scenario(s)** from the **Document > Validate** menu, or the **Validation** toolbar drop-down menu, or from the **Validate** submenu when invoking the contextual menu on the XSLT file in the **Project** view .  
The **Configure Validation Scenario(s)** dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the **Settings** drop-down menu to filter which scenarios are shown.
2. To edit an existing scenario, select the scenario and press the **Edit** button. If you try to edit one of the *read-only* predefined scenarios, Oxygen XML Editor creates a customizable duplicate (you can also use the **Duplicate** button).
3. To add a new scenario, press the **New** button.

The **New scenarios** dialog box is displayed. It lists all validation units of the scenario.

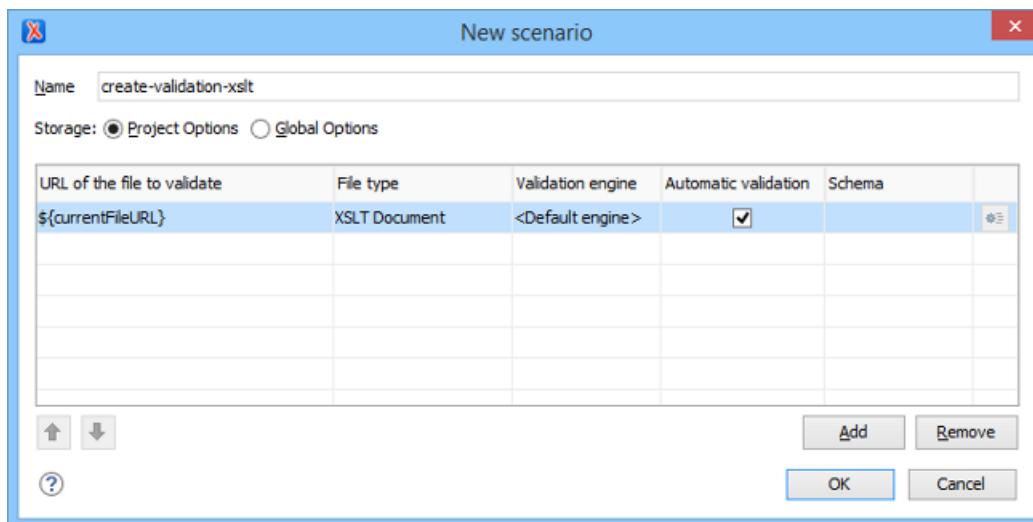

Figure 255: Add / Edit a Validation Unit

4. Configure the following information in this dialog box:
  - a) **Name** - The name of the validation scenario.
  - b) **Storage** - You can choose between storing the scenario in the **Project Options** or **Global Options**.
  - c) **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, double-click its cell and enter the URL in the text field, select it from the drop-down list, or use the **Browse** drop-down menu or **Insert Editor Variable** button.
  - d) **File type** - The file type should be **XSLT Document**.
  - e) **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
  - f) **Automatic validation** - If this option is checked, the validation operation defined by this row is also used by *the automatic validation feature*.
5. To add or edit extensions, click the **Edit extensions** button. This button is only available if the **File type** is set as **XSLT Document** and a **Validation engine** is chosen.  
The **Libraries** dialog box is opened. It is used to specify the jars and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and press the **Move up** or **Move down** buttons.
6. Press **OK** to close the **New scenario** dialog box.  
The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current XSLT document and press the **Apply associated** button to run the validation scenario.

## Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Editor preferences. After a custom validation engine is [properly configured](#), it can be applied on the current document by selecting it from the list of custom validation engines in the Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in [Preferences page](#).
- **MSXML.NET** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in [Preferences page](#).

## Content Completion in XSLT Stylesheets

The list of proposals offered by the **Content Completion Assistant** are context-sensitive and includes proposals that are valid at the current cursor position. You can enhance the list of proposals by specifying an additional schema. This schema is [defined by the user in the Content Completion / XSL preferences](#) page and can be: XML Schema, DTD, RELAX NG schema, or NVDL schema.

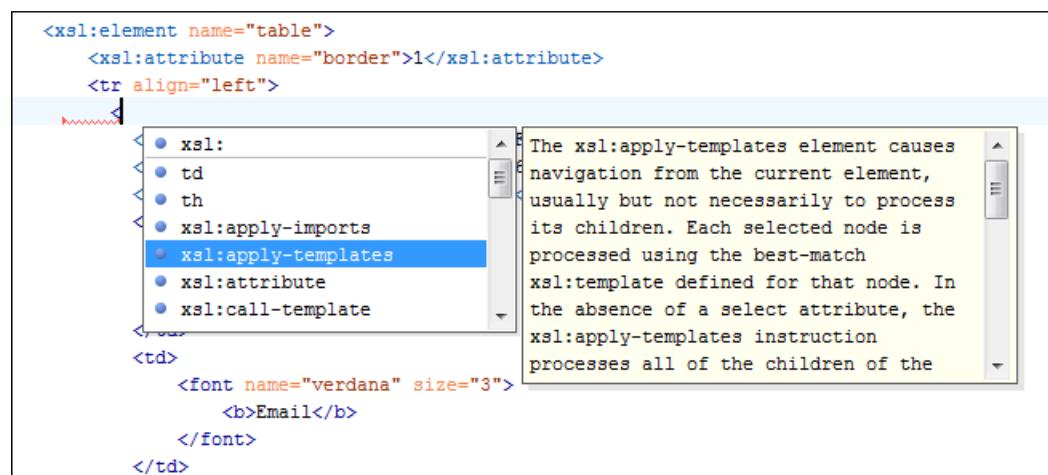

Figure 256: XSLT Content Completion Assistant

The feature is activated in **Text** mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the [Activation delay of the proposals window \(ms\) option](#) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The **Content Completion Assistant** proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The **Content Completion Assistant** also includes [code templates that can be used to quickly insert code fragments](#) into stylesheets.

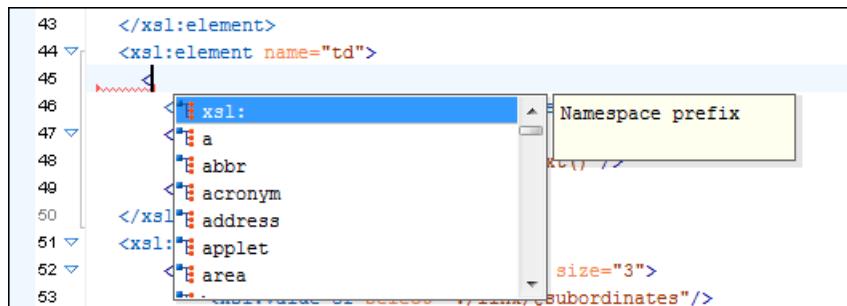

**Note:** For XSL and XSD resources, the **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to [Defining Master Files at Project Level](#).

The extension functions included in the Saxon 6.5.5 and 9.6.0.7 transformation engines are presented in the content completion list only if the Saxon namespace (<http://saxon.sf.net> for XSLT version 2.0 / 3.0 or <http://icl.com/saxon> for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for version 2.0 / 3.0).
- The validation engine specified in [Options](#) page is Saxon 6.5.5 (for version 1.0), Saxon 9.6.0.7 PE or Saxon 9.6.0.7 EE (for version 2.0 / 3.0).

Additionally, the Saxon-CE-specific extension functions and instructions are presented in the list of content completion assistance proposals only if the `http://saxonica.com/ns/interactiveXSLT` namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

**Figure 257: Namespace Prefixes in the Content Completion Assistant**

For the common namespaces such as XSL namespace (`http://www.w3.org/1999/XSL/Transform`), XML Schema namespace (`http://www.w3.org/2001/XMLSchema`), or Saxon namespace (`http://icl.com/saxon` for version 1.0, `http://saxon.sf.net/` for version 2.0 / 3.0), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.

### Content Completion in XPath Expressions

In XSLT stylesheets, the **Content Completion Assistant** provides [all the features available in the XML editor](#) and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets (elements such as `match`, `select`, and `test`), the **Content Completion Assistant** offers the names of XPath and XSLT functions, XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the **Content Completion Assistant** computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the [XSLT/XQuery Input view](#).

Content completion for XPath expressions is started:

- On XPath operators detected in one of the `match`, `select` and `test` attributes of XSLT elements: `:`, `,`, `/`, `//`, `(`, `[`, `,`, `::`, `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination [\*\*Ctrl + Space \(Command + Space on OS X\)\*\*](#) is pressed inside an edited XPath expression.

The proposals presented in the **Content Completion Assistant** are dependent on:

- The context of the current XSLT element.
- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

**Note:** The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

```
<personnel>
 <person id="Big.Boss">
 <name>
 <family>Boss</family>
 <given>Big</given>
 </name>
 <email>chief@oxygenxml.com</email>
 <link subordinates="one.worker"/>
 </person>
 <person id="one.worker">
 <name>
 <family>Worker</family>
 <given>One</given>
 </name>
 <email>one@oxygenxml.com</email>
 <link manager="Big.Boss"/>
 </person>
</personnel>
```

If you enter an `xsl:template` element using the **Content Completion Assistant**, the following actions are triggered:

- The `match` attribute is inserted automatically.
- The cursor is placed between the quotes.
- The XPath **Content Completion Assistant** automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet`: 1.0, 2.0, or 3.0.

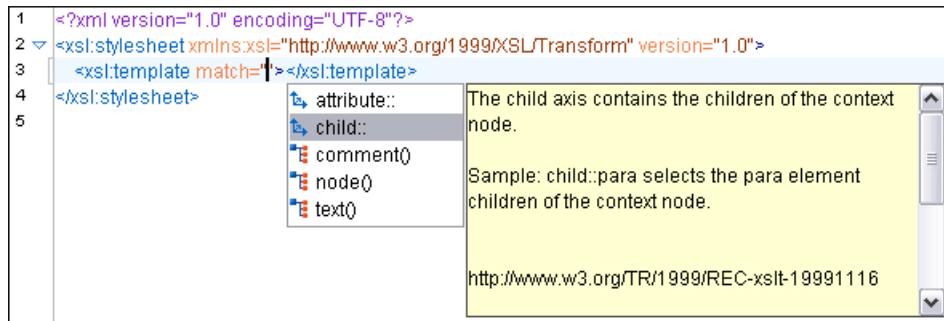

Figure 258: Content Completion in the `match` Attribute

If the cursor is inside the `select` attribute of an `xsl:for-each`, `xsl:apply-templates`, `xsl:value-of` or `xsl:copy-of` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `xsl:template` and `xsl:for-each` as shown in the following figure:

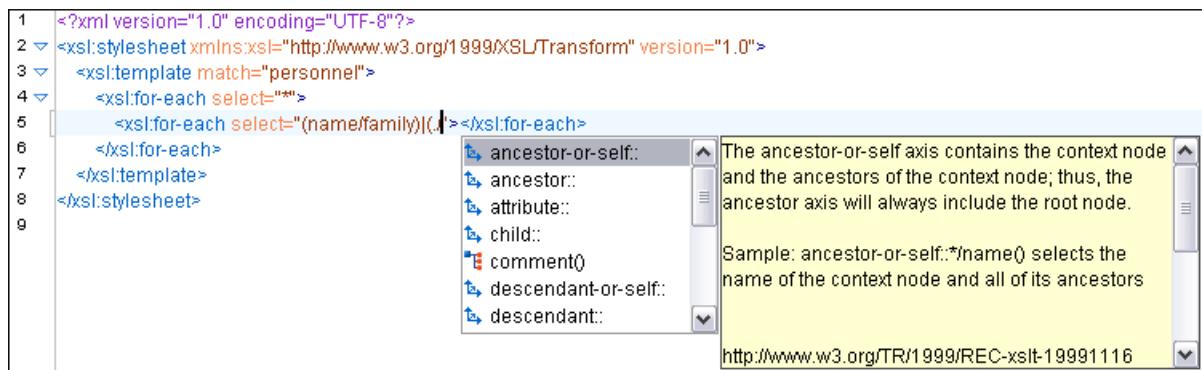

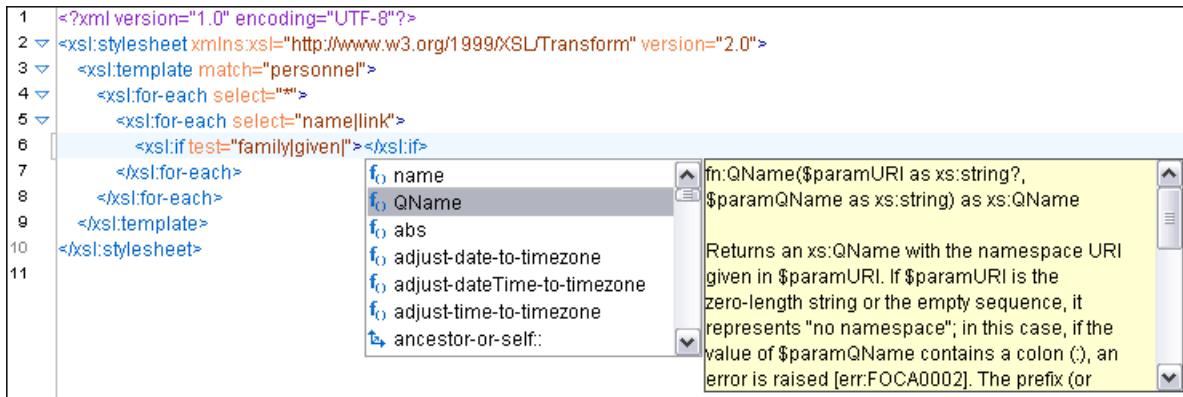

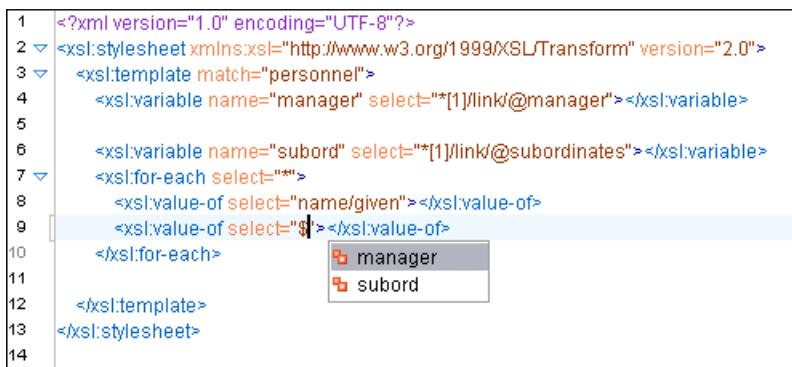

Figure 259: Content Completion in the `select` Attribute

Also XPath expressions typed in the test attribute of an `xsl:if` or `xsl:when` element benefit of the assistance of the content completion.

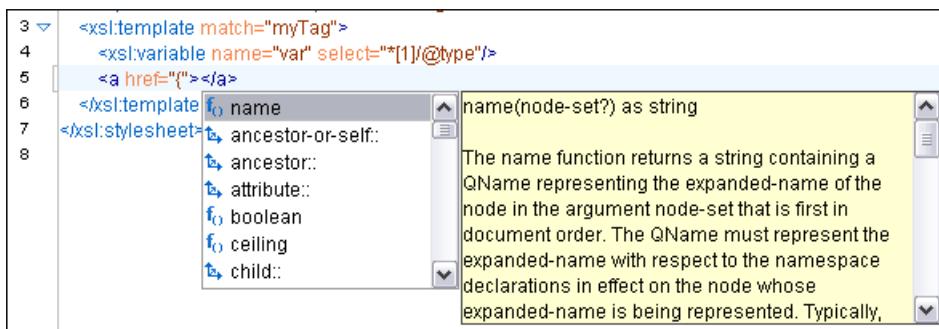

**Figure 260: Content Completion in the test Attribute**

XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the \$ character, which signals the start of such a reference in an XPath expression.

**Figure 261: Content Completion in the test Attribute**

If the { character is the first one in the value of the attribute, the same **Content Completion Assistant** is available also in attribute value templates of non-XSLT elements.

**Figure 262: Content Completion in Attribute Value Templates**

The time delay ([configured in the Content Completion preferences page](#)) for all content completion assistance windows is also applied for the content completion in XPath expressions.

#### Tooltip Helper for the XPath Functions Arguments

When editing the arguments of an XPath/XSLT function, Oxygen XML Editor tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

We want to concatenate the absolute values of two variables, named v1 and v2.

```
<xsl:template match="/">
 <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
```

When moving the cursor before the first abs function, Oxygen XML Editor identifies it as the first argument of the concat function. The tooltip shows in bold font the following information about the first argument:

- Its name is \$arg1.
- Its type is xdt:atomicType.
- It is optional (note the ? sign after the argument type).

The function takes also other arguments, having the same type, and returns a xs:string.

```
name=concat($arg1 as xdt:atomicType?, $arg2 as xdt:atomicType?, ...) as xs:string
 & match="/*"
 & elect="concat(abs($v1), abs($v2))"></xsl:value-of>
 </xsl:template>
 &:stylesheet>
```

**Figure 263: XPath Tooltip Helper - Identify the concat Function's First Argument**

Moving the cursor on the first variable \$v1, the editor identifies the abs as context function and shows its signature:

```
name="v2" se abs($arg as numeric?) as numeric?
 & match="/*"
 & elect="concat(abs($v1), abs($v2))"></xsl:value-of>
 </xsl:template>
 &:stylesheet>
```

**Figure 264: XPath Tooltip Helper - Identify the abs Function's Argument**

Further, clicking the second abs function name, the editor detects that it represents the second argument of the concat function. The tooltip is repainted to display the second argument in bold font.

```
name=concat($arg1 as xdt:atomicType?, $arg2 as xdt:atomicType?, ...) as xs:string
 & match="/*"
 & elect="concat(abs($v1), abs($v2))"></xsl:value-of>
 </xsl:template>
 &:stylesheet>
```

**Figure 265: XPath Tooltip Helper - Identify the concat Function's Second Argument**

The tooltip helper is also available in the [XPath Builder view](#) and [XPath toolbar](#).

## Syntax Highlighting in XSLT

Oxygen XML Editor supports syntax highlighting in XSLT documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#).
2. Go to [Editor > Syntax Highlight](#).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

- Select the **XSL** tab in the **Preview** pane to see the effects of your changes.

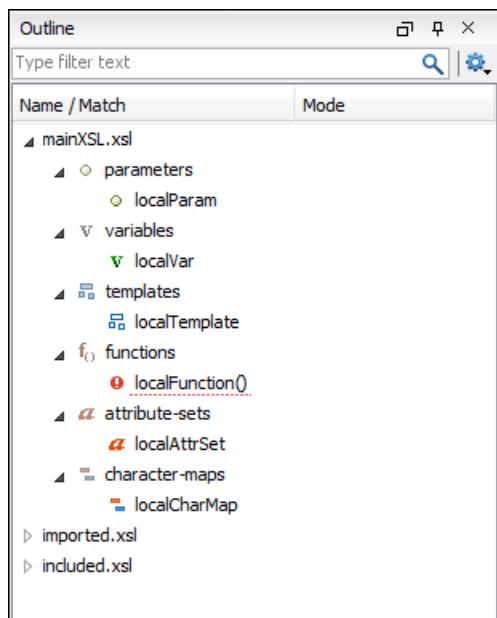

#### Related information

[Customize Syntax Highlight colors](#) on page 100

## XSLT Outline View

The **Outline** view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to [Defining Master Files at Project Level](#).

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 266: XSLT Outline View**

The following actions are available in the **Settings** menu on the **Outline** view toolbar:

#### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

#### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the XSLT editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

#### Show XML structure

Displays the XML document structure in a tree-like structure.

#### Show all components

Displays all components that were collected starting from the main file. This option is set by default.

#### Show only local components

Displays the components defined in the current file only.

#### Group by location/type

The stylesheet components can be grouped by location and type.

When the  **Show XML structure** option is selected, the following actions are available:

 **Show components**

Switches the **Outline** view to the components display mode.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page](#).

The following contextual menu actions are also available when the  **Show components** option is selected in the

 **Settings** menu:

**Edit Attributes**

Opens a small in-place editor that allow you to edit the attributes of the selected node.

 **Cut**

Cuts the currently selected node.

 **Copy**

Copies the currently selected node.

 **Delete**

Deletes the currently selected node.

 **Search References** [Ctrl + Shift + R \(Command + Shift + R on OS X\)](#)

Searches all references of the item found at current cursor position in the defined scope, if any. See [Finding XSLT References and Declarations](#) for more details.

**Search References in**

Searches all references of the item found at current cursor position in the specified scope. See [Finding XSLT References and Declarations](#) for more details.

**Component Dependencies**

Allows you to see the dependencies for the current selected component. See [Component Dependencies View](#) for more details.

**Resource Hierarchy**

Displays the hierarchy for the currently selected resource.

**Resource Dependencies**

Displays the dependencies of the currently selected resource.

 **Rename Component in**

Renames the selected component. See [XSLT Refactoring Actions](#) for more details.

The following contextual menu actions are available in the **Outline** view when the  **Show XML structure** option is selected in the  **Settings** menu:

#### **Append Child**

Displays a list of elements that you can insert as children of the current element.

#### **Insert Before**

Displays a list of elements that you can insert as siblings of the current element, before the current element.

#### **Insert After**

Displays a list of elements that you can insert as siblings of the current element, after the current element.

#### **Edit Attributes**

Opens a small in-place editor that allow you to edit the attributes of the selected node.

#### **Toggle Comment**

Comments/uncomments the currently selected element.

#### **Search references**

Searches for the references of the currently selected component.

#### **Search references in**

Searches for the references of the currently selected component in the context of a scope that you define.

#### **Component dependencies**

Displays the dependencies of the currently selected component.

#### **Rename Component in**

Renames the currently selected component in the context of a scope that you define.

#### **Cut**

Cuts the currently selected component.

#### **Copy**

Copies the currently selected component.

#### **Delete**

Deletes the currently selected component.

#### **Expand More**

Expands the structure of a component in the **Outline** view.

#### **Collapse All**

Collapses the structure of all the component in the **Outline** view.

The stylesheet components information is presented on two columns: the first column presents the name and match attributes, the second column the mode attribute. If you know the component name, match or mode, you can search it in the **Outline** view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type de component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- **Enter** key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor allows you to sort the components of the tree in the **Outline** view.

**Note:** Sorting groups in the **Outline** view is not supported.

Oxygen XML Editor has a predefined order of the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The main file is the one you are editing and it is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

**Note:** When no grouping is available and the table is not sorted, Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

## XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the **XSLT/XQuery Input** view. If the view is not displayed, it can be opened from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

### XSLT

If you click a node in the **XSLT/XQuery Input** view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting `xsl:template`, `xsl:for-each`, or other XSLT elements that have the `match/select/test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

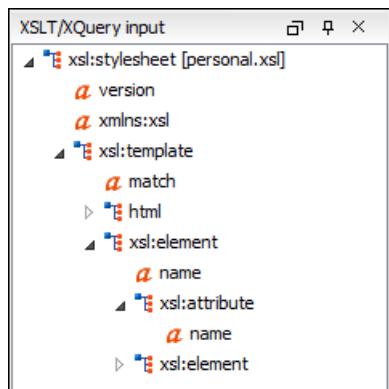

Figure 267: XSLT Input View

### XSLT Example:

For the following XML document:

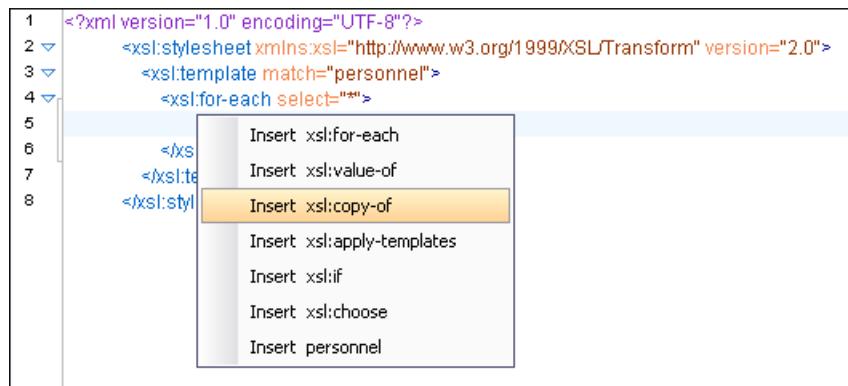

```
<personnel>
 <person id="Big.Boss">
 <name>
 <family>Boss</family>
 <given>Big</given>
 </name>
 <email>chief@oxygencxml.com</email>
 <link subordinates="one.worker"/>
 </person>
 <person id="one.worker">
 <name>
 <family>Worker</family>
 <given>One</given>
 </name>
 <email>one@oxygencxml.com</email>
 <link manager="Big.Boss"/>
 </person>
</personnel>
```

```
</person>
</personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 version="2.0">
 <xsl:template match="personnel">
 <xsl:for-each select="*>
 </xsl:for-each>
 </xsl:template>
 </xsl:stylesheet>
```

if you drag the given element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

**Figure 268: XSLT Input Drag and Drop Pop-up Menu**

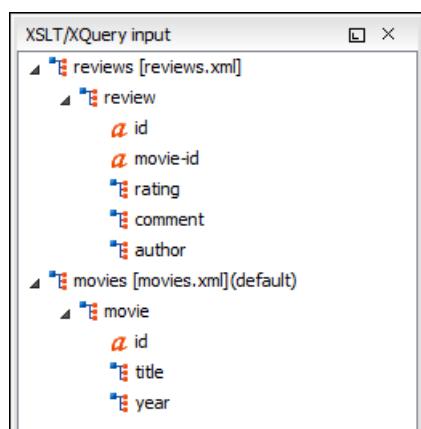

If you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
 <xsl:template match="personnel">
 <xsl:for-each select="*>
 <xsl:copy-of select="name/given"/>
 </xsl:for-each>
 </xsl:template>
</xsl:stylesheet>
```

**Figure 269: XSLT Input Drag and Drop Result**

## XQuery

You can also use the **XSLT/XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

**Figure 270: XQuery Input View**

## XQuery Example:

For the following XML documents:

```
<movies>
<movie id="1">
<title>The Green Mile</title>
<year>1999</year>
</movie>
<movie id="2">
<title>Taxi Driver</title>
<year>1976</year>
</movie>
</movies>

<reviews>
<review id="100" movie-id="1">
<rating>5</rating>
<comment>It is made after a great Stephen King book.
</comment>
<author>Paul</author>
</review>
<review id="101" movie-id="1">
<rating>3</rating>
<comment>Tom Hanks does a really nice acting.</comment>
<author>Beatrice</author>
</review>
<review id="104" movie-id="2">
<rating>4</rating>
<comment>Robert De Niro is my favorite actor.</comment>
<author>Maria</author>
</review>
</reviews>
```

and the following XQuery:

```
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{
}
</maxRating>
</movie>
```

If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

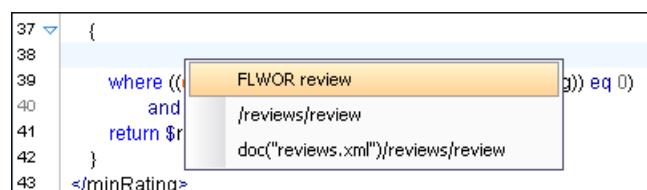

Figure 271: XQuery Input Drag and Drop Pop-up Menu

Select **FLWOR review**, the resulting document will look like this:

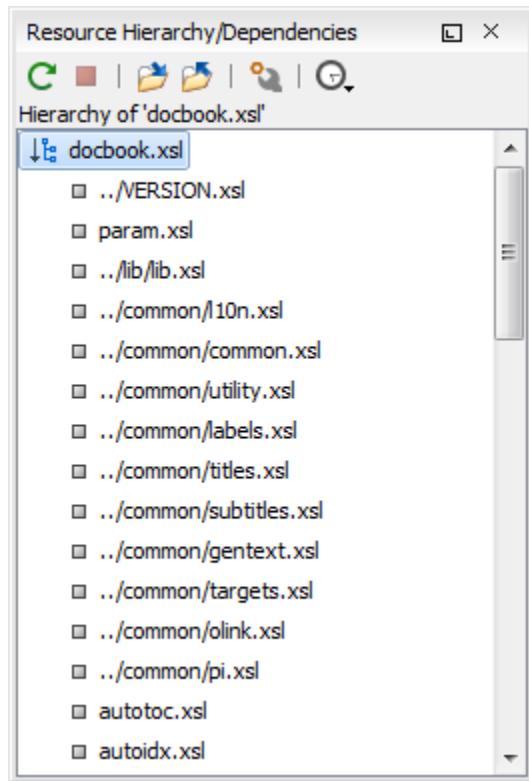

```
37 {
38 for $review in doc("reviews.xml")/reviews/review
39 return
40 where ((compare($rev/rating/text(), string($minRating)) eq 0)
41 and ($rev/0movie-id = $movie/0id))
42 return $rev/author
43 }
```

Figure 272: XQuery Input Drag and Drop Result

## XSLT Resource Hierarchy/Dependencies View

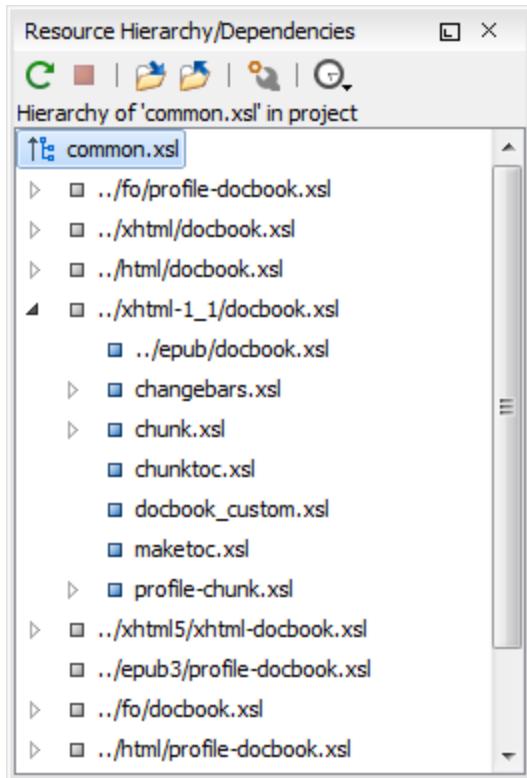

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a stylesheet. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the hierarchy of a stylesheet, select the desired stylesheet in the **Project** view and choose **Resource Hierarchy** from the contextual menu.

**Figure 273: Resource Hierarchy/Dependencies View - Hierarchy for docbook.xsl**

If you want to see the dependencies of a stylesheet, select the desired stylesheet in the **Project** view and choose **Resource Dependencies** from the contextual menu.

**Figure 274: Resource Hierarchy/Dependencies View - Dependencies for common.xsl**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

**Refresh**

Refreshes the Hierarchy/Dependencies structure.

**Stop**

Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the **\*Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

**Rename resource**

Renames the selected resource.

### Show Resource Hierarchy

Shows the hierarchy for the selected resource.

### Show Resource Dependencies

Shows the dependencies for the selected resource.

### Add to Master Files

Adds the currently selected resource in *the Master Files directory*.

### Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

### Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

### Related information

[Working with Modular XML Files in the Master Files Context](#) on page 472

[Search and Refactor Operations Scope](#) on page 463

### Moving/Renaming XSLT Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

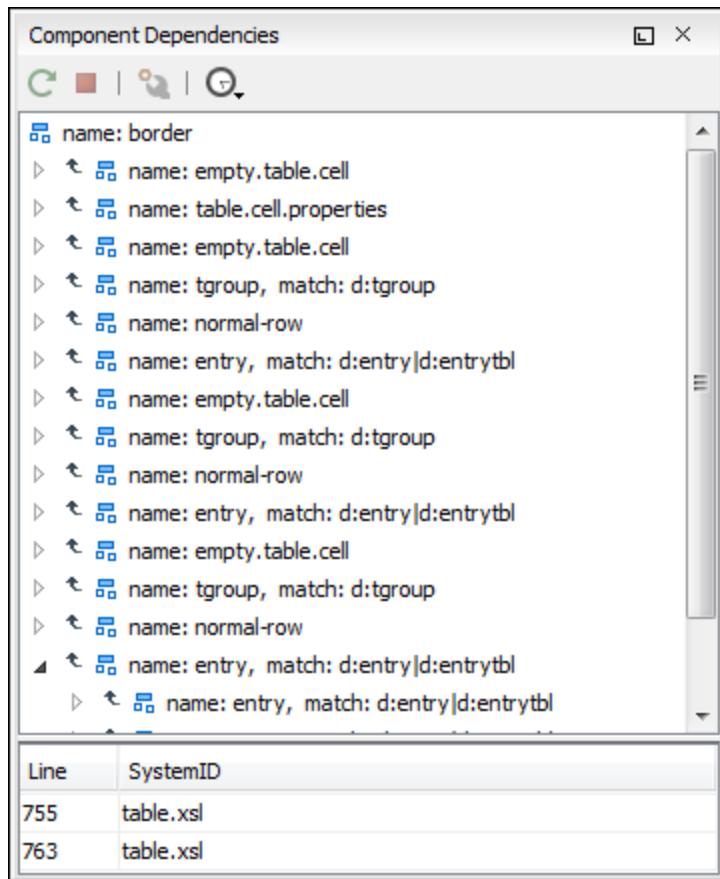

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

## XSLT Component Dependencies View

The Component Dependencies view allows you to see the dependencies for a selected XSLT component. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of an XSLT component, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

**Figure 275: Component Dependencies View - Hierarchy for table.xsl**

In the Component Dependencies view you have several actions in the toolbar:

**Refresh**

Refreshes the dependencies structure.

**Stop**

Stops the dependencies computing.

**Configure**

Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

**History**

Allows you to repeat a previous dependencies computation.

The following actions are available on the contextual menu:

**Go to First Reference**

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

**Go to Component**

Shows the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon .

**Related information**

[Search and Refactor Operations Scope](#) on page 463

## Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

**Note:** Oxygen XML Editor also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X))** contextual menu action. Matches are displayed in separate tabs of the **Results** view.

## Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the **Search** submenu of the contextual menu and from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the current edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

-  **Show Definition** - Moves the cursor to the location of the definition of the current item.

**Note:** You can also use the [\*\*Ctrl + Single-Click \(Command + Single-Click on OS X\)\*\*](#) shortcut on a reference to display its definition.

## XSLT Stylesheet Component Documentation Support

Oxygen XML Editor offers built-in support for documenting XSLT stylesheets. If the expanded *QName* of the element has a non-null namespace URI, the *xsl:stylesheet* element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Editor offers its own XML schema that defines such documentation elements. The schema is named *stylesheet\_documentation.xsd* and can be found in *[OXYGEN\_INSTALL\_DIR]/frameworks/stylesheet\_documentation*. The user can also specify a custom schema in [\*XSL Content Completion options\*](#).

When content completion is invoked inside an XSLT editor by pressing [\*\*Ctrl + Space \(Command + Space on OS X\)\*\*](#), it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

In **Text** mode, to add documentation blocks while editing use the **Add component documentation** action available in the contextual menu.

In **Author** mode, the following stylesheet documentation actions are available in the contextual menu, **Component Documentation** submenu:

- **Add component documentation** - Adds documentation blocks for the component at cursor position.
- **Paragraph** - Inserts a new documentation paragraph.
- **Bold** - Makes the selected documentation text bold.
- **Italic** - Makes the selected documentation text italic.
- **List** - Inserts a new list.
- **List Item** - Inserts a list item.
- **Reference** - Inserts a documentation reference.

If the cursor is positioned inside the `xsl:stylesheet` element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

#### Example of a documentation block using Oxygen XML Editor built-in schema

```
<xd:doc>
 <xd:desc>
 <xd:p>Search inside parameter <xd:i>string</xd:i>
 for the last occurrence of parameter
 <xd:i>searched</xd:i>. The substring starting from the 0 position
 to the identified last occurrence will be returned.
 <xd:ref name="f:substring-after-last" type="function"
 xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also
 </xd:ref>
 </xd:p>
 </xd:desc>
 <xd:param name="string">
 <xd:p>String to be analyzed</xd:p>
 </xd:param>
 <xd:param name="searched">
 <xd:p>Marker string. Its last occurrence will be identified</xd:p>
 </xd:param>
 <xd:return>
 <xd:p>A substring starting from the beginning of <xd:i>string</xd:i>
 to the last occurrence of <xd:i>searched</xd:i>.
 If no occurrence is found an empty string will be returned.
 </xd:p>
 </xd:return>
</xd:doc>
```

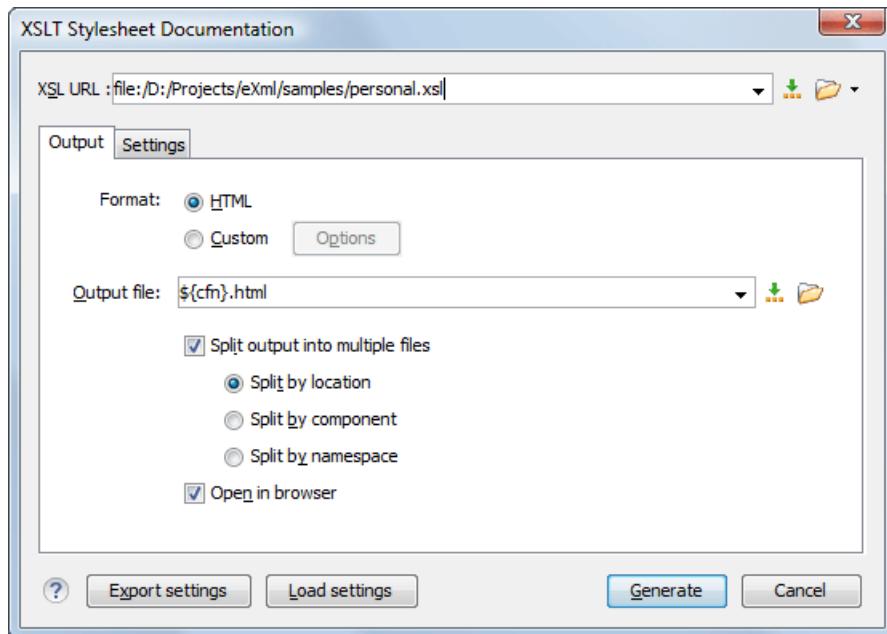

#### Related information

[Generating Documentation for an XSLT Stylesheet](#) on page 518

## Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a *custom output format*, you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

**Figure 276: XSLT Stylesheet Documentation Dialog Box**

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

### Output Tab

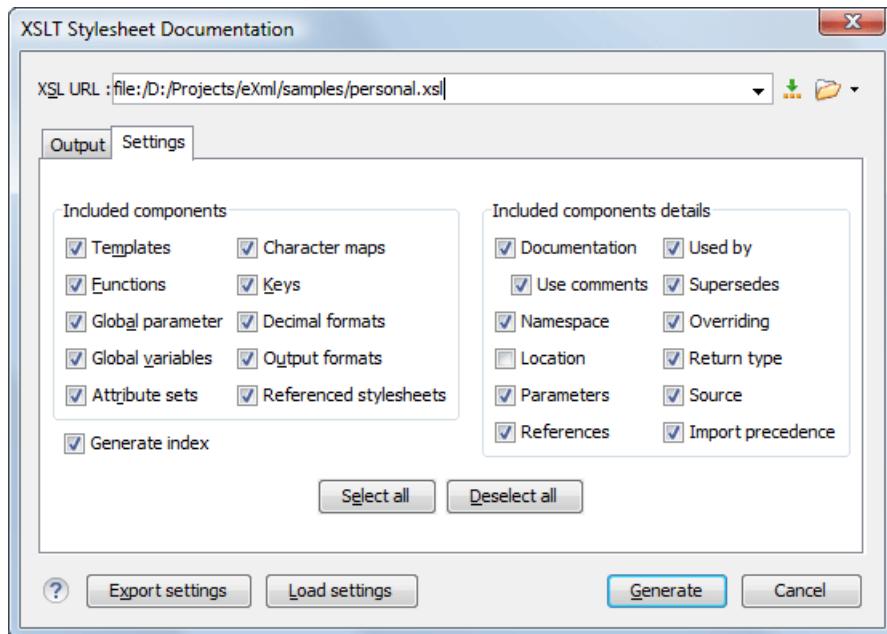

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in [HTML output format](#).
  - **Custom** - The documentation is generated in a [custom output format](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

### Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

**Figure 277: Settings Tab of the XSLT Stylesheet Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist.
  - A subset of DITA elements. The recognized elements are: concept, topic, task, codeblock, p, b, i, ul, ol, pre, s1, sli, step, steps, li, title, xref.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - Doxsl documentation framework. Supported elements are : codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listItem, module, parameter, template, attribute-set;

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a [custom format](#) instead of the built-in [HTML format](#) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same *documentation from the command-line interface*.)

**Load settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XSLT documentation.

### Generate XSLT Documentation in HTML Format

The XSLT documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

The screenshot shows the Oxygen XML Editor interface with the following details:

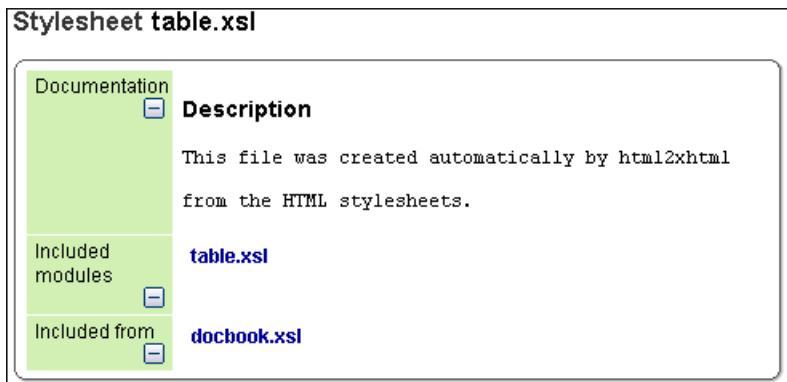

- Main Window:** Displays the "Main stylesheet xsIDocHtml.xsl". It includes a "Documentation" section, a "Description" section containing a detailed description of the stylesheet, and an "Imported modules" section listing several XSLT files.
- Showing Panel:** A right-hand panel titled "Showing:" with checkboxes for "Documentation", "Parameters", "Used by", "References", "Imported modules", and "Source".
- Table of Contents:** A sidebar on the left showing a tree structure of XSLT components, including "unknownDocToHtml.xsl", "docbookDocToHtml.xsl", and a expanded node for "createJsIdsArray".
- Template Details:** A detailed view for the "createJsIdsArray" template, showing its "Documentation", "Description" (which states it creates a Javascript array of IDs), "Parameters" (arrayName), "Variables" (a list of variables), and "Function" (getIDMd(\$node as item())).

**Figure 278: XSLT Stylesheet Documentation Example**

The generated documentation includes the following:

- Table of Contents - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the match ones second).
- Information about main, imported, and included stylesheets. This information consists of:
  - XSLT modules included or imported by the current stylesheet.

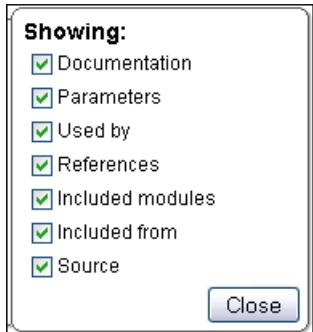

- The XSLT stylesheets where the current stylesheet is imported or included.
- The stylesheet location.

**Figure 279: Information About an XSLT Stylesheet**

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the **Showing** options or the **Collapse** or **Expand** buttons.

**Figure 280: Showing Options**

For each element included in the documentation, the section presents the element type followed by the element name (value of the name or match attribute for match templates).

**Function func:substring-before-last**

Documentation	<p><b>Description</b></p> <p>Get the substring before the last occurrence of the given substring</p> <p><b>Parameters</b></p> <p><b>string</b> The string in which to search</p> <p><b>searched</b> The string to search</p> <p><b>Return</b></p> <p>The substring starting from the start of the <b>string</b> to the index of the last occurrence of <b>searched</b></p>

Figure 281: Documentation for an XSLT Element

### Generate XSLT Documentation in a Custom Format

XSLT stylesheet documentation can be also generated in a custom format. You can choose the format from the [XSLT Stylesheet Documentation dialog box](#). Specify your own stylesheet to transform the intermediary XML generated in the documentation process. You must write your stylesheet based on the schema xsIDocSchema.xsd from `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. You can create a custom format starting from one of the stylesheets used in the predefined HTML, PDF, and DocBook formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation/xsl`.

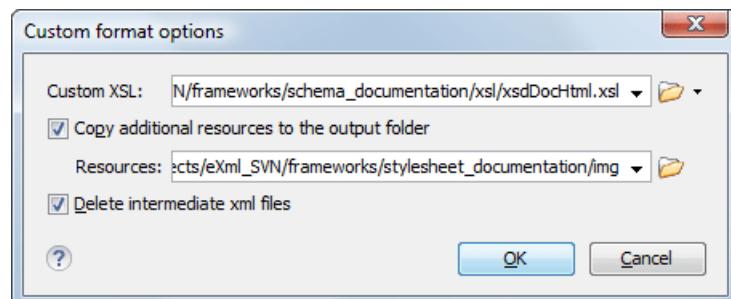

Figure 282: Custom Format Options Dialog Box

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

## Generating XSLT Documentation From the Command-Line Interface

You can export the settings of the **XSLT Stylesheet Documentation** dialog box to an XML file by pressing the **Export settings** button. With the exported settings file, you can generate the same documentation from the command line by running the script `stylesheetDocumentation.bat` (on Windows) / `stylesheetDocumentation.sh` (on OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The script can be integrated in an external batch process launched from the command-line interface.

The command-line parameter of the script is the relative path to the exported XML settings file. The files that are specified with relative paths in the exported XML settings are resolved relative to the script directory.

```

## XSLT Quick Assist Support

The *Quick Assist* support helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1 (Meta + Alt + 1)** on Mac OS X keyboard shortcuts.

Two categories of actions are available in the **Quick Assist** menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:

### Extract template

Extracts the selected XSLT instructions sequence into a new template.

### Move to another stylesheet

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

### Extract local variable

Allows you to create a new local variable by extracting the selected XPath expression.

### Extract global variable

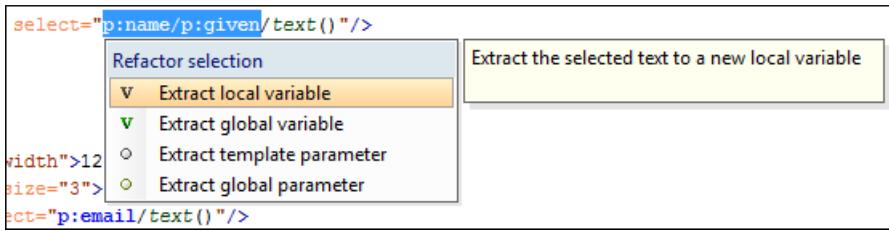

Allows you to create a new global variable by extracting the selected XPath expression.

### Extract template parameter

Allows you to create a new template parameter by extracting the selected XPath expression.

### Extract global parameter

Allows you to create a new global parameter by extracting the selected XPath expression.

**Figure 283: XSLT Quick Assist Support - Refactoring Actions**

- Actions available when the cursor is positioned over the name of a component:

#### **Rename Component in**

Renames the component and all its dependencies.

#### **Search Declarations**

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

#### **Search References**

Searches all references of the component in a predefined scope.

#### **Component Dependencies**

Searches the component dependencies in a predefined scope.

#### **Change Scope**

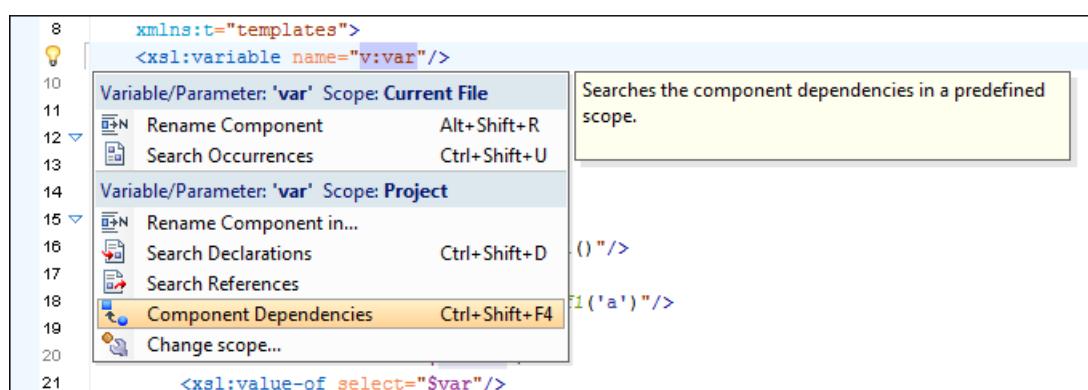

Configures the scope that will be used for future search or refactor operations.

#### **Rename Component**

Allows you to rename the current component in-place.

#### **Search Occurrences**

Searches all occurrences of the component within the current file.

**Figure 284: XSLT Quick Assist Support - Component Actions**

#### **Related information**

## XSLT Quick Fix Support

The Oxygen XML Editor Quick Fix support helps you resolve various errors that appear in a stylesheet by proposing quick fixes to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

**Note:** The quick fixes are available only when validating an XSLT file with Saxon HE/PE/EE.

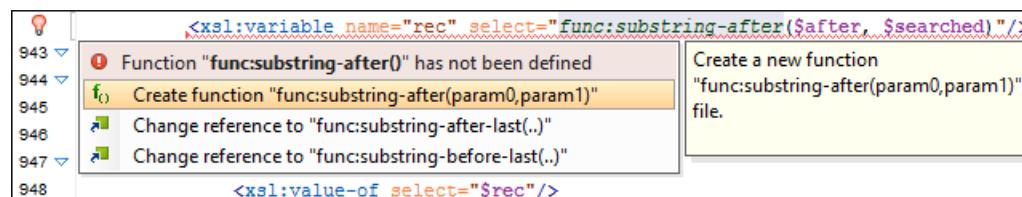

Figure 285: Example of an Undefined XSLT Functions Quick Fix

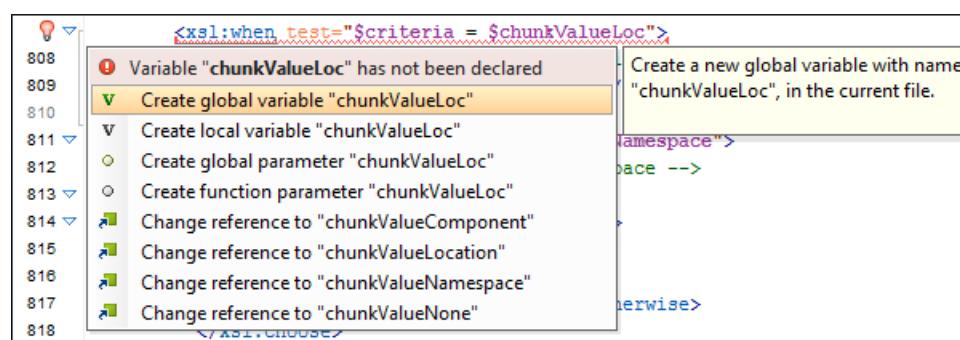

Figure 286: Example of an Undeclared XSLT Variables/Parameters Quick Fix

Oxygen XML Editor provides XSLT quick fixes for the following types of instances:

- Template does not exist**, when the template name referenced in a call-template element does not exist. The following fixes are available:
  - Create template "templateName"** - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the call-template element.
  - Change reference to "newTemplateName"** - changes the name of the missing template referenced in the call-template element. The proposed new names are the existing templates with names similar with the missing one.
- Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
  - Create global variable "varName"** - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
  - Create global parameter "paramName"** - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.

- **Create local variable "varName"** - creates a local variable with the specified name before the current element.
- **Create template parameter "paramName"** - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
- **Create function parameter "paramName"** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
- **Change reference to "varName"** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.
- **Parameter from a called template is not declared**, when a parameter referenced from a call-template element is not declared. The following fixes are available:
  - **Create parameter "paramName" in the template "templateName"** - creates a new parameter with the specified name in the referenced template.
  - **Change "paramName" parameter reference to "newParamName"** - changes the parameter reference from the call-template element to a parameter that is declared in the called template.
  - **Remove parameter "paramName" from call-template** - removes the parameter with the specified name from the call-template element.
- **No value supplied for required parameter**, when a required parameter from a template is not referenced in a call-template element. The following quick-fix is available:
  - **Add parameter "paramName" in call-template** - creates a new parameter with the specified name in call-template element.
- **Function "prefix:functionName()" has not been defined**, when a function declaration is not found. The following quick fixes are available:
  - **Create function "prefix:functionName(param1, param2)"** - creates a new function with the specified signature, after the current top level element from stylesheet.
  - **Change function to "newFunctionName(..)"** - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.
- **Attribute-set "attrSetName" does not exist**, when the referenced attribute set does not exist. The following quick fixes are available:
  - **Create attribute-set "attrSetName"** - creates a new attribute set with the specified name, after the current top level element from stylesheet.
  - **Change reference to "attrSetName"** - changes the referenced attribute set to an already defined one.
- **Character-map "chacterMap" has not been defined**, when the referenced character map declaration is not found. The following quick fixes are available:
  - **Create character-map "characterMapName"** - creates a new character map with the specified name, after the current top level element from stylesheet.
  - **Change reference to "characterMapName"** - changes the referenced character map to an already defined one.

## XSLT Refactoring Actions

Oxygen XML Editor offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the **Refactoring** submenu of the contextual menu (or from the **Document > Refactoring** menu):

-  **Extract template** (Active only when the selection contains well-formed elements) - Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with a `<xsl:call-template>` instruction referencing the newly created template.

**Note:** The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

-  **Extract function** - Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines.
-  **Create local variable** - Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.
-  **Move to another stylesheet** (Active only when entire components are selected) - Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:
  1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
  2. If you choose to move the components to an existing one, select the destination stylesheet. Press the **Choose** button to select the destination stylesheet file. Oxygen XML Editor will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:
    - **Include** - The current stylesheet will use an `xsl:include` instruction to reference the destination stylesheet.
    - **Import** - The current stylesheet will use an `xsl:import` instruction to reference the destination stylesheet.
    - **None** - There will be created no relation between the current and destination stylesheets.
  3. Press the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.
- **Convert attributes to xsl:attributes** - Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

```
<person id="Big{test}Boss"/>
```

is converted to:

```
<person>
 <xsl:attribute name="id">
 <xsl:text>Big</xsl:text>
 <xsl:value-of select="test"/>
 <xsl:text>Boss</xsl:text>
 </xsl:attribute>
</person>
```

- **Convert xsl:if into xsl:choose/xsl:when** - Converts an `xsl:if` block to an `xsl:when` block surrounded by an `xsl:choose` element. For example, the following block:

```
<xsl:if test="a">
 <!-- XSLT code -->
</xsl:if>
```

is converted to:

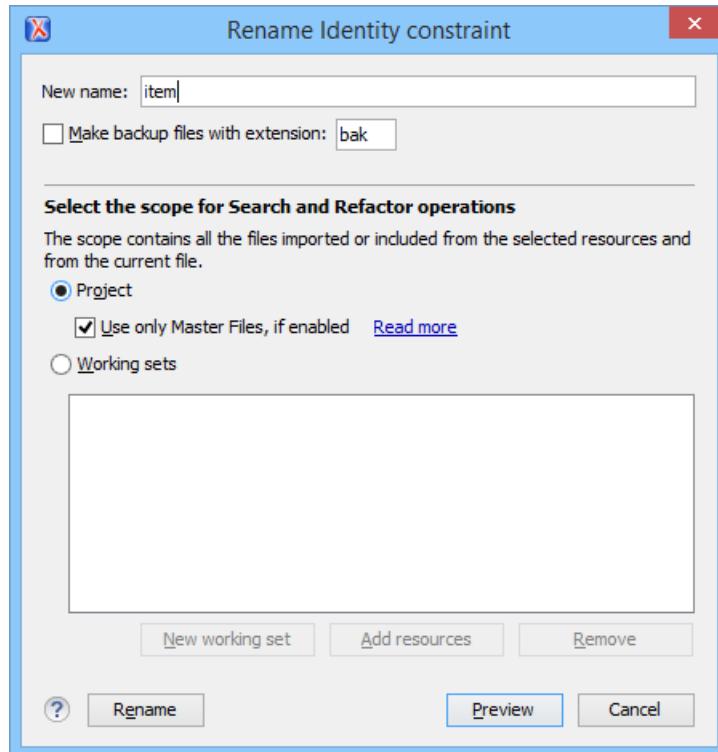

```
<xsl:choose>
 <xsl:when test="a">
 <!-- XSLT code -->
 </xsl:when>
 <xsl:otherwise>
 |
 </xsl:otherwise>
</xsl:choose>
```

(where the | character is the current cursor position)

-  **Extract local variable** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Editor allows you to edit the name of the variable.
-  **Extract global variable** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Editor allows you to edit the name of the variable.

- Note:** Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.
  - **Extract template parameter** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.
  - **Extract global parameter** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.
- Note:** Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

**Figure 287: Rename Identity Constraint Dialog Box**

**Note:** Many of these refactoring actions are also proposed by the [Quick Assist support](#).

To watch our video demonstration about XSLT refactoring, go to [https://www.oxygenxml.com/demo/XSL\\_Refactoring.html](https://www.oxygenxml.com/demo/XSL_Refactoring.html).

## XSLT Unit Test (XSpec)

XSpec is a behavior driven development (BDD) framework for XSLT and XQuery. XSpec consists of a syntax for describing the behavior of your XSLT or XQuery code, and some code that enables you to test your code against those descriptions.

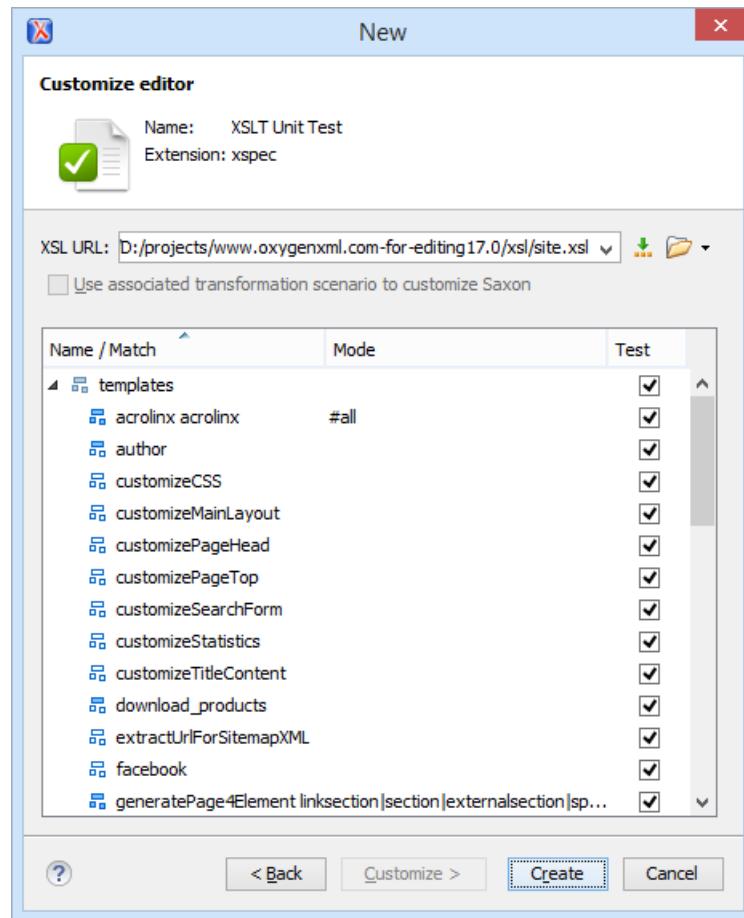

To create an XSLT Unit Test, go to **File > New > XSLT Unit Test**. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the **Project** view. Oxygen XML Editor allows you to customize the XSpec

document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a master XSL document.

To run an XSLT Unit Test, open the XSPEC file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar.

**Note:** The transformation scenario is defined in the XSPEC *document type*.

When you create an XSpec document based on an XSL document, Oxygen XML Editor uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Editor uses extensions and properties of Saxon 9.6.0.7, improving the Ant scenario associated with the XSpec document.

**Figure 288: New XSLT Unit Test Wizard**

An XSpec file contains one, or more test scenarios. You can test a stylesheet in one of the following ways:

- Test an entire stylesheet.

Testing is performed in a certain context. You can define a context as follows:

- Inline context, building the test based on a string.

```
<x:scenario label="when processing a para element">
 <x:context>
 <para>...</para>
 </x:context>
 ...
</x:scenario>
```

- Based on an external file, or on a part of an external file extracted with an XPath expression.

```
<x:scenario label="when processing a para element">
 <x:context href="source/test.xml" select="/doc/body/p[1]" />
 ...
</x:scenario>
```

- Test a function.

```
<x:scenario label="when capitalising a string">
 <x:call function="eg:capital-case">
 <x:param select="'an example string'" />
 <x:param select="true()" />
 </x:call>
 ...
</x:scenario>
```

- Test a template with a name.

```
<x:call template="createTable">
 <x:param name="nodes">
 <value>A</value>
 <value>B</value>
 </x:param>
 <x:param name="cols" select="2" />
</x:call>
```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to <https://github.com/expat/xspec/wiki/Writing-Scenarios>.

## Editing Ant Build Files

---

This section explains the features of the Ant build file editor.

### Related information

[Editing XML Documents in Text Mode](#) on page 282

## Editing Ant Build Files in the Context of Master Files

Smaller interrelated modules that define a complex Ant build file cannot be correctly edited or validated individually due to their interdependency with other modules. For example, a *target* defined in a main build file is not visible when you edit an included or imported module. Oxygen XML Editor provides support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger Ant build structure.

You can set a main Ant build file either by using the *master files support from the Project view*, or a *validation scenario*.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main build file. In this case, it considers the current module as the main build file.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger build structure.
- **Content Completion Assistant** displays all components valid in the current context.
- The **Outline** view displays the components collected from the entire build file structure.

## Validate Ant Build Files

Oxygen XML Editor performs the validation of Ant build files with the help of a built-in processor, which is largely based on the Apache Ant libraries. The path to these libraries can be configured in the [Ant preferences page](#). The validation processor accesses the [parameters set in the associated Ant transformation scenario](#) and uses them as Ant properties when validating the current build script.

Oxygen XML Editor automatically validates Ant build files as you type. You can also validate the currently edited file by selecting the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu.

**Tip:** To make a custom task available in the Ant validation engine, add a JAR file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

## Create a Validation Scenario for Ant Build Files

If you want to customize the validation process for Ant build files, you can create a new validation scenario (or configure an existing one). For example, if you want to validate interrelated modules that define a complex Ant build file, you can specify the main Ant file by configuring a validation scenario. To create or configure a validation scenario, select  **Configure Validation Scenario(s)** from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu.

### Passing parameters to the Ant validation engine

Ant validation scenarios cannot be configured to accept custom Ant parameters. However, you can specify values for the parameters in your Ant document using an Ant transformation scenario:

1. Create a new [Ant transformation scenario](#).
2. Edit the transformation scenario and [set all parameters](#) you need to pass to your Ant document.
3. Associate the new scenario with your Ant document (in the [Configure Transformation Scenarios\(s\) dialog box](#)). You do not need to run the transformation scenario. Every time a validation operation is triggered, the built-in validation engine uses the parameters set in the transformation scenario.

**Note:** This behavior is available only for the validation scenarios that use the built-in validation engine. The custom defined validation engines do not benefit from this functionality.

## Content Completion in Ant Build Files

The proposals offered by the **Content Completion Assistant** are context-sensitive.

The **Content Completion Assistant** proposes various item types that are defined in the current Ant build and in the imported and included builds. The proposals include:

- Element names
- Attribute names
- Property names

**Note:** In addition to the user-defined properties, the **Content Completion Assistant** offers the following values:

- The system properties set in the Java Virtual Machine.
- The built-in properties that Ant provides.
- Target names
- Task and type reference IDs

**Tip:** To make a custom task available in the **Content Completion Assistant**, add a JAR file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

**Note:** For Ant resources, the proposals are collected starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to [Defining Master Files at Project Level](#).

### Related information

## Syntax Highlighting in Ant Files

Oxygen XML Editor supports syntax highlighting in Ant files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Ant build files, follow these steps:

1. [Open the Preferences dialog box \(Options > Preferences\)](#).
2. Go to [Editor > Syntax Highlight](#).
3. Select and expand the **Ant Property** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

## Related information

[Syntax Highlight Preferences](#) on page 100

## Ant Outline View

The **Outline** view for Ant files displays the list of all the components (properties, targets, extension points, task type definitions and references) from both the edited Ant build file and its imported and included modules. For Ant resources, the **Outline** view collects its components starting from the master files. The master files can be defined in the project and the main build file can be specified in a validation scenario. For more details, see [Defining Master Files at Project Level](#).

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

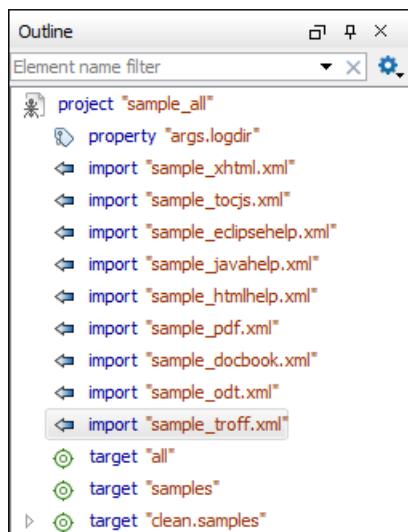

Figure 289: Ant Outline View

The following actions are available in the **Settings** menu on the Outline view toolbar:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches. By default, this filter is not selected.

### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the Ant editor. Selecting one of the components from the outline view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

### Show XML structure

Displays the XML document structure in a tree-like manner.

### Sort

Sorts the components in the **Outline** view alphabetically.

### Show all components

Displays all components that were collected starting from the main file. This option is set by default.

### Show only local components

Displays the components defined in the current file only.

### Group by location/type

The build file components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

### Show components

Switches the **Outline** view to the components display mode.

### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

### Show element name

Show/hide element name.

### Show text

Show/hide additional text content for the displayed elements.

### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

The following actions are available in the contextual menu of the **Outline** view (when the  **Show XML structure** option is selected in the  **Settings** menu):

#### **Append Child**

Displays a list of elements that can be inserted as children of the current element.

#### **Insert Before**

Displays a list of elements that can be inserted as siblings of the current element, before the current element.

#### **Insert After**

Displays a list of elements that can be inserted as siblings of the current element, after the current element.

#### **Edit Attributes**

Displays an in-place attribute editing window.

#### **Toggle Comment**

Comments/uncomments the currently selected element.

#### **Search References** [Ctrl + Shift + R](#) ([Command + Shift + R](#) on OS X)

Sets the search scope to the current component and searches all references of the item found at current cursor position in the defined scope. See [Find References and Declarations of Ant Components](#) for more details.

#### **Search References in**

Sets the search scope to the specified scope and searches all references of the item found at current cursor position in the specified scope. See [Find References and Declarations of Ant Components](#) for more details.

#### **Component Dependencies**

Shows the dependencies for the current selected component. See [Ant Component Dependencies View](#) for more details.

#### **Rename Component in**

Renames the selected component. See [Ant Refactoring Actions](#) for more details.

#### **Cut, Copy, Delete**

Executes the typical editing actions on the currently selected component.

#### **Expand More**

Expands recursively all sub-components of the selected component.

### Collapse All

Collapses recursively all sub-components of the selected component.

You can search a component in the **Outline** view by typing its name in the filter text field at the top of the view or directly on the tree structure. When you type the component name in the text field, you can switch to the tree structure using the following:

- **Down** arrow key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match (such as **\*textToFind\***).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor has a predefined order for the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The main file is the one you are editing and it is located at the top of the list.
- For type, the order is: properties, targets, references.

**Note:** When no grouping is available Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

## Ant Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for an Ant build file by analyzing imported or included build files. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the hierarchy of a build file, select it in the **Project** view and choose **Resource Hierarchy** from the contextual menu.

If you want to see the dependencies of a build file, select it in the **Project** view and choose **Resource Dependencies** from the contextual menu.

The following actions are available in the **Resource Hierarchy/Dependencies** view:

### Refresh

Refreshes the Hierarchy/Dependencies structure.

### Stop

Stops the hierarchy/dependencies computing.

### Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

### Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

### Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

## History

Provides access to the list of previously computed dependencies. Use the **\*Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

### **Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

### **Copy location**

Copies the location of the resource.

### **Move resource**

Moves the selected resource.

### **Rename resource**

Renames the selected resource.

### **Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

### **Show Resource Dependencies**

Shows the dependencies for the selected resource.

## Add to Master Files

Adds the currently selected resource in *the Master Files directory*.

### **Expand All**

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

### **Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

## Ant Component Dependencies View

The Component Dependencies view allows you to see the dependencies for a selected Ant component. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of an Ant component, select the desired component in the editor or **Outline** view and choose the **Component Dependencies** action from the contextual menu. The action is available for the following components: *properties*, *targets*, *extension-points*, and *references* (those that have an id set).

The following toolbar actions are available in the **Component Dependencies** view:

## Refresh

Refreshes the dependencies structure.

## Stop

Stops the dependencies computing.

## Configure

Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

## History

Allows you to repeat a previous dependencies computation.

The following actions are available from the contextual menu:

### **Go to First Reference**

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

## Go to Component

Shows the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another, these references are listed in a table displayed at the bottom of **Component Dependencies** view. When a recursive reference is encountered, it is marked with a special icon .

### Related information

[Search and Refactor Operations Scope](#) on page 463

## Highlight Component Occurrences

When a component (for example *property* or *target*) is found at the current cursor position, they are highlighted in both the document and in the stripe bar at the right side of the document. Oxygen XML Editor also supports occurrences highlight for type and task references.

Customizable colors are used (one for the component definition and another one for component references). Occurrences are displayed until another component is selected and a new search is performed. All highlights are removed when you start to edit the document.

This feature is enabled by default. To configured it, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Mark Occurrences**. If the automatic feature is disabled for a particular type of file, you can perform this search by going to **Search > Search Occurrences in File** **Ctrl + Shift + U** (**Command + Shift + U** on OS X) in the contextual menu. Matches are displayed in separate tabs of the **Results** view.

### Related information

[Mark Occurrences Preferences](#) on page 107

## Find References and Declarations of Ant Components

The following search actions related to references and declarations of Ant components are available from the **Search** submenu of the contextual menu and from the **Document > References** menu::

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify after selecting a scope for the search operation.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when defining a new scope.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

-  **Show Definition** - Moves the cursor to the location of the definition of the current item.

**Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

### Related information

[Search and Refactor Operations Scope](#) on page 463

## Ant Quick Assist Support

The *Quick Assist* support helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb icon  placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1 (Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

The quick assist support offers direct access to the following actions:

### **Rename Component in**

Renames the component and all its dependencies.

### **Search Declarations**

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

### **Search References**

Searches all references of the component in a predefined scope.

### **Component Dependencies**

Searches the component dependencies in a predefined scope.

### **Change Scope**

Configures the scope that will be used for future search or refactor operations.

### **Rename Component**

Allows you to rename the current component in-place.

### **Search Occurrences**

Searches all occurrences of the component within the current file.

#### **Related information**

[Ant Component Dependencies View](#) on page 537

[Ant resource Hierarchy/Dependencies View](#) on page 536

[Ant Refactoring Actions](#) on page 539

[Search and Refactor Operations Scope](#) on page 463

## **Ant Quick Fix Support**

The Oxygen XML Editor Quick Fix support helps you resolve missing target reference errors that may occur when developing Ant build documents.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a Quick Fix is available for that particular error or warning, you can access the Quick Fix proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a quick fix icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the quick fix menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

Oxygen XML Editor provides the following types of quick fixes for Ant build files:

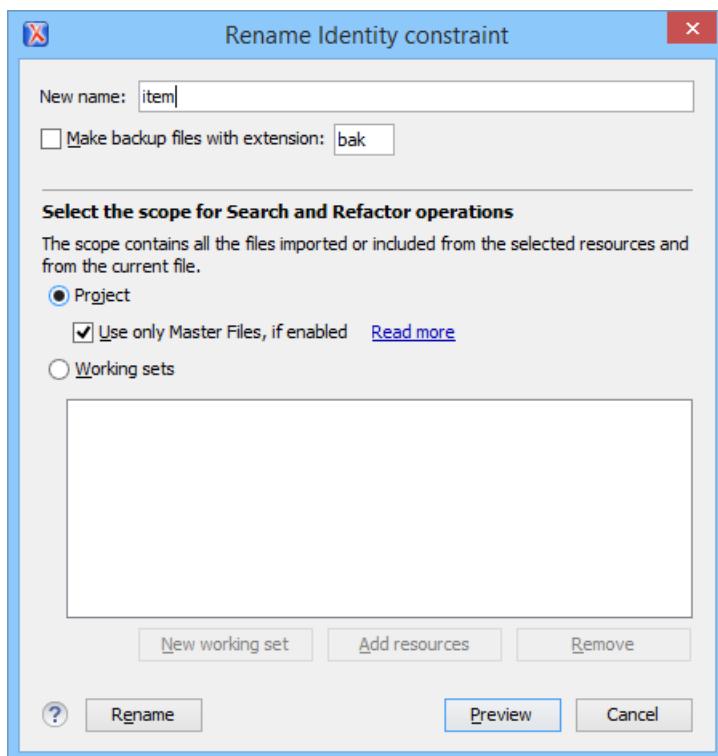

- **Create new target** - Creates a new target with the specified name.
- **Change reference to "targetName"** - Corrects the reference to point to an already defined target.
- **Remove target reference** - Removes the erroneous reference.

## **Ant Refactoring Actions**

The following refactoring actions can be applied on *targets*, *extension-points*, *properties*, and *references* and allow you to consistently rename a component in the entire Ant build file structure. They are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

**Figure 290: Rename Identity Constraint Dialog Box**

## Editing XML Schemas

---

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for both XML Schema 1.0 and 1.1 and you can edit XML Schema files in the following editing modes:

- **Text editing mode** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode** - Displays XML Schema files in a structured spreadsheet-like grid.
- **Design editing mode** - Visual schema designer that helps you understand the structure and develop complex schemas.
- **Author editing mode** - The visual **Author** mode is also available for XML Schema, allowing you to visually edit the schema annotations. It presents a polished and compact view of the XML Schema, with support for links on imported/included schemas.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents](#) on page 464.

### Related information

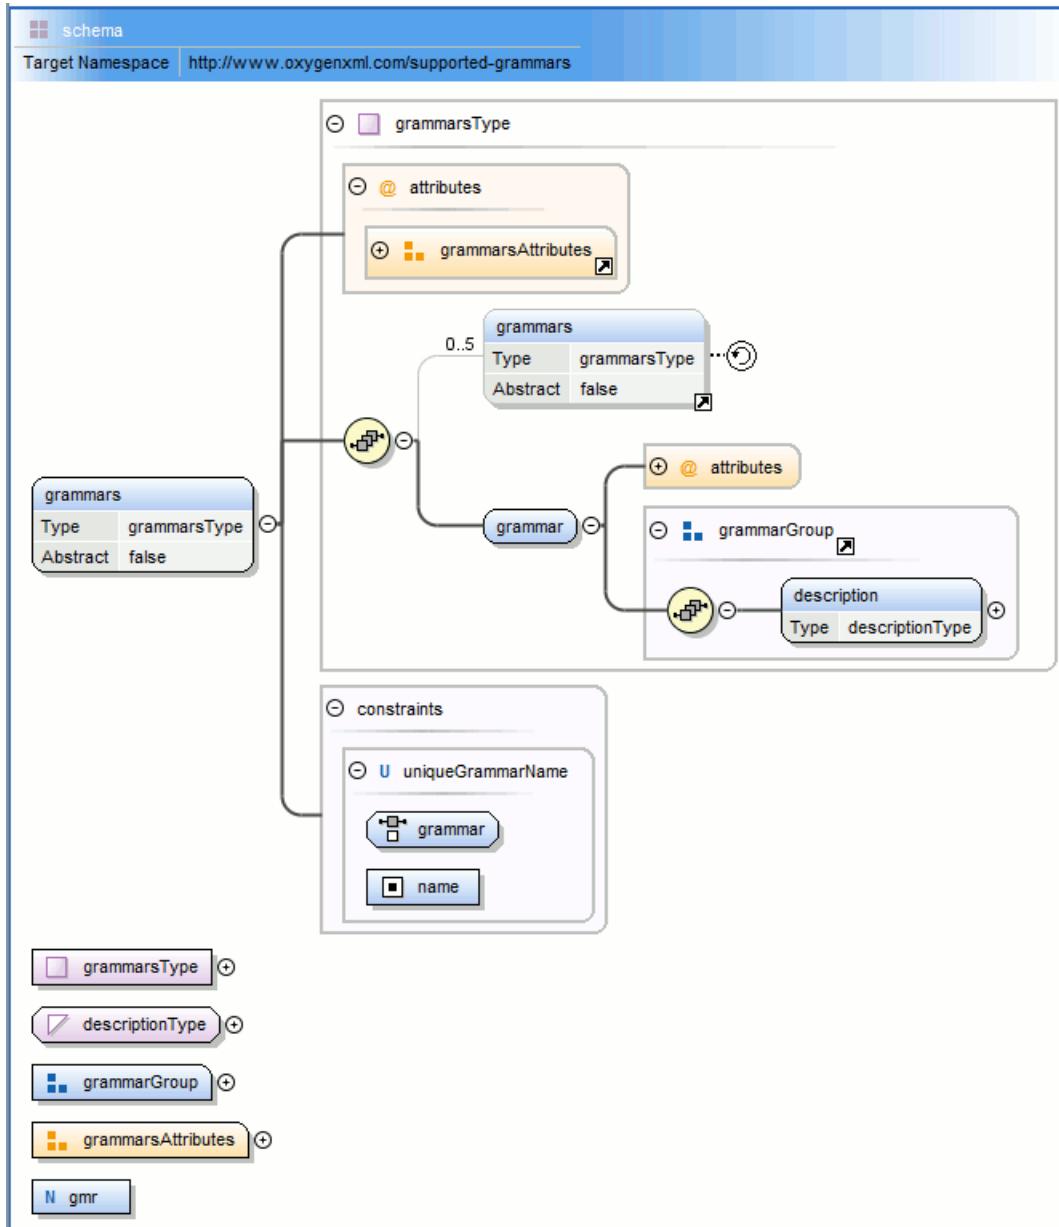

[Associating a Schema to XML Documents](#) on page 464

## Design Editing Mode (XML Schema Diagram Editor)

XML Schemas enable document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor provides a simple and expressive XML Schema diagram editor (**Design mode**) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The diagram font can be increased using the usual Oxygen XML Editor shortcuts: **(Ctrl (Meta on Mac OS) + "+")**, **(Ctrl (Meta on Mac OS)+"-")**, **(Ctrl (Meta on Mac OS) + 0)** or **(Ctrl (Meta on Mac OS) - mouse wheel)**. The whole diagram can also be zoomed with one of the predefined factors *available in the Schema preferences panel*. The same zoom factor is applied for the print and save actions.

**Figure 291: XML Schema Diagram**

To watch our video demonstration about the basic aspects of designing an XML Schema using the new Schema Editor, go to [https://www.oxygenxml.com/demo/XML\\_Schema\\_Editing.html](https://www.oxygenxml.com/demo/XML_Schema_Editing.html).

#### Navigation in the XML Schema Design Mode

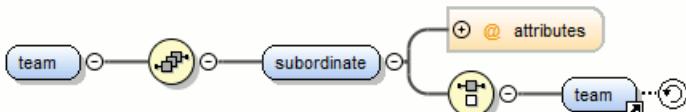

The following editing and navigation features work for all types of schema components in the XML Schema **Design mode**:

- Move/reference components in the diagram using drag-and-drop actions.

- Select consecutive components on the diagram (components from the same level) using the **Shift** key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on Mac OS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use **Home/End** keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on OS X)** key combination to go to the diagram root and **Ctrl + End (Command + End on OS X)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline** view:
  - **Back** (go to previous schema component).
  - **Forward** (go to next schema component).
  - **\* Go to Last Modification** (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Show Definition** action.
- Search in the diagram using the **Find/Replace dialog box** or the **Quick find toolbar**. You can find/replace components only in the current file scope.
- You can expand and see the contents of the imports/includes/redefines in the diagram. In order to edit components from other schemas the schema for each component will be opened as a separate file in Oxygen XML Editor.

**Tip:** If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a *recurse symbol* (). Click this symbol to navigate between the element declaration and its reference.

**Figure 292: Recursive Reference**

### Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline** view to a compositor in the diagram. Also, the components order in an `xs:sequence` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **move** - Context dependent, the selected component is moved to the destination.
- **reference** - Context dependent, the selected component is referenced from the parent.
- **copy** - If **(Ctrl (Meta on Mac OS))** key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- - When moving a component.
- - When referencing a component.
- - When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press **(Enter)**. The list of properties that can be displayed for each component can be customized [in the Preferences](#).

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press **(Enter)** on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

#### Related information

[Searching and Refactoring Actions in XML Schemas](#)

[Component Dependencies View for XML Schema](#)

[XML Schema Resource Hierarchy / Dependencies View](#)

[Generating Sample XML Files](#)

[Schema Design Preferences](#) on page 88

#### Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

##### **Show Definition (Ctrl + Shift + Enter)**

Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

##### **Open Schema (Ctrl + Shift + Enter)**

Opens the selected schema. This action is available for `xsd:import`, `xsd:include` and `xsd:redefine` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

##### **Edit Attributes ()**

Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the [Attributes View](#) and the [Facets View](#). The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

##### **Append child**

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

##### **Insert before**

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

##### **Insert after**

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

## New global

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `xsd:include` or `xsd:redefine` element.

**Note:** If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

## Edit Schema Namespaces

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes** view for the schema or by double-clicking the schema component.

## Edit Annotations

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

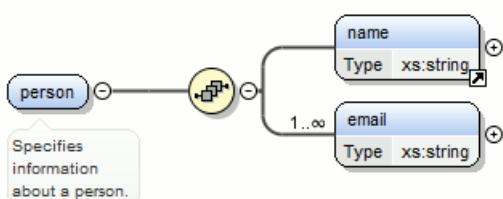

- **Edit all appinfo/documentation items for a specific annotation** - All appinfo/documentation items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (documentation/appinfo), content, source (optional, specify the source of the documentation/appinfo element) and `xml:lang`. The content of a documentation/appinfo item can be edited in the **Content** area below the table.
- **Insert/Insert before/Remove documentation/appinfo**. The **Add** button allows you to insert a new annotation item (documentation/appinfo). You can add a new item before the item selected in table by pressing the **Insert Before** button. Also, you can delete the selected item using the **Remove** button.
- **Move items up/down** - to do this use the **Move up** and **Move down** buttons.
- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.
- **Specify an ID for the component annotation**. An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are presented in the diagram also below the reference component. The **Edit Annotations** action invoked from the contextual menu edit the annotations for the reference. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

**Note:** For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

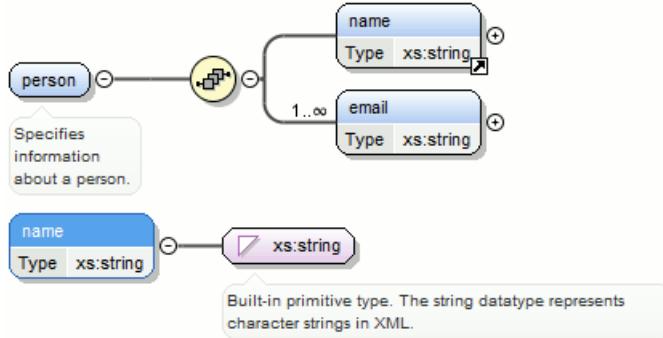

## Extract Global Element

Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

**Figure 293: Extracting a Global Element**

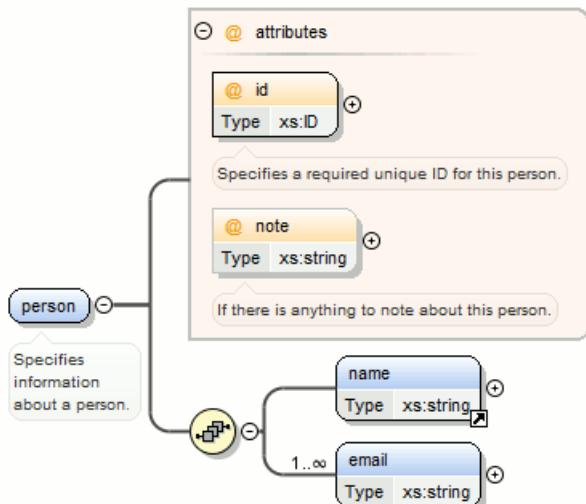

If you use the **Extract Global Element** action on a name element , the result is:

**Figure 294: Extracting a Global Element on a name Element**

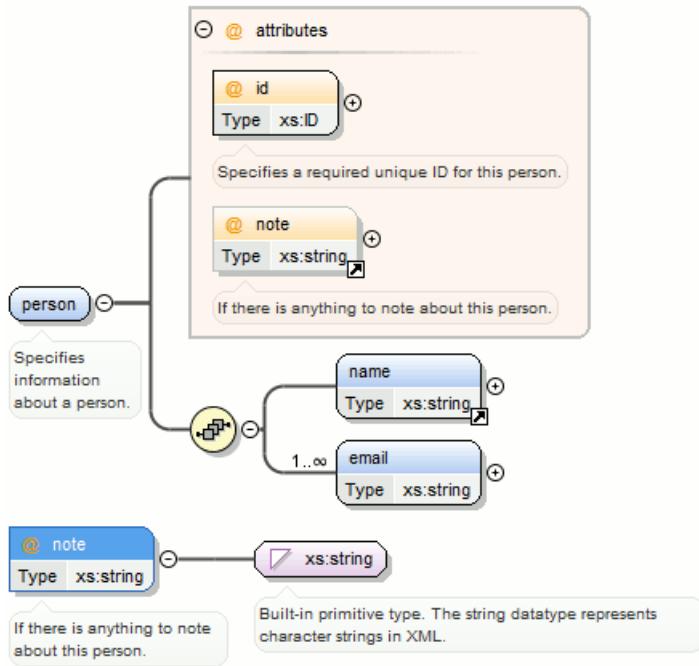

### Extract Global Attribute

Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

**Figure 295: Extracting a Global Attribute**

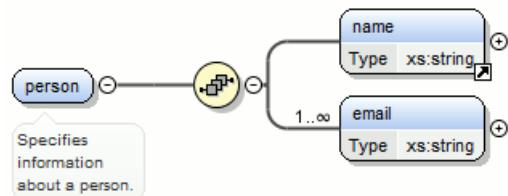

If you use the **Extract Global Attribute** action on a note attribute, the result is:

**Figure 296: Extracting a Global Attribute on a note Attribute**

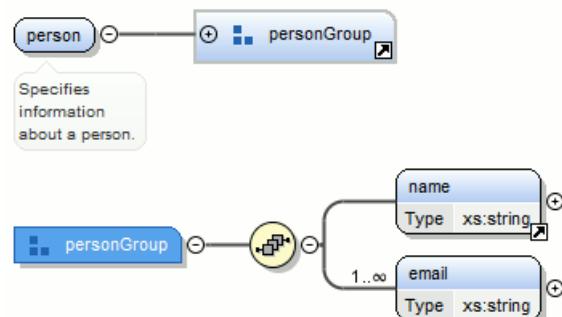

#### Extract Global Group

Action available for composers (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is enabled only if the parent of the composer is not a group.

If you use the **Extract Global Group** action on the sequence element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type personGroup, the result is:

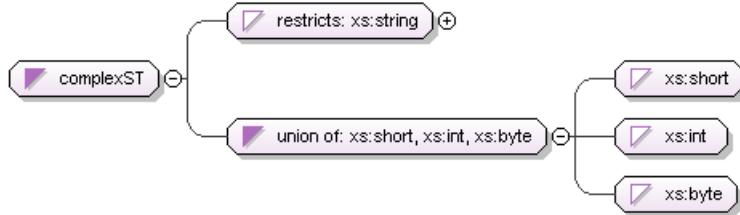

**Figure 297: Extracting a Global Group**

**Figure 298: Extracting a Global Group on a sequence Element**

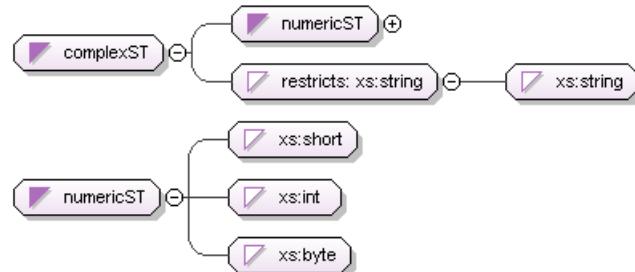

#### Extract Global Type

Action used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

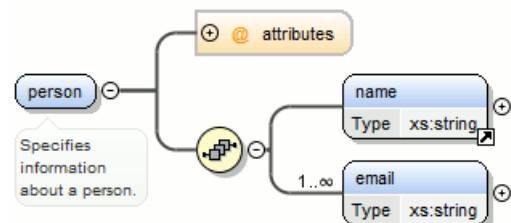

**Figure 299: Extracting a Global Simple Type**

If you use the action on the union component and choose numericST for the new global simple type name, the result is:

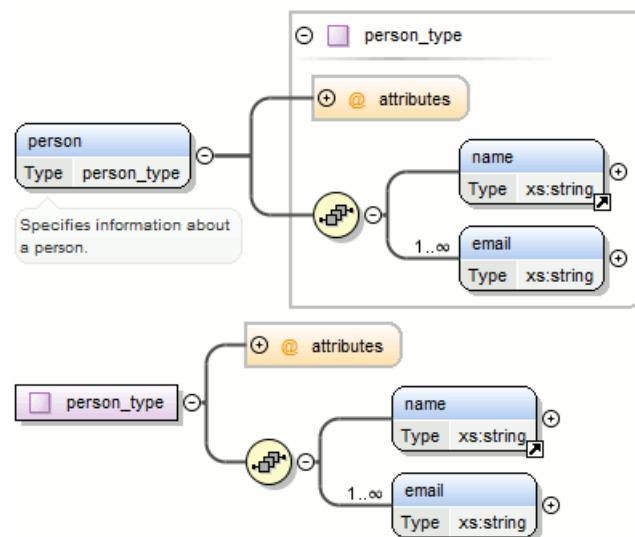

**Figure 300: Extracting a Global Simple Type on a union Component**

**Figure 301: Extracting a Global Complex Type**

If you use the action on a person element and choose person\_type for the new complex type name, the result is:

**Figure 302: Extracting a Global Complex Type on a person Element**

#### **Rename Component in**

Rename the selected component.

 **Cut Ctrl + X (Command + X on OS X)**

Cut the selected component(s).

 **Copy Ctrl + C (Command + C on OS X)**

Copy the selected component(s).

 **Copy XPath**

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

 **Paste Ctrl + V (Command + V on OS X)**

Paste the component(s) from the clipboard as children of the selected component.

**Paste as Reference**

Create references to the copied component(s). If not possible a warning message is displayed.

**Remove (Delete)**

Remove the selected component(s).

**Override component**

Copies the overridden component in the current XML Schema. This option is available for *xs:override* components.

**Redefine component**

The referenced component is added in the current XML Schema. This option is available for *xs:redefine* components.

**Optional**

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The *minOccurs* property is set to 0 and the *use* property for attributes is set to optional.

**Unbounded**

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The *maxOccurs* property is set to unbounded and the *use* property for attributes is set to required.

**Search**

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

 **Search References**

Searches all references of the item found at current cursor position in the defined scope if any.

**Search References in**

Searches all references of the item found at current cursor position in the specified scope.

**Search Occurrences in File**

Searches all occurrences of the item found at current cursor position in the current file.

 **Component Dependencies**

Allows you to see the dependencies for the current selected component.

**Resource Hierarchy**

Allows you to see the hierarchy for the current selected resource.

**Flatten Schema**

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

**Resource Dependencies**

Allows you to see the dependencies for the current selected resource.

### **Expand All**

Recursively expands all sub-components of the selected component.

### **Collapse All**

Recursively collapses all sub-components of the selected component.

### **Save as Image**

Save the diagram as image, in JPEG, BMP, SVG or PNG format.

### **Generate Sample XML Files**

Generate XML files using the current opened schema. The selected component is the XML document root.

See more in the [Generate Sample XML Files](#) section.

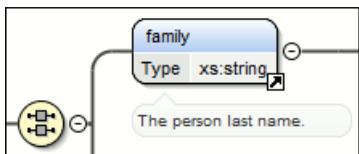

### **Options**

Show the [Schema preferences panel](#).

## **XML Schema Components**

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, `family` is a required element).

**Figure 303: Example: Required Component**

- A thin line to identify a connection with an optional component (in the following image, `email` is an optional element).

**Figure 304: Example: Optional Component**

The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

### **xs:schema**

 schema  
Target Namespace <http://www.oxygenxml.com/supported-grammars>

**Figure 305: The xs:schema Component**

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-schema>.

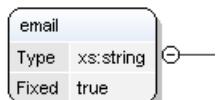

By default, it displays the `targetNamespace` property when rendered.

**Table 10: xs:schema Properties**

Property Name	Description	Possible Values
<b>Target Namespace</b>	The schema target namespace.	Any URI

Property Name	Description	Possible Values
<b>Element Form Default</b>	Determining whether or not local element declarations will be namespace-qualified by default.	qualified, unqualified, [Empty]. Default value is unqualified.
<b>Attribute Form Default</b>	Determining whether or not local attribute declarations will be namespace-qualified by default.	qualified, unqualified, [Empty]. Default value is unqualified.
<b>Block Default</b>	Default value of the block attribute of xs:element and xs:complexType.	#all, extension, restriction, substitution, restriction extension, restriction substitution, extension substitution, restriction extension substitution, [Empty].
<b>Final Default</b>	Default value of the final attribute of xs:element and xs:complexType.	#all, restriction, extension, restriction extension, [Empty].
<b>Default Attributes</b>	Specifies a set of attributes that apply to every complex Type in a schema document.	Any.
<b>Xpath Default Namespace</b>	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
<b>Version</b>	Schema version	Any token.
<b>ID</b>	The schema id	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>SystemID</b>	The schema system id	Not editable property.

#### xs:element

**Figure 306: The xs:element Component**

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-element>.

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

**Table 11: xs:element Properties**

Property Name	Description	Possible Values	Mentions
<b>Name</b>	The element name. Always required.	Any NCName for global or local elements, any QName for element references.	If missing, will be displayed as '[element]' in diagram.

Property Name	Description	Possible Values	Mentions
<b>Is Reference</b>	When set, the local element is a reference to a global element.	true/false	Appears only for local elements.
<b>Type</b>	The element type.	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].	For all elements. For references, the value is set in the referenced element.
<b>Base Type</b>	The extended/restricted base type.	All declared or built-in types	For elements with complex type, with simple or complex content.
<b>Mixed</b>	Defines if the complex type content model will be mixed.	true/false	For elements with complex type.
<b>Content</b>	The content of the complex type.	simple/complex	For elements with complex type that extends/restricts a base type. It is automatically detected.
<b>Content Mixed</b>	Defines if the complex content model will be mixed.	true/false	For elements with complex type that has a complex content.
<b>Default</b>	Default value of the element. A default value is automatically assigned to the element when no other value is specified.	Any string	The fixed and default attributes are mutually exclusive.
<b>Fixed</b>	A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.	Any string	The fixed and default attributes are mutually exclusive.
<b>Min Occurs</b>	Minimum number of occurrences of the element.	A numeric positive value. Default value is 1	Only for references/local elements
<b>Max Occurs</b>	Maximum number of occurrences of the element.	A numeric positive value. Default value is 1	Only for references/local elements

Property Name	Description	Possible Values	Mentions
<b>Substitution Group</b>	Qualified name of the head of the substitution group that this element belongs to.	All declared elements. For XML Schema 1.1 this property supports multiple values.	For global and reference elements
<b>Abstract</b>	Controls whether or not the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.	true/false	For global elements and element references
<b>Form</b>	Defines if the element is "qualified" (belongs to the target namespace) or "unqualified" (doesn't belong to any namespace).	unqualified/qualified	Only for local elements
<b>Nillable</b>	When this attribute is set to true, the element can be declared as nil using an xsi:nil attribute in the instance documents.	true/false	For global elements and element references
<b>Target Namespace</b>	Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.	Not editable property.	For all elements.

Property Name	Description	Possible Values	Mentions
<b>Block</b>	Controls if the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through <code>xsi:type</code> and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the <code>blockDefault</code> attribute of the parent <code>xs:schema</code> .	#all, restriction, extension, substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution	For global elements and element references
<b>Final</b>	Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the <code>finalDefault</code> attribute of the parent <code>xs:schema</code> .	#all, restriction, extension, restriction extension, [Empty]	For global elements and element references
<b>ID</b>	The component id.	Any id	For all elements.
<b>Component</b>	The edited component name.	Not editable property.	For all elements.
<b>Namespace</b>	The component namespace.	Not editable property.	For all elements.
<b>System ID</b>	The component system id.	Not editable property.	For all elements.

#### xs:attribute

The manager ID.

**Figure 307: The xs:attribute Component**

Defines an attribute. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-attribute>.

An attribute by default displays the following properties when rendered in the diagram: *default*, *fixed*, *use* and *type*. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

**Table 12: xs:attribute Properties**

Property Name	Description	Possible Value	Mentions
<b>Name</b>	Attribute name. Always required.	Any NCName for global/local attributes, all declared attributes' QName for references.	For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.
<b>Is Reference</b>	When set, the local attribute is a reference.	true/false	For local attributes.
<b>Type</b>	Qualified name of a simple type.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.	For all attributes. For references, the type is set to the referenced attribute.
<b>Default</b>	Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
<b>Fixed</b>	When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
<b>Use</b>	Possible usage of the attribute. Marking an attribute "prohibited" is useful to exclude attributes during derivations by restriction.	optional, required, prohibited	For local attributes
<b>Form</b>	Specifies whether or not the attribute is qualified (must have a namespace prefix in the instance XML document). The default value for this attribute is specified by the attributeFormDefault attribute of the xs:schema document element.	unqualified/qualified	For local attributes.

Property Name	Description	Possible Value	Mentions
<b>Inheritable</b>	Specifies if the attribute is inheritable. Inheritable attributes can be used by <alternative> element on descendant elements.	true/false	For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.
<b>Target Namespace</b>	Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace.	Any URI	Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.
<b>ID</b>	The component id.	Any id	For all attributes.
<b>Component</b>	The edited component name.	Not editable property.	For all attributes.
<b>Namespace</b>	The component namespace.	Not editable property.	For all attributes.
<b>System ID</b>	The component system id.	Not editable property.	For all attributes.

#### xs:attributeGroup

The properties of an area.

**Figure 308: The xs:attributeGroup Component**

Defines an attribute group to be used in complex type definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-attributeGroup>.

**Table 13: xs:attributeGroup Properties**

Property Name	Description	Possible Values	Mentions
<b>Name</b>	Attribute group name. Always required.	Any NCName for global attribute groups, all declared attribute groups for reference.	For all global or referenced attribute groups. If missing, will be displayed as '[attributeGroup]' in diagram.
<b>ID</b>	The component id.	Any id	For all attribute groups.
<b>Component</b>	The edited component name.	Not editable property.	For all attribute groups.
<b>Namespace</b>	The component namespace.	Not editable property.	For all attribute groups.
<b>System ID</b>	The component system id.	Not editable property.	For all attribute groups.

## xs:complexType

**Figure 309: The xs:complexType Component**

Defines a top level complex type. Complex Type Definitions provide for: See more data at <http://www.w3.org/TR/xmlschema11-1/#element-complexType>.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

**Tip:** A complex type that is a base type to another type will be rendered with yellow background.

**Table 14: xs:complexType Properties**

Property Name	Description	Possible Values	Mentions
<b>Name</b>	The name of the complex type. Always required.	Any NCName	Only for global complex types. If missing, will be displayed as '[complexType]' in diagram.
<b>Base Type Definition</b>	The name of the extended/restricted types.	Any from the declared simple or complex types.	For complex types with simple or complex content.
<b>Derivation Method</b>	The derivation method.	restriction/ extension	Only when base type is set. If the base type is a simple type, the derivation method is always extension.
<b>Content</b>	The content of the complex type.	simple/ complex	For complex types that extend/restrict a base type. It is automatically detected.
<b>Content Mixed</b>	Specifies if the complex content model will be mixed.	true/false	For complex contents.
<b>Mixed</b>	Specifies if the complex type content model will be mixed.	true/false	For global and anonymous complex types.

Property Name	Description	Possible Values	Mentions
<b>Abstract</b>	When set to true, this complex type cannot be used directly in the instance documents and needs to be substituted using an xsi:type attribute.	true/false	For global and anonymous complex types.
<b>Block</b>	Controls if a substitution (either through a xsi:type or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot "unblock" them), which can also be blocked in the element definition. The default value is defined by the blockDefault attribute of xs:schema.	all, extension, restriction, extension restriction, [Empty]	For global complex types.
<b>Final</b>	Controls whether the complex type can be further derived by extension or restriction to create new complex types.	all, extension, restriction, extension restriction, [Empty]	For global complex types.
<b>Default Attributes Apply</b>	The schema element can carry a defaultAttributes attribute, which identifies an attribute group. Each complexType defined in the schema document then automatically includes that attribute group, unless this is overridden by the defaultAttributesApply attribute on the complexType element.	true/false	This property is available only for XML Schema 1.1.
<b>ID</b>	The component id.	Any id	For all complex types.
<b>Component</b>	The edited component name.	Not editable property.	For all complex types.
<b>Namespace</b>	The component namespace.	Not editable property.	For all complex types.
<b>System ID</b>	The component system id.	Not editable property.	For all complex types.

## xs:simpleType

The person name.

**Figure 310: The xs:simpleType Component**

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-simpleType>.

**Tip:** A simple type that is a base type to another type will be rendered with yellow background.

**Table 15: xs:simpleType Properties**

Name	Description	Possible Values	Scope
<b>Name</b>	Simple type name. Always required.	Any NCName.	Only for global simple types. If missing, will be displayed as '[simpleType]' in diagram.
<b>Derivation</b>	The simple type category: restriction, list or union.	restriction,list or union	For all simple types.
<b>Base Type</b>	A simple type definition component. Required if derivation method is set to restriction.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to restriction.
<b>Item Type</b>	A simple type definition component. Required if derivation method is set to list.	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to list. Derivation by list is the process of transforming a simple datatype (named the item type) into a whitespace-separated list of values from this datatype. The item type can be defined inline by adding a simpleType definition as a child element of the list element, or by reference, using the itemType attribute (it is an error to use both).
<b>Member Types</b>	Category for grouping union members.	Not editable property.	For global and anonymous simple types with the derivation method set to union.

Name	Description	Possible Values	Scope
<b>Member</b>	A simple type definition component. Required if derivation method is set to union.	All global simple types and built-in simple types (from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to union. Deriving a simple datatype by union merges the lexical spaces of several simple datatypes (called member types) to create a new simple datatype. The member types can be defined either by reference (through the memberTypes attribute) or embedded as simple datatype local definitions in the xs:union element. Both styles can be mixed.
<b>Final</b>	Blocks any further derivations of this datatype (by list, union, derivation or all).	#all, list, restriction, union, list restriction, list union, restriction union. In addition, [Empty] proposal is present for set empty string as value.	Only for global simple types.
<b>ID</b>	The component id.	Any id.	For all simple types
<b>Component</b>	The name of the edited component.	Not editable property.	Only for global and local simple types
<b>Namespace</b>	The component namespace.	Not editable property.	For global simple types.
<b>System ID</b>	The component system id.	Not editable property.	Not present for built-in simple types..

#### xs:alternative

The *type alternatives* mechanism allows you to specify type substitutions on an element declaration.

**Note:** xs:alternative is available for XML Schema 1.1.

**Figure 311: The xs:alternative Component**

**Table 16: xs:alternative Properties**

Name	Description	Possible Values
<b>Type</b>	Specifies type substitutions for an element, depending on the value of the attributes.	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].
<b>Test</b>	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression.
<b>XPath Default Namespace</b>	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
<b>ID</b>	Specifies the component ID.	Any ID.
<b>Component</b>	Specifies the type of XML schema component.	Not editable property.
<b>System ID</b>	Points to the document location of the schema.	Not editable property.

**xs:group****Figure 312: The xs:group Component**

Defines a group of elements to be used in complex type definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-group>.

When referenced, the graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the group are drawn using dotted lines if the group is optional.

**Table 17: xs:group Properties**

Property Name	Description	Possible Values	Mentions
<b>Name</b>	The group name. Always required.	Any NCName for global groups, all declared groups for reference.	If missing, will be displayed as '[group]' in diagram.
<b>Min Occurs</b>	Minimum number of occurrences of the group.	A numeric positive value. Default value is 1.	Appears only for reference groups.

Property Name	Description	Possible Values	Mentions
<b>Max Occurs</b>	Maximum number of occurrences of the group.	A numeric positive value. Default value is 1.	Appears only for reference groups.
<b>ID</b>	The component id.	Any id	For all groups.
<b>Component</b>	The edited component name.	Not editable property.	For all groups.
<b>Namespace</b>	The component namespace.	Not editable property	For all groups.
<b>System ID</b>	The component system id.	Not editable property.	For all groups.

#### xs:include

**Figure 313: The xs:include Component**

Adds multiple schemas with the same target namespace to a document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-include>.

**Table 18: xs:include properties**

Property Name	Description	Possible Values
<b>Schema Location</b>	Included schema location.	Any URI
<b>ID</b>	Include ID.	Any ID
<b>Component</b>	The component name.	Not editable property.

#### xs:import

**Figure 314: The xs:import Component**

Adds multiple schemas with a different target namespace to a document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-import>.

**Table 19: xs:import Properties**

Property Name	Description	Possible Values
<b>Schema Location</b>	Imported schema location	Any URI
<b>Namespace</b>	Imported schema namespace	Any URI
<b>ID</b>	Import ID	Any ID
<b>Component</b>	The component name	Not editable property.

#### xs:redefine

**Figure 315: The xs:redefine Component**

Redefines simple and complex types, groups, and attribute groups from an external schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-redefine>.

**Table 20: xs:redefine Properties**

Property Name	Description	Possible Values
<b>Schema Location</b>	Redefine schema location.	Any URI
<b>ID</b>	Redefine ID	Any ID
<b>Component</b>	The component name.	Not editable property.

#### xs:override

**Figure 316: The xs:override Component**

The override construct allows replacements of old components with new ones without any constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-override>.

**Table 21: xs:override Properties**

Property Name	Description	Possible Values
<b>Schema Location</b>	Redefine schema location.	Any URI
<b>ID</b>	Redefine ID	Any ID

#### xs:notation

**Figure 317: The xs:notation Component**

Describes the format of non-XML data within an XML document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-notation>.

**Table 22: xs:notation Properties**

Property Name	Description	Possible values	Mentions
<b>Name</b>	The notation name. Always required.	Any NCName.	If missing, will be displayed as '[notation]' in diagram.
<b>System Identifier</b>	The notation system identifier.	Any URI	Required if public identifier is absent (otherwise, optional).
<b>Public Identifier</b>	The notation public identifier.	A Public ID value	Required if system identifier is absent (otherwise, optional).
<b>ID</b>	The component id.	Any ID	For all notations.
<b>Component</b>	The edited component name.	Not editable property.	For all notations.
<b>Namespace</b>	The component namespace.	Not editable property.	For all notations.

Property Name	Description	Possible values	Mentions
<b>System ID</b>	The component system id.	Not editable property.	For all notations.

**xs:sequence / xs:choice / xs:all**

**Figure 318: xs : sequence**

xs : sequence specifies that the child elements must appear in a sequence. Each child element can occur from 0 to any number of times. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-sequence>.

**Figure 319: xs : choice**

xs : choice allows only one of the elements contained in the declaration to be present within the containing element. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-choice>.

**Figure 320: xs : all**

xs : all specifies that the child elements can appear in any order. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-all>.

The compositor graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the compositor are drawn using dotted lines if the compositor is optional.

**Table 23: xs : sequence, xs : choice, xs : all Properties**

Property Name	Description	Possible Values	Mentions
<b>Compositor</b>	Compositor type.	sequence, choice, all.	'all' is only available as a child of a group or complex type.
<b>Min Occurs</b>	Minimum occurrences of compositor.	A numeric positive value. Default is 1.	The property is not present if compositor is 'all' and is child of a group.
<b>Max Occurs</b>	Maximum occurrences of compositor.	A numeric positive value. Default is 1.	The property is not present if compositor is 'all' and is child of a group.
<b>ID</b>	The component id.	Any ID	For all composers.
<b>Component</b>	The edited component name.	Not editable property.	For all composers.
<b>System ID</b>	The component system id.	Not editable property.	For all composers.

## xs:any

**Figure 321: The xs:any Component**

Enables the author to extend the XML document with elements not specified by the schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-any>.

The graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

**Table 24: xs:any Properties**

Property Name	Description	Possible Values
<b>Namespace</b>	The list of allowed namespaces. The namespace attribute expects a list of namespace URLs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
<b>notNamespace</b>	Specifies the namespace that extension elements or attributes cannot come from.	##local, ##targetNamespace
<b>notQName</b>	Specifies an element or attribute that is not allowed.	##defined
<b>Process Contents</b>	Type of validation required on the elements allowed for this wildcard.	skip, lax, strict
<b>Min Occurs</b>	Minimum occurrences of any	A numeric positive value. Default is 1.
<b>Max Occurs</b>	Maximum occurrences of any	A numeric positive value. Default is 1.
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The name of the edited component.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

## xs:anyAttribute

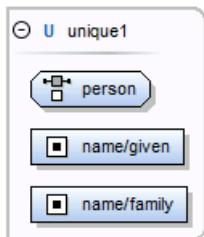

**Figure 322: The xs:anyAttribute Component**

Enables the author to extend the XML document with attributes not specified by the schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-anyAttribute>.

**Table 25: xs:anyAttribute Properties**

Property Name	Description	Possible Value
<b>Namespace</b>	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
<b>Process Contents</b>	Type of validation required on the elements allowed for this wildcard.	skip, lax, strict
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The name of the edited component.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

#### xs:unique

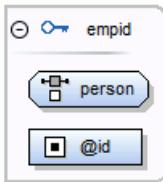

**Figure 323: The xs:unique Component**

Defines that an element or an attribute value must be unique within the scope. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-unique>.

**Table 26: xs:unique Properties**

Property Name	Description	Possible Values
<b>Name</b>	The unique name. Always required.	Any NCName.
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>Namespace</b>	The component namespace.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

### xs:key

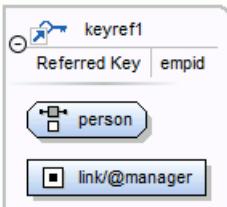

**Figure 324: The xs:key Component**

Specifies an attribute or element value as a key (unique, non-nullable and always present) within the containing element in an instance document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-key>.

**Table 27: xs:key Properties**

Property Name	Description	Possible Value
<b>Name</b>	The key name. Always required.	Any NCName.
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>Namespace</b>	The component namespace.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

### xs:keyRef

**Figure 325: The xs:keyRef Component**

Specifies that an attribute or element value corresponds to that of the specified key or unique element. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-keyref>.

A keyref by default displays the *Referenced Key* property when rendered.

**Table 28: xs:keyRef Properties**

Property Name	Description	Possible Values
<b>Name</b>	The keyref name. Always required.	Any NCName.
<b>Referenced Key</b>	The name of referenced key.	any declared element constraints.
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>Namespace</b>	The component namespace.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

### xs:selector

**Figure 326: The xs:selector Component**

Specifies an XPath expression that selects a set of elements for an identity constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-selector>.

**Table 29: xs:selector Properties**

Property Name	Description	Possible Values
<b>XPath</b>	Relative XPath expression identifying the element that the constraint applies to.	An XPath expression.
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

#### xs:field

**Figure 327: The xs:field Component**

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-field>.

**Table 30: xs:field Properties**

Property Name	Description	Possible Values
<b>XPath</b>	Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint.	An XPath expression.
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

#### xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

**Note:** xs:assert is available for XML Schema 1.1.

**Figure 328: The xs:assert Component**

**Table 31: xs:assert Properties**

Property Name	Description	Possible Values
<b>Test</b>	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression.
<b>XPath Default Namespace</b>	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
<b>ID</b>	Specifies the component ID.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

**xs:openContent****Figure 329: The xs:openContent Component**

The openContent element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the complexType definition) or at the schema level.

For further details about the openContent component, go to <http://www.w3.org/TR/xmlschema11-1/#element-openContent>.

**Table 32: xs:openContent Properties**

Property Name	Description	Possible Value
<b>Mode</b>	Specifies where the extension elements can be inserted.	The value can be: "interleave", "suffix" or "none". The default value is "interleave".
<b>ID</b>	The component id.	Any ID.
<b>Component</b>	The edited component name.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

**Note:** This component is available for XML Schema 1.1 only. To change the version of the XML Schema, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema**.

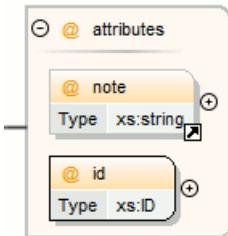

**Constructs Used to Group Schema Components**

This section explains the components that can be used for grouping other schema components:

- [Attributes](#)

- *Constraints*
- *Substitutions*

#### Attributes

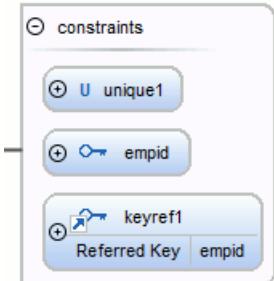

**Figure 330: Attributes Construct**

Groups all attributes and attribute groups belonging to a complex type.

**Table 33: attributes Properties**

Property Name	Description	Possible Values
<b>Component</b>	The element for which the attributes are displayed.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

#### Constraints

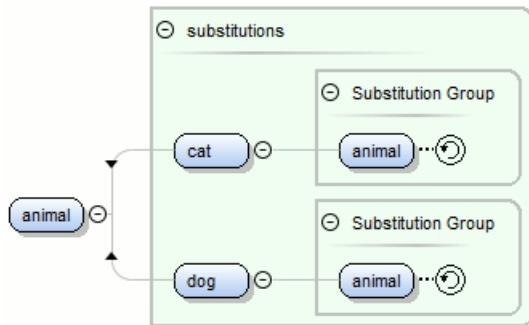

**Figure 331: Constraints Construct**

Groups all constraints (*xs:key*, *xs:keyRef* or *xs:unique*) belonging to an element.

**Table 34: constraints Properties**

Property Name	Description	Possible Values
<b>Component</b>	The element for which the constraints are displayed.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

## Substitutions

**Figure 332: Substitutions Construct**

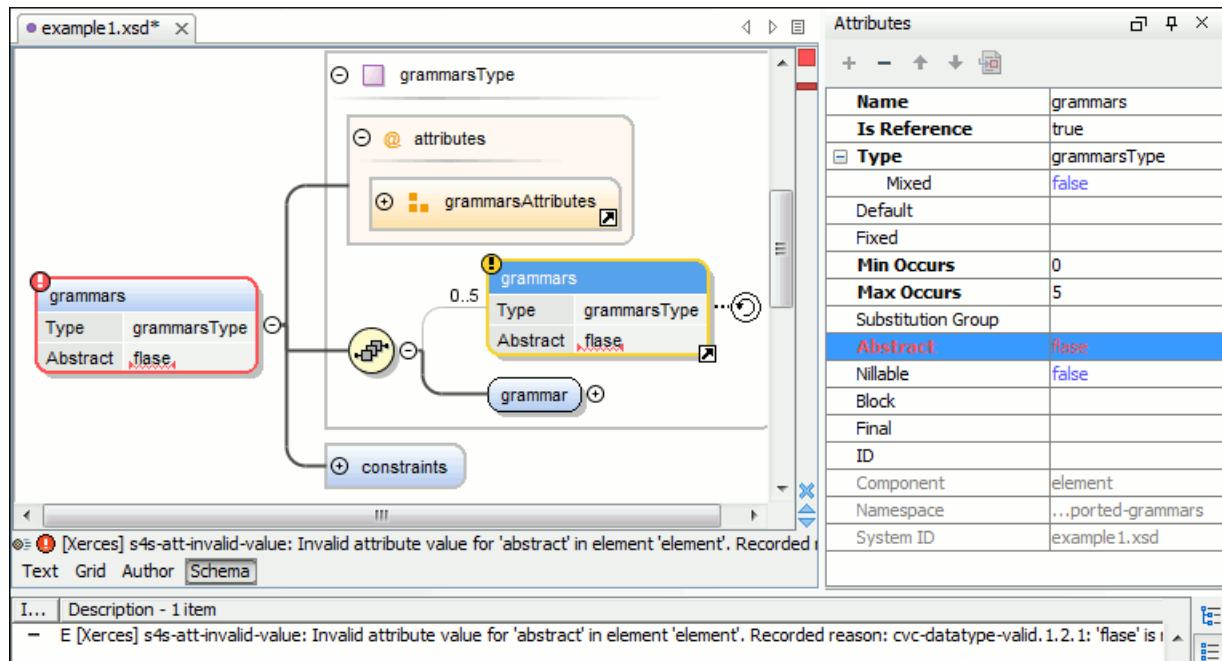

Groups all elements that can substitute the current element.

**Table 35: substitutions Properties**

Property Name	Description	Possible Values
<b>Component</b>	The element for which the substitutions are displayed.	Not editable property.
<b>System ID</b>	The component system id.	Not editable property.

## Schema Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor [XML documents validation](#) capability.

**Figure 333: XML Schema Validation**

A schema validation error is presented by highlighting the invalid component:

- In the [Attributes View](#).
- In the diagram by surrounding the component that has the error with a red border.
- A marker on the errors stripe at the right of the diagram view.
- A status label with a red icon (⚠) below the diagram view.

Invalid facets for a component are highlighted in the [Facets View](#).

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the [Document checking user preferences](#). When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the **Validate** action from the **Document > Validate** menu or from the **Validation** toolbar drop-down menu, all validation errors will be presented in the **Errors** tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

**Important:** If the schema imports only the namespace of other schema without specifying the schema location and a [catalog is set-up](#) that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

**Tip:** If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is an XML Schema module.

### Edit Schema Namespaces

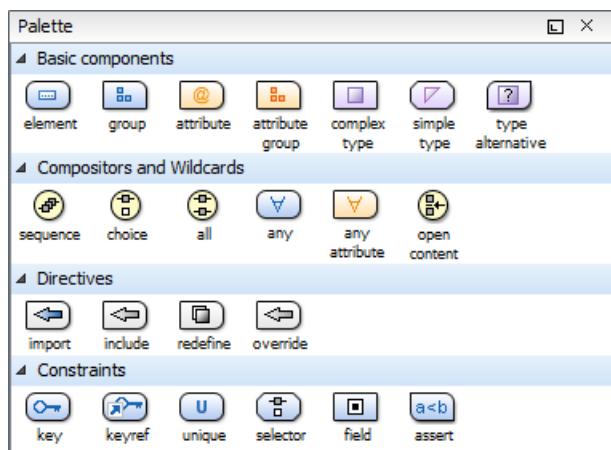

You can use the **XML Schema Namespaces** dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the **Design** mode these namespaces can be modified anytime by choosing **Edit Schema Namespaces** from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The **XML Schema Namespaces** dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

### XML Schema Palette View

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the [XML Schema preferences page](#). If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 334: Palette View**

Components are organized functionally into 4 collapsible categories:

- Basic components: *elements*, *group*, *attribute*, *attribute group*, *complex type*, *simple type*, *type alternative*.
- Compositors and Wildcards: *sequence*, *choice*, *all*, *any*, *any attribute*, *open content*.

- Directives: *import*, *include*, *redefine*, *override*.
- Identity constraints: *key*, *keyref*, *unique*, *selector*, *field*, *assert*.

**Note:** The type *alternative*, *open content*, *override*, and *assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

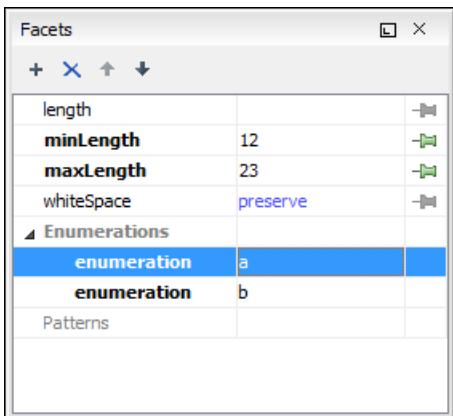

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

**Note:** You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option (default color is red).

To watch our video demonstration about the Schema palette and developing XML Schemas, go to [https://www.oxygenxml.com/demo/Schema\\_Palette.html](https://www.oxygenxml.com/demo/Schema_Palette.html) and [https://www.oxygenxml.com/demo/Developing\\_XML\\_Schemas.html](https://www.oxygenxml.com/demo/Developing_XML_Schemas.html) respectively.

### XML Schema Facets View

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 335: Facets View**

The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

**Important:** Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the [Document Checking user preferences](#).

The **Facets** view provides the following actions in its toolbar and contextual menu:

Allows you to add a new enumeration or a new pattern.

### Remove

Allows you to remove the value of a facet.

### Edit Annotations

Allows you to edit an annotation for the selected facet.

### Move Up

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

### Move Down

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

### Copy

Copy the attribute value.

### Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the [XML Schema Regular Expressions Builder](#) that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the  Pin button.

## Editing XML Schema in Text Editing Mode

The Oxygen XML Editor **Text** editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple [refactoring actions](#). The Outline view has two display modes: the [standard outline](#) mode and the [components](#) mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, enable the [Show Full Model XML Schema diagram](#) checkbox from the [Diagram](#) preferences page.

## Editing XML Schema in the Master Files Context

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the [master files support from the Project view](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- **Content Completion Assistant** displays all the referable components valid in the current context. This includes components defined in modules other than the currently edited one.
- The **Outline** displays the components collected from the entire schema structure.

## Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#), go to [Editor > Document Checking](#), and disable the [Enable automatic validation](#) option.

To validate an XML Schema document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

## Related concepts

[Validation Scenario](#) on page 444

## Related information

[Validating XML Documents Against a Schema](#) on page 438

[Associating a Schema to XML Documents](#) on page 464

[Presenting Validation Errors in Author Mode](#) on page 231

[Presenting Validation Errors in Text Mode](#) on page 200

## References to XML Schema Specification

The same as in editing XML documents, the message of an error obtained by validation of an XML Schema document includes a reference to the W3C specification for XML Schema. An error message contains an *Info* field that will open the browser on the "XML Schema Part 1:Structures" specification at exactly the point where the error is described, thus allowing you to understand the reason for that error.

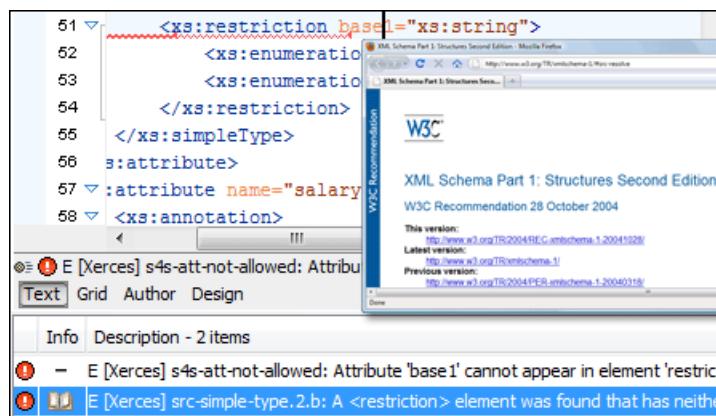

Figure 336: Link to Specification for XML Schema Errors

Validation of an XML Schema containing a type definition with a `minOccurs` or `maxOccurs` attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Editor window. Otherwise, for large values of the `minOccurs` and `maxOccurs` attributes, the validator fails with an *OutOfMemory* error that might make Oxygen XML Editor unusable without restarting the entire application.

**Important:** If the schema imports only a namespace without specifying the schema location and a [catalog is set up](#) to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.

## Content Completion in XML Schema

The intelligent **Content Completion Assistant** available in Oxygen XML Editor enables rapid, in-line identification and insertion of elements, attributes and attribute values valid in the editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The **Content Completion Assistant** is enabled by default. To disable it, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Content Completion**, and disable the **Enable content completion** option.

When active, the **Content Completion Assistant** displays a list of context-sensitive proposals valid at the current cursor position. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the **Content Completion Assistant** displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected content in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the [selected schema version](#), Oxygen XML Editor populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Editor helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing `xs:annotation/xs:appinfo` elements of an XML Schema, the Content Completion Assistant proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the [XSD Content Completion](#) preferences page.

## XML Schema Outline View

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

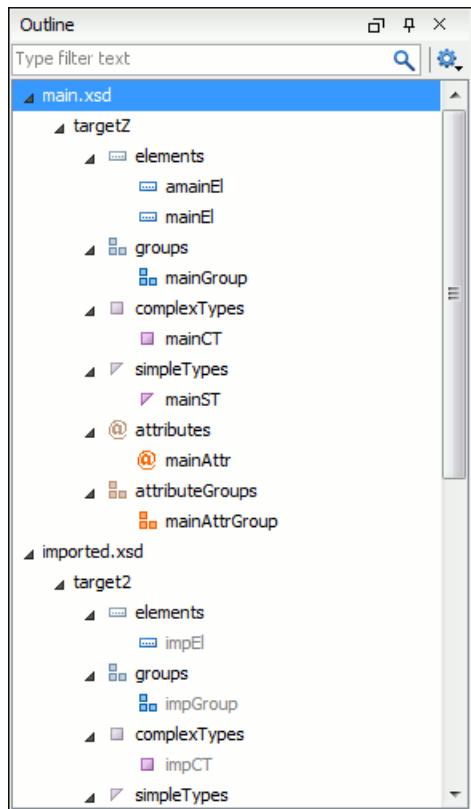

Figure 337: Outline View for XML Schema

The **Outline** view provides the following options in the **Settings** menu on the **Outline** view toolbar:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

### Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

### Sort

Allows you to sort alphabetically the schema components.

## Show all components

Displays all components that were collected starting from the main files. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the componentNS namespace.

## Show referable components

Displays all components (collected starting from the main files) that can be referenced from the current file. This option is set by default.

## Show only local components

Displays the components defined in the current file only.

## Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

### **Remove (Delete)**

Removes the selected item from the diagram.

### **Search References (Ctrl (Meta on Mac OS)+Shift+R)**

Searches all references of the item found at current cursor position in the defined scope, if any.

### **Search References in**

Searches all references of the item found at current cursor position in the specified scope.

### **Component Dependencies (Ctrl (Meta on Mac OS)+Shift+F4)**

Allows you to see the dependencies for the current selected component.

### **Resource Hierarchy (F4)**

Allows you to see the hierarchy for the current selected resource.

### **Resource Dependencies (Shift + F4)**

Allows you to see the dependencies for the current selected resource.

### **Rename Component in**

Renames the selected component.

### **Generate Sample XML Files**

Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

## Related information

[Searching and Refactoring Actions in XML Schemas](#)

[Component Dependencies View for XML Schema](#)

[XML Schema Resource Hierarchy / Dependencies View](#)

[Generating Sample XML Files](#)

[Editing Relax NG Schema in the Master Files Context on page 631](#)

## XML Schema Attributes View

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

The screenshot shows the 'Attributes' view window with the following data:

Name	family
▲ Type	[ST - union]
▲ Member Types	
Member	xs:string
Default	
Fixed	
Substitution Group	
Abstract	false
Nillable	false
Block	
Final	
ID	
Component	element
Namespace	
System ID	personal.xsd

**Figure 338: Attributes View**

The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the [Document checking user preferences](#).

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing [Edit Schema Namespaces](#) from the contextual menu on the schema root. See more in the [Edit Schema Namespaces](#) section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

Allows you to add a new member type to an union's member types category.

Allows you to remove the value of a property.

Allows you to move up the current member to an union's member types category.

Allows you to move down the current member to an union's member types category.

Copy the attribute value.

#### [Show DefinitionCtrl \(Meta on MAC OS\) + Click](#)

Shows the definition for the selected type.

#### Show Facets

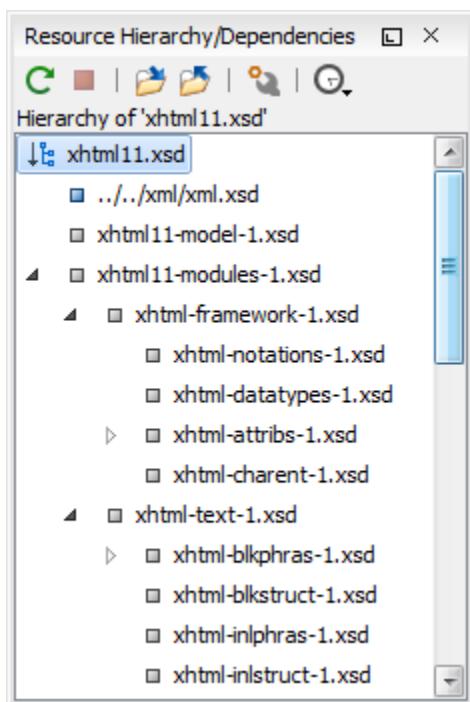

Allows you to edit the facets for a simple type.

### XML Schema Resource Hierarchy / Dependencies View

The **Resource Hierarchy / Dependencies** view allows you to easily see the hierarchy / dependencies for an XML Schema, a [Relax NG schema](#) or an [XSLT stylesheet](#). If the view is not displayed, it can be opened from the **Window > Show View** menu.

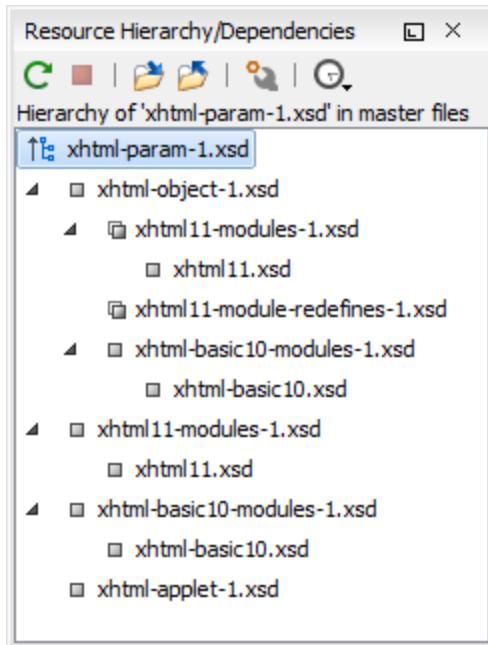

The **Resource Hierarchy / Dependencies** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

The build process for the hierarchy view is started with the **Resource Hierarchy** action available on the contextual menu of the editor panel.

**Figure 339: Resource Hierarchy/Dependencies View - Hierarchy for xhtml11.xsd**

The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

**Figure 340: Resource Hierarchy/Dependencies View - Dependencies for xhtml-param-1.xsd**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

**Refresh**

Refreshes the Hierarchy/Dependencies structure.

**Stop**

Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the **\*Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

**Rename resource**

Renames the selected resource.

**Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

## Show Resource Dependencies

Shows the dependencies for the selected resource.

## Add to Master Files

Adds the currently selected resource in the **Master Files** directory.

## Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

## Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

**Note:** The **Move resource** or **Rename resource** actions give you the option to *update the references to the resource*.

## Related information

[Working with Modular XML Files in the Master Files Context](#) on page 472

[Search and Refactor Operations Scope](#) on page 463

## Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

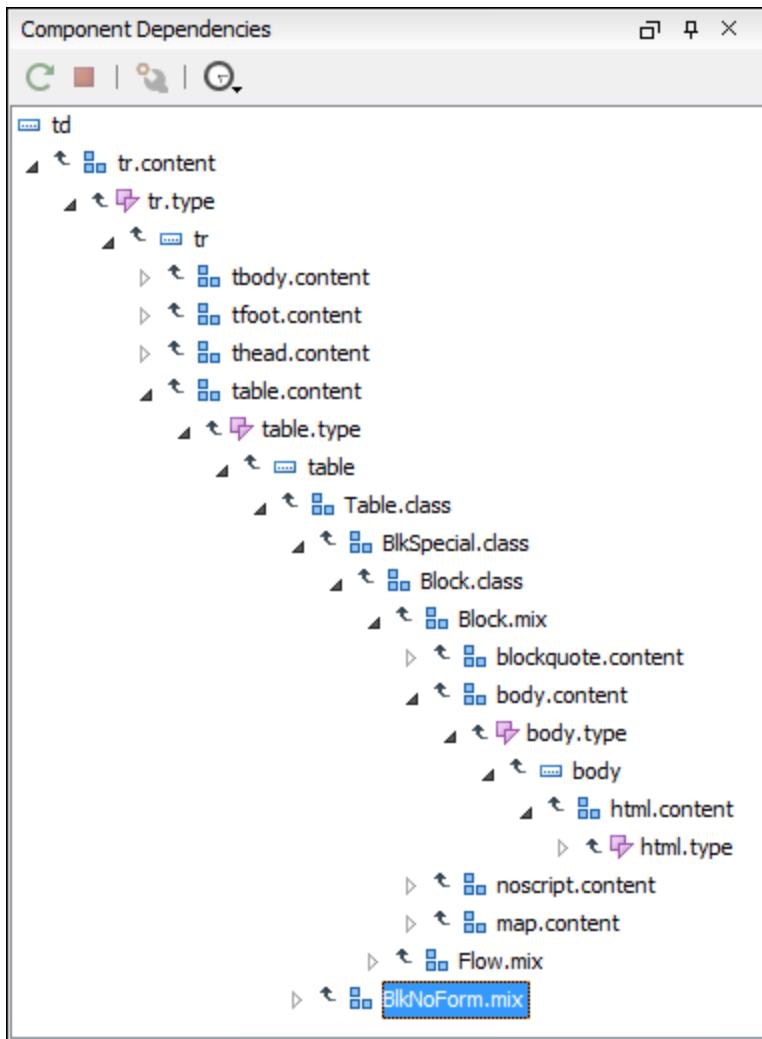

## Component Dependencies View for XML Schema

The **Component Dependencies** view allows you to spot the dependencies for the selected component of an XML Schema, a [Relax NG schema](#), a [NVDL schema](#) or an [XSLT stylesheet](#). If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of a schema component:

- Select the desired schema component in the editor.
- Choose the **Component Dependencies** action from the contextual menu.

The action is available for all named components (for example, elements or attributes).

**Figure 341: Component Dependencies View - Hierarchy for xhtml11.xsd**

In the **Component Dependencies** view the following actions are available in the toolbar:

#### Refresh

Refreshes the dependencies structure.

#### Stop

Stop the dependencies computing.

#### Configure

Allows you to configure a search scope to compute the dependencies structure.

#### History

Contains a list of previously executed dependencies computations.

The contextual menu contains the following actions:

#### **Go to First Reference**

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

#### **Go to Component**

Shows the definition of the currently selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another components, a small table is displayed that contains all these references. When a recursive reference is encountered, it is marked with a special icon .

## Related information

[Search and Refactor Operations Scope](#) on page 463

## Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File ()** contextual menu action. All matches are displayed in a separate tab of the **Results** view.

## Searching and Refactoring Actions in XML Schemas

### Search Actions

The following search actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
-  **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

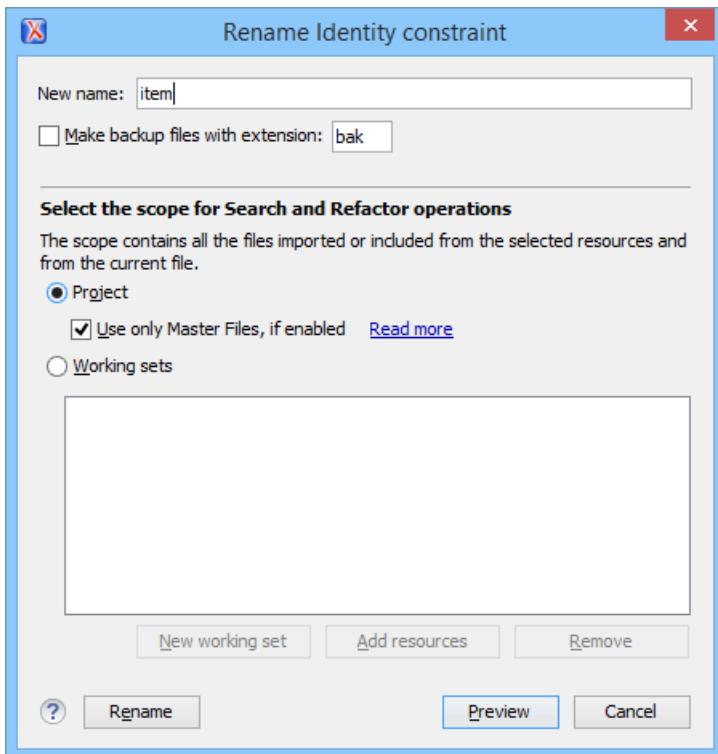

-  **Show Definition** - Moves the cursor to the definition of the referenced XML Schema item.

**Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

### Refactoring Actions

The following refactoring actions can be applied on attribute, attributeGroup, element, group, key, unique, keyref, notation, simple, or complex types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

**Figure 342: Rename Identity Constraint Dialog Box**

#### Related information

[Search and Refactor Operations Scope](#) on page 463

## Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers quick fixes for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides quick fixes for numerous types of problems, including the following:

Problem type	Available quick fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

## XML Schema Quick Assist Support

The *Quick Assist* support improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1 (Meta + Alt + 1 on Mac OS X)** keyboard shortcuts.

**Figure 343: Quick Assist Support**

The quick assist support offers direct access to the following actions:

### **Rename Component in**

Renames the component and all its dependencies.

### **Search Declarations**

Sets the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

### **Search References**

Sets all references of the component in a predefined scope.

### **Component Dependencies**

Sets the component dependencies in a predefined scope.

### **Change Scope**

Configures the scope that will be used for future search or refactor operations.

### **Rename Component**

Allows you to rename the current component in-place.

### **Search Occurrences**

Sets all occurrences of the component within the current file.

To watch our video demonstration about improving schema development using the **Quick Assist** action set, go to [https://www.oxygenxml.com/demo/Quick\\_Assist.html](https://www.oxygenxml.com/demo/Quick_Assist.html).

## Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in [XML Schema preferences page](#).

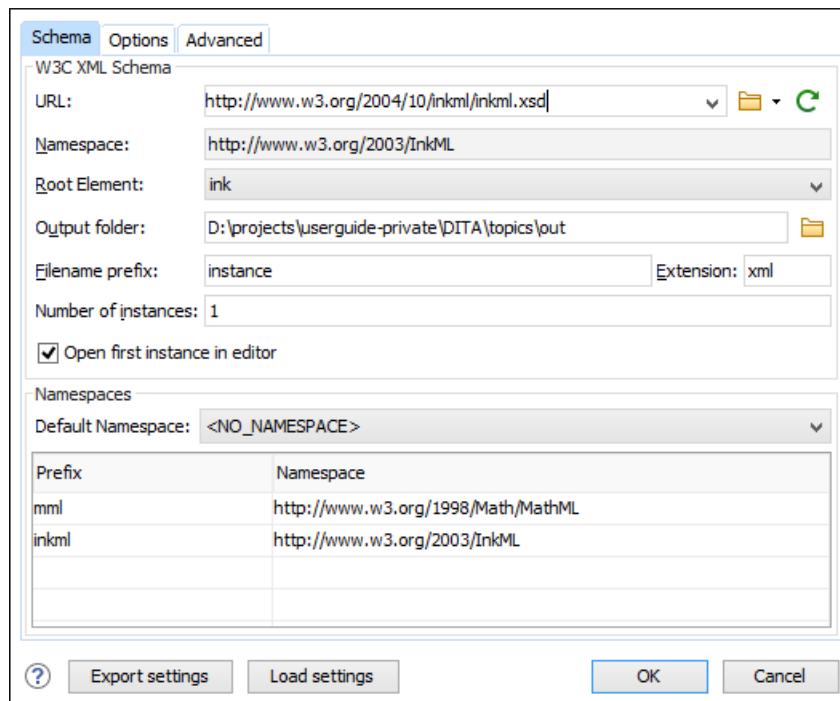

To generate sample XML files from an XML Schema, use the  **Generate Sample XML Files** action from the **Tools** menu. This action is also available in the contextual menu of the schema *Design mode*. The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

For more information about this tool, watch our video demonstration about generating sample XML files at [https://www.oxygenxml.com/demo/Generate\\_Sample\\_XML\\_Files.html](https://www.oxygenxml.com/demo/Generate_Sample_XML_Files.html).

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the [Sample XML Files Generator preferences page](#). You can also run the tool from the command line using exported options.

### Schema Tab (Generate Sample XML Files Tool)

The  **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the **Schema** tab.

**Figure 344: Generate Sample XML Files Dialog Box (Schema Tab)**

This tab includes the following options:

#### URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing tools in the  **Browse** drop-down list.

#### Namespace

Displays the namespace of the selected schema.

#### Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

#### Output folder

Path to the folder where the generated XML instances will be saved.

## Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: prefixN.extension, where N represents an incremental number from 0 up to the specified **Number of instances**.

## Number of instances

The number of XML files to be generated.

## Open first instance in editor

When checked, the first generated XML file is opened in the editor.

## Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

## Load settings

Use this button to load previously exported settings.

## Export settings

Use this button to save the current settings for future use.

You can click **OK** at any point to generate the sample XML files.

## Options Tab (Generate Sample XML Files Tool)

The  **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Options** tab allows you to set specific options for namespaces and elements.

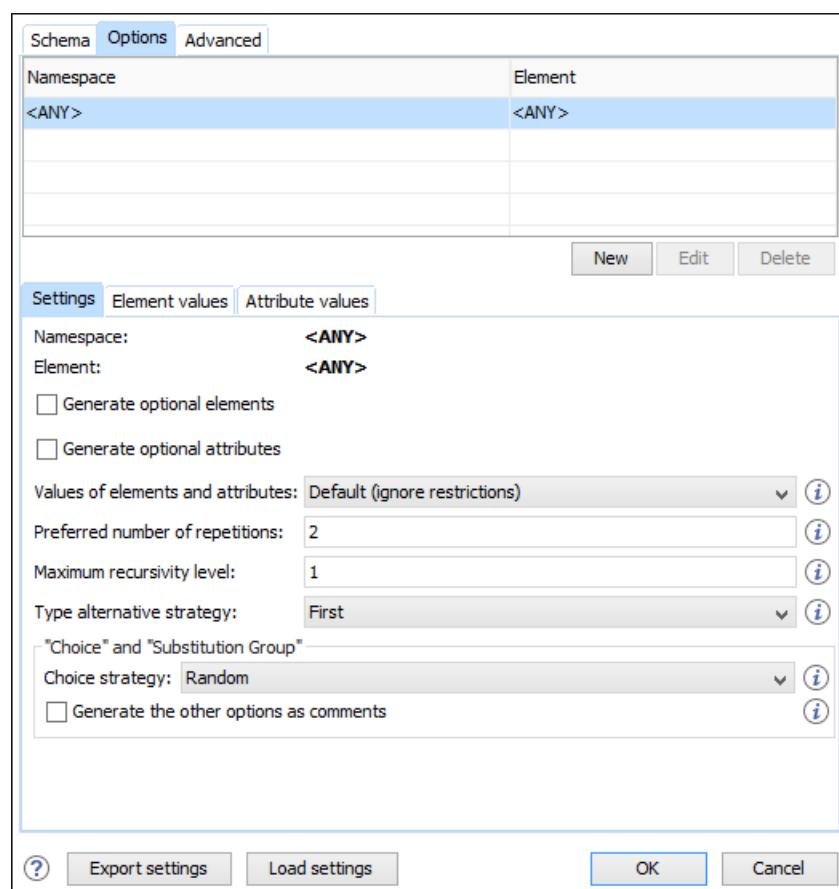

Figure 345: Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:

### Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

### Settings subtab

#### Namespace

Displays the namespace specified in the table at the top of the dialog box.

#### Element

Displays the element specified in the table at the top of the dialog box.

#### Generate optional elements

When checked, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

#### Generate optional attributes

When checked, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

#### Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **XML Instances Generator** preferences page). Note that type restrictions are ignored when this option is enabled. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.

**Important:** If all of the following are true, the **XML Instances Generator** outputs invalid values:

- At least one of the restrictions is a `regexp`.
- The value generated after applying the `regexp` does not match the restrictions imposed by one of the facets.

#### Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

#### Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

#### Type alternative strategy

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

#### Choice strategy

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

### **Generate the other options as comments**

If enabled, generates the other possible choices or substitutions (for xs:choice and substitutionGroup). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

### **Element values subtab**

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

### **Attribute values subtab**

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

### **Load settings**

Use this button to load previously exported settings.

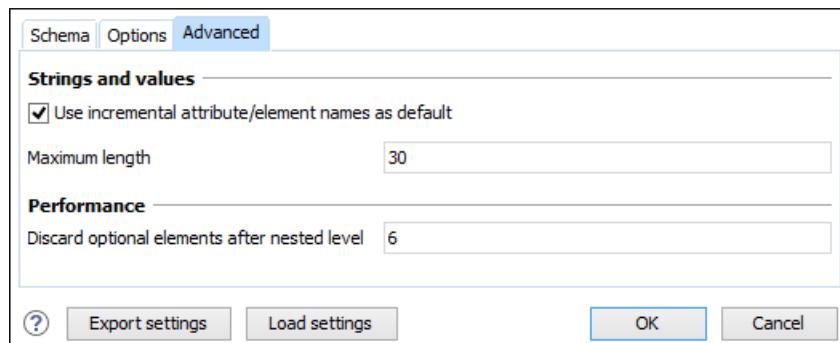

### **Export settings**

Use this button to save the current settings for future use.

You can click **OK** at any point to generate the sample XML files.

### **Advanced Tab (Generate Sample XML Files Tool)**

The  **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Advanced** tab allows you to set some options in regards to output values and performance.

**Figure 346: Generate Sample XML Files Dialog Box (Advanced Tab)**

This tab includes the following options:

#### **Use incremental attribute / element names as default**

If checked, the value of an element or attribute starts with the name of that element or attribute. For example, for an element the generated values are: a1, a2, a3, and so on. If not checked, the value is the name of the type of that element / attribute (for example: string, decimal, etc.)

#### **Maximum length**

The maximum length of string values generated for elements and attributes.

#### **Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

### **Running the Generate Sample XML Files Tool from the Command Line**

The **Generate Sample XML Files** tool can be also used from command line by running the script called `xmlGenerator.bat` (on Windows) / `xmlGenerator.sh` (on Mac OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The parameters can be set in the dialog box, exported to an XML file on disk with

the **Export settings** button, and then reused from command line. With the exported settings file, you can generate the same XML instances from the command line as from the dialog box. For example:

```
xmlGenerator.bat path_of_CFG_file
```

The script can be integrated in an external batch process launched from the command line. The command line parameter of the script is the relative path to the exported XML settings file. The files specified with relative paths in the exported XML settings will be made absolute relative to the folder where the script is run.

The following example shows such an XML configuration file:

### XML Configuration File

```
<settings>
 <schemaSystemId>http://www.w3.org/2001/XMLSchema.xsd</schemaSystemId>
 <documentRoot>schemas</documentRoot>
 <outputFolder>D:\projects\output</outputFolder>
 <filenamePrefix>instance</filenamePrefix>
 <filenameExtension>xml</filenameExtension>
 <noOfInstances>1</noOfInstances>
 <openFirstInstance>true</openFirstInstance>
 <defaultNamespace><NO_NAMESPACE></defaultNamespace>
 <element namespace="<ANY>" name="<ANY>">
 <generateOptionalElements>false</generateOptionalElements>
 <generateOptionalAttributes>false</generateOptionalAttributes>
 <valuesForContentType>DEFAULT</valuesForContentType>
 <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
 <maximumRecursivityLevel>1</maximumRecursivityLevel>
 <choicesAndSubstitutions strategy="RANDOM"
 generateOthersAsComments="false"/>
 <attribute namespace="<ANY>">
 name="<ANY>"
 <attributeValue>attrValue1</attributeValue>
 <attributeValue>attrValue2</attributeValue>
 </attribute>
 </element>
 <element namespace="<NO_NAMESPACE>">
 name="<ANY>"
 <generateOptionalElements>true</generateOptionalElements>
 <generateOptionalAttributes>true</generateOptionalAttributes>
 <valuesForContentType>DEFAULT</valuesForContentType>
 <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
 <maximumRecursivityLevel>1</maximumRecursivityLevel>
 <choicesAndSubstitutions strategy="RANDOM"
 generateOthersAsComments="true"/>
 <elementValue>value1</elementValue>
 <elementValue>value2</elementValue>
 <attribute namespace="<ANY>">
 name="<ANY>"
 <attributeValue>attrValue1</attributeValue>
 <attributeValue>attrValue2</attributeValue>
 </attribute>
 </element>
</settings>
```

## Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:** You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

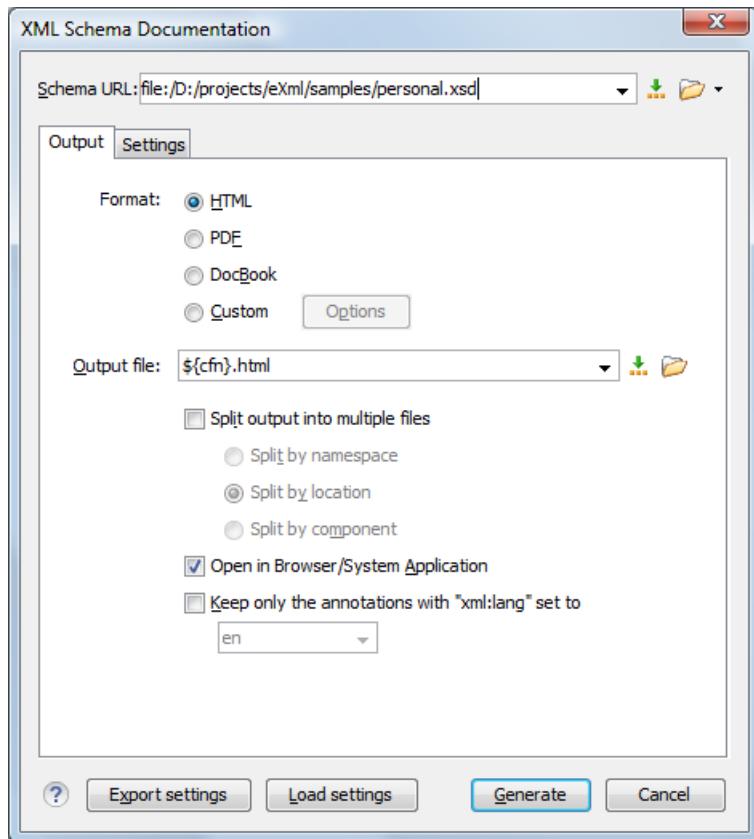

Figure 347: XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

### Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in [HTML output format](#).
  - **PDF** - The documentation is generated in [PDF output format](#).
  - **DocBook** - The documentation is generated in [DocBook output format](#).
  - **Custom** - The documentation is generated in a [custom output format](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

- Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.
- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

## Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

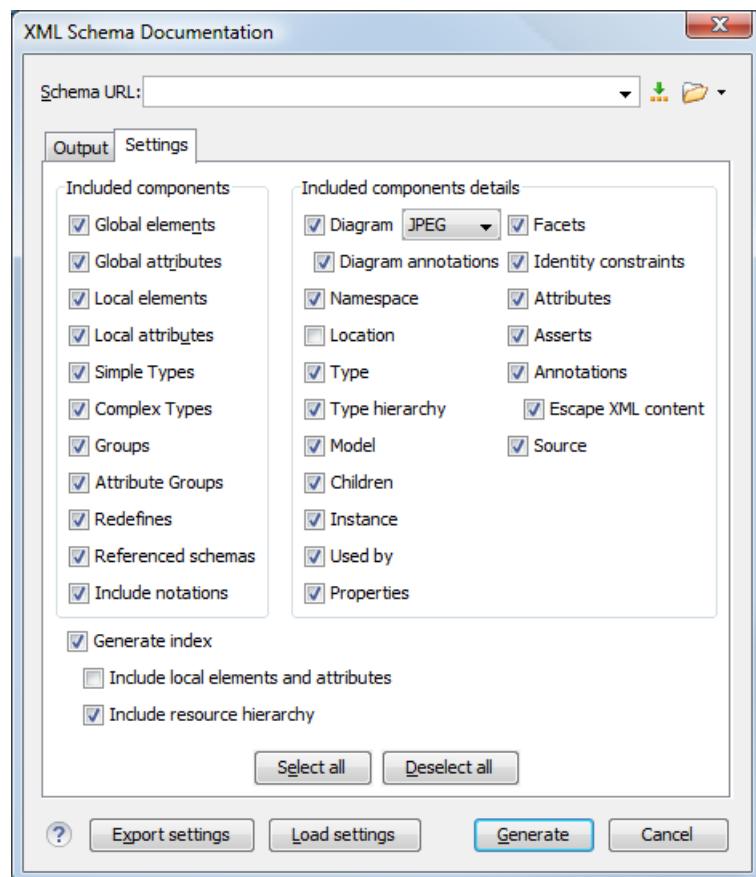

Figure 348: Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties](#) page.
  - **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.

- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - xs :all - Its children will be separated by space characters.
  - xs :sequence - Its children will be separated by comma characters.
  - xs :choice - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If checked, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is disabled by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same [documentation from the command line interface](#).)

**Load settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

#### Related information

[Customizing the PDF Output of Generated XML Schema Documentation](#) on page 595

### Output Formats for Generating XML Schema Documentation

XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the [Schema Documentation](#) dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

#### HTML Output Format

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by [the schema diagram editor](#). These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the xs :documentation elements of the input XML Schema for formatting the documentation text (for example, <b>, <i>, <u>, <ul>, <li>, etc.) are rendered in the generated HTML documentation.

The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in [the schema diagram panel of the Oxygen XML Editor XSD editor panel](#).

**Figure 349: XML Schema Documentation Example**

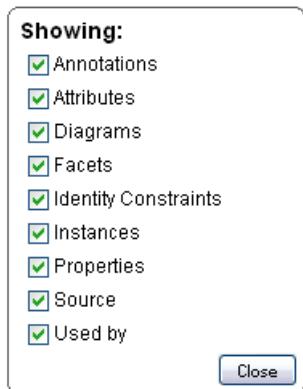

The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target namespace, schema properties (attribute form default, element form default, version), and schema location.

Namespace	No namespace
Properties	Attribute Form Default: <b>unqualified</b> Element Form Default: <b>unqualified</b>
Schema location	file:///D:/personal.xsd

**Figure 350: Information About a Schema**

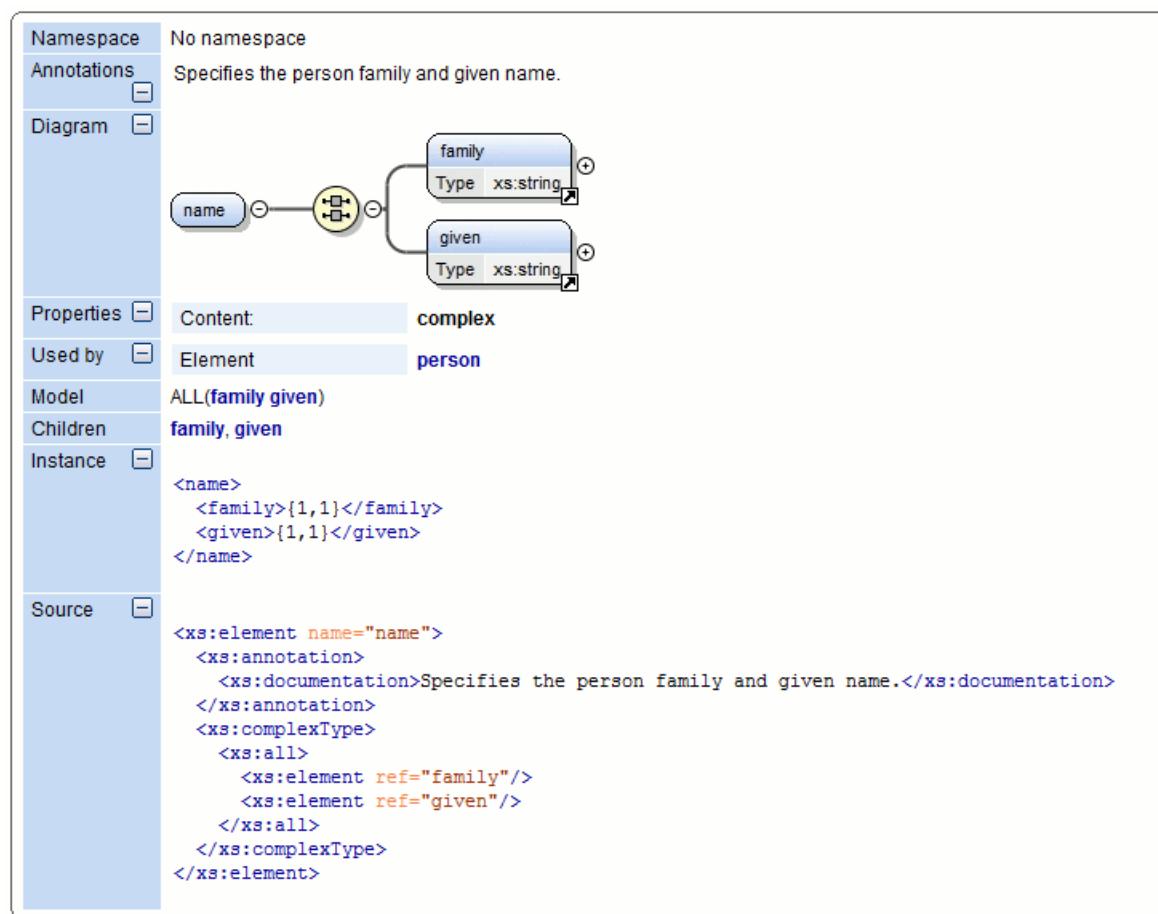

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the **Collapse** or **Expand** buttons.

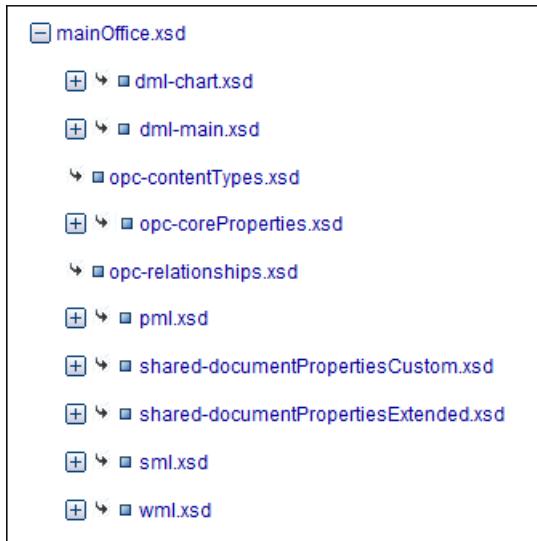

**Figure 351: Showing Options**

For each component included in the documentation, the section presents the component type follow by the component name. For local elements and attributes, the name of the component is specified as *parent name/component name*. You can easily go to the parent documentation by clicking the parent name.

**Figure 352: Documentation for a Schema Component**

If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

**Figure 353: Example: Generated Documentation**

### PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the [FO Processors](#) preferences page.

For information about customizing the PDF output, see [Customizing the PDF Output of Generated XML Schema Documentation](#) on page 595.

### DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a predefined transformation scenario (such as, *DocBook PDF* or *DocBook HTML*) on the output file, or configure your own transformation scenario for it to convert it into whatever format you desire.

### Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema `xsdDocSchema.xsd` from `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation`. You can create a custom format starting from one of the stylesheets used in the predefined HTML, PDF, and DocBook formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl`.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

### Customizing the PDF Output of Generated XML Schema Documentation

To customize the PDF output of the generated XML Schema documentation, use the following procedure:

1. Customize the `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl` stylesheet to include the content that you want to add in the PDF output. Add the content in the XSLT template with the `match="schemaDoc"` attribute between the `info` and `xsl:apply-templates` elements, as commented in the following example:

```

<info>
 <pubdate><xsl:value-of select="format-date(current-date(),
 '[Mn] [D], [Y]', 'en', (), ())"/></pubdate>
</info>
 <!-- Add the XSLT template content with match="schemaDoc" attribute here -->
<xsl:apply-templates select="schemaHierarchy"/>

```

**Note:** The content that you insert here has to be wrapped in DocBook markup. For details about working with DocBook see the following video demonstration: [https://www.oxygenxml.com/demo/DocBook\\_Editing\\_in\\_Author.html](https://www.oxygenxml.com/demo/DocBook_Editing_in_Author.html).

2. Create an intermediary file that holds the content of your XML Schema documentation.
  - a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
  - b. Select **Custom** for the output format and click the **Options** button.
  - c. In the **Custom format options** dialog box, do the following:
    - a. Enter the customized stylesheet in the **Custom XSL** field (`[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl`).
    - b. Enable the **Copy additional resources to the output folder** option, and leave the default selection in the **Resources** field.
    - c. Click **OK**.
  - d. When you return to the **XML Schema Documentation** dialog box, just press the **Generate** button to generate a DocBook XML file with an intermediary form of the Schema documentation.
3. Create the final PDF document.
  - a. Use the  **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu, click **New**, and select **XML transformation with XSLT**.
  - b. In the **New Scenario** dialog box, go to the **XSL URL** field and choose the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/oxygen/xsdDocDocbookCustomizationF0.xsl` file.
  - c. Go to the **FO Processor** tab and enable the **Perform FO Processing** and **XSLT result as input** options.
  - d. Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
  - e. Click **Apply Associated**.

**Tip:** If you want your modifications to be permanent so that you can simply select the PDF output format in the **XML Schema Documentation** dialog box, rather than configuring a custom format each time you generate this documentation, follow this procedure:

1. Create a JAR or ZIP file that includes the modified stylesheet (customized in step 1 above), placed in the following directory structure: `builtin/documentation/schema_documentation/xsdDocDocbook.xsl`.
2. Create a new directory named `endorsed` inside the `[OXYGEN_INSTALL_DIR]/lib` directory and place the created JAR or ZIP file inside it.
3. Restart Oxygen XML Editor and the PDF output format will now use your customized stylesheet.

### Generating XML Schema Documentation From the Command-Line Interface

You can export the settings of the **XML Schema Documentation dialog box** to an XML file by pressing the **Export settings** button. With the exported configuration file, you can generate the same documentation from the command-line interface by running the following script:

- `schemaDocumentation.bat` on Windows.
- `schemaDocumentation.sh` on OS X / Unix / Linux.

The script is located in the Oxygen XML Editor installation folder. The script can be integrated in an external batch process launched from the command-line interface. The script accepts a variety command line arguments that allow you to configure the documentation.

The accepted syntax and arguments are as follows:

```
schemaDocumentation schemaFile [[-cfg:configFile] | [[-out:outputFile] [-format:<value>] [-xsl:<xslFile>] [-split:<value>] [-openInBrowser:<value>]] | --help | -help | --h | -h]
```

#### schemaFile

The XML Schema file.

**-cfg:configfile**

The exported configuration file. It contains the output file, output format options, split method, and some advanced options regarding the included components and components details. If an external configuration file is specified, all other supplied arguments except for the XML Schema file will be ignored.

**-out:outputFile**

The file where the generated documentation will be saved. By default, it is the name of the schema file with an *html* extension.

**-format:<value>**

The output format type used when generating the documentation. Possible values are as follows:

- html - To generate documentation in HTML format.
- pdf - To generate documentation in PDF format.
- docbook - To generate documentation in DocBook format.
- custom - To generate documentation in a custom format.

**-xsl:<xslFile>**

The XSL file to be applied on the intermediate XML format. If there is no XSL file provided, the result will be in the HTML format.

**-split:<value>**

The split method used when generating the documentation. Splitting is recommended for large schemas.

Possible values are as follows:

- none (default value) - To generate one single output file.
- namespace - To generate an output file for every namespace in the schema.
- component - To generate an output file for every component in the schema.
- location - To generate an output file for every schema location.

**-openInBrowser:<value>**

Opens the result of the transformation in a browser or system application. Possible values are true or false (default value).

**--help | -help | --h | -h**

Displays the available options.

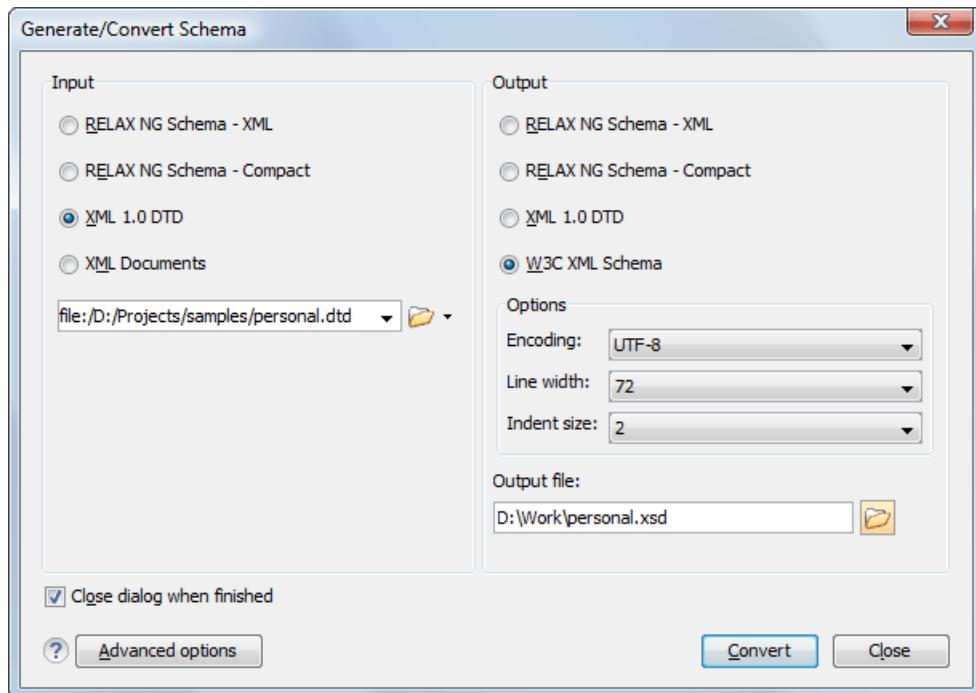

Example of the script in a Windows command line:

```
schemaDocumentation example.xsd -out:schemaDocumentation.html
-format:custom -xsl:example.xsl -split:namespace
```

## Converting Schema to Another Schema Language

The  **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses [Trang multiple format converter](#) to perform the actual schema conversions.

To use this tool, select the  **Generate/Convert Schema (Alt + Shift + C (Command + Alt + C on OS X))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project** view. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

**Figure 354: Generate/Convert Schema Dialog Box**

The **Generate/Convert Schema** dialog box includes the following options:

#### **Input section**

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

#### **Output section**

Allows you to select the language of the target schema.

#### **Options**

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

#### **Output file**

Specifies the path for the output file that will be generated.

#### **Close dialog when finished**

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

#### **Advanced options**

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

#### **XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.

- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using an annotation attribute `prefix:defaultValue` where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-atlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

### W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `processContents` attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).

## Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

**Result:** The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the [Data Sources preferences page](#) where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:

- **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
- **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

**Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.
6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
  - a. Select the database column you want to configure.

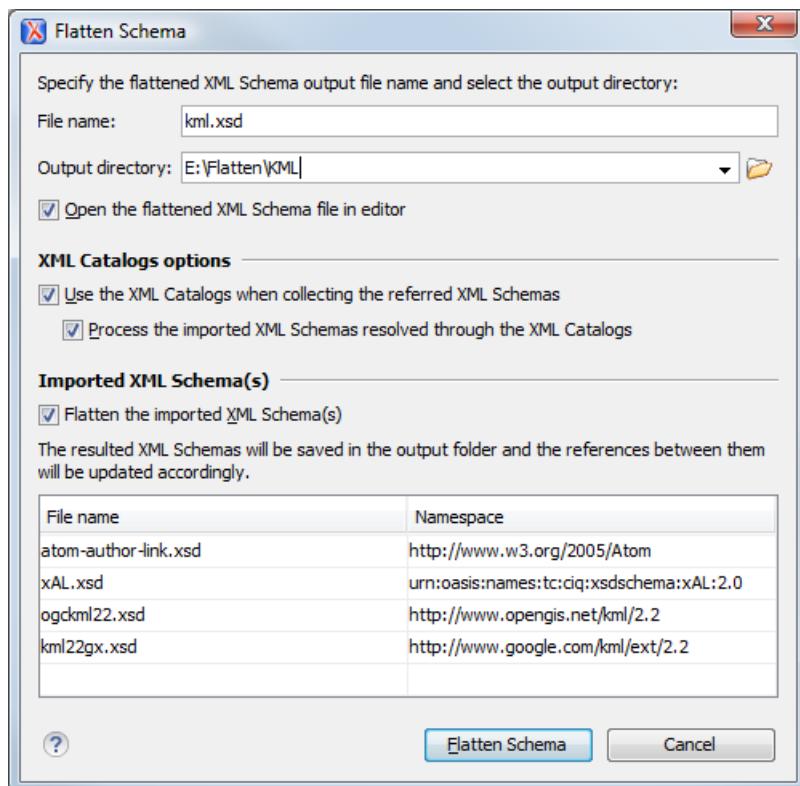

- b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
  - c. You can also change the name of the selected database column by changing it in the **Name** text field.
7. Click **Generate XML Schema**.

**Result:** The database structure is converted to an XML Schema and it is opened for viewing and editing.

## Flatten an XML Schema

You can organize an XML schema linked by `xs:include` and `xs:import` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `xs:include` and `xs:import` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. The action opens the **Flatten Schema** dialog box that allows you to configure the operation.

**Figure 355: Flatten Schema Dialog Box**

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

**Note:** If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `xs:include`, `xs:redefine`, and `xs:override` elements with the ones coming from the included files.

### Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

#### File name

The name of the output file.

## **Output directory**

The path of the output directory where the flattened schema file will be saved.

## **Open the flattened XML Schema file in editor**

Opens the main flattened schema in the editing area after the operation completes.

## **Use the XML Catalogs when collecting the referenced XML Schemas**

Enables the imported and included schemas to be resolved through the available XML Catalogs.

**Note:** Changing this option triggers the recalculation of the dependencies graph for the main schema.

## **Process the imported XML Schemas resolved through the XML Catalogs**

Specifies whether or not the imported schemas that were resolved through an XML Catalog are also processed.

## **Flatten the imported XML Schema(s)**

Specifies whether or not the imported schemas are flattened.

**Note:** For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

## **Flatten Schema from the Command Line**

The **Flatten Schema** tool can be also ran from command line by using the following command:

- flattenSchema.bat on Windows
- sh flattenSchemaMac.sh on OS X
- sh flattenSchema.sh on Unix/Linux

The command line accepts the following parameters:

- -in:inputSchemaURL - The input schema URL.
- -outDir:outputDirectory - The directory where the flattened schemas should be saved.
- -flattenImports:<boolean\_value> - Controls whether or not the imported XML Schemas should be flattened. The default value true.
- -useCatalogs:<boolean\_value> - Controls if the references to other XML Schemas should be resolved through the available XML Catalogs. The default value false.
- -flattenCatalogResolvedImports:<boolean\_value> - Controls whether or not the imported schemas that were resolved through the XML Catalogs should be flattened. The default value is true.

**Note:** This option is used only when -useCatalogs is set to true.

- -verbose - Provides information about the current flatten XML Schema operation.
- --help | -help | --h | -h - Prints the available parameters for the operation.

### **Command Line Example for Windows**

```
flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
-outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
-flattenCatalogResolvedImports:true -verbose
```

### **Command Line Example for OS X**

```
sh flattenSchemaMac.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
-outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
-flattenCatalogResolvedImports:true -verbose
```

### **Command Line Example for Unix/Linux**

```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
-outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
-flattenCatalogResolvedImports:true -verbose
```

## XML Schema Regular Expressions Builder

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

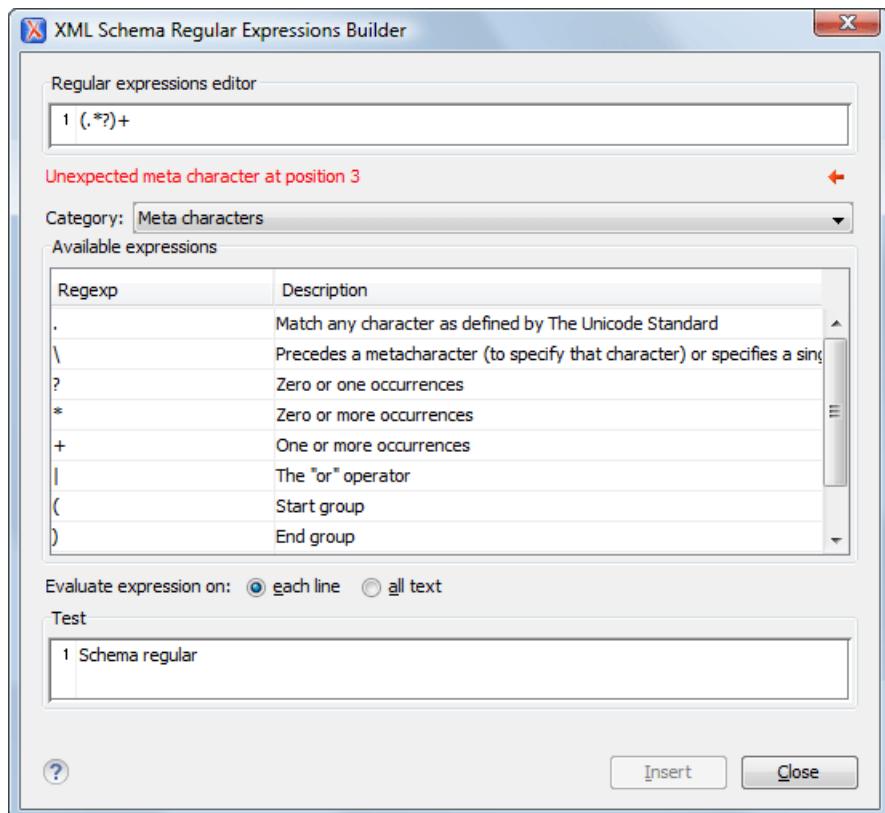

Figure 356: XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

### Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space (Command + Space on OS X)**.

### Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button ( highlights the error inside the regular expression.

### Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

### Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

### Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

## Test

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** or **schema Design mode**. Accordingly, the **Insert** button will be disabled if the current document is edited in these modes.

**Note:** Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

## XML Schema 1.1

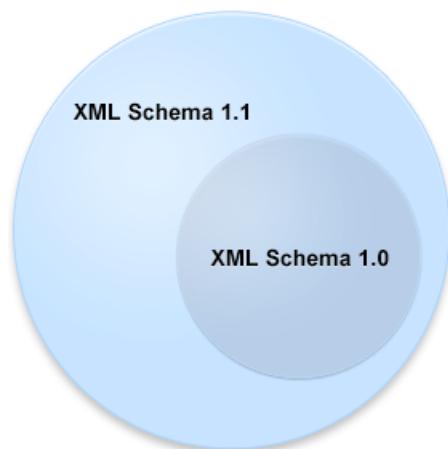

Oxygen XML Editor offers full support for XML Schema 1.1, including:

- XML Documents Validation and Content Completion Based on XML Schema 1.1.
- XML Schema 1.1 Validation and Content Completion.
- Editing XML Schema 1.1 files in the Schema **Design** mode.
- The Flatten Schema action.
- Resource Hierarchy/Dependencies and Refactoring Actions.
- Master Files.
- Generating Documentation for XML Schema 1.1.
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.

**Note:** To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: <http://www.thaiopensource.com/validate/xsd-version> (the possible values are 1.0 or 1.1).

**Tip:** To enable the full XPath expression in assertions and type alternatives, you need to set the <http://www.thaiopensource.com/validate/full-xpath> option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

**Figure 357: XML Schema 1.1**

The significant new features in XSD 1.1 are:

- **Assertions** - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- **Conditional type assignment** - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.

- **Open content** - Content models can use the `openContent` element to specify content models with *open content*. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to [http://www.w3.org/TR/xmlschema11-1/#ch\\_specs](http://www.w3.org/TR/xmlschema11-1/#ch_specs).

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

**Note:** An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the **Content Completion Assistant** presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Parser > XML Schema**.

To watch our video demonstration about the XML Schema 1.1 support, go to [https://www.oxygenxml.com/demo/XML\\_Schema\\_11.html](https://www.oxygenxml.com/demo/XML_Schema_11.html).

#### Related information

[Setting the XML Schema Version](#) on page 604

## Setting the XML Schema Version

Oxygen XML Editor lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the `minVersion` and `maxVersion` attributes, from the <http://www.w3.org/2007/XMLSchema-versioning> namespace, on the schema root element.

**Note:** The versioning attributes take priority over the XML Schema version defined in the preferences page.

**Table 36: Using the `minVersion` and `maxVersion` Attributes to Set the XML Schema Version**

Versioning Attributes	XML Schema Version
<code>minVersion = "1.0" maxVerion = "1.1"</code>	1.0
<code>minVersion = "1.1"</code>	1.1
<code>minVersion = "1.0" maxVerion = greater than "1.1"</code>	The XML Schema version defined in the <a href="#">XML Schema preferences page</a>
Not set in the XML Schema document	The XML Schema version defined in the <a href="#">XML Schema preferences page</a>

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the `minVersion` and `maxVersion` attributes on the schema element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (`xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning`) is inserted automatically if it does not exist.
- **XML Schema 1.1** - Inserts the `minVersion` attribute on the schema element and gives it the value "1.1". Also, removes the `maxVersion` attribute if it exists and adds the versioning namespace (`xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning`) if it is not declared.
- **Default XML Schema version** - Removes the `minVersion` and `maxVersion` attributes from the schema element. The default schema version, defined in the **XML Schema** preferences page, is used.

**Note:** The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Editor to its default options.

Oxygen XML Editor automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Editor takes into account the `minVersion` and `maxVersion` attributes defined in the XML Schema.

## Editing XQuery Documents

---

This section explains the features of the XQuery editor and how to use them.

### XQuery Outline View

The XQuery document structure is presented in the **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

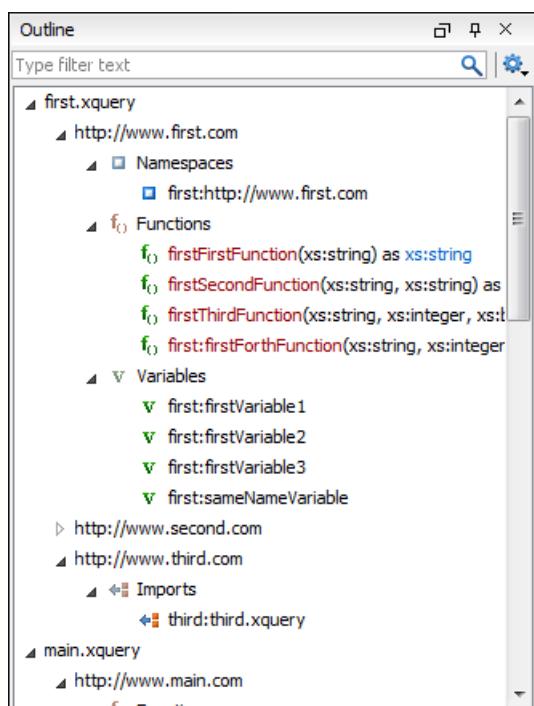

Figure 358: XQuery Outline View

The following actions are available in the **Settings** menu on the **Outline** view toolbar:

#### **Selection update on cursor move**

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

## Sort

Allows you to alphabetically sort the XQuery components.

## Show all components

Displays all collected components starting from the current file. This option is set by default.

## Show only local components

Displays the components defined in the current file only.

## Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, **(Enter)**, **(Tab)**, **(Shift-Tab)**. To switch from tree structure to the filter text field, you can use **(Tab)**, **(Shift-Tab)**.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

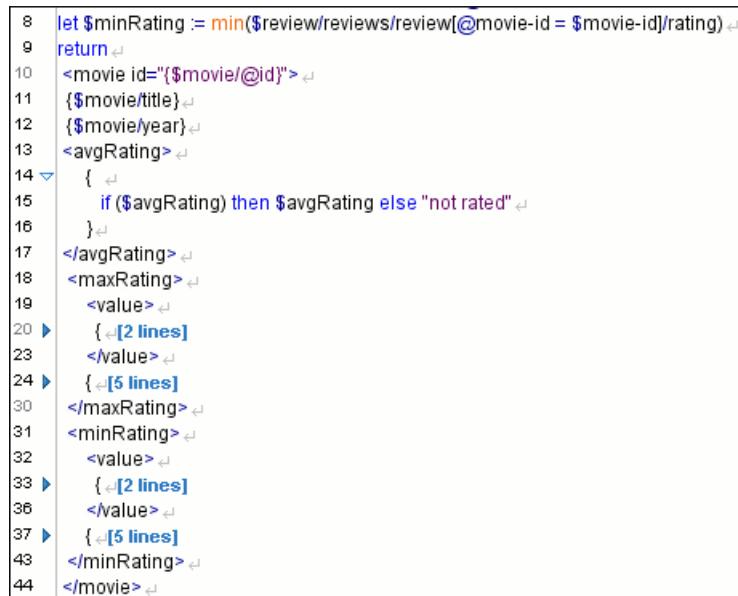

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

## Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same *folding features available for XML documents* are also available in XQuery documents.

```
8 let $minRating := min($review/reviews/review[@movie-id = $movie-id]/rating)
9 return
10 <movie id="{$movie/@id}">
11 {$movie/title}
12 {$movie/year}
13 <avgRating>
14 {
15 if ($avgRating) then $avgRating else "not rated"
16 }
17 </avgRating>
18 <maxRating>
19 <value>
20 {[2 lines]}
21 </value>
22 {[5 lines]}
23 </maxRating>
24 <minRating>
25 <value>
26 {[2 lines]}
27 </value>
28 {[5 lines]}
29 </minRating>
30 </movie>
```

**Figure 359: Folding in XQuery Documents**

There is available the action **Go to Matching Bracket Ctrl + Shift + G** on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current folding element.

## Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Editor assists you in maintaining a consistent code writing style with the  **Format and Indent** action that is available in the **Document > Source** menu and also on the toolbar..

The  **Format and Indent** action achieves this by performing the following steps:

- Manages whitespaces, by collapsing or inserting space characters where needed.
- Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the [Format Preferences page](#).

**Note:** These operations can be performed only if your XQuery document conforms with W3C XQuery 1.0, XQuery Update Facility 1.0, and XQuery 3.0 specifications. If the *Format and Indent* operation fails, the document is left unaltered and an error message is presented in the **Results** view.

## Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

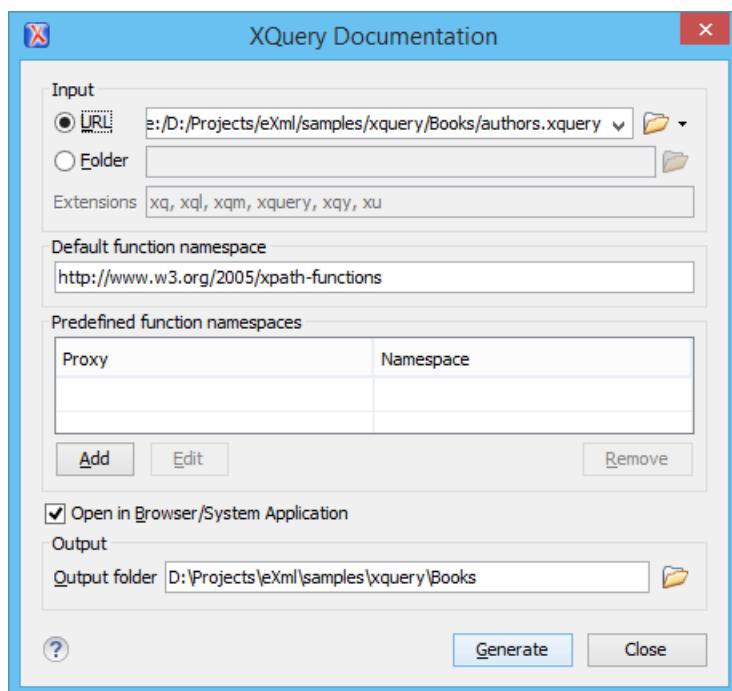

Figure 360: XQuery Documentation Dialog Box

The following options are available:

- Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - URLFile** - The URL of the file in which you want to generate the documentation.
  - Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation

- component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.
- Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.
- **Output** - Allows you to specify where the generated documentation is saved on disk.

## Editing WSDL Documents

---

WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Editor provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support for validation, a specialized **Content Completion Assistant**, a component oriented **Outline** view, searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the **Content Completion Assistant** offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Editor also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

```

97 <output name="getVersion3Out">
98 <soap:body use="encoded" namespace="http://arcweb.esri.com/services/v2/PlaceFinderSample">
99 </output>
100 <soap:address location="http://arcweb.esri.com/services/v2/PlaceFinderSample" />
101 </operation>
102 </binding>

```

Description - 1 item Resource  
E cvc-complex-type.2.4.a: Invalid content was found ... PlaceFinderSample

E cvc-complex-type.2.4.a: Invalid content was found starting with element 'soap:address'. One of '{http://schemas.xmlsoap.org/wsdl/}fault' is expected.

**Figure 361: Validating a WSDL file**

To watch our video demonstration about the WSDL editing support in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Create\\_New\\_WSDL.html](https://www.oxygenxml.com/demo/Create_New_WSDL.html).

### Related information

[Editing XML Documents in Text Mode](#) on page 282

## Editing WSDL Documents in the Master Files Context

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger WSDL structure.

You can set a main WSDL document either using the [master files support from the Project view](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a master file include:

- Correct validation of a module in the context of a larger WSDL structure.
- **Content Completion Assistant** displays all components valid in the current context.
- The **Outline** displays the components collected from the entire WSDL structure.

**Note:** When you edit an XML schema document that has a WSDL document set as master, the validation operation is performed over the master WSDL document.

To watch our video demonstration about editing WSDL documents in the master files context, go to [https://www.oxygenxml.com/demo/WSDL\\_Working\\_Modules.html](https://www.oxygenxml.com/demo/WSDL_Working_Modules.html).

## Validating WSDL Documents

By default, WSDL files are validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document Checking**, and disable the **Enable automatic validation** option.

To validate a WSDL document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

## Content Completion Assistance in WSDL Documents

The **Content Completion Assistant** is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. Another important capability of the **Content Completion Assistant** is to propose references to the defined components when you edit attribute values. For example, when you edit the type attribute of a binding element, the **Content Completion Assistant** proposes all the defined port types. Each proposal that the **Content Completion Assistant** offers is accompanied by a documentation hint.

**Note:** XML schema specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

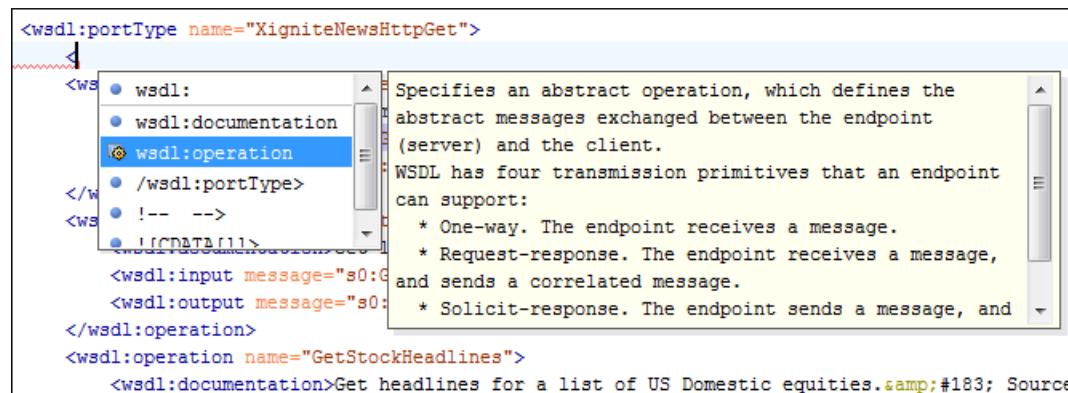

Figure 362: WSDL Content Completion Assistant

**Note:** The **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to [Defining Master Files at Project Level](#).

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

**Figure 363: Namespace Prefixes in the Content Completion Assistant**

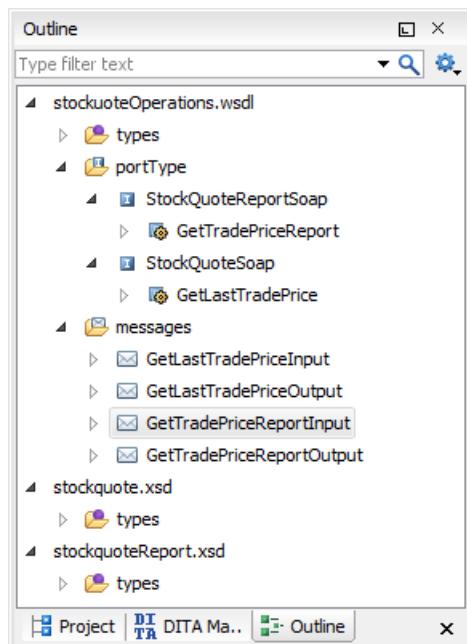

For the common namespaces, such as XML Schema namespace (<http://www.w3.org/2001/XMLSchema>) or SOAP namespace (<http://schemas.xmlsoap.org/wsdl/soap/>), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.

## WSDL Outline View

The **Outline** view for WSDL documents displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the [Master Files support](#), the **Outline** view collects the components of a WSDL document starting from the master files of the current document.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 364: WSDL Outline View**

The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the **Show XML structure** and **Show components** actions in the **Settings** menu on the **Outline** view toolbar. The following actions are available:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

## Selection update on cursor move

Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the  **Show components** option is selected, the following actions are available:

### Show XML structure

Displays the XML structure of the current document in a tree-like manner.

### Sort

Sorts the components in the **Outline** view alphabetically.

### Show all components

Displays all the components that were collected starting from current document or from the main document, if it is defined.

### Show referable components

Displays all the components that you can reference from the current document.

### Show only local components

Displays the components defined in the current file only.

### Group by location

Groups the WSDL components by their location.

### Group by type

Groups the WSDL components by their type.

### Group by namespace

Groups the WSDL components by their namespace.

**Note:** By default, all the three grouping criteria are active.

When the  **Show XML structure** option is selected, the following actions are available:

### Show components

Switches the **Outline** view to the components display mode.

### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

### Show element name

Show/hide element name.

### Show text

Show/hide additional text content for the displayed elements.

### Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

### Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

The following contextual menu actions are available in the **Outline** view when the  **Show components** option is selected in the  **Settings** menu:

## Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Cuts the currently selected component.

Copies the currently selected component.

Deletes the currently selected component.

Searches for the references of the currently selected component.

## Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

## Component dependencies

Displays the dependencies of the currently selected component.

## Resource Hierarchy

Displays the hierarchy for the currently selected resource.

## Resource Dependencies

Displays the dependencies of the currently selected resource.

Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the **Outline** view when the **Show XML structure** option is selected in the **Settings** menu:

## Append Child

Displays a list of elements that you can insert as children of the current element.

## Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

## Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

## Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Comments/uncomments the currently selected element.

Searches for the references of the currently selected component.

## Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Displays the dependencies of the currently selected component.

Renames the currently selected component in the context of a scope that you define.

Cuts the currently selected component.

**Copy**  
Copies the currently selected component.

**Delete**  
Deletes the currently selected component.

**Expand More**  
Expands the structure of a component in the **Outline** view.

**Collapse All**  
Collapses the structure of all the component in the **Outline** view.

To switch from the tree structure to the text filter, use **Tab** and **Shift-Tab**.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- \* - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

## WSDL Resource Hierarchy/Dependencies View in WSDL Documents

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a WSDL resource. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Note:** The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

To view the hierarchy of a WSDL document, select the document in the **Project** view and choose **Resource Hierarchy** from the contextual menu.

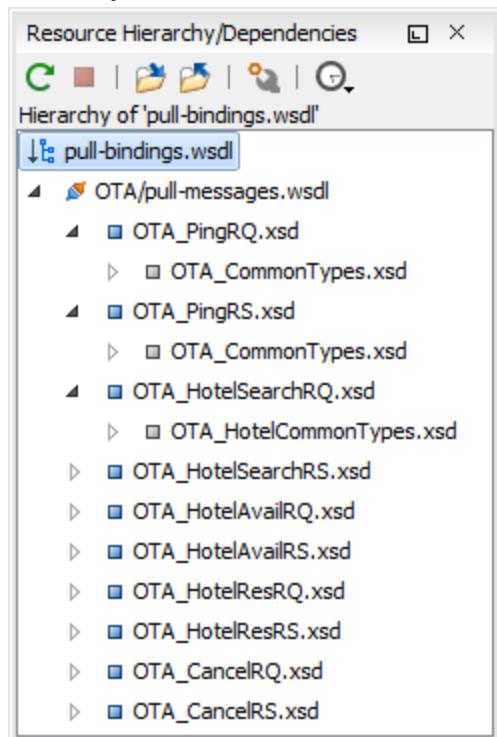

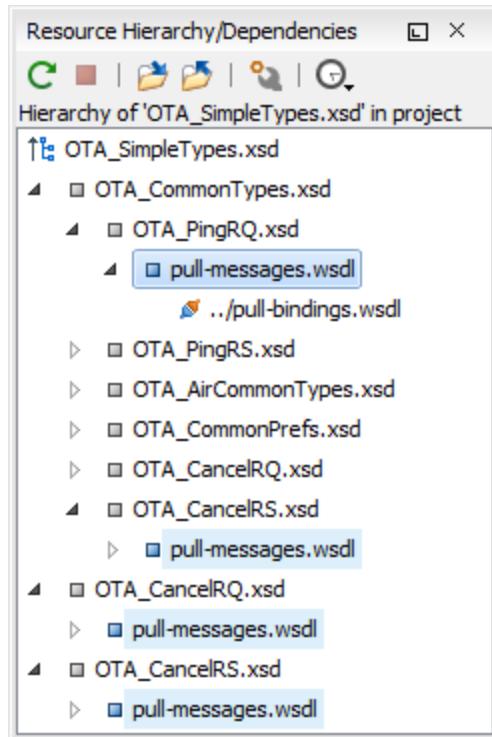

Figure 365: Resource Hierarchy/Dependencies View

If you want to see the dependencies of a WSDL document, select the document in the **Project** view and choose **Resource Dependencies** from the contextual menu.

**Figure 366: Resource Hierarchy/Dependencies View**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

**Refresh**

Refreshes the Hierarchy/Dependencies structure.

**Stop**

Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

### Rename resource

Renames the selected resource.

### Show Resource Hierarchy

Shows the hierarchy for the selected resource.

### Show Resource Dependencies

Shows the dependencies for the selected resource.

### Add to Master Files

Adds the currently selected resource in *the Master Files directory*.

### Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

### Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

**Note:** The **Move resource** or **Rename resource** actions give you the option to *update the references to the resource*.

### Related information

[Working with Modular XML Files in the Master Files Context](#) on page 472

[Search and Refactor Operations Scope](#) on page 463

### Moving/Renaming WSDL Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

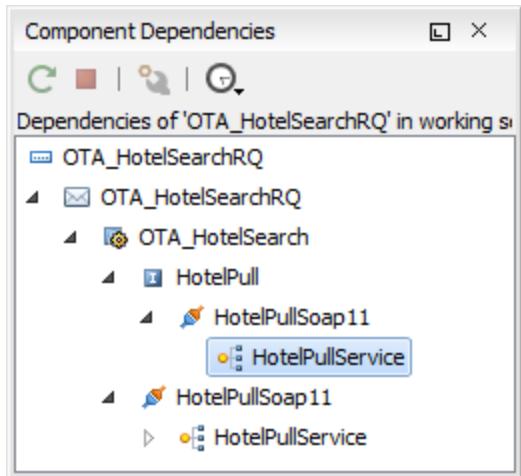

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

## Component Dependencies View in WSDL Documents

The **Component Dependencies** view allows you to view the dependencies for a selected WSDL component. If the view is not displayed, it can be opened from the **Window > Show View** menu.

To view the dependencies of an WSDL component, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. This action is available for all WSDL components (messages, port types, operations, bindings and so on).

**Note:** If you search for dependencies of XML Schema elements, the **Component Dependencies** view presents the references from WSDL documents.

**Figure 367: Component Dependencies View**

The following actions are available in the toolbar of the **Component Dependencies** view:

**Refresh**

Refreshes the dependencies structure.

**Stop**

Stops the dependencies computing.

**Configure**

Allows you to configure a *search scope* to compute the dependencies structure. You can decide to use the defined scope for future operations automatically, by checking the corresponding check box.

**History**

Allows you to repeat a previous dependencies computation.

The following actions are available in the contextual menu of the **Component Dependencies** view:

**Go to First Reference**

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

**Go to Component**

Displays the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon .

## Highlight Component Occurrences in WSDL Documents

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Editor searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box ([Options > Preferences](#)) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File ()** action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

## Searching and Refactoring Operations in WSDL Documents

### Search Actions

The following search actions are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
-  **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **Document > Schema** menu:

-  **Show Definition** - Takes you to the location of the definition of the current item.

**Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

## Refactoring Actions

The following refactoring actions are available from the **Refactoring** submenu from the **Document > Refactoring** menu or in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

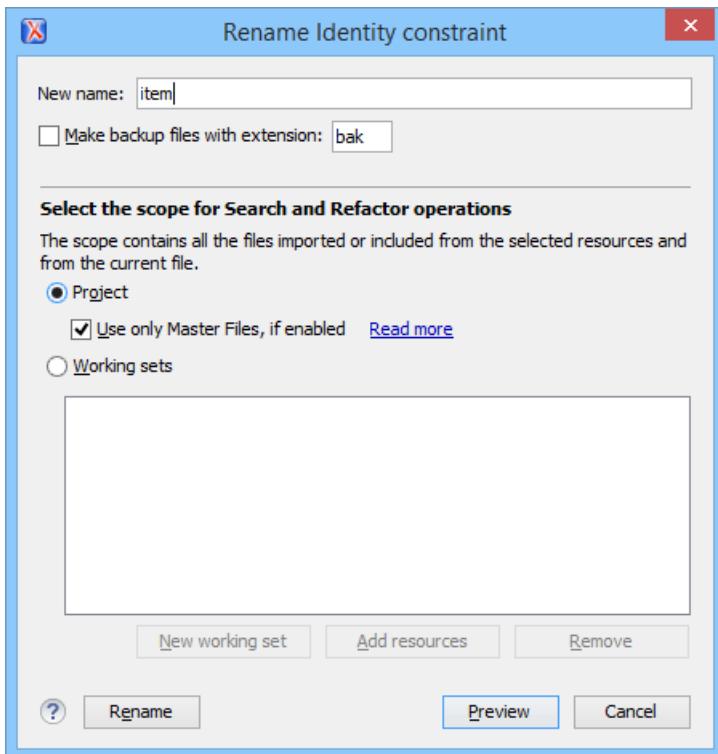

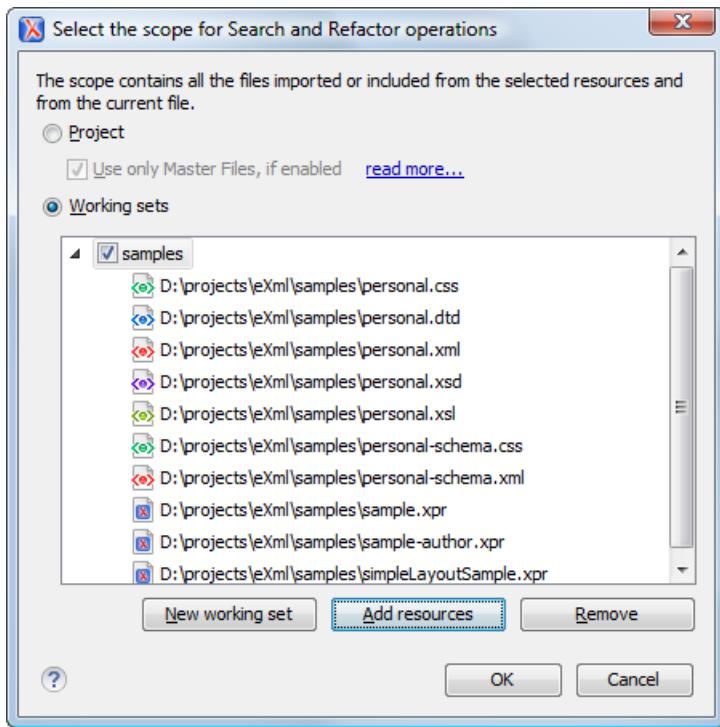

Figure 368: Rename Identity Constraint Dialog Box

#### Searching and Refactoring Operations Scope in WSDL Documents

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Assist action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the **Master Files support**.

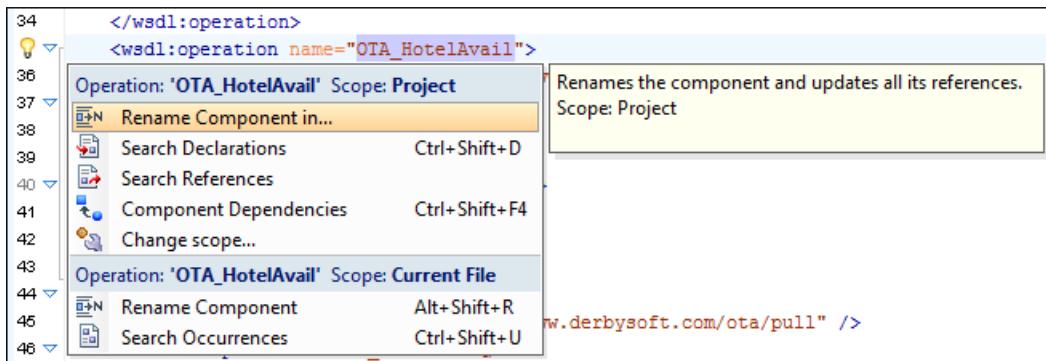

**Figure 369: Change Scope Dialog Box**

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

## Quick Assist Support in WSDL Documents

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

**Figure 370: WSDL Quick Assist Support**

The quick assist support offers direct access to the following actions:

### Rename Component in

Renames the component and all its dependencies.

### Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

### Search References

Searches all references of the component in a predefined scope.

#### Component Dependencies

Searches the component dependencies in a predefined scope.

#### Change Scope

Configures the scope that will be used for future search or refactor operations.

#### Rename Component

Allows you to rename the current component in-place.

#### Search Occurrences

Searches all occurrences of the component within the current file.

## Generating Documentation for WSDL Documents

You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a *custom output format* by using a custom stylesheet.

**Note:** The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view.

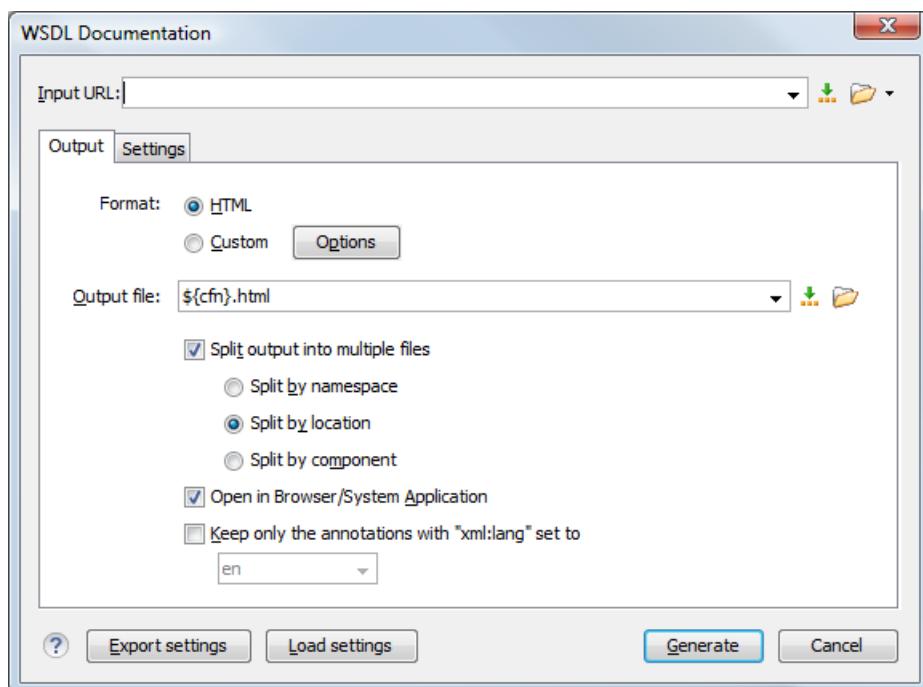

Figure 371: WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

### Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:

- **HTML** - The documentation is generated in [HTML output format](#).
- **Custom** - The documentation is generated in a [custom output format](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

## Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

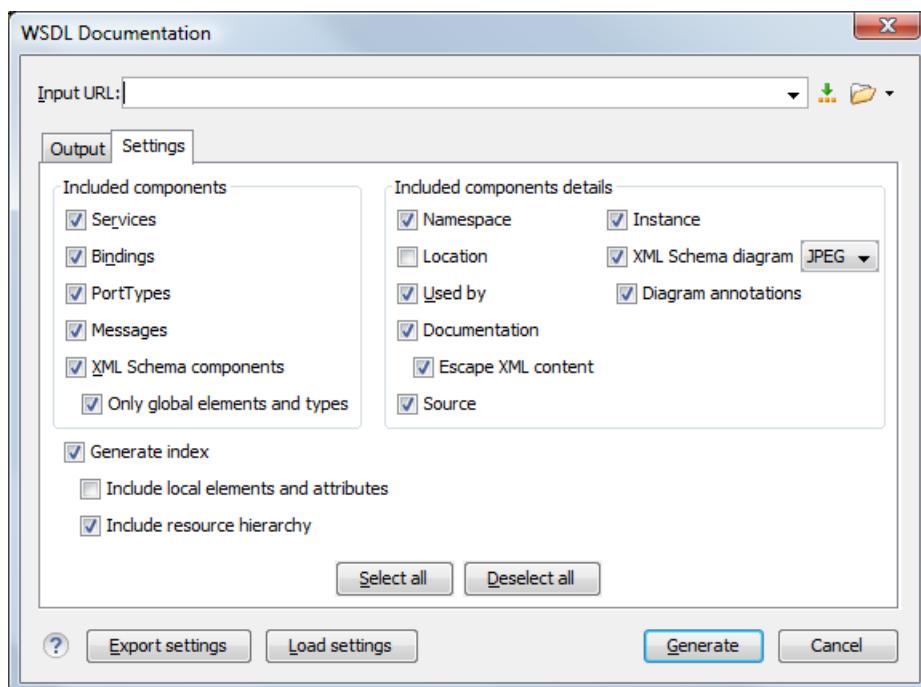

Figure 372: Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.

- **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
- **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
- **Component Details**
  - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - **Location** - Presents the location information for each WSDL or XML Schema component.
  - **Used by** - Presents the list of components that reference the current one.
  - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - **Source** - Presents the XML fragment that defines the current component.
  - **Instance** - Generates a sample XML instance for the current component.

**Note:** This option applies to the XML Schema components only.
- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
  - **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If checked, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is disabled by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same [documentation from the command-line interface](#).)

**Load settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

## Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

**Main WSDL stockQuoteService.wsdl**

Name	StockQuote
Namespace	http://example.com/stockquote/service

**Service tns:StockQuoteService**

Namespace	http://example.com/stockquote/service
Documentation	Provides the last trade price for a stock.
Ports	StockQuotePort
Binding	tns:StockQuoteSoap
Extensibility	<soap:address location="http://example.com/ stockquote"/>
Source	<pre> &lt;wsdl:service name="StockQuoteService"&gt;     &lt;wsdl:documentation&gt;Provides the last trade price for a     stock.&lt;/wsdl:documentation&gt;     &lt;wsdl:port bindings="tns:StockQuoteSoap"     name="StockQuotePort"&gt;         &lt;soap:address location="http://example.com/         stockquote"/&gt;     &lt;/wsdl:port&gt; &lt;/wsdl:service&gt; </pre>

**Showing:**

- Ports
- Operations
- Documentation
- Source
- Used by

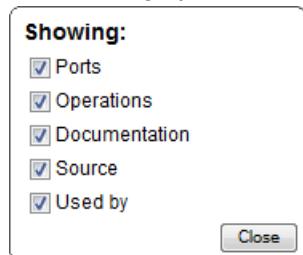

Figure 373: WSDL Documentation in HTML Format

The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the **Collapse** or **Expand** buttons.

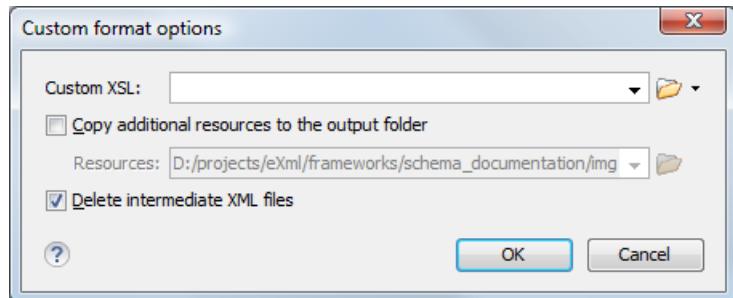

**Figure 374: Showing Options**

#### Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Editor uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the `wsdlDocHtml.xsl` XSLT stylesheet or create your own.

**Note:** The `wsdlDocHtml.xsl` stylesheet that is used to obtain the HTML documentation is located in the `[OXYGEN_INSTALL_DIR]/frameworks/wsdl_documentation/xsl` folder.

**Note:** The intermediary XML document complies with the `wsdlDocSchema.xsd` XML Schema. This schema is located in the `[OXYGEN_INSTALL_DIR]/frameworks/wsdl_documentation` folder.

**Figure 375: Custom Format Options Dialog Box**

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

#### Generating WSDL Documentation from the Command-Line Interface

To generate documentation for a WSDL document from the command line, open the **WSDL Documentation** dialog box and click **Export settings**. Using the exported settings file you can generate the same documentation from the command line by running the following scripts:

- `wsdlDocumentation.bat` on Windows.
- `wsdlDocumentation.sh` on Unix / Linux.
- `wsdlDocumentationMac.sh` on Mac OS X.

The scripts are located in the installation folder of Oxygen XML Editor. You can integrate the scripts in an external batch process launched from the command-line interface.

## WSDL SOAP Analyzer

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **Tools** menu).

### Composing a SOAP Request

**WSDL SOAP Analyzer** is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the  **WSDL SOAP Analyzer** toolbar button.
- Use the  **WSDL SOAP Analyzer** action from the **Tools** menu.
- Go to **Open with > WSDL SOAP Analyzer** in the contextual menu of the **Project** view.

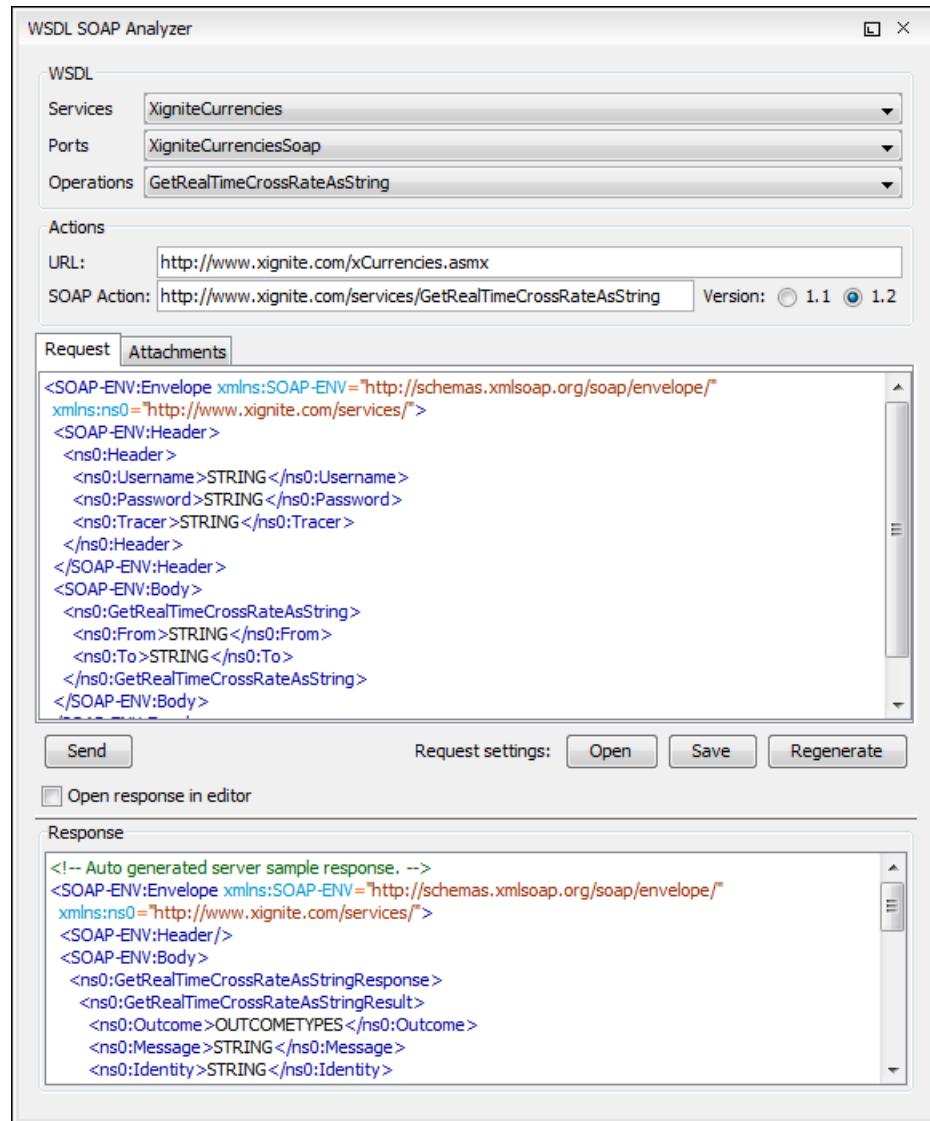

Figure 376: WSDL SOAP Analyzer Dialog Box

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is <http://schemas.xmlsoap.org/soap/envelope/> for SOAP 1.1 or <http://www.w3.org/2003/05/soap-envelope> for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the [Testing Remote WSDL Files](#) section.

**Note:** SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

### Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools >  WSDL SOAP Analyzer**.
2. On the **WSDL File** tab enter the URL of the remote WSDL file.

You enter the URL:

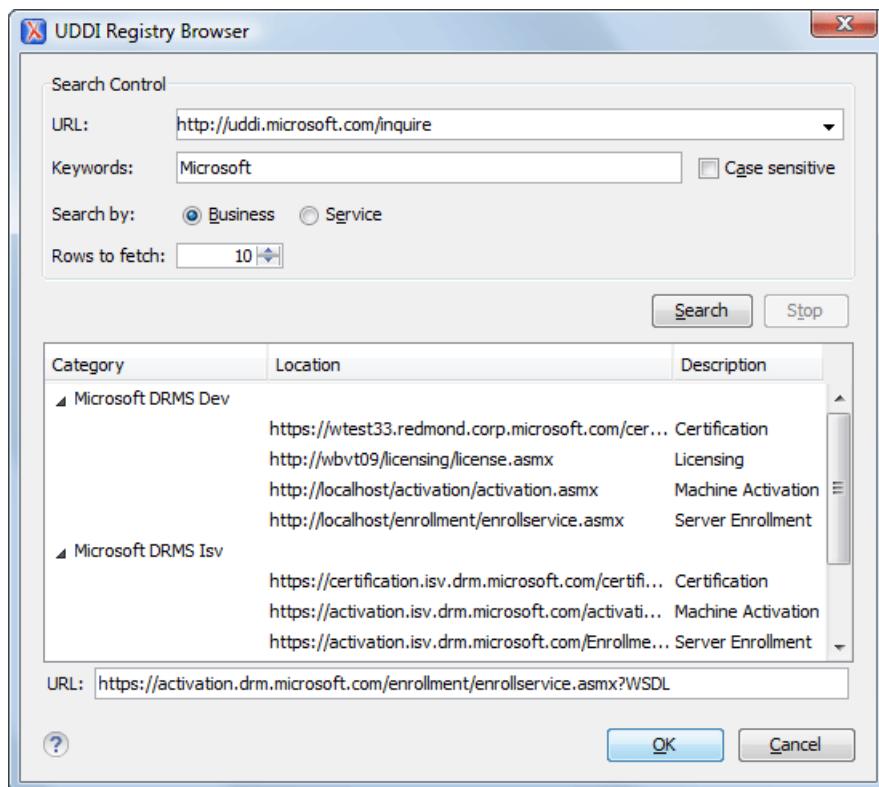

- by typing
- by browsing the local file system
- by browsing a remote file system
- by browsing [a UDDI Registry](#)

3. Press the **OK** button.

This will open the **WSDL SOAP Analyzer** tool. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

## UDDI Registry Browser

Pressing the  button in the **WSDL File Opener** dialog box (menu **Tools > WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.

**Figure 377: UDDI Registry Browser Dialog Box**

The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When checked, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

## Editing CSS Stylesheets

Oxygen XML Editor includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to [create new CSS documents or templates](#).
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes CSS files more readable.

- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

## Validating CSS Stylesheets

Oxygen XML Editor includes a built-in CSS Validator, integrated with general validation support. This makes the [usual validation features](#) for presenting errors also available for CSS stylesheets.

When you edit a CSS document, you can access the [CSS validator options](#) by selecting  **Validation options** from the **Document > Validate** menu.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in [the CSS validation preferences](#). The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen](#) that can be used in [Author mode](#). That means all Oxygen specific extensions are accepted in a CSS stylesheet by [the built-in CSS validator](#) when this profile is selected.

### Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

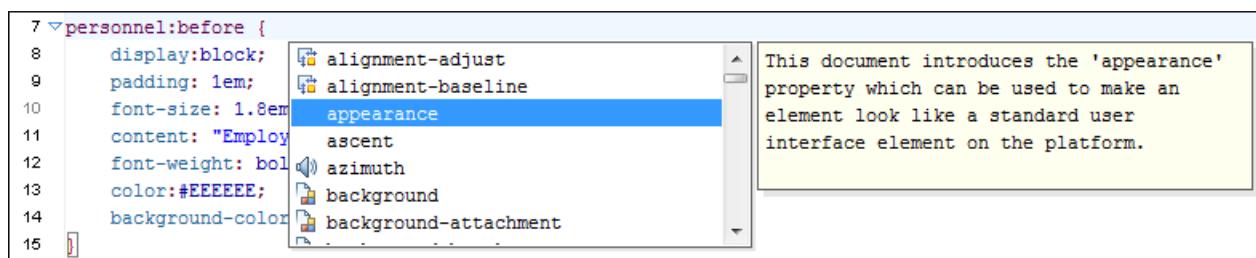

1. Create a file named **CustomProperties.xml** that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="http://www.oxygenxml.com/ns/css
 http://www.oxygenxml.com/ns/css/CssProperties.xsd"
 xmlns="http://www.oxygenxml.com/ns/css">
 <property name="custom">
 <summary>Description for custom property.</summary>
 <value name="customValue"/>
 <value name="anotherCustomValue"/>
 </property>
</css_keywords>
```

2. Go to your desktop and create the **builtin/css-validator** / folder structure.
3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command.  
The `custom_props.jar` file is created.
5. Go to `[OXYGEN_INSTALL_DIR]/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to `[OXYGEN_INSTALL_DIR]/lib/endorsed`.

## Content Completion in CSS Stylesheets

A **Content Completion Assistant**, similar to [the one available for XML documents](#) offers the CSS properties and the values available for each property. It is activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property. The **Content Completion Assistant** also includes [code templates that can be used to quickly insert code fragments](#) into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

**Figure 378: Content Completion in CSS Stylesheets**

The properties and values available are dependent on the CSS Profile selected in the [CSS preferences](#). The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile **CSS 3 with Oxygen extensions** includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen XML Editor](#) that can be used in *Author mode*.

**Proposals for CSS Selectors** - After inserting a CSS selector, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

**Proposals for @media and @import Rules** - After inserting @media or @import <url> rules, the content completion assistance will propose a list of supported media types.

### Related tasks

[Specify Custom CSS Properties](#) on page 627

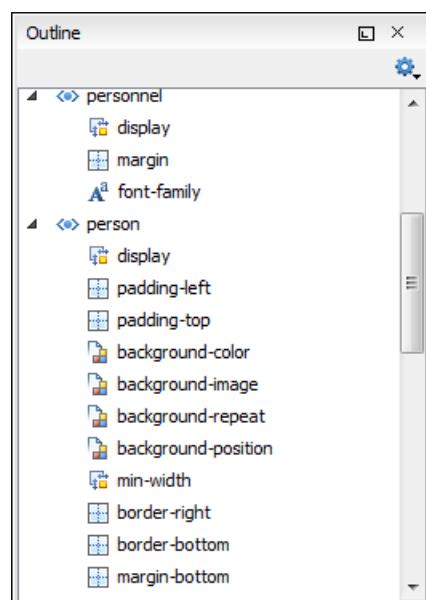

## CSS Outline View

The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Editor highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 379: CSS Outline View**

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

## Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same [folding features available for XML documents](#) are also available in CSS stylesheets.

**Note:** To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

## Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the [format and indent operation available for XML documents](#) is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

## Minifying CSS Stylesheets

*Minification* (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Editor opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Editor performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

**Note:** The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

**Note:** To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **Document > Source** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

## Editing LESS CSS Stylesheets

---

Oxygen XML Editor provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables*, *nesting*, *mixins*, *operators*, and *functions*. Oxygen XML Editor offers additional LESS features that include:

- **Create new LESS files and templates** - You can use the built-in new file wizards to [create new LESS documents or templates](#).
- **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in LESS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Compile to CSS** - Options are available to compile LESS files to CSS.
- **Syntax highlighting** - Oxygen XML Editor supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.
- **Shortcut to open resources** - While editing LESS files, you can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to <http://lesscss.org/>.

## Validating LESS Stylesheets

Oxygen XML Editor includes a built-in *LESS CSS Validator*, integrated with general validation support. The [usual validation features](#) for presenting errors also available for LESS stylesheets.

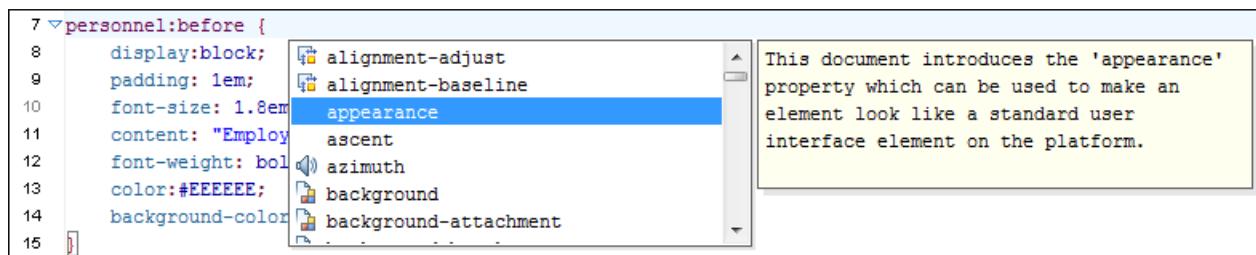

Oxygen XML Editor provides three validation methods:

- Automatic validation as you type - marks validation errors in the document as you are editing.

- Validation upon request, by pressing the **Validate** button from the **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.
- Validation scenarios, by selecting **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor. This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

## Content Completion in LESS Stylesheets

A **Content Completion Assistant** offers the LESS properties and the values available for each property. It is activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into LESS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

**Figure 380: Content Completion in LESS Stylesheets**

The properties and values available are dependent on the CSS Profile selected in the [CSS preferences](#).

## Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Editor provides both manual and automatic options to compile LESS stylesheets into CSS.

**Important:** The LESS processor works well only with files having the *UTF-8* encoding. Thus, it is highly recommended that you always use the *utf-8* encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select **Compile to CSS (Ctrl + Shift + C (Command + Shift + C on OS X))**.
2. Enable the [\*\*Automatically compile LESS to CSS when saving\*\*](#) option in the settings ([open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Open/Save > Save Hooks**). If enabled, when you save a LESS file it will automatically be compiled to CSS (this option is disabled by default).

**Important:** If this option is enabled, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

## Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode** - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** and **Logical Model View**.

- **Grid editing mode** - Displays Relax NG schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting the schema similar to the Relax NG compact syntax. It links to imported schemas and external references. Embedded Schematron is also supported in Relax NG schemas with XML syntax.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents](#) on page 464.

#### Related information

[Associating a Schema to XML Documents](#) on page 464

## Editing Relax NG Schema in the Master Files Context

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Relax NG document either using the [master files support from the Project view](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- **Content Completion Assistant** displays all the referable components valid in the current context. This includes components defined in modules other than the currently edited one.
- The **Outline** displays the components collected from the entire schema structure.

## Relax NG Schema Diagram Editor

This section explains how to use the graphical diagram editor for Relax NG schemas.

### Introduction to Relax NG Schema Diagram Editor

Oxygen XML Editor provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

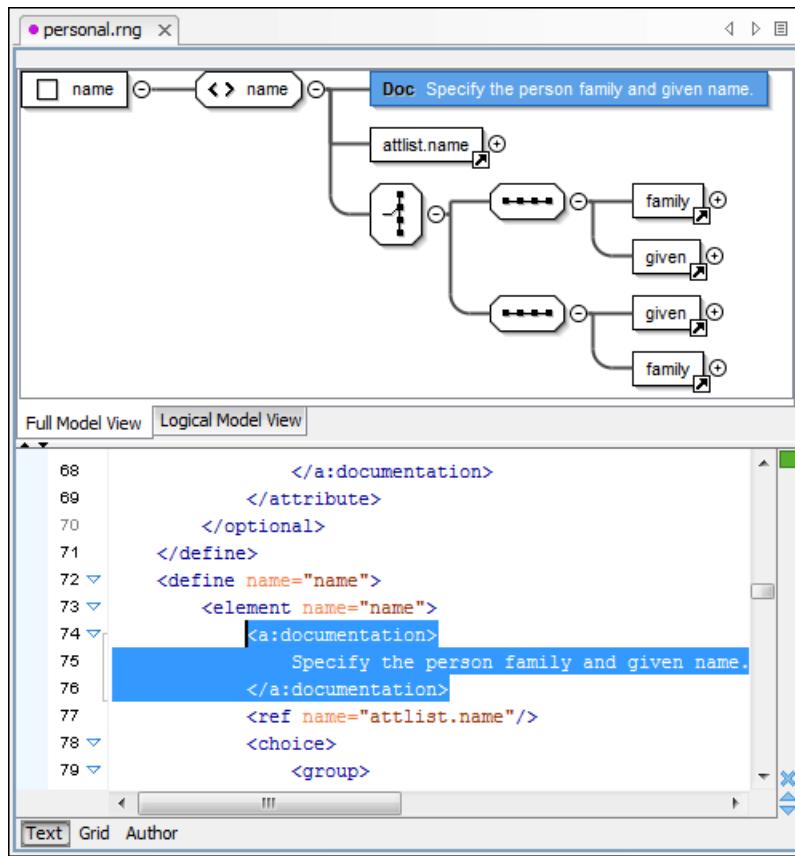

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

Oxygen XML Editor is the only XML editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

### Full Model View

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View**.

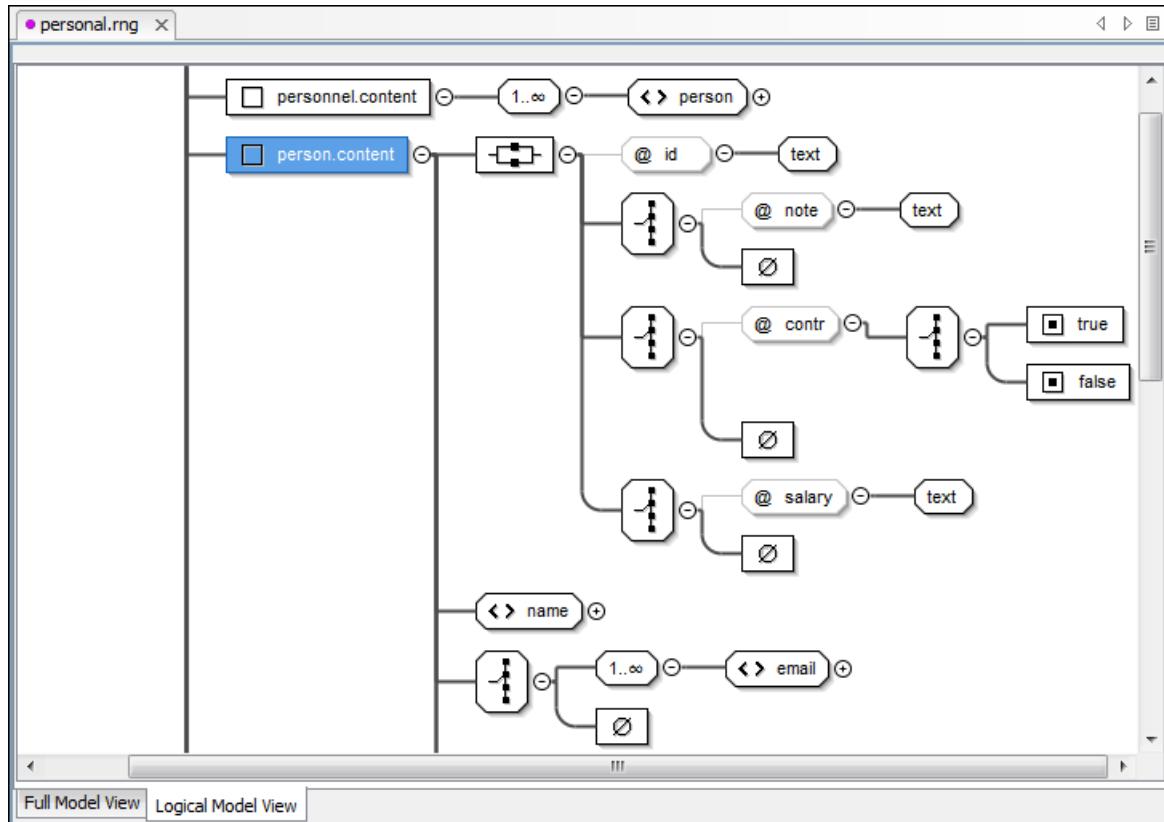

**Figure 381: Relax NG Schema Editor - Full Model View**

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

#### Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

**Figure 382: Logical Model View for a Relax NG Schema**

### Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

- - define pattern with the name attribute set to the value shown inside the rectangle (in this example `name`).
- - define pattern with the combine attribute set to `interleave` and the name attribute set to the value shown inside the rectangle (in this example `attlist.person`).
- - define pattern with the combine attribute set to `choice` and the name attribute set to the value shown inside the rectangle (in this example `attlist.person`).
- - element pattern with the name attribute set to the value shown inside the rectangle (in this example `name`).
- - attribute pattern with the name attribute set to the value shown inside the rectangle (in this case `note`).
- - ref pattern with the name attribute set to the value shown inside the rectangle (in this case `family`).
- - oneOrMore pattern.
- - zeroOrMore pattern.

-  - optional pattern.
-  - choice pattern.
-  - value pattern (for example, used inside a choice pattern).
-  - group pattern.
-  - A pattern from the Relax NG Annotations namespace (<http://relaxng.org/ns/compatibility/annotations/1.0>) that is treated as a documentation element in a Relax NG schema.
-  - text pattern.
-  - empty pattern.

### **Actions Available in the Schema Diagram Editor**

When editing Relax NG schemas in **Full Model View**, the contextual menu offers the following actions:

#### **Append child**

Appends a child to the selected component.

#### **Insert Before**

Inserts a component before the selected component.

#### **Insert After**

Inserts a component after the selected component.

#### **Edit attributes**

Edits the attributes of the selected component.

#### **Remove**

Removes the selected component.

#### **Show only the selected component**

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

#### **Show Annotations**

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

#### **Auto expand to references**

This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

#### **Collapse Children**

Collapses the children of the selected view.

#### **Expand Children**

Expands the children of the selected view.

#### **Print Selection**

Prints the selected view.

#### **Save as Image**

Saves the current selection as JPEG, BMP, SVG or PNG image.

## C Refresh

Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** instead of the diagram.

## Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document Checking**, and disable the **Enable automatic validation** option.

To validate a Relax NG schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates a Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

## Relax NG Outline View

The **Outline** view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the **Full Model View** and **Logical Model View** cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

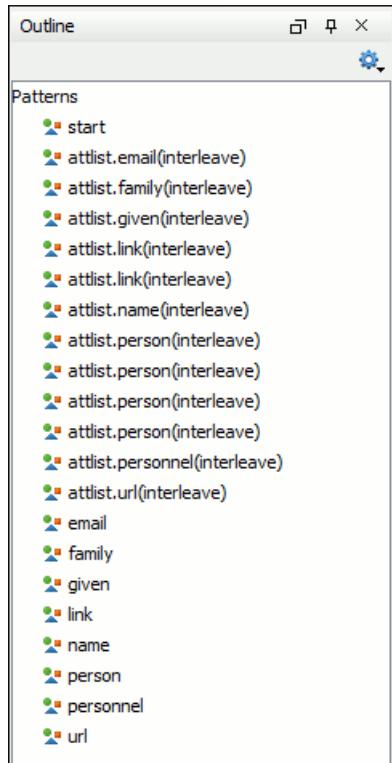

Figure 383: Relax NG Outline View

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the  **Show components** option is selected in the  **Settings** menu on the **Outline** view toolbar, the following option is available:

 **Show XML structure**

Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the  **Settings** menu on the **Outline** view toolbar when the  **Show XML structure** option is selected:

**Filter returns exact matches**

The text filter of the **Outline** view returns only exact matches.

 **Selection update on cursor move**

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram will be also selected in the **Outline** view.

 **Show components**

Shows the defined pattern collected from the current document.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page](#).

The following contextual menu actions are also available in the **Outline** view when the  **Show XML structure** option is selected in the  **Settings** menu:

**Append Child**

Displays a list of elements that you can insert as children of the current element.

**Insert Before**

Displays a list of elements that you can insert as siblings of the current element, before the current element.

**Insert After**

Displays a list of elements that you can insert as siblings of the current element, after the current element.

**Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Toggle Comment**

Comments/uncomments the currently selected element.

 **Search references**

Searches for the references of the currently selected component.

### Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

### Component dependencies

Displays the dependencies of the currently selected component.

### Rename Component in

Renames the currently selected component in the context of a scope that you define.

### Cut

Cuts the currently selected component.

### Copy

Copies the currently selected component.

### Delete

Deletes the currently selected component.

### Expand More

Expands the structure of a component in the **Outline** view.

### Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

## RNG Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a schema. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the hierarchy of a schema, select the desired schema in the **Project** view and choose **Resource Hierarchy** from the contextual menu.

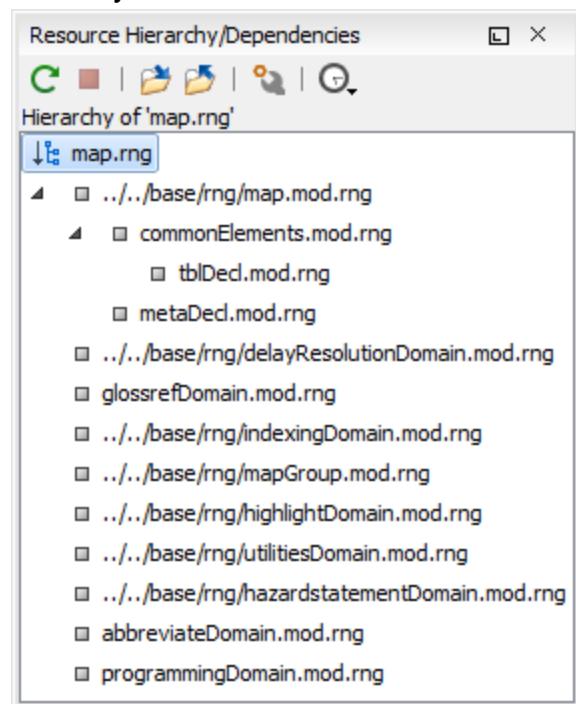

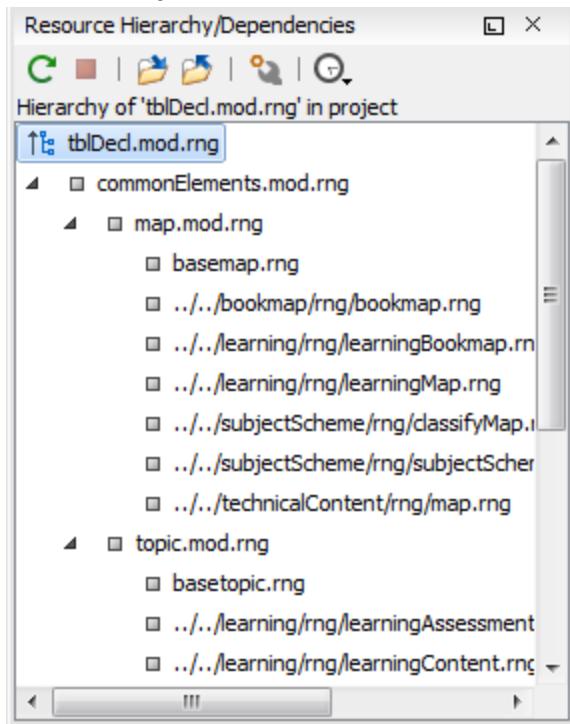

Figure 384: Resource Hierarchy/Dependencies View - hierarchy for map.rng

If you want to see the dependencies of a schema, select the desired schema in the **Project** view and choose **Resource Dependencies** from the contextual menu.

**Figure 385: Resource Hierarchy/Dependencies View - Dependencies for `tblDecl.mod.rng`**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

**Refresh**

Refreshes the Hierarchy/Dependencies structure.

**Stop**

Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

**Rename resource**

Renames the selected resource.

### Show Resource Hierarchy

Shows the hierarchy for the selected resource.

### Show Resource Dependencies

Shows the dependencies for the selected resource.

### Add to Master Files

Adds the currently selected resource in *the Master Files directory*.

### Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

### Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

**Note:** The **Move resource** or **Rename resource** actions give you the option to *update the references to the resource*.

### Related information

[Working with Modular XML Files in the Master Files Context](#) on page 472

[Search and Refactor Operations Scope](#) on page 463

### Moving/Renaming RNG Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

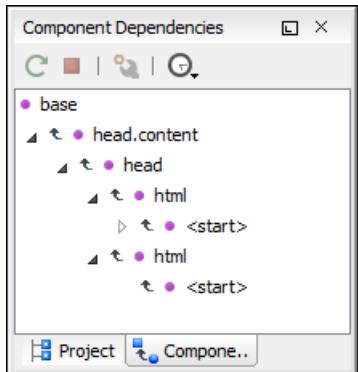

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

**Note:** Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

## Component Dependencies View for RelaxNG Schemas

The **Component Dependencies** view allows you to see the dependencies for a selected Relax NG component. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of a RelaxNG component, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named defines.

**Figure 386: Component Dependencies View - Hierarchy for base.rng**

In the Component Dependencies view you have several actions in the toolbar:

### C Refresh

Refreshes the dependencies structure.

### ■ Stop

Stops the dependencies computing.

### ○ Configure

Allows you to configure a search scope to compute the dependencies structure. You can decide to use automatically the defined scope for future operations by checking the corresponding checkbox.

### ○ History

Allows you to repeat a previous dependencies computation.

The following actions are available on the contextual menu:

#### Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

#### Go to Component

Shows the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another components, a small table is displayed that contains all references. When a recursive reference is encountered, it is marked with a special icon .

#### Related information

[Search and Refactor Operations Scope](#) on page 463

## Searching and Refactoring Actions in RNG Schemas

### Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
-  **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

-  **Show Definition** - Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

**Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

## Refactoring Actions

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

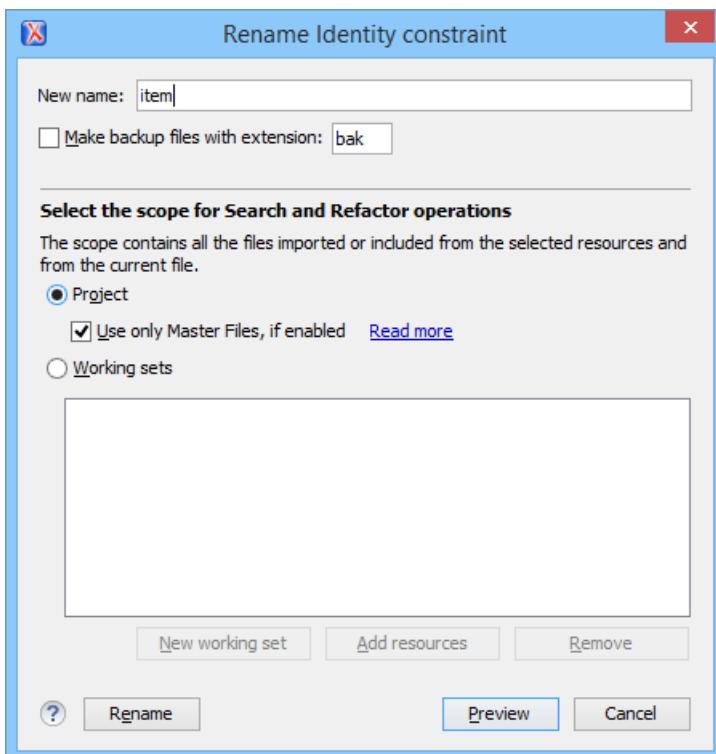

Figure 387: Rename Identity Constraint Dialog Box

## Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers quick fixes for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:** For XML documents validated against XSD schemas, the quick fixes are only available if you use the default Xerces validation engine.

Quick fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides quick fixes for numerous types of problems, including the following:

Problem type	Available quick fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

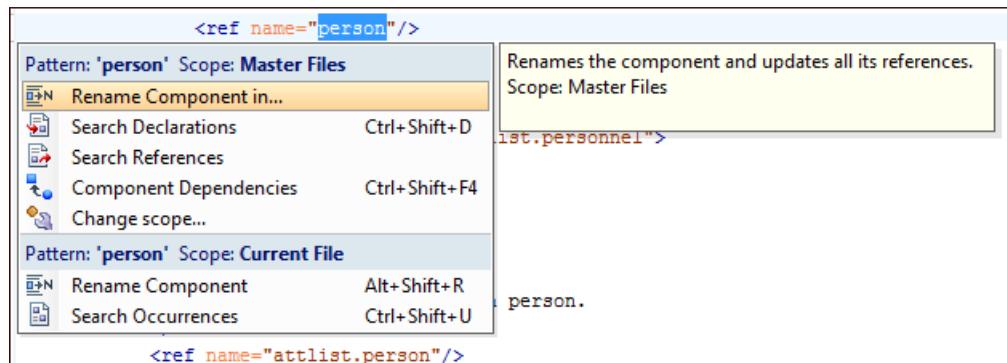

#### Related information

[Schematron Quick Fixes \(SQF\)](#) on page 483

## RNG Quick Assist Support

The *Quick Assist* support improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

**Figure 388: RNG Quick Assist Support**

The quick assist support offers direct access to the following actions:

### **Rename Component in**

Renames the component and all its dependencies.

### **Search Declarations**

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

### **Search References**

Searches all references of the component in a predefined scope.

### Component Dependencies

Searches the component dependencies in a predefined scope.

### Change Scope

Configures the scope that will be used for future search or refactor operations.

### Rename Component

Allows you to rename the current component in-place.

### Search Occurrences

Searches all occurrences of the component within the current file.

#### Related information

## Configuring a Custom Datatype Library for a RELAX NG Schema

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface [specified on the www.thaiopensource.com website](#).

The jar file containing the custom library and any other dependent jar file must be added to the classpath of the application, that is the jar files must be added to the folder `[OXYGEN_INSTALL_DIR]/lib`.

To load the custom library, restart Oxygen XML Editor.

## Editing NVDL Schemas

---

Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Editor offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode** - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** and **Logical Model View**.
- **Grid editing mode** - Displays NVDL schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting them in a compact and easy to understand representation.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents](#) on page 464.

#### Related information

[Associating a Schema to XML Documents](#) on page 464

## NVDL Schema Diagram

This section explains how to use the graphical diagram of a NVDL schema.

### Introduction to NVDL Schema Diagram Editor

Oxygen XML Editor provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

Oxygen XML Editor is the only XML Editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram, selects the underlying code in the source editor.

### Full Model View

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a **Full Model View** and a **Logical Model View**.

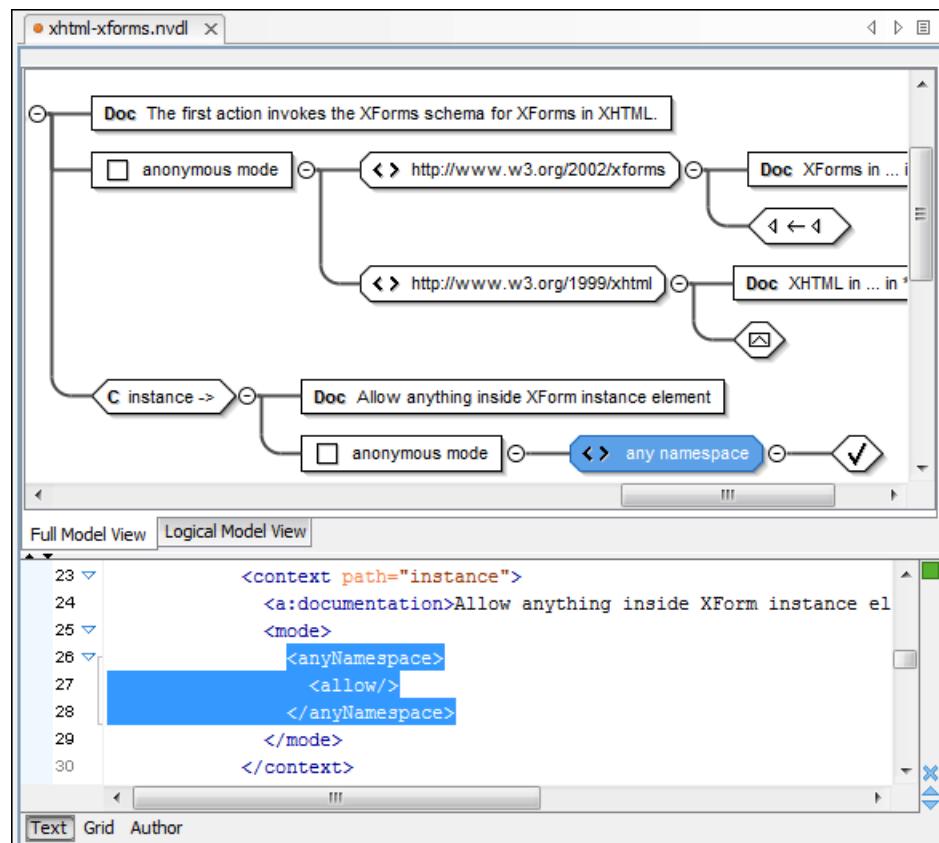

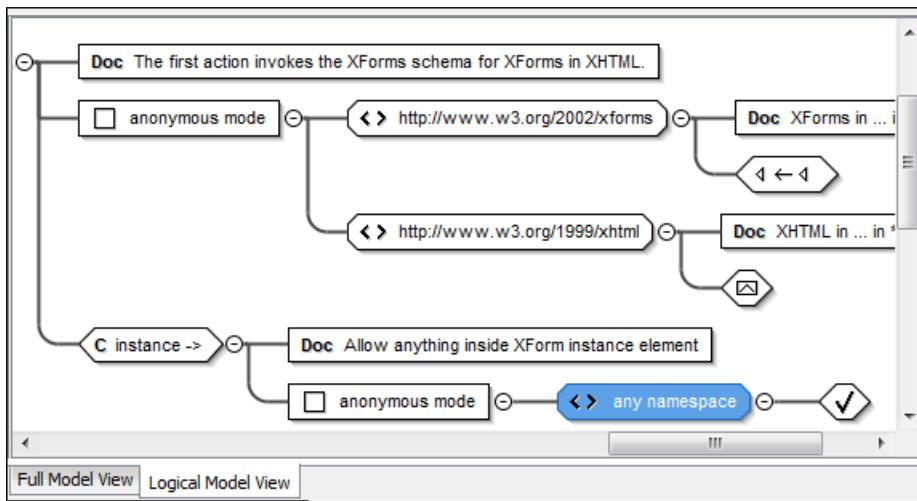

Figure 389: NVDL Schema Editor - Full Model View

The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

### Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

**Figure 390: Logical Model View for an NVDL Schema**

#### Actions Available in the Diagram Editor

The contextual menu offers the following actions:

##### Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

##### Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

##### Auto expand to references

This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

##### Collapse Children

Collapses the children of the selected view.

##### Expand Children

Expands the children of the selected view.

##### Print Selection

Prints the selected view.

##### Save as Image

Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

##### Refresh

Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** instead of the diagram.

## NVDL Outline View

The **Outline** view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

## Validating NVDL Schema Documents

By default, NVDL schema files are validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document Checking**, and disable the **Enable automatic validation** option.

To validate an NVDL schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

#### Related information

[Validating XML Documents Against a Schema](#) on page 438

## Component Dependencies View for NVDL Schemas

The **Component Dependencies** view allows you to see the dependencies for a selected NVDL named mode. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the dependencies of an NVDL mode, select the desired component in the editor and choose the **Component Dependencies** action from the contextual menu. The action is available for all named modes.

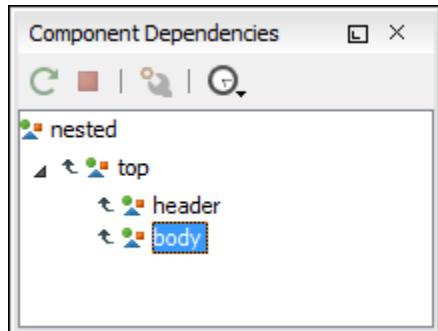

Figure 391: Component Dependencies View - Hierarchy for test.nvd1

In the **Component Dependencies** the following actions are available on the toolbar:

#### Refresh

Refreshes the dependencies structure.

#### Stop

Allows you to stop the dependencies computing.

#### Configure

Allows you to configure a search scope to compute the dependencies structure. If you decide to set the application to use automatically the defined scope for future operations, select the corresponding checkbox.

#### History

Repeats a previous dependencies computation.

The following actions are available in the contextual menu:

#### Go to First Reference

Selects the first reference of the referenced component from the current selected component in the dependencies tree.

#### Go to Component

Shows the definition of the current selected component in the dependencies tree.

**Tip:** If a component contains multiple references to another component, a small table containing all references is displayed. When a recursive reference is encountered it is marked with a special icon .

## Searching and Refactoring Actions in NVDL Schemas

### Search Actions

The following search actions can be applied on name, useMode, and startMode attributes and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
-  **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

-  **Show Definition** - Moves the cursor to its definition in the schema used by the NVDL to validate it.

**Note:** You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

## Refactoring Actions

The following refactoring actions can be applied on name, useMode, and startMode attributes and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

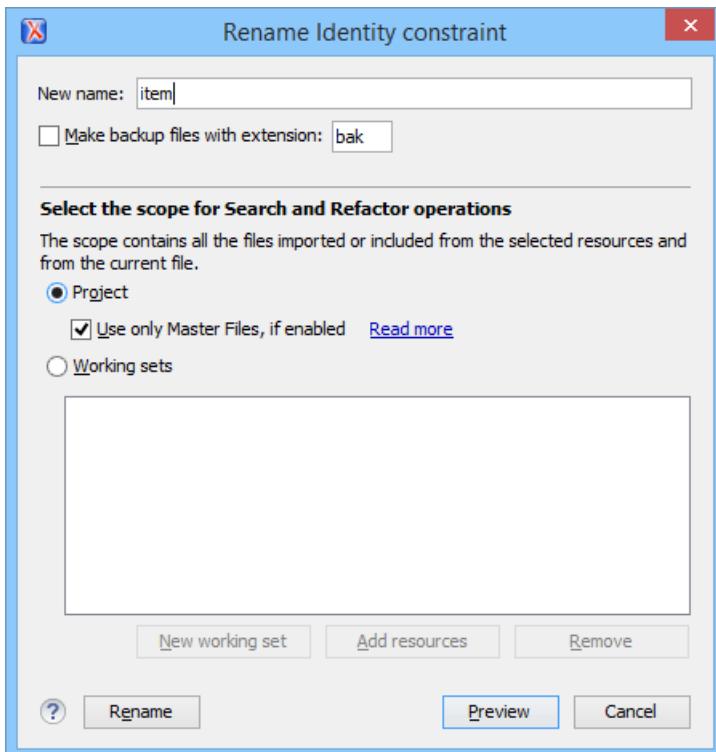

Figure 392: Rename Identity Constraint Dialog Box

## Editing JSON Documents

---

This section explains the features of the Oxygen XML Editor JSON Editor and how to use them.

### Editing JSON Documents in Text Mode

When editing JSON documents in the **Text** editing mode, the [usual text editing actions](#) are available, along with other editor specific actions, including:

- [Find / Replace](#)
- [Drag and Drop](#)
- [Validation](#)
- [Format and Indent \(Pretty Print\)](#)

**Note:** You can run XPath expressions on opened JSON documents, but in **Text** mode the XPath results cannot be mapped in the document. However, they can be mapped in the **Grid** editing mode. You can use the **Grid** button at the bottom of the editor panel to switch to that editing mode.

```
personal.json [C:\Program Files (x86)\Oxygen XML Editor 13\samples\json\personal.json] - <oXygen/> XML Editor
File Edit Find Project Options Tools Document Window Help
External Tools Saxon-EE
personal.json x
1 {"personnel": {"person": [
2 {
3 "id": "Big.Boss",
4 "name": {
5 "family": "Boss",
6 "given": "Big"
7 },
8 "email": "chief@oxygenxml.com",
9 "link": {"subordinates": "one.worker two.worker three.worker four.worker five.worker"}
10 },
11 {
12 "id": "one.worker",
13 "name": {
14 "family": "Worker",
15 "given": "One"
16 },
17 "email": "one@oxygenxml.com",
18 "link": {"manager": "Big.Boss"}
19 },
20 {
21 "id": "two.worker",
22 "name": {
23 "family": "Worker",
24 "given": "Two"

**Figure 393: JSON Editor Text Mode**

#### **Related information**

[Text Preferences](#) on page 74

*Editing JSON Documents in Grid Mode* on page 650

## Syntax Highlighting in JSON Documents

Oxygen XML Editor supports syntax highlighting in JSON files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. Open the **Preferences** dialog box (**Options > Preferences**).
  2. Go to **Editor > Syntax Highlight**.
  3. Select and expand the **JSON** section in the top pane.
  4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

#### **Related information**

## Syntax Highlight Preferences on page 100

## Folding in JSON

In a large JSON document, the data enclosed in the '{' and '}' characters can be collapsed so that only the needed data remain in focus. The [folding features available for XML documents](#) are available in JSON documents.

## Editing JSON Documents in Grid Mode

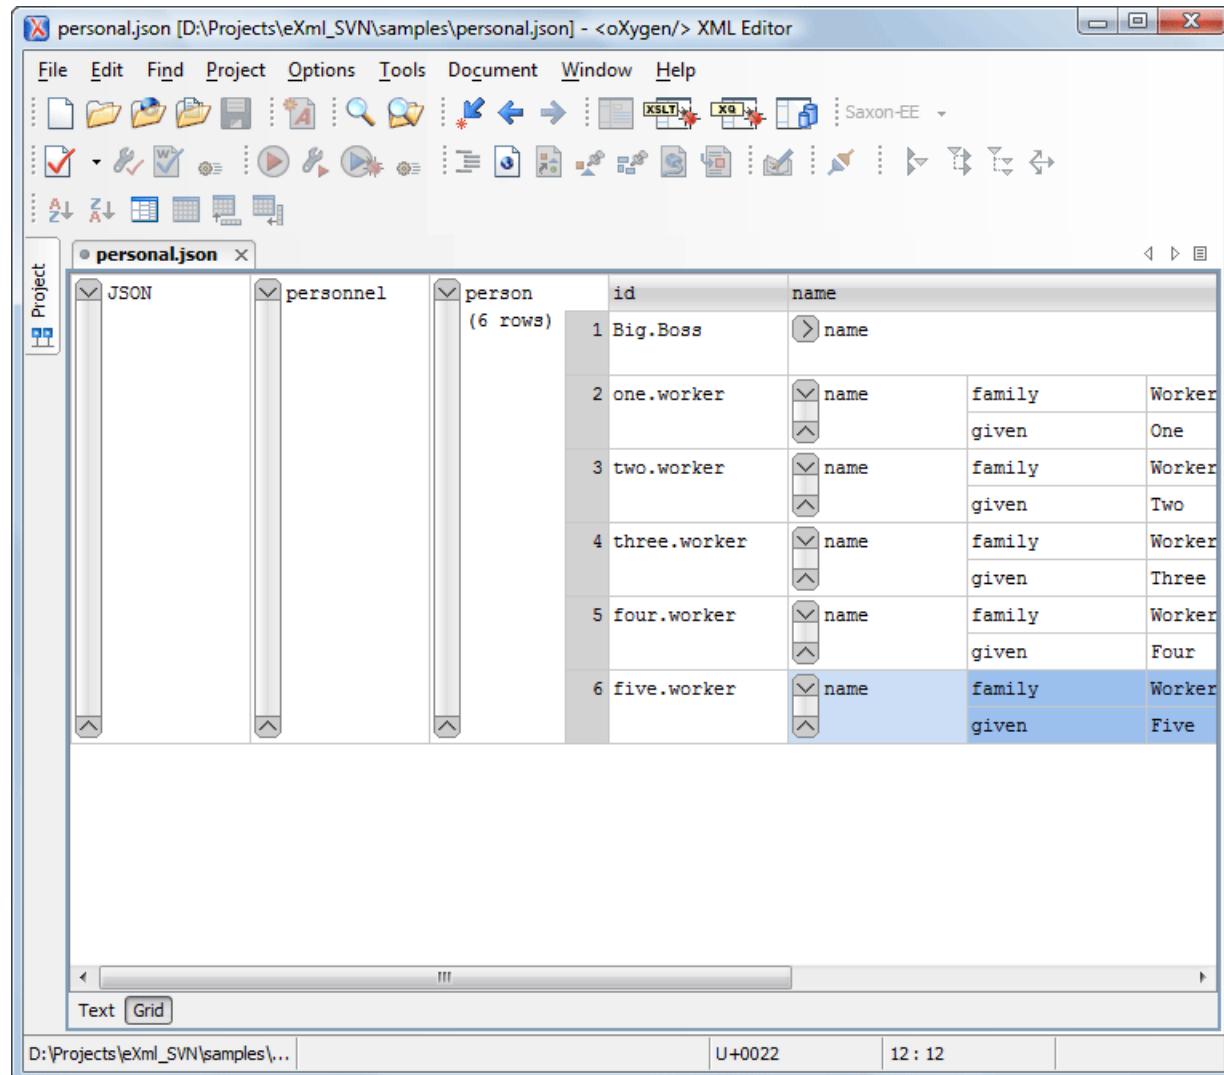

Figure 394: JSON Editor Grid Mode

Oxygen XML Editor allows you to view and edit the JSON documents in the [Grid mode](#). The JSON is represented in **Grid** mode as a compound layout of nested tables in which the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. You can also use the following JSON-specific contextual actions:

### Array

Useful when you want to convert a JSON value to array.

### Insert value before

Inserts a value before the currently selected one.

### Insert value after

Inserts a value after the currently selected one.

### Append value as child

Appends a value as a child of the currently selected value.

You can [customize the JSON grid appearance](#) according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

#### Related information

[Grid Editing Mode](#) on page 201

[Grid Preferences](#) on page 76

## Validating JSON Documents

Oxygen XML Editor includes a built-in JSON validator (based on the free JAVA source code available on [www.json.org](http://www.json.org)), integrated with the general validation support.

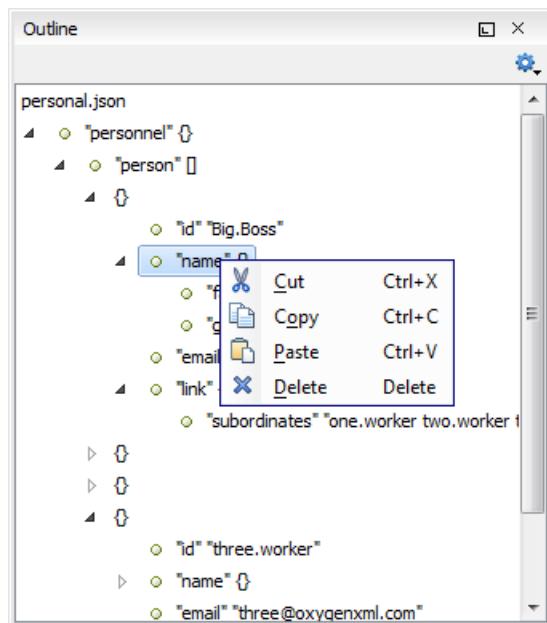

#### Related information

[Presenting Validation Errors in Text Mode](#) on page 200

[Document Checking Preferences](#) on page 91

## JSON Outline View

The **Outline** view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

**Figure 395: JSON Outline View**

The following actions are available in the contextual menu of the JSON **Outline** view:

- **Cut**
- **Copy**
- **Paste**
- **Delete**

The **Settings** menu on the JSON **Outline** view toolbar allows you to enable **Selection update on cursor move**. This option controls the synchronization between the **Outline** view and source the document. Oxygen XML Editor synchronizes the selection in the **Outline** view with the cursor moves or the changes you make in the JSON editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

## XML to JSON Converter

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. It can be found in the **Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools** menu.

The **XML to JSON** dialog box is displayed:

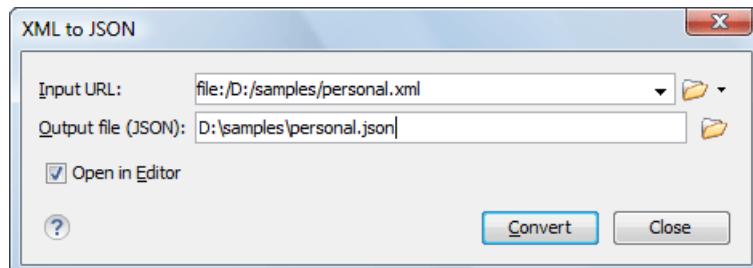

Figure 396: XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the conversion JSON result.
4. Check the **Open in Editor** option to open the JSON result of the conversion in the Oxygen XML Editor JSON Editor.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.

A screenshot of the Oxygen XML Editor showing two tabs: "personal.xml" and "personal.json". The "personal.xml" tab shows an XML document with three "person" elements. The "personal.json" tab shows the corresponding JSON output. Both tabs have line numbers and "Text" and "Grid" buttons at the bottom.

Figure 397: Example: XML to JSON Operation Result

## Editing StratML Documents

---

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Editor supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline** view. Oxygen XML Editor implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

## Editing XLIFF Documents

---

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Editor provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New file templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/css/`.
- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/1.2`, and for version 2.0 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0`.

XLIFF Version 2.0 Enhanced Support:

- Support for validating XLIFF 2.0 documents using modules. The default modules are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0/modules`.

## Editing JavaScript Documents

---

This section explains the features of the Oxygen XML Editor JavaScript Editor and how you can use them.

### JavaScript Editing Actions

Oxygen XML Editor allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

```

12 <function newPage(filename, overlay) {
13 divs = document.getElementsByTagName("div");
14
15 if (divs) {
16 var xdiv = divs[0];
17
18 if (xdiv) {
19 var xid = xdiv.getAttribute("id");
20
21 var mytoc = window.top.frames[0];
22 if (mytoc.lastUnderlined) {
23 mytoc.lastUnderlined.style.textDecoration = "none";
24 }
25
26 var tdiv = xbGetElementById(xid, mytoc);
27
28 if (tdiv) {
29 var ta = tdiv.getElementsByTagName("a").item(0);
30 ta.style.textDecoration = "underline";
31 mytoc.lastUnderlined = ta;
32 }
33 }
34 }
35
36 if (overlay != 0) {
37 overlaySetup('lc');
38 }

```

**Figure 398: JavaScript Editor Text Mode**

The contextual menu of the **JavaScript** editor offers the following actions:

**Cut**  
Allows you to cut fragments of text from the editing area.

**Copy**  
Allows you to copy fragments of text from the editing area.

**Paste**  
Allows you to paste fragments of text in the editing area.

**Toggle Comment**  
Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

**Toggle Line Comment**  
Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

#### **Go to Matching Bracket**

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Editor moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

**Note:** A rectangle decorates the opening or closing bracket that matches the current one, at all times.

#### **Source**

Allows you to select one of the following actions:

##### **To Lower Case**

Converts the selection content to lower case characters.

##### **To Upper Case**

Converts the selection content to upper case characters.

### **Capitalize Lines**

Converts to upper case the first character of every selected line.

### **Join and Normalize Lines**

Joins all the rows you select to one row and normalizes the content.

### **Insert new line after**

Inserts a new line after the line at the cursor position.

### **Modify all matches**

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

### **Open**

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

### **Compare**

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

### **Folding**

When you invoke the contextual menu from the folding stripe on the left side of the editor, the following actions are available:

#### **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**

Folds all the elements except the current element.

#### **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the elements indented with one level inside the current element.

#### **Expand Child Folds**

Unfolds all child elements of the currently selected element.

#### **Expand All (Ctrl + NumPad\* (Command + NumPad\* on OS X))**

Unfolds all elements in the current document.

## **Validating JavaScript Files**

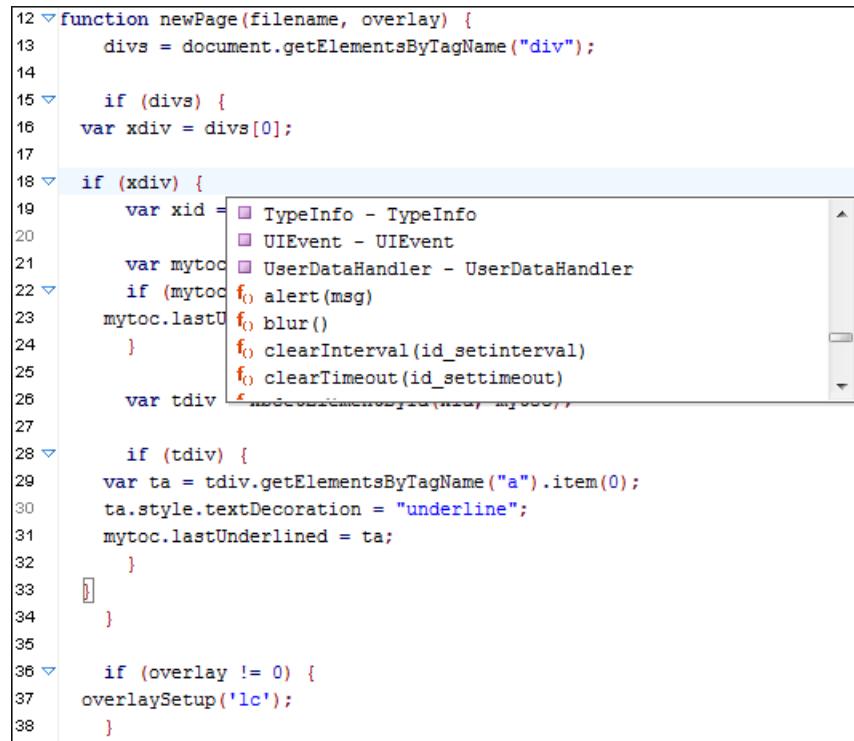

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Editor uses the Mozilla Rhino library for validation. For more information about this library, go to <http://www.mozilla.org/rhino/doc.html>. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Editor can validate a JavaScript document both on-request and automatically.

## **Content Completion in JavaScript Documents**

When you edit a JavaScript document, the **Content Completion Assistant** presents you a list of the elements you can insert at the cursor position. For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

**Note:** These icons decorate both the elements from the content completion list of proposals and from the **Outline** view.

The screenshot shows a code editor window with a scroll bar on the right. A tooltip-like pop-up window is displayed over a portion of the code, listing several JavaScript objects and methods. The visible code is as follows:

```
12 function newPage(filename, overlay) {
13 divs = document.getElementsByTagName("div");
14
15 if (divs) {
16 var xdiv = divs[0];
17
18 if (xdiv) {
19 var xid = TypeInfo - TypeInfo
20 UIEvent - UIEvent
21 UserDataHandler - UserDataHandler
22 if (mytoc)
23 mytoc.lastU f0 alert(msg)
24 mytoc.lastU f0 blur()
25 mytoc.lastU f0 clearInterval(id_setinterval)
26 mytoc.lastU f0 clearTimeout(id_settimeout)
27 var tdiv = document.createElement("div")
28
29 if (tdiv) {
30 var ta = tdiv.getElementsByTagName("a").item(0);
31 ta.style.textDecoration = "underline";
32 mytoc.lastUnderlined = ta;
33 }
34 }
35
36 if (overlay != 0) {
37 overlaySetup('lc');
38 }
39 }
40 }
```

The tooltip contains the following items:

- TypeInfo - TypeInfo
- UIEvent - UIEvent
- UserDataHandler - UserDataHandler

**Figure 399: JavaScript Content Completion Assistant**

The **Content Completion Assistant** collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

## JavaScript Outline View

Oxygen XML Editor present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

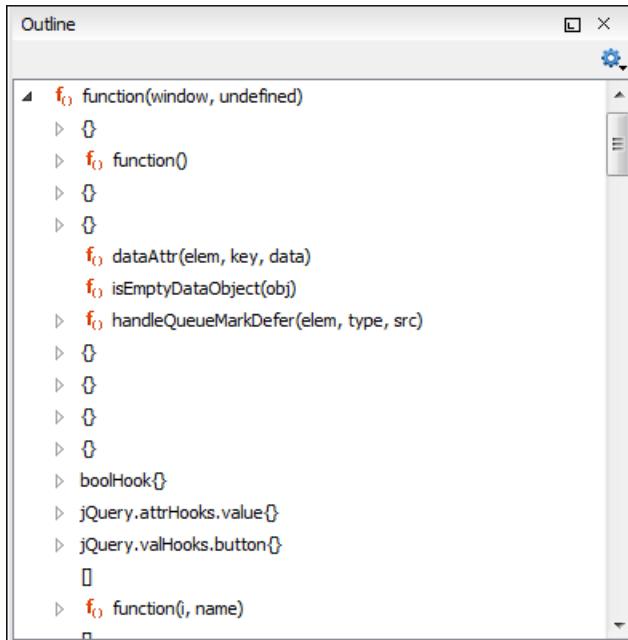

Figure 400: JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

- - function
- - variable
- - object
- - property
- - method

The contextual menu of the JavaScript **Outline** view contains the usual Cut, Copy, Paste, and Delete actions. From the Settings menu, you can enable the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

## Editing XProc Scripts

An XProc script is edited as an XML document that is validated against a RELAX NG schema. If the script has an associated transformation scenario, then the XProc engine from the scenario is invoked as validating engine. The default engine for XProc scenarios is the Calabash engine that comes bundled with Oxygen XML Editor version 18.1.

The content completion inside the element `input/inline` from the XProc namespace `http://www.w3.org/ns/xproc` offers elements from the following schemas depending both on the `port` attribute and the parent of the `input` element. When invoking the content completion inside the XProc element `inline`, the list of content completion proposals is populated as follows:

- If the value of the `port` attribute is `stylesheet` and the `xslt` element is the parent of the `input` elements, the **Content Completion Assistant** offers XSLT elements.
- If the value of the `port` attribute is `schema` and the `validate-with-relax-ng` element is the parent of the `input` element, the **Content Completion Assistant** offers RELAX NG schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-xml-schema` element is the parent of the `input` element, the **Content Completion Assistant** offers XML Schema schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-schematron` element is the parent of the `input` element, the **Content Completion Assistant** offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the **Content Completion Assistant** offers elements from all the schemas from the above cases.

The XProc editor assists you in writing XPath expressions by offering a **Content Completion Assistant** and dedicated coloring schemes. To customize the coloring schemes, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

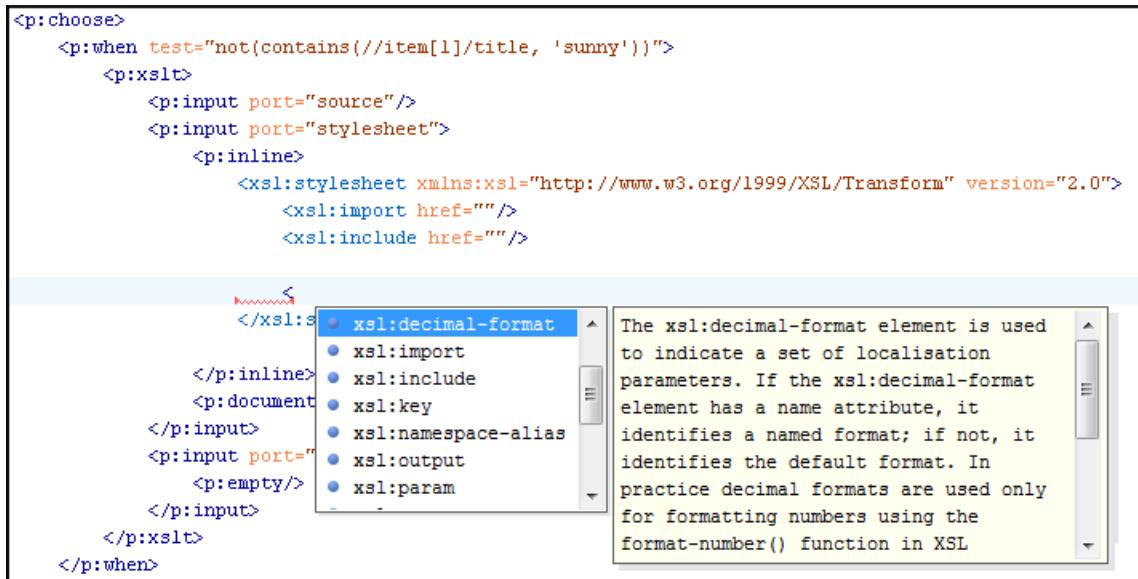

Figure 401: XProc Content Completion

## Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

Oxygen XML Editor assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline** view. You can create a new Schematron schema using one of the Schematron templates available in the [New document wizard](#).

For information about applying and detecting Schematron schemas, see [Associating a Schema to XML Documents](#) on page 464.

### Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to [validate XML documents against Schematron schemas](#) or against combined RELAX NG / W3C XML Schema and Schematron.

### How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO schematron, [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Parser > Schematron**, and select it in the **Embedded rules query language binding** option.
- For standalone ISO Schematron, specify the version by setting the query language to be used in a `queryBinding` attribute on the schema root element. For more information see the [Query Language Binding section of the Schematron specifications](#).
- For Schematron 1.5 (standalone and embedded), [open the Preferences dialog box \(Options > Preferences\)](#), go to **XML > XML Parser > Schematron**, and select the version in the **XPath Version** option.

## **Multi-Lingual Support in Schematron Messages**

You can specify the desired language for the validation messages in [the Schematron Preferences page](#). The Schematron validation messages can be presented in multiple languages by defining the language for each message using the Schematron diagnostics. For more information, see the [Use of Schematron for Multi-Lingual Schemas](#) specification.

## **How to Customize Color Schemes in Schematron**

The Schematron editor renders the XPath expressions with dedicated coloring schemes . To customize the coloring schemes, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

## **Schematron Transformation Scenario**

When you create a Schematron document, Oxygen XML Editor provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

To watch our video demonstration about the Schematron support in Oxygen XML Editor, go to [https://www.oxygenxml.com/demo/Schematron\\_Validation.html](https://www.oxygenxml.com/demo/Schematron_Validation.html), and to [https://www.oxygenxml.com/demo/Editing\\_Schematron\\_Schemas/Editing\\_Schematron\\_Schemas.html](https://www.oxygenxml.com/demo/Editing_Schematron_Schemas/Editing_Schematron_Schemas.html).

### **Related information**

[Editing XML Documents in Text Mode](#) on page 282

[Associating a Schema to XML Documents](#) on page 464

## **Editing Schematron Schema in the Master Files Context**

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Schematron document either using the [master files support from the Project view](#), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- **Content Completion Assistant** displays all the referable components valid in the current context. This includes components defined in modules other than the currently edited one.

## **Validating Schematron Documents**

By default, a Schematron schema is validated as you type. To change this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document Checking**, and disable the **Enable automatic validation** option.

To validate a Schematron document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Editor offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

### **Related information**

[Presenting Schematron Validation Issues](#)

## Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the **Errors** panel at the bottom area of the Oxygen XML Editor window. Each error is flagged with a severity level that can be: *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Editor looks for the following information:

- The **role** attribute, which can have one of the following values:
  - **warn** or **warning** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  - **error** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **fatal** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **info** or **information** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- The start of the message, after trimming leading white-spaces. Oxygen XML Editor looks to match the following exact string of characters (case sensitive):
  - **Warning :** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  - **Error :** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **Fatal :** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **Info :** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- If none of the previous rules match, Oxygen XML Editor sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

**Tip:** You can configure the color for each type in the [Document Checking preferences page](#).

## Content Completion in Schematron Documents

Oxygen XML Editor helps you edit a Schematron schema through the **Content Completion Assistant**, offering proposals that are valid at the cursor position. When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is `phase/active/@pattern`, the **Content Completion Assistant** proposes all the defined patterns.

**Note:** For Schematron resources, the **Content Completion Assistant** collects its components starting from the master files. The master files can be defined in the project or in the associated validation scenario. For further details about the **Master Files** support go to [Defining Master Files at Project Level](#).

If the editing context is an attribute value that is an XPath expression (such as `assert/@test` or `report/@test`), the Content Completion Assistant offers the names of XPath functions, the XPath axes, and user-defined variables.

The **Content Completion Assistant** displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes `path`, `select`, `context`, `subject`, `test` depending on [the Schematron options](#) that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.6.0.7

namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions as in the following figure:

```
48 <sch:rule context="t:Type[= 'Doubles']">
49 <sch:assert test="..>Par
50 you're playing doubles t
51 divisible by 2.</sch:ass
52 <sch:assert test="..>Par
53 ..>Teams/@nbrTeams * 2
54 of participants must equ
55 </sch:rule>
56 <sch:rule context="t:Partici
57 <sch:assert test="count(t:
58 Name elements in <sch:na
59 attribute.</sch:assert>
60 </sch:rule>
61 <sch:rule context="t:Teams/t
62 <sch:assert test="key('Pa
63 also be a participant in
64 </sch:rule>
65 </sch:pattern>
66 <!-- Pattern Teams -->
67 <sch:pattern id="Teams">
68 <sch:rule context="t:Teams">
69 <sch:assert diagnostics="d1" test="count(t:Team) = @nbrTeams">The
```

The id function selects elements by their unique ID. When the argument to id is of type node-set, then the result is the union of the result of applying id to the string-value of each of the nodes in the argument node-set. When the argument to id is of any other

**Figure 402: XSLT Extension Functions in Schematron Schema Content Completion**

The **Content Completion Assistant** also includes *code templates that can be used to quickly insert code fragments* into Schematron documents.

## XML Schema or RELAX NG with Embedded Schematron Rules

Schematron rules can be embedded into an XML Schema through annotations (using the `appinfo` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules.

### Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with both RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas. For example:

```
<?xml-model href="percent.rng" type="application/xml"
 schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
 schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

### Validating XML Documents with XML Schema and Embedded Schematron

Similarly, you can specify an XML Schema having the embedded Schematron rules.

```
<?xml-model href="percent.xsd" type="application/xml"
 schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

**Note:** When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema , and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

## Example: Embedded Schematron in Relax NG Schema

```
<sch:pattern>
 <sch:rule context="...">
 <sch:assert test="...">>Message.</sch:assert>
 </sch:rule>
</sch:pattern>
```

## Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
 <sch:pattern>
 <sch:rule context="...">
 <sch:assert test="...">>Message.</sch:assert>
 </sch:rule>
 </sch:pattern>
</xsd:appinfo>
```

### Related information

[Embed Schematron Quick Fixes in Relax NG or XML Schema](#) on page 676

## Schematron Outline View

The **Outline** view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

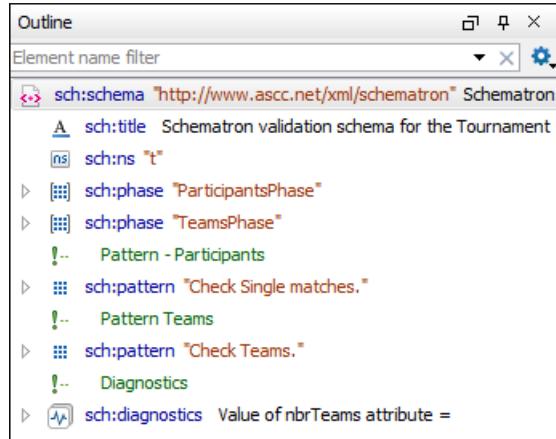

Figure 403: Schematron Outline View

The following actions are available in the **Settings** menu on the **Outline** view toolbar:

### Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

### Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

### Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

### Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

### Show element name

Show/hide element name.

## Show text

Show/hide additional text content for the displayed elements.

## Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel](#).

## Configure displayed attributes

Displays the [XML Structured Outline preferences page](#).

The following contextual menu actions are also available in the **Outline** view:

### **Append Child**

Displays a list of elements that you can insert as children of the current element.

### **Insert Before**

Displays a list of elements that you can insert as siblings of the current element, before the current element.

### **Insert After**

Displays a list of elements that you can insert as siblings of the current element, after the current element.

### **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

## Toggle Comment

Comments/uncomments the currently selected element.

## Cut

Cuts the currently selected component.

## Copy

Copies the currently selected component.

## Delete

Deletes the currently selected component.

## Expand More

Expands the structure of a component in the **Outline** view.

## Collapse All

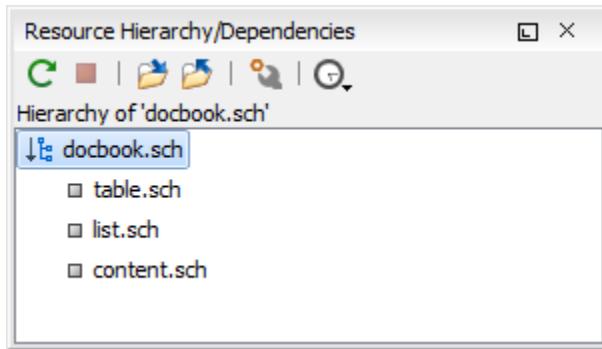

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (\*, ?) and separate multiple patterns with commas.

## Schematron Resource Hierarchy/Dependencies View

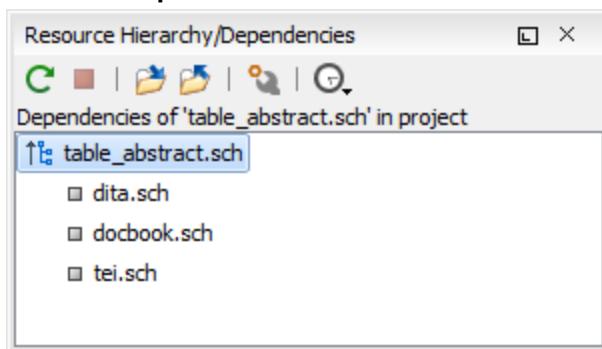

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a Schematron schema. If the view is not displayed, it can be opened from the **Window > Show View** menu.

If you want to see the hierarchy of a schema, select the desired schema in the **Project** view and choose **Resource Hierarchy** from the contextual menu.

**Figure 404: Resource Hierarchy/Dependencies View**

If you want to see the dependencies of a schema, select the desired schema in the **Project** view and choose **Resource Dependencies** from the contextual menu.

**Figure 405: Resource Hierarchy/Dependencies View - Dependencies for table\_abstract.sch**

The following actions are available in the **Resource Hierarchy/Dependencies** view:

**Refresh**

Refreshes the Hierarchy/Dependencies structure.

**Stop**

Stops the hierarchy/dependencies computing.

**Show Hierarchy**

Allows you to choose a resource to compute the hierarchy structure.

**Show Dependencies**

Allows you to choose a resource to compute the dependencies structure.

**Configure**

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

**History**

Provides access to the list of previously computed dependencies. Use the **\*Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

**Open**

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Copy location**

Copies the location of the resource.

**Move resource**

Moves the selected resource.

#### Rename resource

Renames the selected resource.

#### Show Resource Hierarchy

Shows the hierarchy for the selected resource.

#### Show Resource Dependencies

Shows the dependencies for the selected resource.

#### Add to Master Files

Adds the currently selected resource in *the Master Files directory*.

#### Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

#### Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

**Note:** The **Move resource** or **Rename resource** actions give you the option to *update the references to the resource*.

#### Moving/Renaming Schematron Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Enable this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Enable this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is enabled, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

#### Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Editor searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, *open the Preferences dialog box (Options > Preferences)* and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on OS X)** action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

## Searching and Refactoring Operations in Schematron Documents

### Search Actions

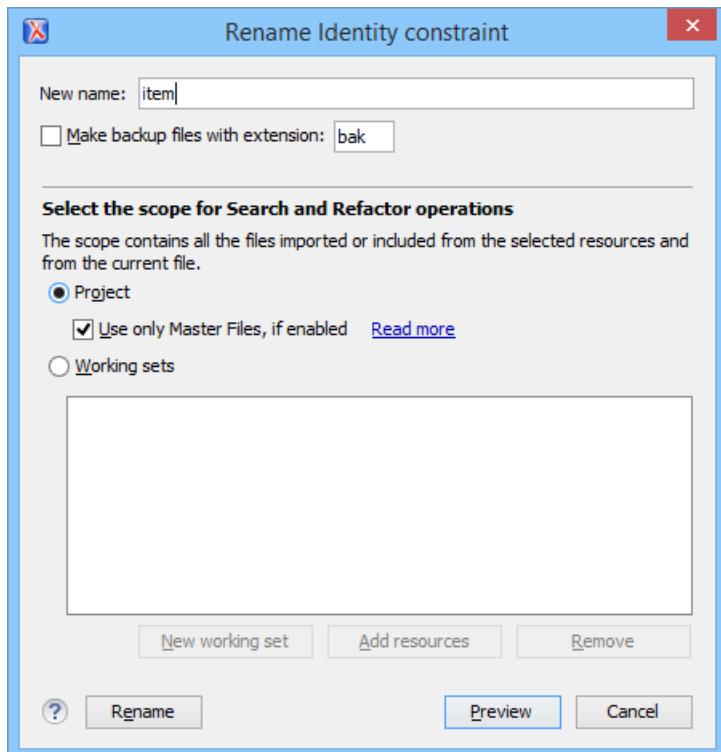

The following search actions can be applied on pattern, phase, or diagnostic types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
-  **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

### Refactoring Actions

The following refactoring actions can be applied on pattern, phase, or diagnostic types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

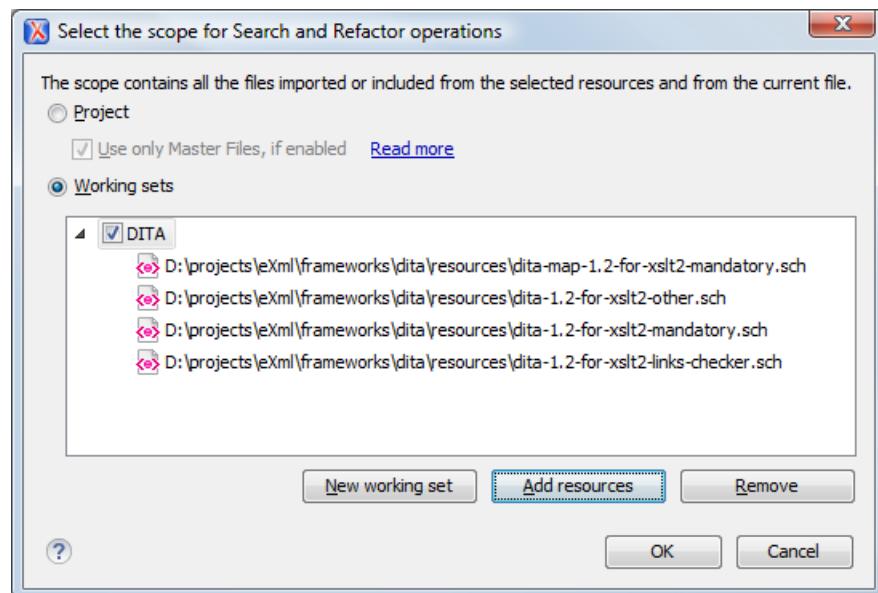

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

**Figure 406: Rename Identity Constraint Dialog Box**

### Searching and Refactoring Operations Scope in Schematron Documents

The scope is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the Quick Assist action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple working sets. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the **Master Files support**.

**Figure 407: Change Scope Dialog Box**

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the working set structure.

## Quick Assist Support in Schematron Documents

The Quick Assist support improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The Quick Assist feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the quick assist menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

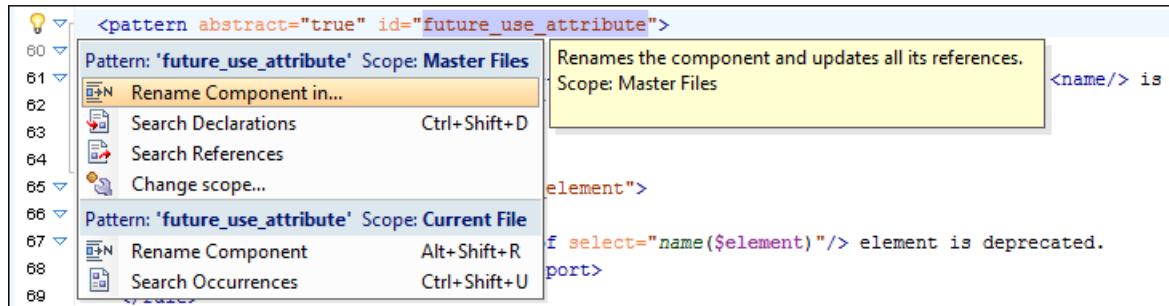

Figure 408: Schematron Quick Assist Support

The quick assist support offers direct access to the following actions:

### **Rename Component in**

Renames the component and all its dependencies.

### **Search Declarations**

Sets the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

### **Search References**

Sets all references of the component in a predefined scope.

### **Component Dependencies**

Sets the component dependencies in a predefined scope.

### **Change Scope**

Configures the scope that will be used for future search or refactor operations.

### **Rename Component**

Allows you to rename the current component in-place.

### **Search Occurrences**

Sets all occurrences of the component within the current file.

## Editing Schematron Quick Fixes

Oxygen XML Editor provides support for editing the *Schematron Quick Fixes*. You can define a library of quick fixes by editing them directly in the current Schematron file or in a separate file. Oxygen XML Editor assists you in editing Schematron Quick Fixes with schema-based content completion, syntax highlighting, and validation as you type.

For information about applying and detecting the Schematron schemas that include SQF, see [Associating a Schema to XML Documents](#) on page 464.

### Related information

[Oxygen XML Blog: Schematron Checks to Help Technical Writing](#)

## Schematron Quick Fixes (SQF)

Oxygen XML Editor provides support for Schematron Quick Fixes (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with `assert` or `report` messages.

A typical use case is using Schematron Quick Fixes to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: <http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html>.

### Displaying the Schematron Quick Fix Proposals

The defined Schematron Quick Fixes are displayed on validation errors in **Text** mode and **Author** mode.

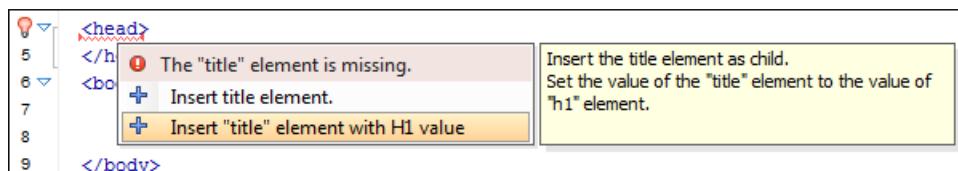

Figure 409: Example of a Schematron Quick Fix

### Related information

[Editing Schematron Quick Fixes](#) on page 668

[Schematron Quick Fix Specifications](#)

[Presenting Schematron Validation Issues](#)

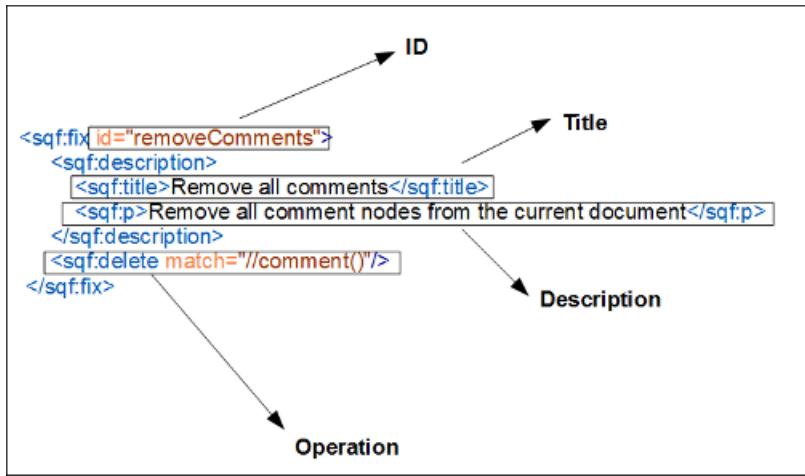

## Defining Schematron Quick Fixes

You can define and customize Schematron Quick Fixes directly in the current Schematron file or in a separate Schematron file. The Schematron Quick Fixes are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can refer the quick fixes from the `assert` or `report` elements in the values of the `sqf:fix` attributes.

### Defining a Schematron Quick Fix

The basics of a Schematron Quick Fix is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the `id` attribute from the `fix` element and must be unique in the current context. It is used to refer the quick fix from a `report` or `assert` element.
- **Name** - The name of the quick fix is defined by the `title` element.
- **Description** - Defined by the text in the paragraphs (`p`) of the `description` element.
- **Operations** - The following basic types of [operations \(elements\)](#) are supported:
  - `<sqf:add>` Element - To add a new node or fragment in the document.
  - `<sqf:delete>` Element - To remove a node from the document.
  - `<sqf:replace>` Element - To replace a node with another node or fragment.
  - `<sqf:stringReplace>` Element - To replace text content with other text or a fragment.

**Figure 410: Schematron Quick Fix Components**

The assertion message that generates the quick fix is added as the description of the problem to be fixed. The title is presented as the name of the quick fix. The content of the paragraphs (p) within the description element are presented in the tooltip message when the quick fix is selected.

#### Additional Elements Supported in the Schematron Quick Fixes

##### <sqf:user-entry>

This element defines a value that must be set manually by the user. For more information, see [User Entry SQF Operation](#) on page 673.

##### <sqf:call-fix>

This element calls another quick fix within a quick fix. The called quick fix must be defined globally or in the same Schematron rule as the calling quick fix. A calling quick fix adopts the activity elements of the called quick fix and should not include other activity elements. You can also specify which parameters are sent by using the <sqf:with-param> child element.

##### <sqf:group>

Allows you to group multiple quick fixes and refer them from an assert or report element.

##### <sqf:fixes>

Is defined globally and contains global fixes and groups of fixes.

##### <sqf:keep>

Used to copy the selected nodes that are specified by the select attribute.

**Note:** In Oxygen XML Editor the copied nodes cannot be manipulated by the current or other activity elements.

##### <sqf:param>

Defines a parameter for a quick fix. If the parameter is defined as abstract then the type and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

#### Other SQF Notes

**Note:** The sqf:default-fix attribute is ignored in Oxygen XML Editor.

For more details on editing Schematron Quick Fixes, go to: [Schematron Quick Fix Specifications](#)

#### Basic Schematron Quick Fix Operations

There are four basic operations that can be executed in a Schematron Quick Fix: *Add*, *Delete*, *Replace*, and *String Replace*.

## Add

The `<sqf :add>` element allows you to add a node to the instance. An anchor node is required to select the position for the new node. The anchor node can be selected by the `match` attribute. Otherwise, it is selected by the `context` attribute of the rule.

The `target` attribute defines the name of the node to be added. It is required if the value of the `node-type` attribute is set to anything other than "comment".

The `<sqf :add>` element has a `position` attribute and it determines the position relative to the anchor node. The new node could be specified as the first child of the anchor node, the last child of the anchor node, before the anchor node, or after the anchor node (`first-child` is the default value). If you want to add an attribute to the anchor node, do not use the `position` attribute.

**Note:** If you insert an element and its content is empty, Oxygen XML Editor will insert the required element content.

### An Example of the `<sqf :add>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
 xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
 <pattern>
 <rule context="head">
 <assert test="title" sqf:fix="addTitle">title element missing.</assert>
 <sqf:fix id="addTitle">
 <sqf:description>
 <sqf:title>Insert title element.</sqf:title>
 </sqf:description>
 <sqf:add target="title" node-type="element">Title text</sqf:add>
 </sqf:fix>
 </rule>
 </pattern>
</schema>
```

### Specific Add Operations:

- **Insert Element** - To insert an element, use the `<sqf :add>` element, set the value of the `node-type` to "element", and specify the element *QName* with the `target` attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix" />`).
- **Insert Attribute** - To insert an attribute, use the `<sqf :add>` element, set the value of the `node-type` to "attribute", and specify the attribute *QName* with the `target` attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix" />`).
- **Insert Fragment** - If the `node-type` is not specified, the `<sqf :add>` element will insert an XML fragment. The XML fragment must be well formed. You can specify the fragment in the `add` element or by using the `select` attribute.
- **Insert Comment** - To insert a comment, use the `<sqf :add>` element and set the value of the `node-type` to "comment".
- **Insert Processing Instruction** - To insert a processing instruction, use the `<sqf :add>` element, set the value of the `node-type` to "pi" or "processing-instruction", and specify the name of the processing instruction in the `target` attribute.

## Delete

The `<sqf :delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion the `<sqf :delete>` element can include a `match` attribute that is an XPath expression (the default value is `.`). If the `match` attribute is not included, it deletes the context node of the Schematron rule.

### An Example of the `<sqf :delete>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
 xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
 <pattern>
 <rule context="*[@xml:lang]">
 <report test="@xml:lang" sqf:fix="remove_lang">
 The attribute "xml:lang" is forbidden.</report>
 <sqf:fix id="remove_lang">
 <sqf:description>
 <sqf:title>Remove "xml:lang" attribute</sqf:title>
```

```

 </sqf:description>
 <sqf:delete match="@xml:lang"/>
 </sqf:fix>
</rule>
</pattern>
</schema>

```

## Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

### An Example of the `<sqf:replace>` Element:

```

<schema xmlns="http://purl.oclc.org/dsdl/schematron"
 xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
 <pattern>
 <rule context="title">
 <report test="exists(ph)" sqf:fix="resolvePh" role="warn">
 ph element is not allowed in title.</report>
 <sqf:fix id="resolvePh">
 <sqf:description>
 <sqf:title>Change the ph element into text</sqf:title>
 </sqf:description>
 <sqf:replace match="ph">
 <value-of select=". "/>
 </sqf:replace>
 </sqf:fix>
 </rule>
 </pattern>
</schema>

```

### Other Attributes for Replace Operations:

- **node-type** - Determines the type of the replacing node. The permitted values include:
  - **keep** - Keeps the node type of the node to be replaced.
  - **element** - Replaces the node with an element.
  - **attribute** - Replaces the node with an attribute.
  - **pi** - Replaces the node with a processing instruction.
  - **comment** - Replaces the node with a comment.
- **target** - By using a *QName* it gives the replacing node a name. This is necessary when the value of the `node-type` attribute is anything other than "comment".
- **select** - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the `select` attribute. If the `select` attribute is not specified then the content of the `<sqf:replace>` element is used instead.

## String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

### Attributes for the String Replace Operation:

- **match** - Allows you to select text nodes that contain the sub-strings you want to replace.
- **select** - Allows you to select the replacing fragment, in case you do not want to set it in the content of the `stringReplace` element.
- **regex** - Matches the sub-strings using a regular expression.

**Note:** Consider the following information about using regular expressions in the `stringReplace` element:

- The regular expressions from this operation are compiled as Java regular expressions. For more information, see <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>.
- The **j flag** allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of `\b` in a regular expression to match word boundaries. For more information, see [http://www.saxonica.com/html/documentation/functions\\_fn/matches.html](http://www.saxonica.com/html/documentation/functions_fn/matches.html).
- Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.

**Attention:** The context of the content within the `<sqf:stringReplace>` element is set to the whole text node, rather than the current sub-string.

### An Example of the `<sqf:stringReplace>` Element:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
 xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
 <sch:pattern>
 <sch:rule context="text()">
 <sch:report test="matches(., '[o0][xX]ygen')"
 sqf:fix="changeWord">The oXygen word is not allowed</sch:report>
 <sqf:fix id="changeWord">
 <sqf:description>
 <sqf:title>Replace word with product</sqf:title>
 </sqf:description>
 <sqf:stringReplace regex="[o0][xX]ygen"><ph keyref="product"/>
 </sqf:stringReplace>
 </sqf:fix>
 </sch:rule>
 </sch:pattern>
 </sch:schema>
```

#### Related information

[User Entry SQF Operation](#) on page 673

[Restricting Quick Fix Operations](#) on page 673

### User Entry SQF Operation

The `<sqf:user-entry>` element defines a value that must be set manually by the user. If multiple `user-entry` elements are defined, Oxygen XML Editor will display a dialog box for each one, in which the user can specify values. Also, the `<user-entry>` element can be used as an XPath variable where the XPath variable is the name of the `user-entry`.

### An Example of the `<sqf:user-entry>` Element:

```
<sqf:fix id="duplicate">
 <sqf:description>
 <sqf:title>Change the name of the element</sqf:title>
 </sqf:description>
 <sqf:user-entry name="newName" default="product">
 <sqf:description>
 <sqf:title>Enter the new name of the element</sqf:title>
 </sqf:description>
 </sqf:user-entry>
 <sqf:replace node-type="element" target="${newName}" select="child::node()"/>
</sqf:fix>
```

#### Related information

[Basic Schematron Quick Fix Operations](#) on page 670

### Restricting Quick Fix Operations

To restrict a quick fix or a specific operation to only be available if certain conditions are met, the `use-when` attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the `use-when` attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the `use-when` condition is applied to the `<sqf:fix>` element:

```
<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth"
 role="replace">
 <sqf:description>
 <sqf:title>Subtract excessive width from the last element.</sqf:title>
 </sqf:description>
 <let name="delta" value="$colWidthSummarized - 100"/>
 <sqf:add match="html:col[last()]" target="width" node-type="attribute">
 <let name="newWidth" value="number(substring-before(@width, '%')) - $delta"/>
 <value-of select="concat($newWidth, '%')"/>
 </sqf:add>
</sqf:fix>
```

#### Related information

[Basic Schematron Quick Fix Operations](#) on page 670

## Formatting/Indenting Content Inserted by SQF Operations

Content that is inserted by the **Add**, **Replace**, or **String Replace** Schematron Quick Fix operations is automatically indented unless you set the value of the `xml:space` attribute to `preserve` on the operation element. There are several methods available to format the content that is inserted:

- **xsl:text** - You can use an `xsl:text` element to format the inserted content and keep the automatic indentation, as in the following example:

```
<sqf:add position="last-child">
 <row><xsl:text>
 </xsl:text>
 <entry>First column</entry><xsl:text>
 </xsl:text>
 <entry>Second column</entry><xsl:text>
 </xsl:text>
 </row><xsl:text>
 </xsl:text>
</sqf:add>
```

- **xml:space** - Use the `xml:space` attribute and set its value to `preserve` to format the content and specify the spacing between elements, as in the following example:

```
<sqf:add node-type="element" target="codeblock" xml:space="preserve">
 /* a long sample program */
 Do forever
 Say "Hello, World"
End</sqf:add>
```

### Related information

[Basic Schematron Quick Fix Operations](#) on page 670

## Executing Schematron Quick Fixes in Other Documents

You can apply Schematron Quick Fixes over nodes from referenced documents (using `XInclude` or external entities), and you can access them as nodes in your current document.

Also, you can apply the quick fixes over other documents using the `doc()` function in the value of the `match` attribute. For example, you can add a new key in the `keylist.xml` file using the following operation:

```
<sqf:add match="doc('keylist.xml')/KeyList" target="Key"
 node-type="element" select="Key2">
```

## Validating Schematron Quick Fixes

By default, Schematron Quick Fixes are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, [open the Preferences dialog box \(Options > Preferences\)](#), go to **Editor > Document Checking**, and disable the **Enable automatic validation** option.

To validate Schematron Quick Fixes manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

## Content Completion in SQF

Oxygen XML Editor helps you edit Schematron Quick Fixes embedded in a Schematron document by offering proposals that are valid at the cursor position in a *Content Completion Assistant*. When you edit the value of an attribute that references a quick fix *id*, the ids are collected from the entire definition scope. For example, if the editing context is `assert/@sqf:fix`, the *Content Completion Assistant* proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as `sqf:add/@match` or `replace/@select`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The **Content Completion Assistant** displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the attributes `path`, `select`, `context`, `subject`, and `test`, depending on *the Schematron options* that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.6.0.7 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions.

## Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a quick fix id in a Schematron document, Oxygen XML Editor searches for the quick fix declaration and all its references and highlights them automatically.

Customizable colors are used: one for the quick fix definition and another one for its references. Occurrences are displayed until another quick fix is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences dialog box (Options > Preferences)** and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X))** action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

## Searching and Refactoring Operations in SQF

### Search Actions

The following search actions can be applied on quick fix ids and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

-  **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
-  **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
-  **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

### Refactoring Actions

The following refactoring actions can be applied on quick fix ids and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
-  **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

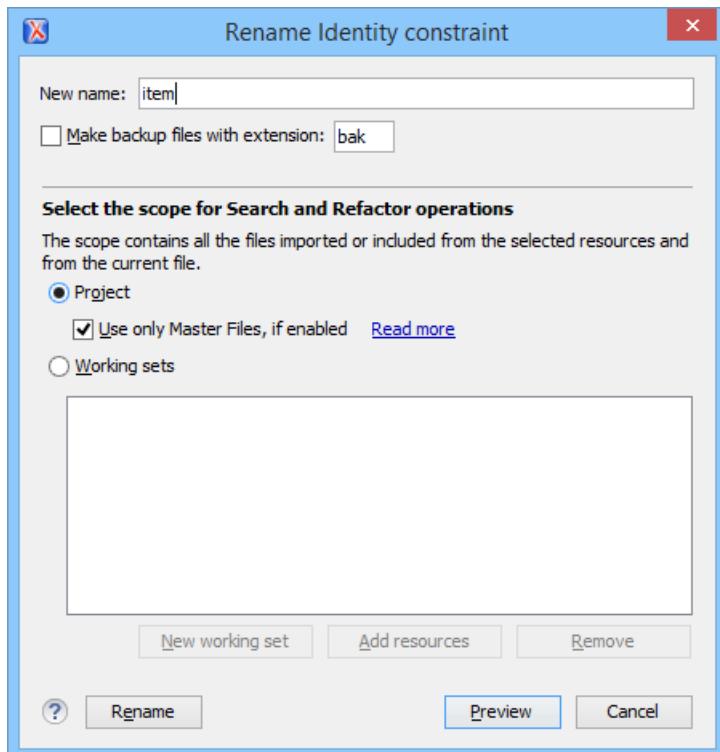

Figure 411: Rename Identity Constraint Dialog Box

## Embed Schematron Quick Fixes in Relax NG or XML Schema

Schematron Quick Fixes can be embedded into an XML Schema through annotations (using the appinfo element), or in a schematron rule embedded in the RELAX NG Schema. For more information about embedding schematron in XML Schema or Relax NG, see [XML Schema or RELAX NG with Embedded Schematron Rules](#) on page 661.

Oxygen XML Editor is able to extract and use the embedded Schematron Quick Fixes. To make the embedded Schematron Quick Fixes available, follow these steps:

1. Define a [validation against a schema](#).
2. For the **Schema type**, choose XML Schema or Relax NG.
3. Enable the **Embedded schematron rules** option.

### Example: Embedded Schematron Quick Fix in XML Schema

```
<xsd:appinfo>
 <sch:pattern>
 <sch:rule context="...">
 <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
 <sqf:fix id="fixId">

 </sqf:fix>
 </sch:rule>
 </sch:pattern>
</xsd:appinfo>
```

### Example: Embedded Schematron Quick Fix in Relax NG

```
<sch:pattern>
 <sch:rule context="...">
 <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
 <sqf:fix id="fixId">

 </sqf:fix>
 </sch:rule>
</sch:pattern>
```

**Tip:** For more extensive examples, see our samples in the `[OXYGEN_INSTALL_DIR]/samples/schematron` folder.

[Defining Schematron Quick Fixes](#) on page 669

## Integrating SQF in a Framework

You can use Schematron Quick Fixes to assist your content authors by imposing rules for an entire framework (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (fig element) inside a paragraph (p element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its Quick Fix for this particular use-case could look like this:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
 xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
 <pattern id="check.figure.location">
 <rule context="p/fig">
 <report test="true()" role="warn" sqf:fix="moveAfter">
 A figure inside a paragraph doesn't transform well into PDF. </report>
 <sqf:fix id="moveAfter">
 <sqf:description>
 <sqf:title>Move after the paragraph.</sqf:title>
 </sqf:description>
 <let name="figToMove" value="." />
 <sqf:add match="parent::p" select="$figToMove" position="after"/>
 <sqf:delete match=". />
 </sqf:fix>
 </rule>
 </pattern>
 </schema>
```

The result of this example would be that the user will see a warning if they insert a fig element inside a p element and they are presented with the option of selecting the Quick Fix that would move the figure outside the paragraph.

## How to Integrate SQF in a Framework

To integrate a Schematron Quick Fix in a framework, follow these steps:

1. [Define a Schematron Quick Fix for a rule](#) in an existing or new Schematron file.
2. Save it somewhere in your framework directory. For example, the default framework directory for DITA is located in: [OXYGEN\_INSTALL\_DIR]/frameworks/dita/.
3. Add a reference to the Schematron file that includes the SQF in your framework by following the procedure in [Associating a Schema in Validation Scenarios Defined in the Document Type](#) on page 467.
4. Open a document in your framework and test the new rule and quick fix.
5. You can continue to refine the rule and develop additional rules as needed.

## Editing SVG Files

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text, and embedded raster graphics with many painting styles, scripting through languages such as ECMAScript, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation frameworks (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Editor adds SVG support by using the [Batik distribution](#) package (an open source project developed by the Apache Software Foundation) and the [default XML catalog](#) resolves the SVG DTD.

**Note:** Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the [Batik Implementation Status](#) page.

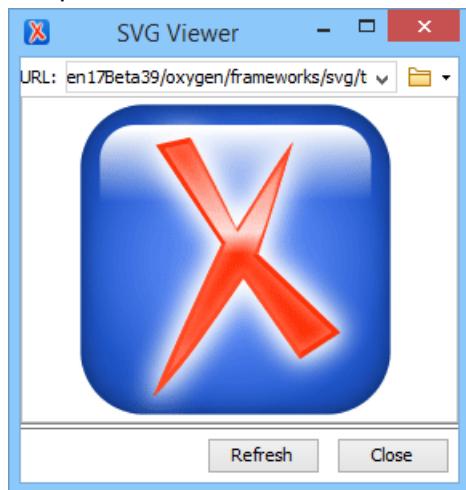

## How to Render SVG Images that Use Java Scripting

1. Copy the `js.jar` library from the [Batik distribution](#) into the Oxygen XML Editor `lib` folder.
2. Restart the application.

## Standalone SVG Viewer

Oxygen XML Editor includes a simple SVG Viewer that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

**Figure 412: SVG Viewer**

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project** view and selecting **Open with > SVG Viewer**.

### Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

#### Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

#### Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.
- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

#### Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** keyboard shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

#### Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

## Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

## Pan

To pan an image, **click and drag** the image with your mouse.

## Related information

[SVG 1.2 Rendering Issues](#) on page 1535

## Integrated SVG Viewer in the Results Panel

Oxygen XML Editor includes an integrated SVG Viewer that can render the results of an XSLT transformation scenario that generates SVG images in the results panel at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select **Show in results view as > SVG** in the [Output tab of the XSLT transformation scenario configuration dialog box](#). When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the results panel.

### Example of a Use-Case

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Editor or exported from a external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.
3. Create an [XML transformation with XSLT scenario](#).
4. While configuring the transformation scenario, select **Show in results view as > SVG in the Output tab** of the configuration dialog box.
5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the results panel at the bottom of the editor.

Figure 413: Integrated SVG Viewer

## Editing XHTML Documents

---

Oxygen XML Editor provides support for editing XHTML files. Oxygen XML Editor includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the `[OXYGEN_INSTALL_DIR]/samples/xhtml` folder.

The XHTML editing features include:

- **Source Editing** - You can edit XHTML files in the [Text editing mode](#) (XML source editor) using all of its [useful features](#).
- **Visual Editing** - You can edit XHTML files in the [visual Author editing mode](#) using all of its [authoring features](#).
- **Validation** - Easily identify errors and their location with the Oxygen XML Editor [XML validation features](#).
- **Content Completion** - The **Content Completion Assistant** displays a list of context-sensitive proposals that are valid at the current cursor position.
- **Import HTML as XHTML** - Oxygen XML Editor includes support for [importing HTML files as an XML document](#).
- **Remote Editing** - Oxygen XML Editor has built-in support for [editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols](#), allowing you to edit XHTML pages from your web server.
- **Syntax Highlighting** - XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Syntax Highlight**.

## Editing Markdown Documents

---

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide a syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Editor provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common amongst most Markdown applications, the editor in Oxygen XML Editor also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in DITA maps and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

## Markdown Editor

Oxygen XML Editor provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a splitscreen editor with two panels that are synchronized in real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

### Left-Side Markdown Text Editor

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Editor.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Editor uses *an integration of rules* that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Editor syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even *customize the colors and styles for the syntax highlighting*.
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Editor *automatic spell checking feature* that reports possible misspelled words as you type. You simply need to enable the *Automatic spell check option in the Spell Check preferences page*, then click the **Select editors** button and select **Markdown Editor**.
- **Helpful Toolbar and Contextual Menu Actions** - A *variety of unique actions* are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.
- **Shortcut Keys** - Many of the *shortcut keys that are most commonly used* in Oxygen XML Editor also work in the Markdown editor.

### Right-Side WYSIWYG Preview Pane

The right pane is a WYSIWYG Preview pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the *Preview* pane. There are two tabs available in the *Preview* pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The *Preview* pane includes the following unique features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
- **Export Options** - The **DITA** tab includes a contextual menu action to *export (convert) the current Markdown document to a DITA topic*. Similarly, the **HTML** tab includes a contextual menu action to *export (convert) the Markdown document to HTML*.
- **Automatic Validation** - As you edit Markdown documents, they are *validated automatically*. The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the *Preview* pane or **Results** view at the bottom of the editor.
- **Print Feature** - The Markdown editor includes a **Print** action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the *Preview* pane.
- **Specialized DITA Features** - The Markdown editor includes some unique, *specialized features to integrate it with the powerful DITA support* in Oxygen XML Editor.

[Creating New Markdown Documents](#) on page 682

## Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Editor, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the **Markdown** file template (in the **New Document** folder).
3. Click the **Create** button.

**Result:** A new Markdown document is created and it is opened in the specialized [Markdown Editor](#).

#### Related information

[Markdown Editor](#) on page 680

## Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Editor for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

#### Toolbar Actions

The following default actions are readily available on the toolbar when editing Markdown documents:

## H<sub>1</sub>Header (1st Level)

Inserts an *atx-style first level header* at the cursor position.

## H<sub>2</sub>Header (2st Level)

Inserts an *atx-style second level header* at the cursor position.

## H<sub>3</sub>Header (3rd Level)

Inserts an *atx-style third level header* at the cursor position.

## —Horizontal Rule

Inserts a *horizontal rule* at the cursor position.

## ■ Bold (Strong)

Marks the selected text with *bold*.

## ✗ Italic (Emphasis)

Marks the selected text with *italics*.

## ☒ Strikethrough

Marks the selected text with a *strike-through*.

## { }Code Block

Inserts (or surrounds selected text in) a *codeblock*.

## ””Blockquote

Inserts a *blockquote* at the cursor position.

## 🔗 Insert Link

Opens the **Insert Link** dialog box that allows you to define a *link* to insert at the cursor position.

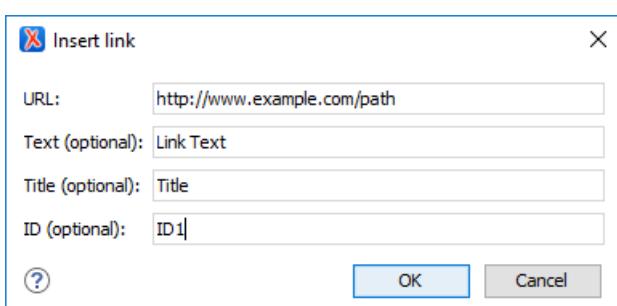

Figure 415: Insert Link Dialog Box

## 🖼 Insert Image

Opens the **Insert Image** dialog box that allows you to define an *image* to insert at the cursor position. You can type the URL of the image you want to insert or use browsing tools in the -**Browse** drop-down menu.

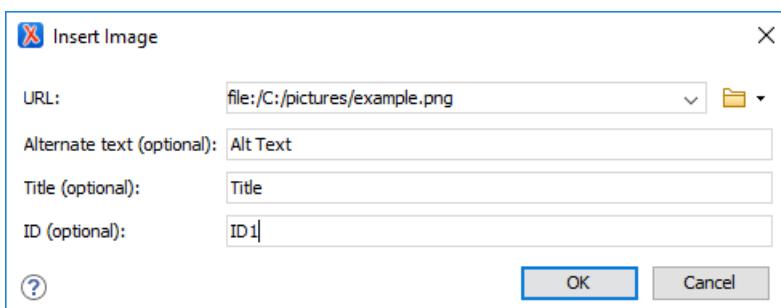

Figure 416: Insert Link Dialog Box

## **Insert Ordered List**

Inserts an [ordered list](#) at the cursor position. Three child list items are also automatically inserted by default.

## **Insert Unordered List**

Inserts an [unordered list](#) at the cursor position. Three child list items are also automatically inserted by default.

## **Insert Task List**

Inserts a [task list](#) at the cursor position. Three child list items are also automatically inserted by default.

## **Insert Table**

Inserts a [table](#) at the cursor position.

## **Contextual Menu Actions**

The following default actions are available in the contextual menu when editing Markdown documents:

Use these actions to execute the typical editing actions on the currently selected content.

## **Source submenu**

This submenu includes the following actions:

### **To Upper Case**

Converts the content selection to upper case characters.

### **To Lower Case**

Converts the content selection to lower case characters.

### **Capitalize Lines**

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

### **Convert Hexadecimal Sequence to Character ([Ctrl + Shift + X \(Command + Shift + X on OS X\)](#))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences: 0x0045, 0X0125, 1253, 265, 43.

## **Base64 Encode/Decode submenu**

This submenu includes the following actions for encoding or decoding base64 schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Base32 Encode/Decode submenu**

This submenu includes the following actions for encoding or decoding base32 schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

### **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

### **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Hex Encode/Decode submenu**

This submenu includes the following actions for encoding or decoding hex schemes:

### **Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

### **Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

## **Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the [Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page](#) will be used. Likewise, the same is true if the [Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is disabled in the Messages preference page](#).

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Join and Normalize Lines ([Ctrl + J \(Command + J on OS X\)](#))**

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

## **Insert new line after ([Ctrl + Alt + Enter \(Command + Alt + Enter on OS X\)](#))**

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

## **Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

## **Open submenu**

The following actions are available in this submenu:

### **Open File at Cursor**

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

### **Open File at Cursor in System Application**

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

## **Compare**

Opens the current file in [the Compare Files tool](#).

## **Show/Hide Preview**

A toggle action that shows or hides the *Preview* pane.

## **Export as DITA Topic**

Converts the current Markdown document into a DITA topic.

## **Export as HTML**

Converts the current Markdown document into an HTML document.

## **Print (Available in the *Preview* pane)**

Opens a page setup dialog box that allows you to configure printing options for the current document.

### **Related information**

[Markdown Editor Syntax Rules and Specifications](#) on page 689

## **Syntax Highlighting in the Markdown Editor**

Oxygen XML Editor supports syntax highlighting in the Markdown editor to improve the readability of the content and make it easier to internalize the semantics of the content.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. [Open the Preferences dialog box \(\*Options > Preferences\*\)](#).
2. Go to [Editor > Syntax Highlight](#).
3. Select and expand the **Markdown** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the *Preview* pane.

### **Related information**

[Syntax Highlight Preferences](#) on page 100

[Markdown Editor](#) on page 680

## **Automatic Validation in Markdown Documents**

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the *Preview* pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the **Results** view at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.

### **Related information**

[Markdown Editor](#) on page 680

## **Working with Markdown Documents in DITA**

Oxygen XML Editor includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the **DITA** tab in the *Preview* pane provides a visualization of how the topic will look after conversion.

### **Export Markdown as a DITA Topic**

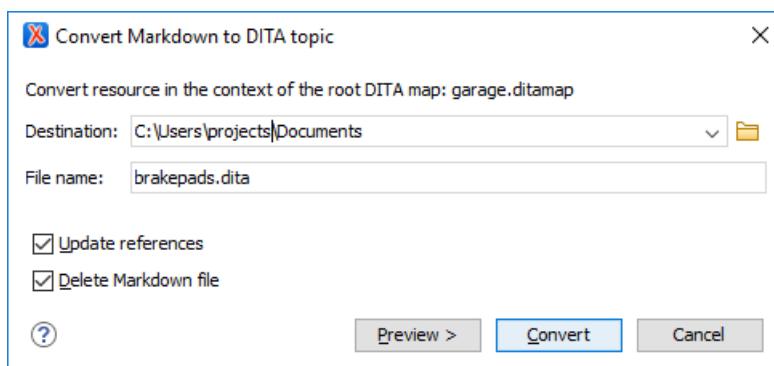

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu of the left-side text editor and the right-side *Preview* pane when the **DITA** tab selected.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

## Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager**. The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child** or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (`topicref` element) with the `format` attribute set to `markdown`.
- **Validate Markdown Documents in DITA Maps** - When you use the **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.
- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

**Figure 417: Convert Markdown to DITA Topic Dialog Box**

This dialog box includes the following options:

### Destination

The destination path for the new DITA topic.

### File Name

Presents the current name and allows you to change it.

### Update references

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

### Delete Markdown file

If enabled, the Markdown version of the file is deleted when the document is converted into a DITA file. If disabled (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

## Preview

Select this button to display a preview of the changes Oxygen XML Editor is about to make.

## Convert

Select this button to perform the conversion.

**Tip:** A sample project for converting Markdown to DITA can be found in the following folder:  
[OXYGEN\_INSTALL\_DIR]/samples/dita/markdown-dita.

[Markdown Editor Syntax Rules and Specifications](#) on page 689

[Automatic Validation in Markdown Documents](#) on page 687

## Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Editor uses rules that were integrated from the most common set of [default Markdown syntax rules](#) along with many of the [GitHub Flavored Markdown rules](#).

The Oxygen XML Editor implementation of the most commonly used syntax rules are as follows:

### Headers

The Markdown editor supports two styles of headers, Setext and Atx.

- **Setext Style**

Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

#### Example: Setext Style Headers

```
First-Level Header (H1)
=====
```

```
Second-Level Header (H2)

```

- **Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6.

Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

#### Example: Atx Style Headers

```
H1 text
H2 text
H3 text
H4 text
H5 text
H6 text
```

### Horizontal Rules (for HTML output only)

You can produce a horizontal rule tag (<hr />) by placing three or more hyphens, asterisks, or underscores on a line by themselves. Optionally, they can be separated by spaces.

- Example: Horizontal Rules

```
* * *
```

```

```

## Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

**Important:** When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (<br />). When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

- **Example: Paragraphs**

```
This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)
This is a new paragraph.
```

## Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

```
italic
italic
```

- **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

```
bold
__bold__
```

- **Strikethrough** - In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

```
~~strikethrough~~
```

**Tip:** You can also combine these styling rules. For example, \*\*BoldText \_ItalicText\_ BoldText\*\* would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as a styling delimiter, you can escape it with a backslash (for example, \\*literal asterisks\\*).

## Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you referencing a local resource on the same server, you can use relative paths.

**Examples: Inline Link**

With a title:

```
Text with [example link text](http://www.example.com/path "Title") an inline link
with a title.
```

Without a title:

Text with [example link text](<http://www.example.com/path>) an inline link without a title.

Relative path:

Text with [example link text](/relative\_path/) an inline link with relative path.

- **Reference Links**

Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

Text with [link text1][id\_1] a reference-type link and [link text2][id\_2] another one.

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

```
[id_1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"
```

Other notes about Reference Links:

- You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

```
[id]: http://example.com/long/path/to/resource/here
 "Optional Title Here"
```

- The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

[My Link][]

and then defined as:

```
[My Link]: http://example.com/
```

## Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

**Note:** These automatic links only work properly in HTML conversions. The *Preview* pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

```
<http://example.com/>
```

For example, in HTML it is converted to:

```
http://example.com/
```

- **Email Addresses**

Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting spambots.

```
<address@example.com>
```

In HTML, it is converted to something like:

```
adress@example.com
```

## Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: *inline* and *reference*. In both cases, the syntax for images begin with an exclamation mark, followed by alt attribute text surrounded by square brackets., and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the alt attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

### **Examples: Inline Images**

With a title:

```
Text with ![Alt text](/path/to/img.jpg "Optional title") an inline image with a title.
```

Without a title:

```
Text with ! [Alt text](/path/to/img.jpg) an inline link without a title.
```

- **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

```
Text with ! [Alt text1][id] a reference-type image.
```

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

```
[id]: url/to/image "Optional Title"
```

## Blockquotes

The Markdown editor uses email-style greater than characters (>) for *blockquotes*. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is more clear) if you put a > before every line.

- **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,
> consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus.
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
>
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
> id sem consectetur libero luctus adipiscing.
```

- *Blockquotes* can be nested by adding additional levels of > characters.

### **Example: Nested Blockquotes**

- > This is the first level of quoting.
- >
- > > This is nestedblockquote.
- >
- > Back to the first level.
- Blockquotes can also contain other Markdown elements (such as headers, lists, and code blocks).

**Example: Blockquotes with Other Markdown Elements**

```
> ## This is a header.
>
> 1. This is the first list item.
> 2. This is the second list item.
>
> Here's some example code:
>
> return shell_exec("echo $input | $markdown_script")
```

### Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

**Example: Inline Code Emphasis**

```
This is a normal sentence with a `code` in the middle.
```

- **Code Blocks**

You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (``` on separate lines.

**Example: Code Block**

```
This is a normal paragraph:
```

```
 This is a code block
```

```
This is a normal paragraph:
```

```
...
```

```
 This is a code block
```

```
...
```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

**Example: Code Block with Indentation**

```
 tell application "something"
 beep
 end tell
```

For example, in HTML the result would look like this:

```
<pre><code>tell application "Foo"
 beep
end tell
</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Editor Markdown editor supports the following languages: *Java, JavaScript, CSS, and Python*.

## Example: Syntax Highlighting in Code Block

```
```css
input[type="submit"] {
    color: white;
    font-weight: bold;
...``
```

Inline XHTML (for HTML output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

- **Example: Inline XHTML**

```
This is a regular paragraph.

<table>
  <tr>
    <td>Col 1</td>
    <td>Col 2</td>
  </tr>
</table>

This is another regular paragraph.
```

Lists

The Markdown editor supports ordered and unordered lists. You can also insert *blockquotes* and *code blocks* inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

- **Unordered Lists**

For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (-) interchangeably.

```
* List item 1
+ List item 2
- List item 3
```

- **Ordered Lists**

For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

```
1. List item 1
8. List item 2
5. List item 3
```

- **Nested Lists**

You can create nested lists by indenting lines by two spaces.

```
1. Ordered list item 1
  1. Nested ordered list item 1
  2. Nested ordered list item 2
    * 2nd level nested unordered list item 1
    * 2nd level nested unordered list item 2
      * 3rd level nested unordered list item 1
2. Ordered list item 2
```

- **Paragraphs Inside Lists**

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

```
* List item 1
```

* List item 2

For both DITA and HTML output, this would result in:

```
<ul>
<li><p>List item 1</p></li>
<li><p>List item 2</p></li>
</ul>
```

- **Multiple Paragraphs Inside Lists**

List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

1. This is a list item with two paragraphs. *Lorem ipsum dolor
 sit amet, consectetuer adipiscing elit. Aliquam hendrerit
 mi posuere lectus.*

*Vestibulum enim wisi, viverra nec, fringilla in, laoreet
 vitae, risus. Donec sit amet nisl. Aliquam semper ipsum
 sit amet velit.*

2. Suspendisse id sem consectetuer libero luctus adipiscing.

- **Blockquotes Inside Lists**

To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that it is under the first letter of the text after the list item marker.

- * A list item with a blockquote:
 > This is a blockquote
 > inside a list item.

- **Code Blocks Inside Lists**

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

- * A list item with a code block:

 This is a code block inside a list item

 ...

 This is a code block inside a list item using the backticks method
  ```

## Task Lists

You can create task lists by prefacing list items with square brackets ([ ]). To mark a task as complete, use [x].

- **Example: Task Lists**

- [ ] Unfinished task 1
- [x] Finished task 2

## Definition Lists

You can create definition lists by using a colon plus a space for each list item.

- **Example: Definition Lists**

- Term 1  
: Definition A  
: Definition B

## Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

- **Creating a Table**

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

First Header	Second Header
Column 1 Row 1 Cell	Column 2 Row 1 Cell
Column 1 Row 2 Cell	Column 2 Row 2 Cell

- **Formatting Rules in Table Cells**

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

First Header	Second Header
<code>'inline code'</code>	Content with <b>bold text</b> inside cell

- **Aligning Text in Tables**

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

Left-aligned	Center-aligned	Right-aligned
<code>:---</code>	<code>:-:-:</code>	<code>--::</code>
Content Cell	Content Cell	Content Cell

## Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (:EMOJICODE:).

- **Example: Emoji**

```
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

## Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```
literal asterisks
```

The Markdown editor provides backslash escapes for the following characters:

```
\ backslash
` backtick
* asterisk
_ underscore
{ } curly braces
[] square brackets
() parentheses
hash mark
+ plus sign
- minus sign (hyphen)
. dot
! exclamation mark
```

## Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, <b>), they are treated as literal characters and escaping is not necessary.

Literal Character	Escaping Code
<	&lt;
>	&gt;
&	&amp;

## Footnotes

The Markdown editor in Oxygen XML Editor supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

```
Here is a footnote reference, [^1]
```

```
[^1]: Here is the footnote.
```

- **Example: Normal Footnote with Multiple Blocks**

```
Here is a footnote reference, [^longnote]
```

```
[^longnote]: Here is the footnote with multiple blocks.
```

```
Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they belong to the previous footnote.
```

- **Example: Inline Footnote**

```
Here is an inline note.^[Inlines notes are easier to write, since you don't have to pick an identifier and move down to type the note.]
```

## Spell Checking

Oxygen XML Editor includes an [automatic \(as-you-type\) spell checking feature](#), as well as a manual spell checking action to open a **Spelling** dialog box that offers a variety of options.

To manually check spelling in the current document, use the  **Check Spelling** action on the toolbar or from the **Edit** menu.

**Figure 418: Check Spelling Dialog Box**

The **Spelling** dialog box contains the following:

**Unrecognized word**

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

**Replace with**

The character string that will replace the misspelled word.

**Guess**

Displays a list of words suggested to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

**Default language**

Allows you to select the default language dictionary used by the spelling engine.

**Paragraph language**

In an XML document, you can mix content written in multiple languages. You can set the language code in the lang or xml:lang attribute for any particular section and Oxygen XML Editor will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

**Begin at cursor position**

Instructs the spell checker to begin checking the document starting from the current cursor position.

**Action Buttons**

**Replace**

Use this button to replace the unrecognized word with the selected word from the **Replace with** field.

**Replace All**

Use this button to replace all occurrences of the unrecognized word with the selected word from the **Replace with** field.

**Ignore**

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Editor skips the content of the XML elements *marked to be ignored*.

**Ignore All**

Ignores all instances of the unrecognized word in the current document.

## Learn

Adds the unrecognized word to the list of valid words.

## Options

Opens the [Spell Check preferences page](#) where you can configure various options in regards to the feature.

### Related information

[AutoCorrect Misspelled Words](#) on page 705

## Spell Check Dictionaries and Term Lists

Oxygen XML Editor uses the *Hunspell* engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Editor includes the following built-in dictionaries for the spell checker:

- English (US) [en\_US]
- English (UK) [en\_GB]
- French [fr]
- German [de\_DE]
- Spanish [es\_ES]

### Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Editor spell checker. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow [these instructions](#) and then add the dictionary to the Oxygen XML Editor spell checker by following [this procedure](#).

### Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Editor provides a way of [adding personalized term lists](#) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Editor uses for storing [learned words](#).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, *legal*, *medical*, *automotive*). They can also be used to control forbidden words.

### Related information

[Adding Spell Check Dictionaries](#) on page 700

[Adding Spell Check Term Lists](#) on page 701

[Building and Testing Hunspell Dictionaries](#)

### Adding Custom Dictionaries and Term Lists

The Oxygen XML Editor spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a .dic file extension) and an affix file (with an .aff file extension). The personalized term lists are custom files (with a .tdi file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Editor spell checker.

You can [add dictionaries](#) and [personalized term lists](#) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the [Spell Check Dictionaries preferences page](#) and the [Include dictionaries and term list from option](#) allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Editor.

## Related information

[Replacing a Spell Check Dictionary](#) on page 701

### Adding Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

### Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a *.dic* file extension) and an *affix* file (with an *.aff* file extension). If the dictionary does not include an affix file (*.aff*), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

**Important:** The name of the files should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, *en\_US\_medical.dic* for a medical dictionary in the US version of the English language or *en\_medical.dic* for a less specific English medical dictionary). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. Open the **Preferences** dialog box ([Options > Preferences](#)) and go to **Editor > Spell Check > Dictionaries**.
3. Choose one of the following two options for adding the downloaded files.
  - a. Copy both files (*.dic* and *.aff*) to the default directory displayed in the **Dictionaries and term lists default folder option**.
  - b. Copy both files (*.dic* and *.aff*) to any other directory, enable the **Include dictionaries and term list from option**, and select that directory. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the spell checker to start using the new dictionary.

### Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a *dictionary* file (with a *.dic* file extension) and an *affix* file (with an *.aff* file extension). The affix file (*.aff*) can be left empty, but it is needed for the mechanism to work properly.

**Important:** The name of the files should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, *en\_US\_medical.dic* for a medical dictionary in the US version of the English language or *en\_medical.dic* for a less specific English medical dictionary). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. In the dictionary file (*.dic* extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

```
2
parabola
asimptotic
```

3. Open the **Preferences** dialog box ([Options > Preferences](#)) and go to **Editor > Spell Check > Dictionaries**.
4. Choose one of the following two options for saving the files.
  - a. Save both files (*.dic* and *.aff*) to the default directory displayed in the **Dictionaries and term lists default folder option**.
  - b. Save both files (*.dic* and *.aff*) to any other directory, enable the **Include dictionaries and term list from option**, and select that directory. If you choose this option, make sure you read [this important note](#).
5. Restart the application for the spell checker to start using the new dictionary.

## Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Follow these instructions: [Building and Testing Hunspell Dictionaries](#).

**Result:** You should end up with a *dictionary* file (with a .dic file extension) and an *affix* file (with an .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

**Important:** The name of the files should begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en\_US\_medical.dic for a medical dictionary in the US version of the English language or en\_medical.dic for a less specific English medical dictionary). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. Open the *Preferences* dialog box ([Options > Preferences](#)) and go to [Editor > Spell Check > Dictionaries](#).
3. Choose one of the following two options for saving the files.
  - a. Save both files (.dic and .aff) to the default directory displayed in the [Dictionaries and term lists default folder option](#).
  - b. Save both files (.dic and .aff) to any other directory, enable the [Include dictionaries and term list from option](#), and select that directory. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the spell checker to start using the new dictionary.

### Related information

[Adding Spell Check Term Lists](#) on page 701

## Adding Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries and the spell checker will be merge them with all the dictionaries and other term lists for a particular language.

## Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a *term list* file (with a .tdi file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en\_US\_myterms.tdi for term list in the US version of the English language or en\_myterms.tdi for a less specific English term list). For a list of language codes, see [https://en.wikipedia.org/wiki/List\\_of\\_ISO\\_639-1\\_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).
2. In the term list file (.tdi extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

```
parabola
asimptotic
*hyperbola
```

3. Open the *Preferences* dialog box ([Options > Preferences](#)) and go to [Editor > Spell Check > Dictionaries](#).
4. Choose one of the following two options for saving the file.
  - a. Save the file (.tdi) to the default directory displayed in the [Dictionaries and term lists default folder option](#).
  - b. Save the file (.tdi) to any other directory, enable the [Include dictionaries and term list from option](#), and select that directory. If you choose this option, make sure you read [this important note](#).
5. Restart the application for the spell checker to start using the new term list.

### Related information

[Adding Spell Check Dictionaries](#) on page 700

## Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

## Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a *.dic* file extension) and an *affix* file (with an *.aff* file extension). If the dictionary does not include an affix file (*.aff*), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Spell Check > Dictionaries](#).
3. Choose one of the following two options to replace existing files.
  - a. Replace the existing files (*.dic* and *.aff*) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option. Leave the **Include dictionaries and term list from** option disabled.
  - b. Replace existing files (*.dic* and *.aff*) for the particular language in a directory specified in the **Include dictionaries and term list from** option. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the spell checker to start using the new dictionary.

## Build a Full Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: [Building and Testing Hunspell Dictionaries](#).
 

**Result:** You should end up with a *dictionary* file (with a *.dic* file extension) and an *affix* file (with an *.aff* file extension). The *affix* file (*.aff*) can be empty, but it is needed for the mechanism to work properly.
2. [Open the Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Spell Check > Dictionaries](#).
3. Choose one of the following two options to replace existing files.
  - a. Replace the existing files (*.dic* and *.aff*) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option. Leave the **Include dictionaries and term list from** option disabled.
  - b. Replace existing files (*.dic* and *.aff*) for the particular language in a directory specified in the **Include dictionaries and term list from** option. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the spell checker to start using the new dictionary.

### Related information

[Adding Custom Dictionaries and Term Lists](#) on page 699

## Learned Words

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Press the **Learn** button from the [Spelling dialog box](#) that is invoked by using the **Check Spelling** action on the toolbar.

**Note:** To delete items from the list of learned words, use the **Delete learned words** option in the [Editor > Spell Check > Dictionaries preferences page](#).

## Ignored Words (Elements)

There are certain XML elements (such as `programlisting`, `codeblock`, or `screen`) in which you may want the content to always be skipped during the spell check process. This can be done in one of several ways:

- You can skip through them manually, word by word, using the **Ignore** button in [the Spelling dialog box](#) that is invoked by using the **Check Spelling** action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the [Ignore elements section](#) in the **Spell Check** preferences page.

## Automatic Spell Check

Oxygen XML Editor includes an option to automatically check the spelling as you type. This feature is disabled by default, but it can be enabled and configured in the [Spell Check preferences page](#). When the **Automatic Spell Check** option is enabled, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

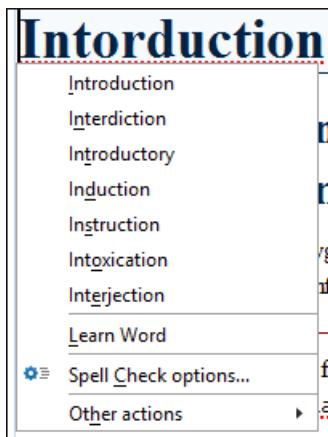

Figure 419: Automatic Spell Checking in Author Mode

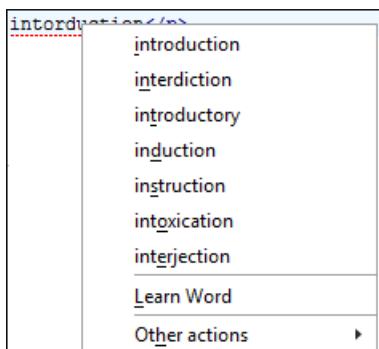

Figure 420: Automatic Spell Checking in Text Mode

The contextual menu includes the following actions:

### Delete Repeated Word

Allows you to delete words that were repeated in consecutive order.

### List of Suggestions

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

### Learn Word

Allows you to add the current unknown word to the persistent dictionary of [learned words](#).

### Spell check options (Available in Author mode only)

Opens the [Spell Check preferences page](#).

## Other actions

This submenu give you access to all the usual contextual menu actions.

## Related information

[Learned Words](#) on page 702

## Spell Check Multiple Files

The **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

- The **Edit** menu.
- The contextual menu of the **Project** view.
- The contextual menu of the **DITA Maps Manager** view.

This action opens the **Check Spelling in Files** dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the **Check All** button to check the spelling in all specified files. The spelling corrections are displayed in [the Results view](#) at the bottom of the editor and you can group the reported errors as a tree with two levels.

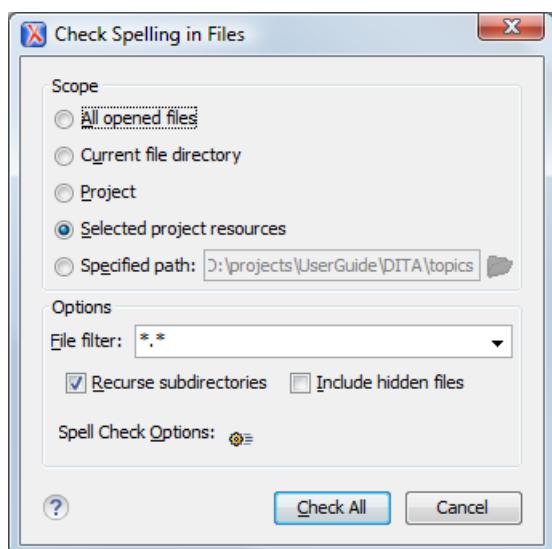

Figure 421: Check Spelling in Files Dialog Box

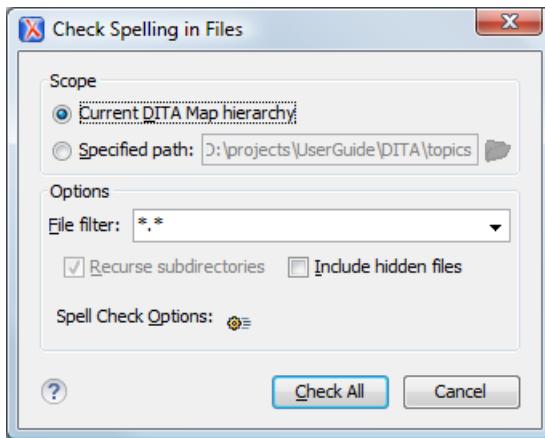

The following scopes are available:

- **All opened files** - The spell check is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When enabled, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When enabled, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the [Spell Check preferences panel](#).

When you invoke the **Check Spelling in Files** action in the **DITA Maps Manager** view, a slightly different version of the dialog box is displayed:

**Figure 422: Check Spelling in Files Dialog Box (Invoked from the DITA Maps Manager View)**

The following scopes are available:

- **Current DITA Map hierarchy** - All the files referenced in the currently selected DITA map, opened in the **DITA Maps Manager** view
- **Specified path** - checks the spelling in the files located at a path that you specify

## AutoCorrect Misspelled Words

---

Oxygen XML Editor includes an AutoCorrect feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in **Author** mode. Oxygen XML Editor includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the AutoCorrect feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the *Replacements Table*.

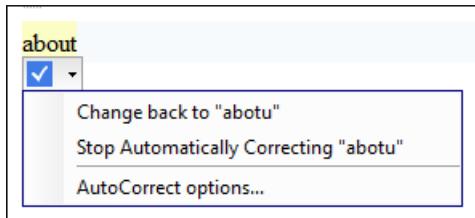

When enabled, the AutoCorrect feature can be used to do the following:

- Automatically correct misspelled words while you edit in **Author** mode.
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R).
- Quickly insert text fragments.

AutoCorrect is enabled by default. To configure this feature, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; : ? ! ' " ) ] }). After a correction, the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following options:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the *AutoCorrect Replacements Table* and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the [Use additional suggestions from the spell checker option](#) is enabled in the [AutoCorrect preferences page](#) and the correction is performed based on the Spell Checker. Selecting this option will add the item to the list of *learned words*.
- **AutoCorrect options** - Opens the [AutoCorrect preferences page](#) that allows you to configure the feature.

**Figure 423: AutoCorrect Widget**

The AutoCorrect feature results in the following types of substitutions in regards to case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

The AutoCorrect feature also uses the list of [ignored elements from the Spell Check preferences page](#). All elements (along with their descendant elements) included in this list will be ignored by the AutoCorrect engine.

#### Related information

[Spell Checking](#) on page 697

## Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the AutoCorrect mechanism, or to replace an existing one, follow these steps:

1. Download an AutoCorrect dictionary file for the desired language. The file needs to have a .dat file extension. An example of a website that includes some AutoCorrect dictionary files is: [OpenOffice Extensions Search Page](#).
2. Open the [Preferences dialog box \(Options > Preferences\)](#) and go to [Editor > Edit Modes > Author > AutoCorrect > Dictionaries](#).
3. Choose one of the following two options for adding the downloaded files.
  - a) Copy the downloaded .dat file to the default directory displayed in the [Dictionaries default folder option](#).. Note that if you are replacing an existing dictionary file, this is the best option.
  - b) Copy the downloaded .dat file to any other directory, enable the [Include dictionaries from option](#), and select that directory. If you choose this option, make sure you read [this important note](#).
4. Restart the application for the AutoCorrect mechanism to start using the new dictionary.

## Loading Large Documents

---

When you open a document with a file size larger than the limit configured in [Open/Save preferences](#), Oxygen XML Editor prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

If your file has a size smaller than 300 MB, the recommended approach is [Optimize loading for large files](#). For documents that exceed 300 MB the recommended approach is [Optimize loading for huge files](#).

## File Sizes Smaller than 300 MB

For editing large documents (file size up to 300 Megabytes), a special memory optimization is implemented on loading such a file so that the total memory allocated for the application is not exceeded.

A temporary buffer file is created on disk so you have to make sure that the available free disk space is at least double the size of the large file that you want to edit. For example, Oxygen XML Editor can load a 200-Megabytes file using a minimum memory setting of 512 Megabytes and at least 400-Megabytes free disk space.

The increase of the maximum size of editable files includes the following restrictions:

- A file larger than the value of the above option is edited only in **Text** mode.
- The [automatic validation](#) is not available when editing a very large file.
- The XPath filter is disabled in [the Find/Replace dialog box](#).
- The bidirectional Unicode support (right-to-left writing) is disabled.
- [The option Format and indent the document on open](#) is disabled for non-XML documents. For XML documents, it is done optimizing the memory usage but without respecting the options set in [the Format preferences page](#).
- Less precise localizations for the results of an [XPath expression](#).

## File Sizes Greater than 300 MB

Files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between different database formats. Traditional text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all the file content must be loaded in memory before the user can actually view it.

The file is split in multiple pages (each having about 1MB in size). Each page is individually loaded (and edited) in the **Text** mode by using the special horizontal slider located at the top of the editing area. The loading operation is very fast and has no upper limit for the size of the loaded file.

The increase of the maximum size of editable files includes the following restrictions:

- For XML files, only the UTF-8, UTF-16, and ASCII encodings are handled; for all non-XML files, the content is considered to be UTF-8.
- Files can be edited in **Text** editing mode only.
- The [automatic validation](#) is disabled.
- The XPath filter is disabled in [the Find/Replace dialog box](#).
- The bidirectional Unicode support (right-to-left writing) is disabled.
- [The Format and indent the document on open option](#) is disabled for non-XML documents. For XML documents, the format and indent operation it is done optimizing the memory usage, but it ignores the options set in [the Format preferences page](#).
- The **Outline** view is not supported.
- The file content is soft wrapped by default.
- The **Find/Replace** dialog box only supports the **Find** action.
- Saving changes is possible if **Safe save** is activated.
- The **undo** operation is not available if you go to other pages and come back to the modified page. the Undo operation loses its previous states if the back and forth between

## Scratch Buffer

---

A handy addition to the document editing is the **Scratch Buffer** view used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the scratch buffer to the editor panel. The **Scratch Buffer** is basically a text area offering XML syntax highlight. The view contextual menu contains basic edit actions such as **Cut**, **Copy**, and **Paste**.

## Handling Read-Only Files

---

If a file marked as read-only is opened in Oxygen XML Editor you can by default perform modifications to it. This behavior is controlled by the [Can edit read only files option](#). When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the [Properties view](#). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.

## Editing Documents with Long Lines

---

When working with documents that contain lines of text that exceed the boundaries of your monitor, you might want to see the text wrapped. To do so, use one of the following methods:

- Press **Ctrl + Shift + Y (Command + Shift + Y on OS X)** to toggle the line wrap feature for the current document only.
- Enable the [Line wrap](#) option in the [Text](#) preferences page to apply the line wrap to all documents.

### Features that Might be Affected by Wrapping Lines of Text

Documents that contain thousands of characters per line can affect the performance of Oxygen XML Editor **Text** mode. When a certain line length limit is reached (controlled from the [Optimize loading for documents with lines longer than \(Characters\)](#) on page [option](#)), Oxygen XML Editor prompts you to wrap the lines of text. By doing so, the following features may be affected to maintain a reasonable level of productivity:

- The editor uses the Monospaced font.
- You cannot set font styles.
- Automatic validation is disabled.
- Automatic spell checking is disabled.
- When editing XML documents, the **XPath** field is disabled in the **Find/Replace** dialog box.
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. We recommend using XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.

## XML Digital Signatures

---

This chapter explains how to apply and verify digital signatures on XML documents.

### Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A digital signature provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A digital signature must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The signature must provide a way to establish the identity of the data's signer for authentication.
- The signature must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A public key system is used to create the digital signature and it's also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, [XML-Signature Syntax and Processing](#)). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The XML Signature is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of canonicalization and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

To canonicalize something means to put it in a standard format that everyone generally uses. Since the signature is dependent on the content it is signing, a signature produced from a non-canonicalized document could possibly be different from one produced from a canonicalized document. The canonical form of an XML document is physical representation of the document produced by the method described in this specification. The term canonical XML refers to XML that is in canonical form. The XML canonicalization method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. The term XML canonicalization refers to the process of applying the XML canonicalization method to an XML document or document subset. XML canonicalization is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the canonical form of the original document before application processing with the canonical form of the document result of the application processing.

A digital signature over the canonical form of an XML document or document subset would allow the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the canonical form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the canonical form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the canonical forms for which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following canonicalization algorithms are used in Oxygen XML Editor: Canonical XML (or Inclusive XML Canonicalization)([XMLC14N](#)) and Exclusive XML Canonicalization([EXCC14N](#)). The first is used for XML where the context doesn't change while the second was designed for canonicalization where the context might change.

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The canonicalization method can specify whether or not comments should be included in the canonical form output by the XML canonicalization method. If a canonical form contains comments corresponding to the comment nodes in the input node-set, the result is called canonical XML with comments. In an uncommented canonical form comments are removed, including delimiter for comments outside document element.

The three operations. [Canonicalize](#), [Sign](#), and [Verify Signature](#), are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

## Related tasks

[Example of How to Digitally Sign XML Files or Content](#) on page 713

[Certificates](#) on page 710

[Canonicalizing Files](#) on page 710

[Signing Files](#) on page 711

[Verifying Signature](#) on page 713

## Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores*.

A *keystore* is an encrypted file that contains private keys and certificates. All keystore entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No keystore can store an entity if its alias already exists in that keystore and cannot store trusted certificates generated with keys in its keystore.

In Oxygen XML Editor there are provided two types of keystores: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. In a PKCS 12 keystore you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the keystore.

To configure the options for a certificate or to validate it, [open the Preferences dialog box \(Options > Preferences\)](#) and go to **XML > XML Signing Certificates**. This opens [the certificates preferences page](#).

## Related information

[Digital Signatures Overview](#) on page 708

## Canonicalizing Files

You can select the canonicalization algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

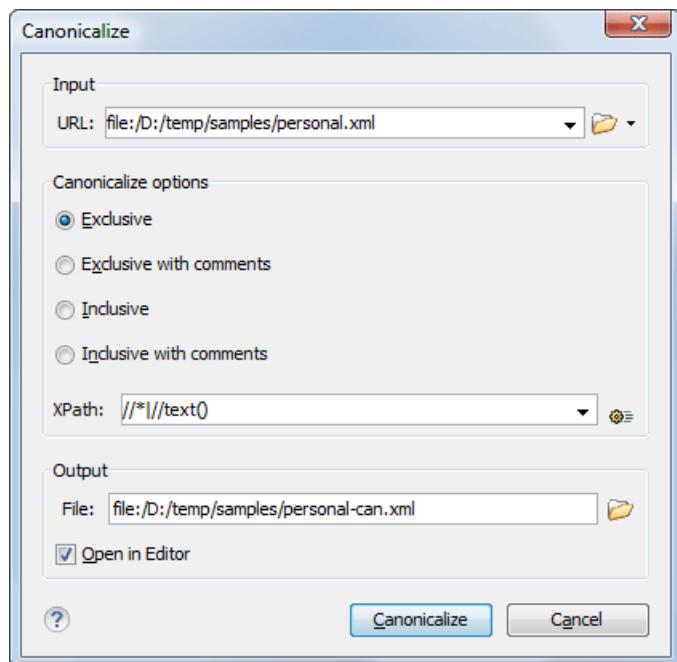

Figure 424: Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.
- Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.
- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
  - **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

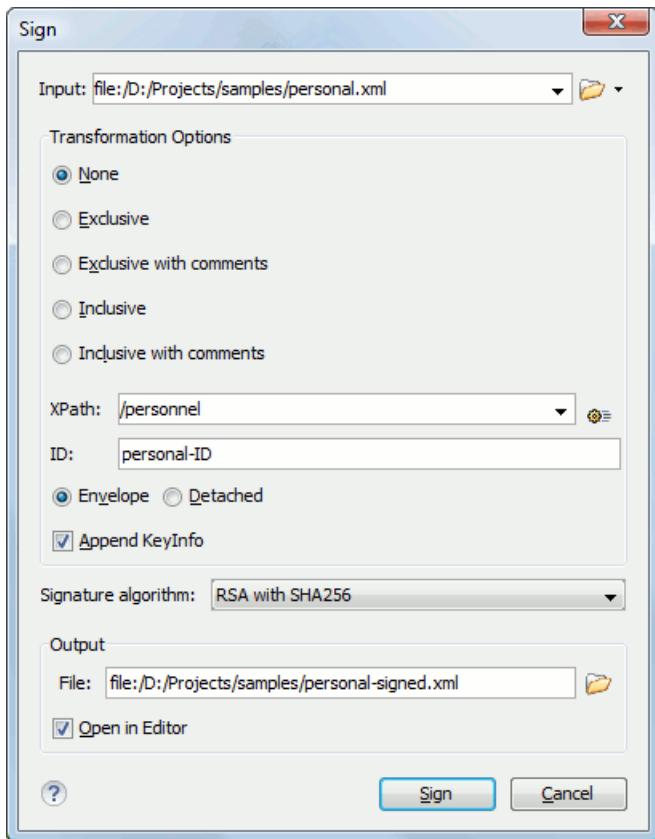

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in the editor.

#### Related information

[Digital Signatures Overview](#) on page 708

## Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

**Figure 425: Signature Settings Dialog Box**

The following options are available:

**Note:** If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page](#) where you can configure a valid certificate.

! Could not obtain a valid certificate. You must configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview](#) section for more information about these options.
  - **None** - If selected, no canonicalization algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization method is used.

**Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security perspective because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.

- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) for more information.
- **Append KeyInfo** - If this option is checked, the ds :KeyInfo element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If checked, the output file will be opened in Oxygen XML Editor.

#### Related tasks

[Example of How to Digitally Sign XML Files or Content](#) on page 713

#### Related information

[Digital Signatures Overview](#) on page 708

[Verifying Signature](#) on page 713

## Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

[Signing Files](#) on page 711

## Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Editor includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Editor installation directory includes a samples folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `person` elements inside the `personnel` element. Suppose you want to digitally sign the specific `person` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `personal.xml` file in Oxygen XML Editor in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu.  
The **Sign** dialog box is displayed.
3. If Oxygen XML Editor cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the [XML Signing Certificates preferences page](#) that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
  - a) Select one of [the Transformation Options](#). For the purposes of this example, select the **Inclusive with comments** option.
  - b) Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.

- c) Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
  - d) Select the **Envelope option** and leave the other options as their default values.
- The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.
5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

## Compare Files or Directories

---

Oxygen XML Editor provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: **Compare Directories** or **Compare Files**. These utilities are available from the **Tools** menu or can be opened as stand-alone applications from the Oxygen XML Editor installation folder (`diffDirs.exe` and `diffFiles.exe`).

#### Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (`diffFiles.bat` and `diffDirs.bat` on Windows, `diffFiles.sh` and `diffDirs.sh` on Unix/Linux, `diffFilesMac.sh` and `diffDirsMac.sh` on OS X). To specify files or directories to compare, you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: `zip`, `docx`, and `xlsx`).

#### Directory Comparison Example

To start a *comparison between the two directories*, use the following construct: `diffDirs.bat/diffDirs.sh/diffDirsMac.sh [directory path 1] [directory path 2]`. If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

#### File Comparison Example

To start a *comparison between 2 or 3 files*, use the following construct: `diffFiles.bat/diffFiles.sh/diffFilesMac.sh [path to left file] [path to right file] [path to base file]`.

If three files are specified, the tool will start in the *3-way comparison mode*. If only two files are specified, the tool will start in the *2-way comparison mode*. The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

For example, to do a 3-way comparison on Windows, the command line would look like this:

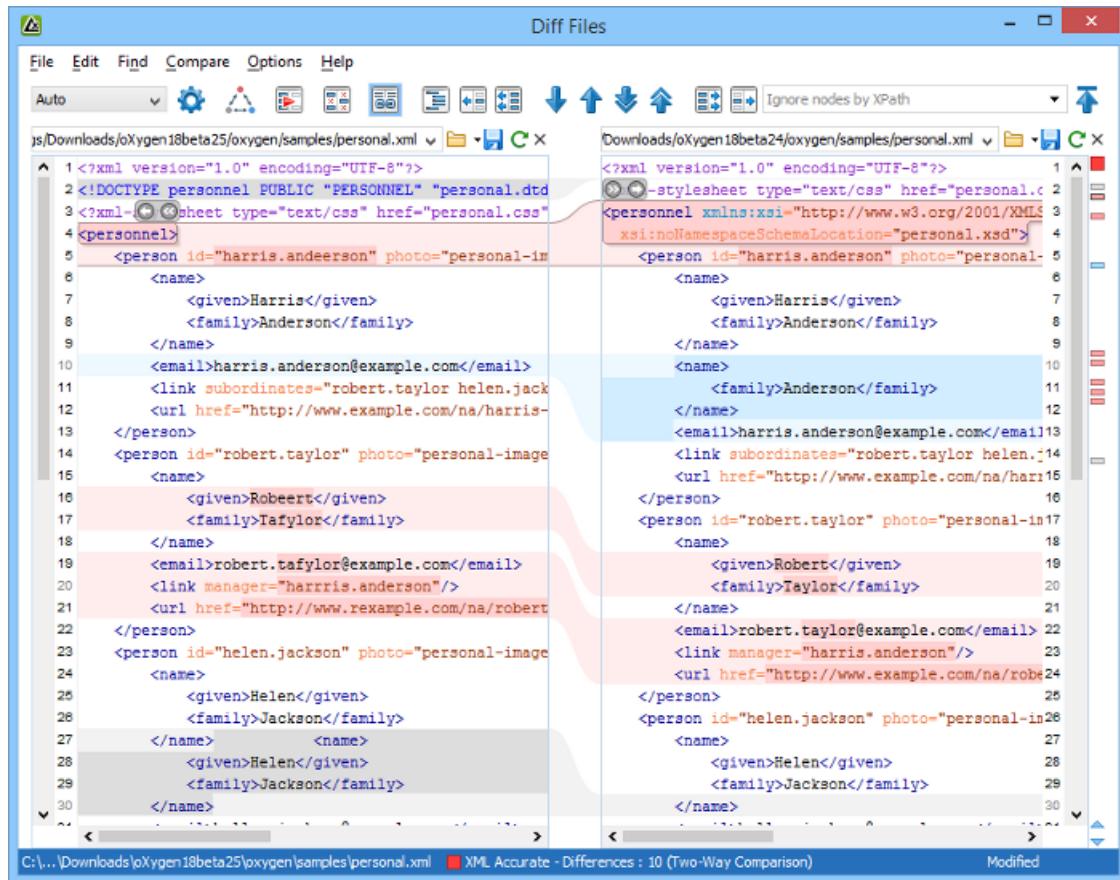

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

## Compare Files

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available

from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffFiles.exe`).

**Figure 426: Compare Files Tool**

### Starting the Tool from a Command Line

The file comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on Unix/Linux, `diffFilesMac.sh` on OS X). To specify the files to compare, you can pass command-line arguments using the following construct: `diffFiles.bat/diffFiles.sh/diffFilesMac.sh [path to left file] [path to right file] [path to 3-way base file]`.

If three files are specified, the tool will start in the [3-way comparison mode](#). If only two files are specified, the tool will start in the [2-way comparison mode](#). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

You can also start the file comparison tool from an external application by using the `[-ext]` argument and there are some additional arguments that are allowed. To see all the details for the command line construct, type `diffFiles.bat --help` in the command line.

For example, to do a 3-way comparison on Windows, the command line might look like this:

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

### Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

#### Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
- Step Result:** The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.
2. To highlight the differences between the two files, click the **Perform File Differencing** button from the toolbar.
3. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
4. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the **XML Fast** or **XML Accurate** algorithms, you can enter an XPath 2.0 expression in the **Ignore nodes by XPath** text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <!DOCTYPE personnel PUBLIC "PERSONNEL"
3 <?xmlstylesheet type="text/css" href="
4 <personnel xmlns="http://www.oxygenxm
<?xml version="1.0" encoding="UTF-8"?> 1 ^
<?xmlstylesheet type="text/css" href= 2
<personnel xmlns="http://www.oxygenxm 3
 <person id="robert.taylor" photo= 4
```

**Figure 427: Two-Way Differences**

### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

### Compare Fragments

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the **Close (Ctrl + W (Command + W on OS X))** button, before pasting the fragments. If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

### Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

### Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

 **Append left change to right and  Append right change to left**

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

 **Copy change from left to right and  Copy change from right to left**

Replaces the content of a change from one side with the content of the corresponding change from the other side.

 **Remove change**

Rejects the change on the particular side and preserves the particular content on the other side.

## Two-Way Diff Algorithms

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of tokens and computes the differences between them. The meaning of a token depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (.xquery, .xq, .xqy, .xqm extensions), DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

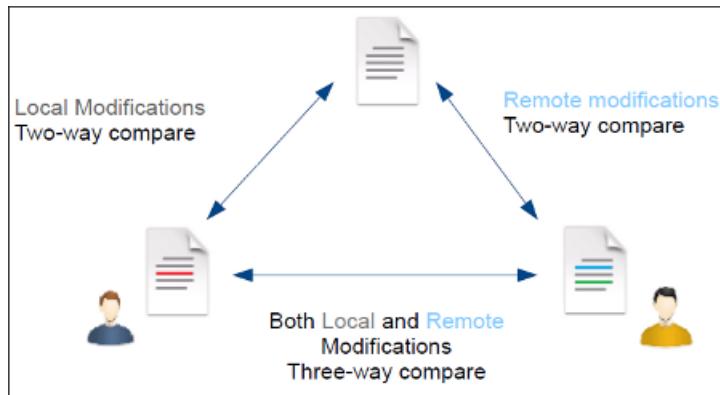

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The < character
  - The /> sequence of characters
  - The name of an attribute inside an XML tag
  - The = sign
  - The " character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

## Three-Way Comparisons

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and

committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.

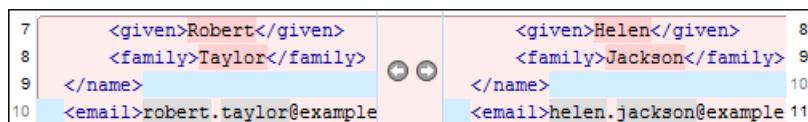

**Figure 428: Three-Way Comparison**

### Compare Files

To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
- Step Result:** The selected files are opened in the two side-by-side editors. A text perspective is used to offer a better view of the differences.
2. Click the **Three-Way Comparison** button on the toolbar and select the base file in the **Base** field. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.
3. To highlight the differences, click the **Perform File Differencing** button on the toolbar.
4. You can use the drop-down menu on the left side of the toolbar to change the *algorithm* for the operation.
5. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

**Figure 429: Three-Way Differences**

### Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the **Files Comparison / Appearance preferences page**, but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.

- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

## Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the **Compare** menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

## Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the  **Perform File Differencing** button.

A variety of actions are available on the [toolbar](#) and in the [various menus](#) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

### Append left change to right and Append right change to left

Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

### Copy change from left to right and Copy change from right to left

Replaces the content of a change from one side with the content of the corresponding change from the other side.

### Remove change

Rejects the change on the particular side and preserves the particular content on the other side.

## Three-Way Diff Algorithms

Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

## Second Level Comparisons

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second level comparison is processed using a [syntax-aware comparison](#), meaning that it looks for identical tokens. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

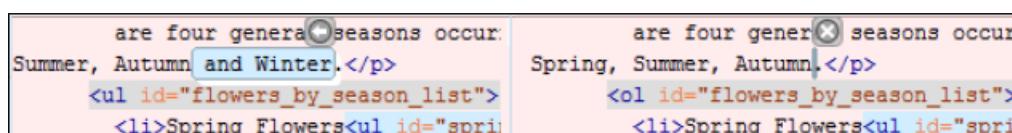

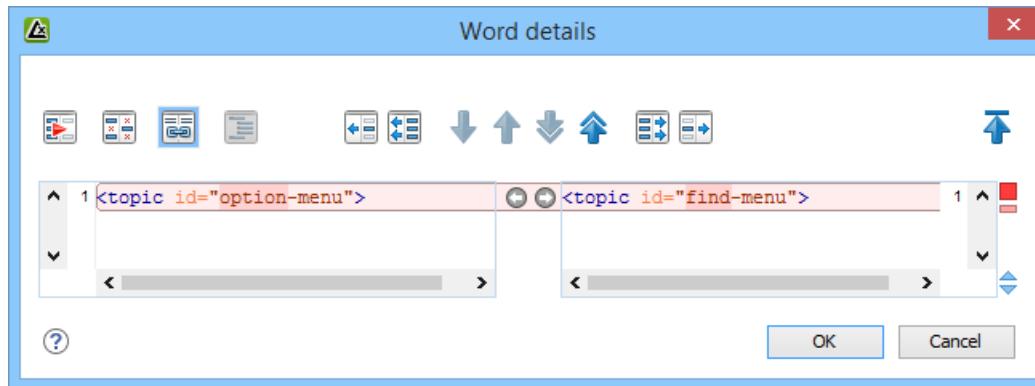

Figure 430: Second Level Diff Comparison

**Note:** If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second level comparison will not automatically be performed. In this case you can manually select a second level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

**Figure 431: Word Level Comparison**

To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

**Figure 432: Character Level Comparison**

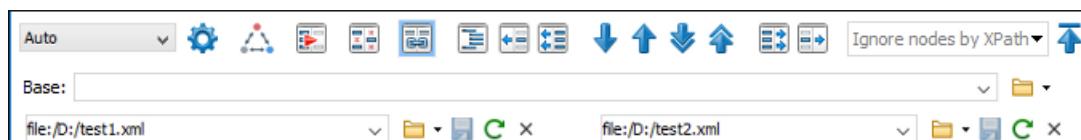

#### Related information

[Files Comparison Preferences Page](#) on page 141

[Compare Directories](#) on page 726

#### Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the **Compare Files** tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

**Figure 433: Compare Toolbar**

The following actions are available:

#### Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

### Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

### Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

### Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

### Synchronized scrolling

Enables or disables synchronized scrolling so that a selected difference can be seen on both sides of the application window. This option is enabled by default.

### Format and Indent Both Files (**Ctrl + Shift + P (Command + Shift + P on OS X)**)

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

### Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

### Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

### Next Block of Changes (**Ctrl + Period (Command + Period on OS X)**)

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

### Previous Block of Changes (**Ctrl + Comma (Command + Comma on OS X)**)

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

## **Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

## **Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

### **Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

### **Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

### **Ignore Nodes by XPath**

You can use this text field to enter an [XPath expression](#) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

**Note:** If an XPath expression is specified in the [Ignore nodes by XPath option](#) in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

## **First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

### **Base**

Available for [three-way comparisons](#). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

### **Left-Side (Source) File**

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

#### **Save**

Saves the changes made in the source (left-side) file.

#### **Reload**

Reloads the source (left-side) file.

#### **Close**

Closes the source (left-side) file.

### **Right-Side (Target) File**

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing tools in the  **Browse** drop-down menu.

#### **Save**

Saves the target (right-side) file.

#### **Reload**

Reloads the target (right-side) file.

### **Close**

Closes the target (right-side) file.

## **Compare Files Tool Menus**

The menus in the **Compare Files** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

### **File Menu**

#### **Source > Open**

Browses for a file that will be displayed in the left panel.

#### **Source > Open URL**

Browses for a remote file that will be displayed in the left panel.

#### **Source > Open File from Archive**

Browses an archive for a file that will be displayed in the left panel.

#### **Source > Reload**

Reloads the file in the left panel.

#### **Source > Save**

Saves the changes made to the file in the left panel.

#### **Source > Save As**

Allows you to choose a destination to save the file in the left panel.

#### **Source > Close**

Closes the file in the left panel.

#### **Target > Open**

Browses for a file that will be displayed in the right panel.

#### **Target > Open URL**

Browses for a remote file that will be displayed in the right panel.

#### **Target > Open File from Archive**

Browses an archive for a file that will be displayed in the right panel.

#### **Target > Reload**

Reloads the file in the right panel.

#### **Target > Save**

Saves the changes made to the file in the right panel.

#### **Target > Save As**

Allows you to choose a destination to save the file in the right panel.

#### **Target > Close**

Closes the file in the right panel.

#### **Base > Open**

Browses for a file that will be compared with both files in a *three-way comparison*.

#### **Base > Open URL**

Browses for a remote file that will be compared with both files in a *three-way comparison*.

#### **Base > Open File from Archive**

Browses an archive for a file that will be compared with both files in a *three-way comparison*.

## **Close (Ctrl + W (Command + W on OS X))**

Closes the application.

## **Edit Menu**

**Cut**  
Cut the selection from the currently focused editor panel to the clipboard.

**Copy**  
Copy the selection from the currently focused editor panel to the clipboard.

**Paste**  
Paste content from the clipboard into the currently focused editor panel.

### **Select all**

Selects all content in the currently focused editor panel.

**Undo**  
Undo changes in the currently focused editor panel.

**Redo**  
Redo changes in the currently focused editor panel.

## **Find Menu**

**Find/Replace**  
Perform *find/replace* operations in the currently focused editor panel.

### **Find Next**

Go to the next match using the same options as the last *find* operation. This action runs in both editor panels.

### **Find Previous**

Go to the previous match using the same options as the last *find* operation. This action runs in both editor panels.

## **Compare Menu**

**Three-Way Comparison**  
Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**  
Looks for differences between the two files displayed in the left and right side panels.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**  
Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**  
Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**  
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

## **Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

## **Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

## **First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

## **Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

## **Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

## **Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

## **Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

## **Show Word Level Details**

Provides a word-level comparison of the selected change.

## **Show Character Level Details**

Provides a character-level comparison of the selected change.

## **Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

## **Options Menu**

### **Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

### **Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

### **Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

### **Import Global Options**

Allows you to import an options set that you have previously exported.

### **Export Global Options**

Allows you to export the current options set to a file.

## **Help Menu**

### **Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

## Use Online Help

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

## Report problem

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the com.oxygenxml.report.problems.url system property. The report is sent in XML format through the report parameter of the POST HTTP method.

## Support Center

Opens the Oxygen XML Editor Support Center web page in a browser.

## Compare Directories

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffDirs.exe).

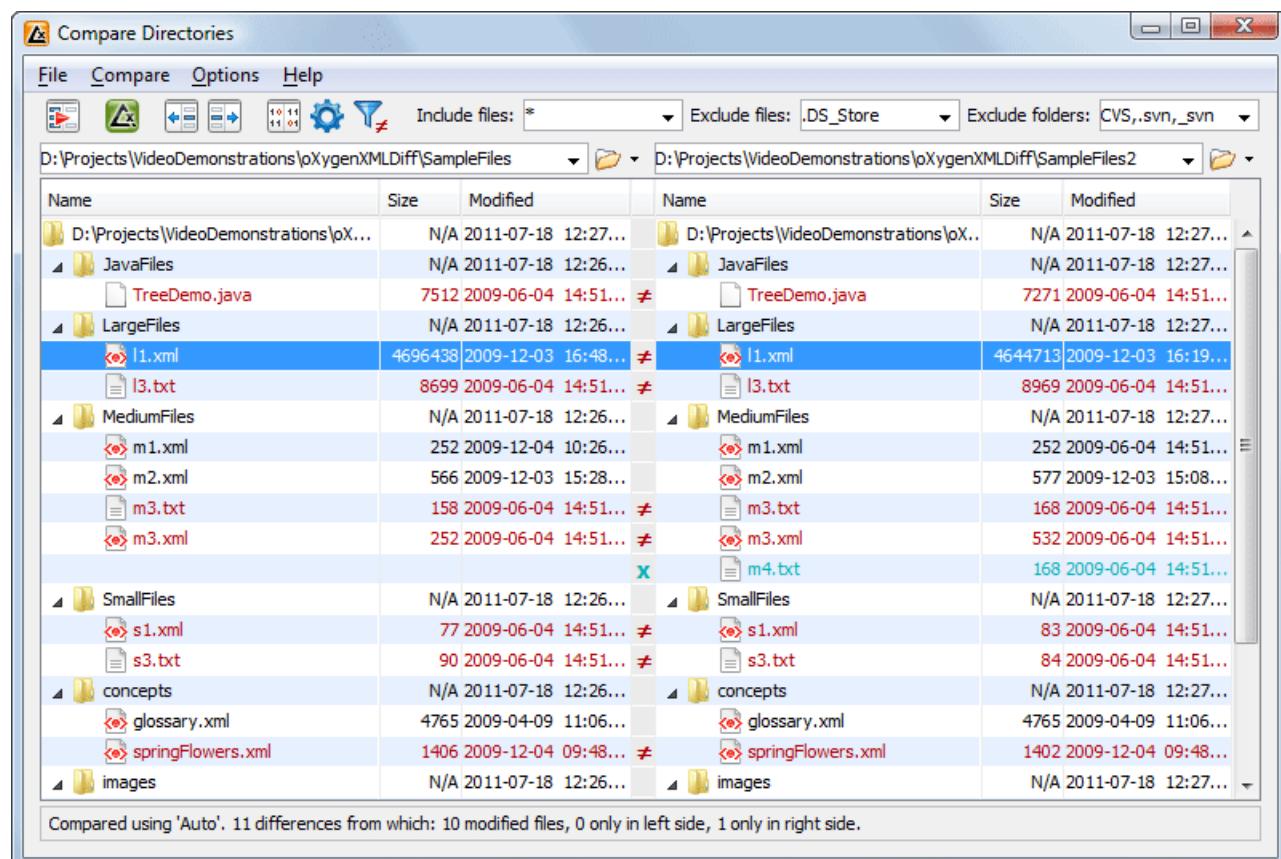

Figure 434: Compare Directories Tool

## Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (diffDirs.bat on Windows, diffDirs.sh on Unix/Linux, diffDirsMac.sh on OS X). To specify the directories to compare, you can pass command-line arguments using the following construct: diffDirs.bat/diffDirs.sh/diffDirsMac.sh [directory path 1] [directory path 2].

If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

## Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

**Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.
3. You can also use the **Diff Options** button to access the [Directories Comparison preferences page](#) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.
2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, enable the [Look in archives option](#) in the **Directories Comparison** preferences page.
3. To highlight the differences, click the **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
- A **#** symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the [Directories Comparison / Appearance preferences page](#). You can double-click lines marked with the **#** symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Editor starts a [file comparison](#) between the two files, using the **Compare Files** tool.

## Related information

[Compare Files](#) on page 714

## Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the **Compare Directories** tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 435: Compare toolbar

## Toolbar Actions

### Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

### Perform Files Differencing

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

### Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

### Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

### Binary Compare

Performs a byte-level comparison on the selected files.

### Diff Options

Opens the [Directory Comparison preferences page](#) where you can configure various options.

### Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

## File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the \* and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the **Exclude files** filter box to read \*.jpeg, \*.png. Each filter includes a drop-down menu with the latest 15 filters applied.

## Contextual Menu Actions

### Perform Files Differencing

Opens the [Compare Files tool](#) that allows you to compare the currently selected files.

### Binary Compare

Performs a byte-level comparison on the selected files.

### Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

### Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

## Open

If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

## Open in System Application

Opens the selected file in the system application that is associated with that type of file. The action is available when launching the **Compare Directories** tool from the **Tools** menu in Oxygen XML Editor.

## Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

## Compare Directories Tool Menus

The menus in the **Compare Directories** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

### File Menu

#### **Close (Ctrl + W (Command + W on OS X))**

Closes the application.

### Compare Menu

#### **Perform Directories Differencing**

Looks for differences between the two directories displayed in the left and right side of the application window.

#### **Perform Files Differencing**

Opens the **Compare Files tool** that allows you to compare the currently selected files.

#### **Copy Change from Right to Left**

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

#### **Copy Change from Left to Right**

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

### Options Menu

#### **Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

#### **Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

#### **Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

#### **Import Global Options**

Allows you to import an options set that you have previously exported.

#### **Export Global Options**

Allows you to export the current options set to a file.

### Help Menu

#### **Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

#### **Use Online Help**

If this option is enabled, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is disabled or an internet connection fails, the help documentation is opened in offline mode.

#### **Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the

`com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

## Support Center

Opens the Oxygen XML Editor Support Center web page in a browser.

## Compare Images

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: *GIF, JPG, JPEG, PNG, and BMP*.

## Compare Directories Against a Base (3-Way)

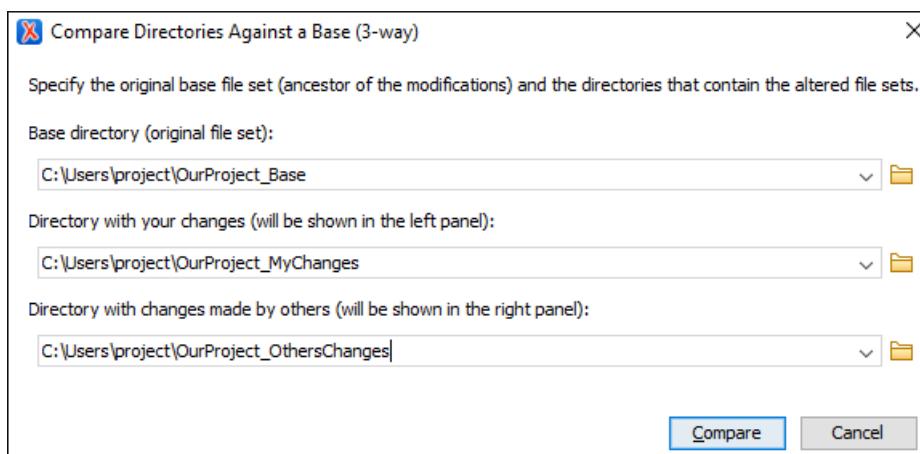

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

### How to Perform 3-Way Directory Comparisons

To perform a 3-way directories comparison, follow these steps:

1. Select **3 Compare Directories Against a Base (3-way)** from the **Tools** menu.

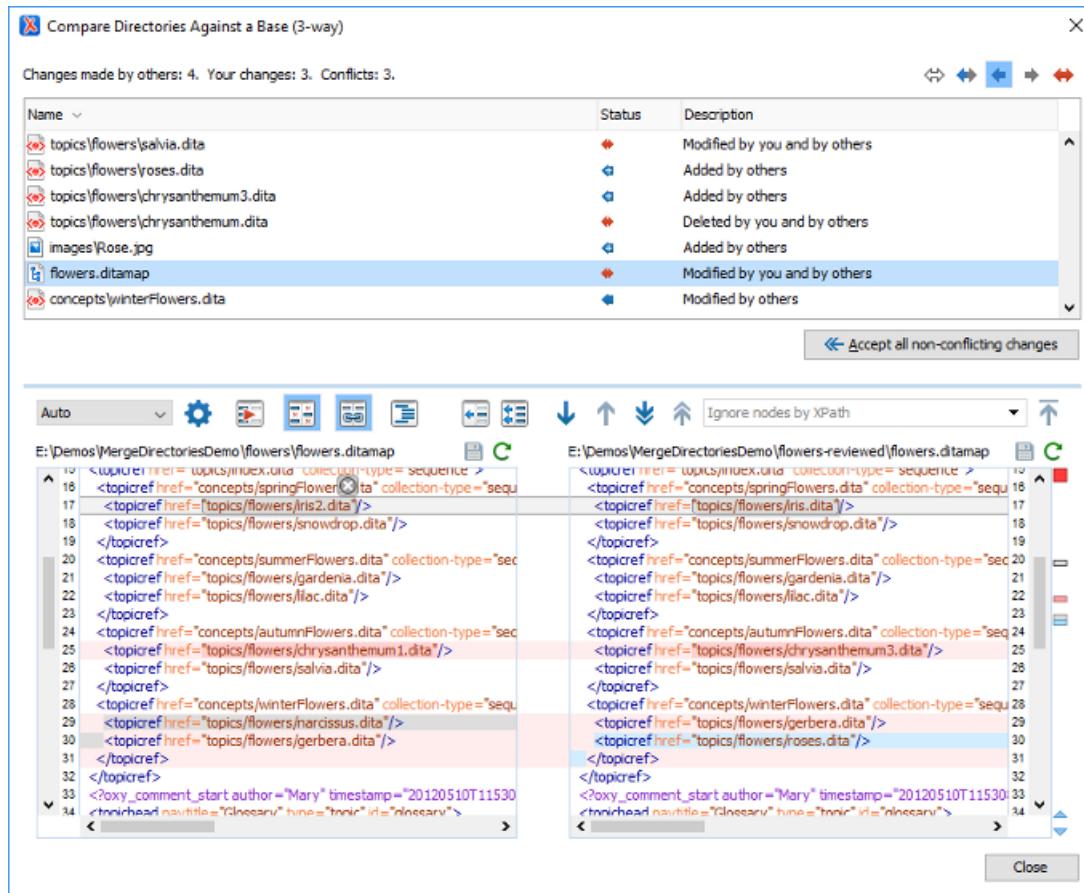

**Step Result:** This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

**Figure 436: Compare Directories Against a Base File Set Chooser**

2. Select the file sets to be compared:
  - **Base directory** - This is the original (base) file set before any modifications were made by you or others.
  - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
  - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.
3. Click the **Compare** button to compare the file sets and open the comparison tool.
4. Use the features and actions described in the next section to identify and merge the changes.

### 3-Way Directory Comparison Tool: Features and Actions

**Figure 437: Compare Directories Against a Base (3-way) Tool**

The 3-way directory comparison tool includes the following features and actions:

#### Number of Changes and Conflicts

The first thing you see in the tool is grand total of all the changes made by others, changes made by you, and the number of conflicts.

#### Filter Buttons

You can filter the list of modifications with the following toggle buttons:

##### >Show all files

Use this button to show all modified and unmodified files, as well as conflicts.

##### Show only files modified by you and others

Filters the list to show all files that have been modified, including conflicts.

##### Show only files modified by others

Filters the list to only show the files that were modified by others.

##### Show only files modified by you

Filters the list to only show the files that were modified by you.

##### Show only conflicting files

Filters the list to only show files that contain conflicts.

#### List of files

This panel shows the list of files in the compared file sets based upon the filter button that is selected. You can see the file path and its status. You can double-click any file to open it in the file comparison panels (the

file from your file set is shown in the left panel while the file from the other file set is shown in the right panel). If you right-click a file in the list, you have access to the following contextual menu actions:

#### Show modifications (Double-Click)

Opens the file in the comparison panels. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel. If the file only exists in one of the file sets, then the panel for the other file set is blank.

#### ← Accept non-conflicting changes

Merges all non-conflicting changes made by others (in the selected files) with your changes. For the files that were modified by both you and others, the tool will try to merge the changes automatically.

#### Overwrite your changes

Overwrites the changes you made to the selected files with the changes made by others.

#### Ignore changes made by others

Ignores the changes made by others to the selected files and keeps your changes.

#### « Accept all non-conflicting changes

Click this button to accept all non-conflicting changes (in all files) made by others and merge them with your own changes. For the files that were modified by both you and others, the tool will try to merge the changes automatically.

### File Comparison Panels

If you double-click a file in the list (or select **Show modifications** from the contextual menu), the files are opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel. The toolbar includes the following actions and options:

#### Algorithm

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

#### Diff Options

Opens the [Files Comparison preferences page](#) where you can configure various options.

#### Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

#### Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

#### Synchronized scrolling

Toggles synchronized scrolling. When enabled, a selected difference can be seen in both panels.

#### Format and Indent Both Files (**Ctrl + Shift + P** (**Command + Shift + P** on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

### **Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

### **Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

### **↓Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is disabled when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

### **↑Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is disabled when the cursor is positioned on the first change block or when there are no changes.

### **↓Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is disabled when the cursor is positioned on the last change or when there are no changes.

### **↑Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is disabled when the cursor is positioned on the first change or when there are no changes.

### **Ignore Nodes by XPath**

You can use this text field to enter an *XPath expression* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.

**Note:** If an XPath expression is specified in the *Ignore nodes by XPath option* in the **Diff / File Comparison** preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

### **↑First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

### **Left-Side File (your changes)**

Above the panel you can see the file path and the following two buttons:

#### **Save**

Saves changes made to the file.

#### **Reload**

Reloads the file.

### **Right-Side File (changes made by others)**

Above the panel you can see the file path and the following two buttons:

#### **Reload**

Reloads the file.

### **Displaying Changes in the File Comparison Panels**

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

```

1 <?xml version="1.0" encoding="UTF-8"?>
2 <!DOCTYPE personnel PUBLIC "PERSONNEL"
3 <?xmlstylesheet type="text/css" href="
4 <personnel>

```

**Figure 438: File Comparison Panels**

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the [Files Comparison / Appearance preferences page](#), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

#### Direct Editing Actions in the File Comparison Panels

You can edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

##### **Append right change to left**

Copies the content of the selected change from the right side and appends it on the left side.

##### **Copy change from right to left**

Replaces the content of a change in the left side with the content of the change in the right side.

##### **Remove change**

Removes the change from the left side.

## Topics:

- [Transformation Scenarios](#)
- [WebHelp System Output](#)

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by other users. This process is known as a *transformation*.

Oxygen XML Editor allows you to use transformation scenarios to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Editor, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for transformation to any format is that your source document is well-formed.

**Note:** You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

## Transformation Scenarios

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Editor, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Types of transformation scenarios include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters.
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters.
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario.
- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters.
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario.

- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters.

**Note:**

Status messages generated during the transformation process are displayed in the [Information view](#).

## Built-in Transformation Scenarios

Oxygen XML Editor included preconfigured built-in transformation scenarios that are used for common transformations. To obtain the desired output, use the  **Apply Transformation Scenario(s)** (**Ctrl + Shift + T** (**Command + Shift + T** on OS X)) action from the toolbar or the **Document > Transformation** menu and choose one of the built-in scenarios for the current document.

You can use the  **Apply Transformation Scenario(s)** action even if the current document is not associated with a transformation scenario.

If the document contains an `xmlstylesheet` processing instruction that refers to an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Editor prompts you to associate the document with a built-in transformation scenario.

The default transformation scenario is suggested based on the processing instruction from the edited document. The **XSL URL** field of the default transformation scenario contains the URL from the `href` attribute of the processing instruction. By default, the **Use xmlstylesheet declaration** checkbox is enabled, Saxon is used as the transformation engine, and no FO processing is performed. The result of the transformation is stored in a file with the same URL as the edited document, but the extension is changed to `html`. The name and path are preserved because the output file name is specified with the help of two **editor variables**:  `${cfid}` and  `${cfn}`.

### DocBook 4 Transformation Scenarios

Default transformation scenarios allow you to convert DocBook 4 to DocBook 5 documents and transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB.

#### Related information

[Editing a Transformation Scenario](#) on page 805

[Configure Transformation Scenario\(s\) Dialog Box](#) on page 806

### DocBook 4 to WebHelp Output

DocBook 4 documents can be transformed into several types of WebHelp systems.

#### WebHelp Classic Output

To publish a DocBook 4 document as a *WebHelp Classic* system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu).
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

#### WebHelp Classic with Feedback Output

To publish a DocBook 4 document as a *WebHelp Classic with Feedback* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see *Deploying a Feedback-Enabled WebHelp System* on page 825.

To watch our video demonstration about the feedback-enabled WebHelp system, go to [https://www.oxygenxml.com/demo/Feedback\\_Enabled\\_WebHelp.html](https://www.oxygenxml.com/demo/Feedback_Enabled_WebHelp.html).

## WebHelp Classic Mobile Output

To publish a DocBook 4 document as a *WebHelp Classic Mobile* system, follow these steps:

1. Click  **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic Mobile** scenario from the **DocBook 4** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic Mobile** transformation is complete, the output is automatically opened in your default browser.

## Customizing WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

### **args.default.language**

This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

### **clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

### **I10n.gentext.default.language**

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

### **use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

### **webhelp.copyright**

Adds a small copyright text that appears at the end of the *Table of Contents* pane.

### **webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

### **webhelp.favicon**

The file path that points to an image to be used as a *favicon* in the WebHelp output.

### **webhelp.footer.file**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
<div id="fb-root"/>
<script>
<!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
if (d.getElementById(id)) return;
js = d.createElement(s); js.id = id;
js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
fjs.parentNode.insertBefore(js, fjs);
(document, 'script', 'facebook-jssdk')) -->
</script>
<div data-share="true" data-show-faces="true" data-action="like"
data-layout="standard" class="fb-like"/>
```

```
</div>
```

### **webhelp.footer.include**

Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then the default Oxygen XML Editor footer is inserted in each WebHelp page.

### **webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

### **webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

### **webhelp.product.id (available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, mobile-phone-user-guide, hvac-installation-guide).

**Note:** You can deploy documentation for multiple products on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

### **webhelp.product.version (available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:** Multiple documentation versions can be deployed on the same server.

**Restriction:** The following characters are not allowed in the value of this parameter: < > / \ ' ( ) { } = ; \* % + &.

### **webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the *Kuromoji* morphological engine that Oxygen XML Editor uses for indexing Japanese content in the WebHelp pages.

### **webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

### **webhelp.skin.css**

Path to a CSS file that sets the style theme in the output WebHelp pages. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp\predefined-skins` directory, or it can be a custom skin CSS generated with the [Oxygen Skin Builder](#) web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.
